MITEL

MD54/74HCT245R

Octal Bus Transceivers with 3-State Buffered Outputs

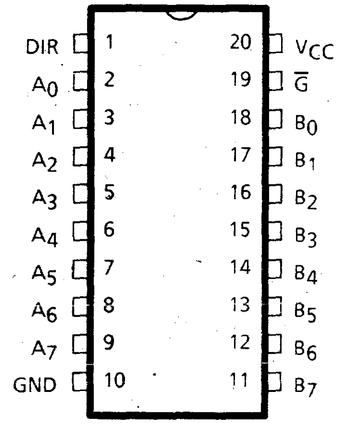
Preliminary Information

October'83

Features

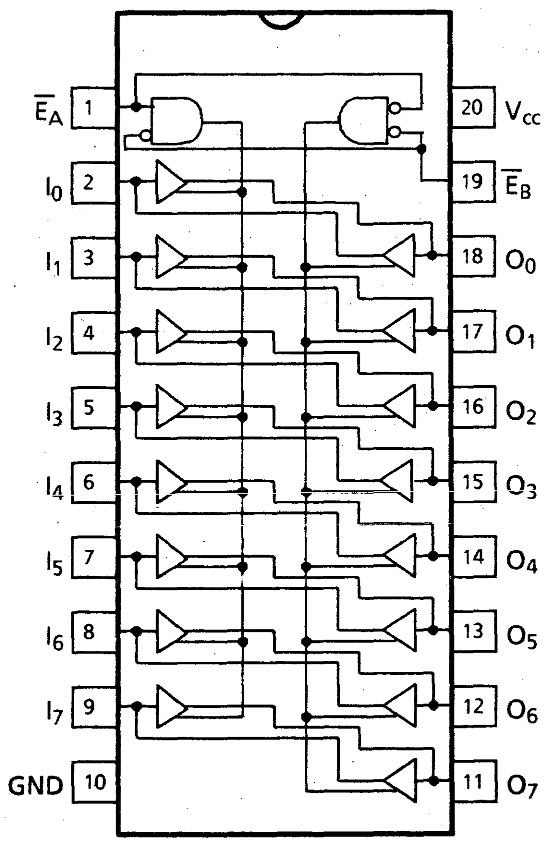
- High latch-up immunity
- High current outputs can drive 30 LSTTL loads
- Low power ISO-CMOS technology
- Bus oriented 3-state outputs
- Meets or exceeds all proposed JEDEC 40.2 specifications
- Fully TTL compatible inputs and outputs
- Pin compatible with 54/74LS245 types

CONNECTION DIAGRAM
DIP (TOP VIEW)



Description

These ISO-CMOS Octal line driver/buffers are designed for high speed asynchronous two-way communication between data buses. The control function inputs minimize external timing requirements. Data transmission from the A bus to the B bus, or from the B bus to the A bus, is provided depending upon the logic leve; at the direction control input (DIR) pin. The enable input (G) pin can be used to disable the device outputs so that the buses are effectively isolated from each other.



Ordering Information

MD54HCT245RCB, Cerdip
-55°C to 125°C
with MIL 883B option

MD74HCT245RE, Plastic Dip
-40°C to 85°C

PIN	DESCRIPTION
A_0 - A_7	Bus A, Data Inputs/Outputs
B_0 - B_7	Bus B, Data Inputs/Outputs
DIR	Direction Control Pin
$\overline{G}$	Enable Input, Active Low
V_{CC}	Supply Voltage
GND	System Ground

FUNCTION TABLE

INPUT	OUTPUT	
ENABLE (G)	CONTROL (DIR)	OPERATION
L	L	A to B
L	H	A to B
H	X	ISOLATION

H = logic "1", L = logic "0", X = don't care,
Z = high impedance

IMPORTANT FEATURES OF YOUR IC MASTER

ONE COMPLETE SOURCE
IC MASTER is the original and only complete guide to currently available integrated circuits, microcomputer boards, development systems. PROM programmers, gate arrays, and other related components of concern to the design engineer. It has become the first place to look in the critical selection of ICs, boards, systems, and equipment. If only one device can fit the requirements of a new design or if hundreds are available, you can find out in seconds by using the IC MASTER.

EASY TO USE
The IC MASTER saves you time. No longer do you have to spend long, tedious hours and days searching through manufacturers' catalogs and data sheets for information. The MASTER gives you—at your fingertips—an easy way to narrow your IC choices quickly, accurately, and systematically with the knowledge that you have just surveyed the entire industry.

PART NUMBER INDEX
This revolutionary index lists all device types made by over 225 manufacturers in numerical sequence excluding prefixes or suffixes. You can find a device number even though you do not know either the full part number or even the manufacturer. Once a basic device number is located in the index, you can obtain instant identification of all manufacturers making a device by that number, regardless of function, and determine the full part number designation. All page references to data sheet material and any existing application note abstracts are also provided. The Part Number Index should not be used as an alternate source directory because two manufacturers may use the same part number, by coincidence, for totally different devices.

PART NUMBER GUIDE
The information in this guide allows you to break down each company's part numbering system into product temperature ranges, packaging variations, and functions. It is an invaluable tool for the elimination of costly and time-consuming ordering errors caused by lack of standardization from manufacturer to manufacturer in part numbering systems.

APPLICATION NOTE DIRECTORY
Application note descriptions are arranged alphabetically by function and application category. Each note's description identifies the specific device or devices featured, provides a 25 to 30 word abstract, and identifies both the manufacturer that originated the note and the specific application note number. This section provides all the information necessary for you to update your application note files speedily, or thoroughly research the existence of application note material for a specific design problem.

MILITARY PARTS DIRECTORY
Cross reference chart identifies all IC devices having received JAN qualification. This chart includes a cross reference listing of device numbers and corresponding military standard 38510 slash numbers and vice versa.

MILITARY DEVICE TESTING TABLE
This table identifies IC manufacturers who test to military standard 38510 and the screening to military standard 883 that they provide.

MILITARY PARTS INDEX
This guide to JAN qualifed parts makes it possible to search devices by function, and to determine if a JAN qualified part exists for a particular functional need.

ADVERTISERS' PRODUCT INDEX
This index directs you to detailed product information for the parts whose manufacturers have included data sheets in IC MASTER. When you are looking for data on a particular manufacturer's products, this index provides the fastest way to find the information you seek.

ALTERNATE SOURCE DIRECTORY
The most comprehensive industry-wide, pin-for-pin, functional equivalent Alternate Source Directory ever compiled. This directory is updated by asking all IC manufacturers to identify each competitive device for which they make a pin-for-pin substitute.

MASTER SELECTION GUIDE
Each guide is organized by specifications and categories to direct you easily and quickly to the device most likely to fill your requirements for a particular application. Once you find those devices that are closest to your needs, you see available sources, and are directed to additional data if provided by advertisers.

MANUFACTURERS AND DISTRIBUTORS DIRECTORY
Locations and phone numbers are given for manufacturers' field sales offices, representatives, and distributors, both domestic and international.

Typical Problems Solved by IC MASTER

• Find All Products That Meet Desired Specifications
• Obtain Data For A Particular Device • Decode Part Numbers
• Determine Alternate Sources • Plus Much More

An engineer can use IC MASTER to solve a wide variety of problems. Answers provided to engineers by IC MASTER can range from finding the device that best meets a particular set of specifications to helping to determine which family of devices should be used in building a system.

Some of the typical problems that IC MASTER can solve are illustrated in the following examples:

Who makes a TTL 4-bit binary full-adder with look-ahead carry?

All functions are listed, in alphabetical order, in the Master Selection Guide Index. In this case, the engineer looks under adders; in the column adjacent to adders, he sees that all types of adders are listed. The particular adder being sought is covered in the Digital section of IC MASTER.

Now that the engineer knows that the devices he seeks are catalogued in the Digital section, he can turn to the Digital Master Selection Guide and see the page number where information on these devices can be obtained.

When he turns to this page, he will notice that certain device numbers and manufacturers are printed in bold face type while others appear in regular type face. Bold face type is used whenever a part's manufacturer has provided a data sheet for the device in IC MASTER. The page number assigned to the data sheet also appears in bold face type so that the engineer can turn to it directly.

Who Makes a High-Speed 12-Bit, Analog-to-Digital Converter With Guaranteed ±½ LSB Linearity and 13-μsec or Faster Conversion Time?

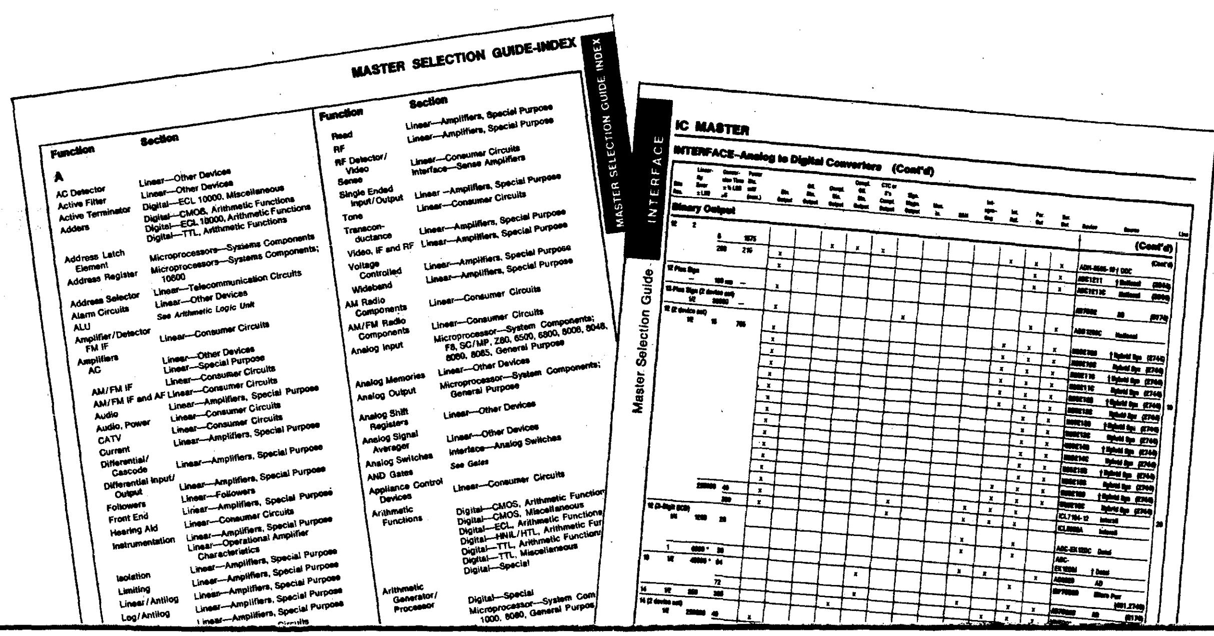
Many manufacturers make devices that meet these specifications including Analog Devices, Burr-Brown, Datel-Intersil, Data Device Corp., Harris, Hybrid Systems, Micro Networks, and Teledyne Philbrick.

The Master Selection Guide for Interface makes it possible for an engineer to find every device that meets the above specifications, regardless of who makes it, in seconds.

The Interface section is organized by product classification; an engineer can turn immediately to the category of interest such as analog switches with drivers, multiplexers, a/d converters with binary output a/d converters with decimal output, d/a converters, display drivers, error checking circuits, keyboard encoder-decoders, line drivers, line transceivers, memory and peripheral drivers, sense amplifiers, etc.

To find every 12-bit analog-to-digital converter with guaranteed ±½ LSB linearity and 13-μsec or faster conversion time, all an engineer has to do is turn directly to the analog-to-digital converter section of the Interface Master Selection Guide.

In this section, devices are organized by key parameters. Under resolution, the engineer finds 12-bit; next he looks under linearity error for ±½ LSB and then he looks under conversion time for devices with 13-μsec or faster specifications.



Ways to Use IC Master

What application notes are available on emulating logic functions with PROMs?

IC MASTER provides the most complete listing of application notes available in print. It is easy to find the right application notes by looking in IC MASTER because the application note directory is organized by function.

There are two ways to look up an application note. An engineer can turn to the index page and find the appropriate function or category such as instrumentation amplifiers, multiplexers, or PROMs.

If he knows the device number, he can look it up in the part number index at the front of IC MASTER and see all of the application notes concerning that device. For example, under 8275, a programmable CRT controller listed in the part number index, the reader is referred to the listing for an Intel application note entitled "CRT Terminal Design Using the 8275 and 8279."

To find an application note concerning the use of PROMs to emulate logic functions, the engineer can turn to the application note section on PROMs and see what notes can be of help.

Each listing in the application note directory provides a detailed descriptive passage for the note, gives its length and identifies the manufacturer who publishes it.

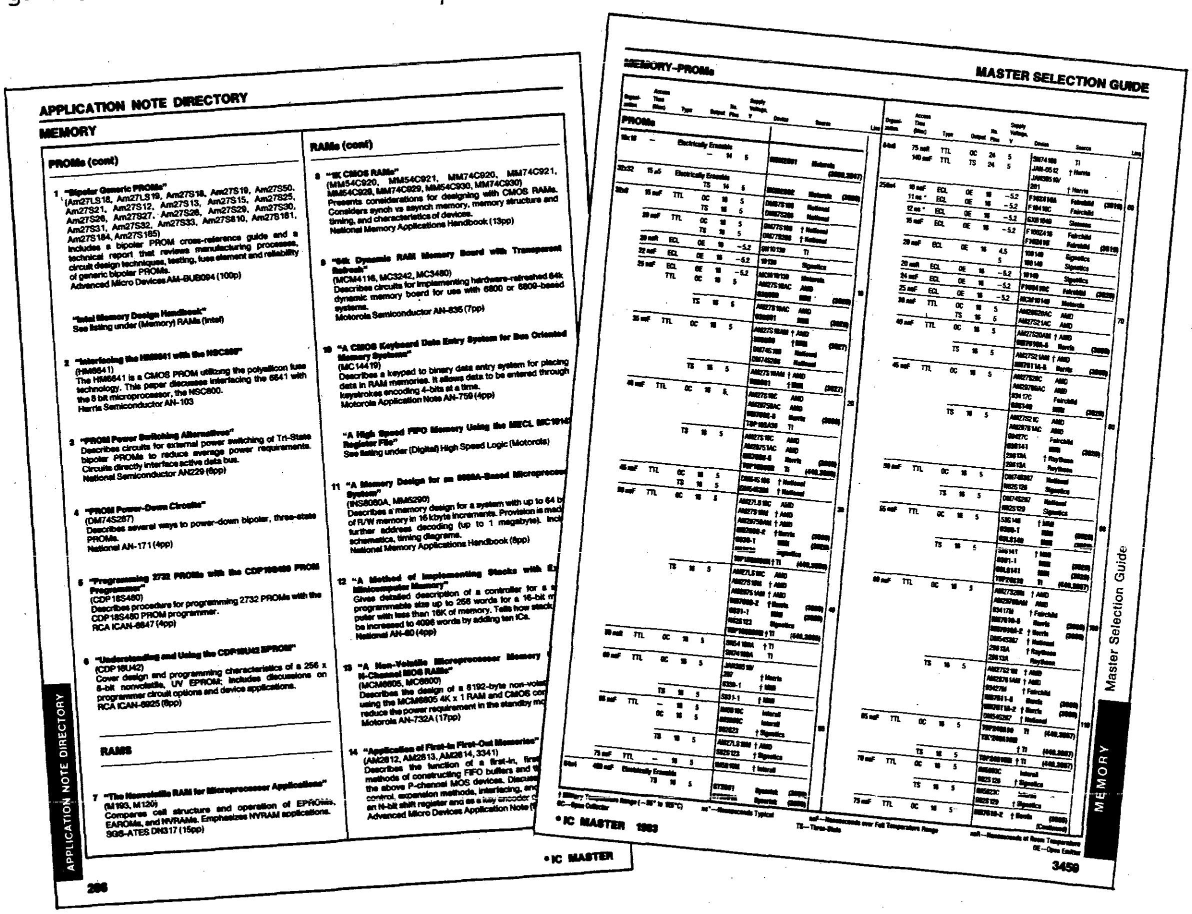
Who makes a 64K dynamic RAM with an access time of 120 ns or faster?

The Memory Section in IC MASTER has a Master Selection Guide which provides initial selection information and data on PROMs, RAMs, ROMs and other types of memories. Each device is characterized by organization (words and bit/word) and access time.

For example, if an engineer was looking for a 64K dynamic RAM, his first step would be to determine organization (words and bit/word). Next, he would locate the desired access time.

When devices are available made by various processes such as NMOS, CMOS, ECL, TTL, etc., the engineer can choose the device that best suits his needs. For further definition, output type, supply voltage and number of pins are listed along with the manufacturer's part number and name.

The engineer's next step in his memory selection process would be to study the applicable data for 64K dynamic RAMs provided by IC manufacturers and pick the most appropriate device. Literally hundreds of pages of engineering data on memories appear in IC MASTER.



Ways to Use IC Master

I need to choose between a full custom or a semi-custom/gate array solution to my design problem.

To help designers weigh custom solutions against semi-custom/gate array approaches, IC MASTER provides a Master Selection Guide on Custom/Semi-Custom and a special section entitled "Options for Going Custom." In this section the advantages and disadvantages of various custom/semi-custom techniques are covered.

The capabilities of IC manufacturers are tabulated for easy comparison; additional information such as available design aids and testing services is also provided.

My application requires microcomputer boards. How do I start?

Single and multiple board microcomputers are arranged by manufacturer. Under each manufacturer, boards are grouped in sequence according to data word size and, within that grouping, according to the microprocessor on which they are based. Hardware and software support are listed for each board.

A supplementary selection guide is included for microcomputer support boards. The boards are grouped according to supported computer systems.

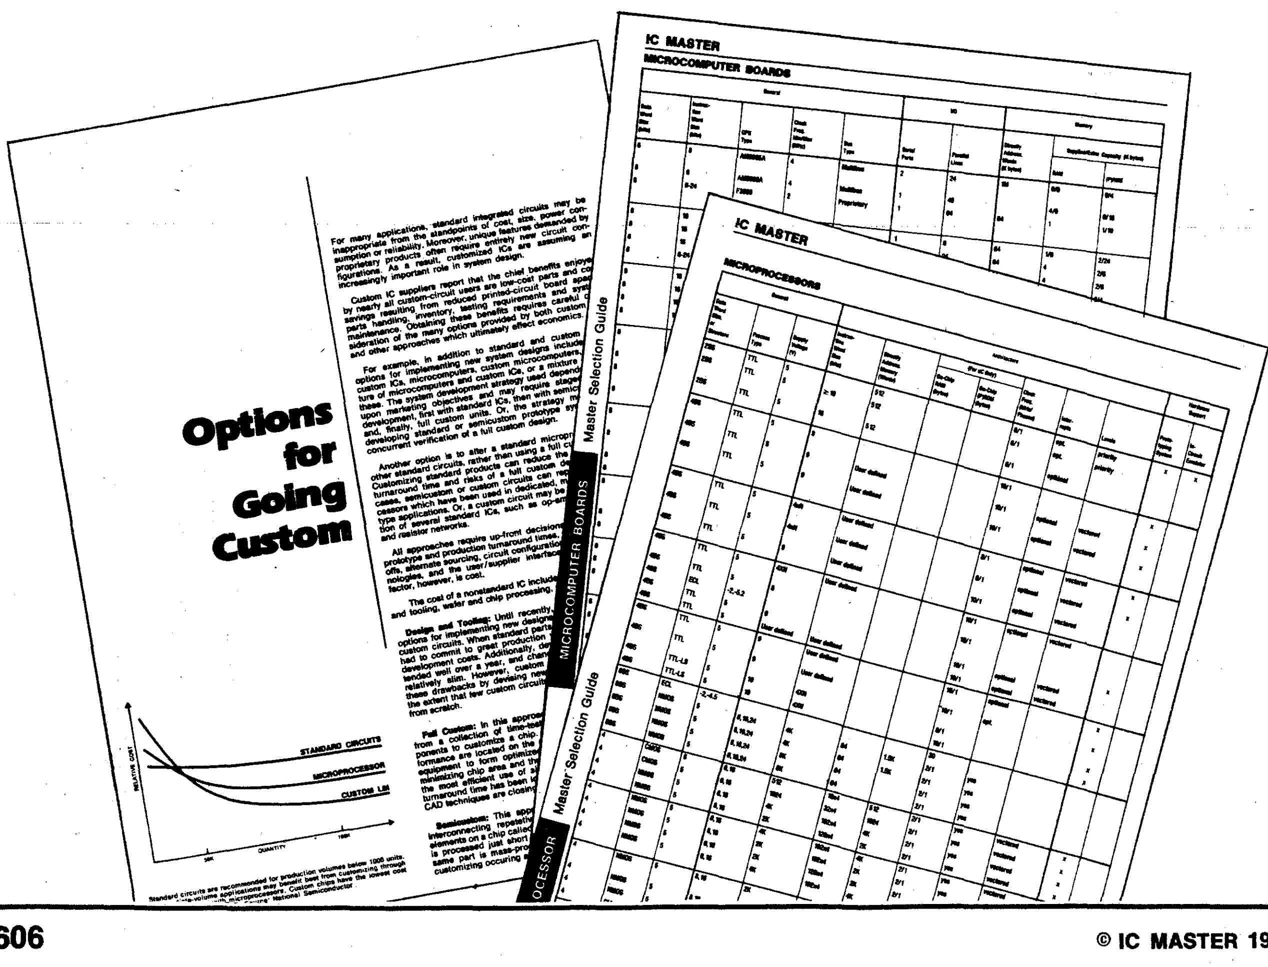
With so many mircoprocessors available, where do I begin?

Simply turn to the Master Selection Guide for Microprocessors. There you will find a listing of all microprocessors currently available and key parameters allowing you to narrow down your selection to a range of products that will meet your major requirements.

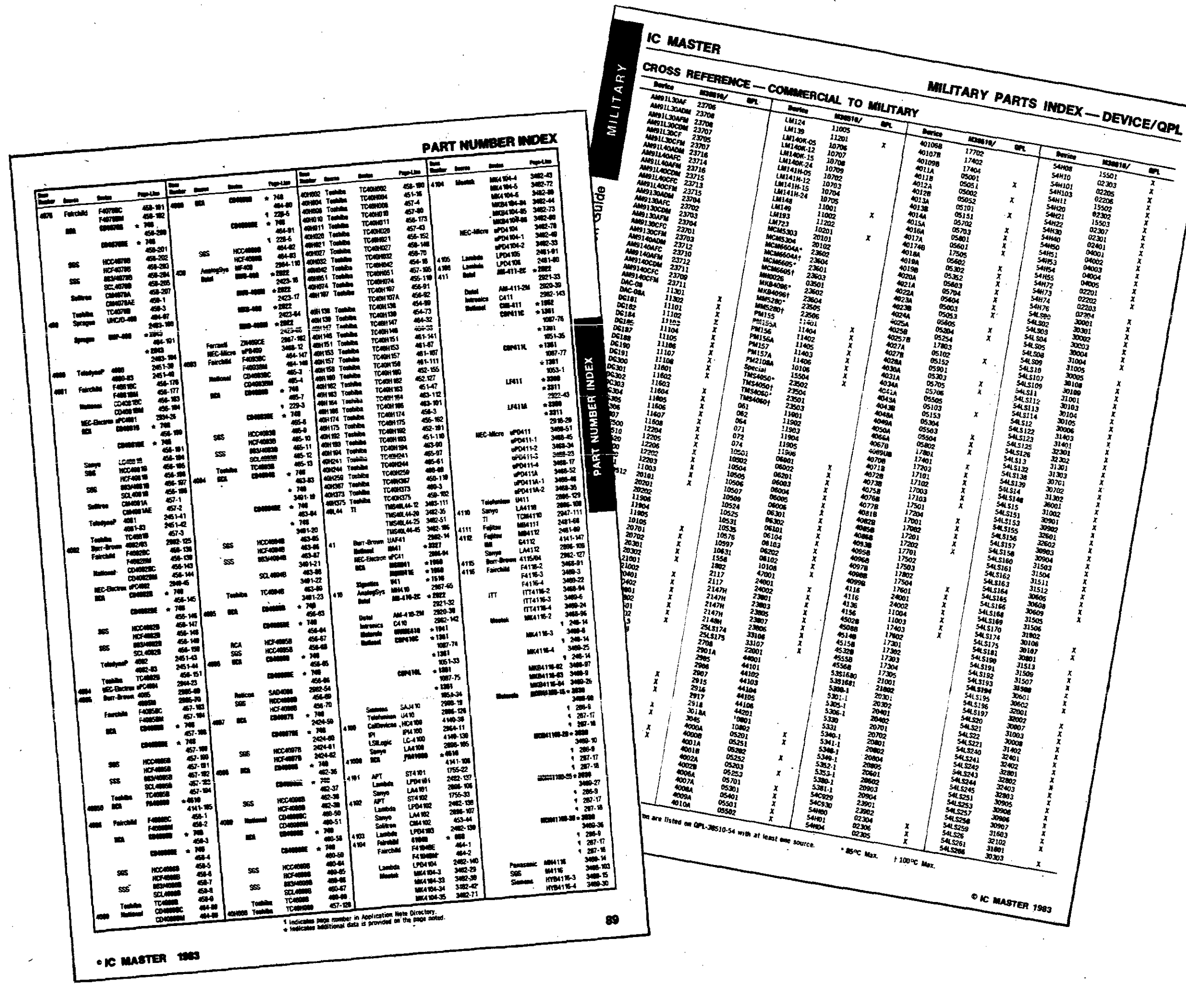
Once the microprocessor that best fits the application has been chosen, the next step is to go to the "system components" section. Here all of the available peripheral devices that work with each microprocessor are arranged by function. Thus, if the microprocessor that has been selected is the 8048, system components specifically developed for use with the 8048 are listed, organized by function.

A "general purpose" section follows the "system components" section and describes devices that can be used with more than one microprocessor family.

Finally, hundreds of pages of the latest microprocessor data sheets, provided by IC manufacturers, are presented, arranged in alphabetical order by manufacturer. Each data sheet is easily found thanks to boldfaced page-number references in the Master Selection Guide.



Ways to Use IC Master



If an engineer knows that the basic part number is 6508, where does he look first?

The place to look is the part number index. Here, all of the prefixes and suffixes have been stripped away to leave only the basic number. This makes it possible to see the manufacturer of every part with the same base number at a glance. Parts with the same base number, it should be kept in mind, are not necessarily identical; in fact, one could be a memory while another might be a linear device. (To find replacements, one should look in the alternate source directory, not in the part number index.)

Under 6508, the engineer would see a number of devices listed and the page and line numbers where data is given for each of the devices. If an application note concerning any of the devices is available, the location of its listing is also shown.

I design to military specs. Where can I find the latest QPL devices?

The IC MASTER includes a comprehensive military parts directory. Within this directory, tables and charts are provided to answer virtually every information need of the engineer involved in military or high-reliability equipment design.

All integrated circuits with JAN qualification are listed in IC MASTER. A cross reference table, relating device numbers to mil spec numbers, is arranged according to device number. A second table, arranged by M-38510 number, makes it possible to look up the part number when the mil spec number is known.

In addition, ICs are also organized by product section and function, which allows the user to find the proper IC without having to know either the commercial or the military part number.

This section of IC MASTER also includes a table showing the capability of manufacturers to perform MIL-STD-883 screening and high-reliability testing.

ADVERTISERS INDEX

INTRODUCTION TO INTERFACE

The Master Selection Guide provides sufficient information for making initial product selections. All devices that appear in this section, both in the initial selection guide and the data pages, are included in the indexes. These index listings lead to the page and line on that page where each device appears.

In the Interface Section the selection parameters differ drastically for each category; therefore each has its own format. The analog to digital converter category has two formats: one for binary output devices and another for decimal units. Some of the products in this section, primarily analog to digital and digital to analog converters, may be hybrids; the hybrids listed are only those packaged to be compatible with ICs.

This section is not complicated by reference to package styles; the package style suffixes are usually deleted. For more information on each companies' suffixes, see the Part Number Guide. Throughout the Master Selection Guide, each full military temperature range (−55°C to 125°C) device is indicated by a (†) before the manufacturer's name. Manufacturers' names are normally spelled out; however, a few are abbreviated and the abbreviations are explained on page 2809.

The manufacturers listed above have provided detailed information on their latest and most significant products.

EINFÜHRUNG INTERFACE-SCHALTUNGEN

Der Master Selection Guide für Interfaceschaltungen enhält alle Informationen, die Sie für die Erstauswahl Ihres Produkts benötigen. Die Bauteile, die in diesem Abschnitt erscheinen, sowohl im Selection Guide als auch auf den Datenblättern, sind in allen Master Indexes enthalten. Diese Register verweisen auf die Seite und Zeile, auf der das entsprechende Bauelement vorkommt.

Im Interface-Teil unterscheiden sich die Auswahl-Parameter drastisch für jede Kategorie; daher hat jede ihre eigene Tabelle. Für Analog-Digital-Wandler gibt es zwei Tabellen: eine für Bauteile mit Binär-Ausgang und eine weitere für Dezimal-Bauteile. Einige Produkte in diesem Teil, hauptsächlich Analog-Digital und Digital-Analog Wandler, können hybride Bauelemente sein. Es werden nur solche hybriden Bauteile aufgeführt, deren Gehäuse kompatibel zu ICs sind.

Dieser Abschnitt wird nicht durch Hinweise auf Gehäuseformen kompliziert. Die entsprechenden Suffixe sind meistens weggelassen. Weitere Information über die Suffixe jedes Herstellers erhalten Sie über das Numerische Typenverzeichnis. Im ganzen Master Selection Guide sind alle Bauteile mit militärischem Temperaturbereich (—55°C bis 125°C) durch ein Kreuz (†) vor dem Namen des Herstellers gekennzeichnet. Die Namen der Hersteller sind normalerweise ausgeschreiben; einge jedoch sind abgekürzt. Die Abkürzungen werden auf S. 2809 erklärt.

INTRODUCTION AUX INTERFACES

Le Guide Général de Sélection fournit suffisamment de renseignements pour permettre des sélections initiales de produits. Tous les appareils cités dans cette Section, à la fois dans la Premier Guide de Sélection et dans les feuilles de données, sont inclus dans tous les index. Ces index indiquent à quelle page et à quelle ligne sur cette page il a été fait mention de tel appareil.

Dans la Section "Interfaces", les paramètres de sélection changent pour chaque categorie, ce qui implique un format spécial pour chacun. Les convertisseurs analogues et digitaux ont deux formats : un pour les appareils à sortie binaire et un autre pour les unités décimales. Certains produits de cette Section, notamment les convertisseurs d'analogue à digital et de digital à analogue, peuvent être des hybrides. Les hybrides énumerés sont ceux qui possédent un boitier compatible aux circuits intégrés.

Cette Section ne fait pas référence aux types de boitier; les suffixes indiquant le type de boitier sont généralement omis. Pour plus d'information sur les suffixes employés par chaque société, reportez-vous au Guide des Numéros de Pièces. Dans tout le Guide Général de Sélection chaque appareil avec sélection compléte de températures imposées par l'Armée (—55°C à 125°C) est indiqué par le signe (†), juste avant le nom du fabricant, Les noms des fabricants sont généralement écrits en entier, certains cependant sont abrégés. Reportez-vous à la page 2809 pour connaître la signification de ces abréviations.

INTRODUCCIÓN A ZONA INTERFACIAL

La Guía Maestra de Selección provee suficiente información para hacer selecciones iniciales de producto. Todas las componentes que aparecen en esta sección, ya sea en la guía de selección inicial o en las páginas de datos, están incluídas entodos los ostros índices. Estas listas de índices los conduce a la página y linea de aquella página donde se encuentra cada componente.

En la sección de Zona Interfacial la selección de parámetros difiere drásticamente para cada categoría; de tal manera que cada una tiene su propio formato. La categoría de convertidores analógicos a digitales tiene dos formatos: uno para componentes de salida binaria y otro para unidades decimales. Algunos de los productos en esta sección, principalmente convertidores analógico a digital y digital a analógico, pueden ser híbridos; los híbridos en la lista son solo aquellos de estilo constructivo compatible con CI*.

Esta sección no es complicada por referencias al estilo constructivo; los sufijos que denotan estilo constructivo han sido generalmente omitidos. Para información adicional sobre sufijos de las compañías, refiérase a la Guía de Número de Pieza. A lo largo de la Guía de Selección Maestra, cada intérvalo completo de temperatura para uso militar (55°C a 125°C) de la componente aparece indicada por el signo (†) que precede al nombre del fabricante. Los nombres de los fabricantes no son generalmente deletreados; sin embargo, algunos aparecen abreviados y las abrieviaturas son explicadas en la página 2809 .

インターフェイスへの案内

マスターセレクションガイドは製品の選択にとりかかるのには充分な情報を備えています。最初のセレクションガイド並にデータ掲載ページとこのマスターセレクションに記載されている製品は全てのインデックスにのっており，その製品のページ数と行数がそのインデックスですぐ分ります。

インターフェイスのセクションではセレクションパラメーターはその製品の属するカテゴリーでもずい分異りますので夫々独自の形態をとっています。例えばＡＤコンバーターは２形態になっています。１つはバイナリ出力製品で他はデシマルユニットとなっています。このセクションではハイブリッドものせています。その中心になるのはＡＤ，ＤＡコンバーターですが，これらハイブリッドはＡＣと互換性のある品種にしぼっています。

パッケージ形状にはふれていません。それを表すサフィックスも除いています。各社のパッケージを探したい時はパーツナンバーガイドを参照して下さい。マスターセレクション全部にわたり，ミリタリー温度範囲の製品はそのメーカ名の前に(　)印がついています。メーカー名は簡略化していませんがしてある場合には2809 ページを参照して下さい。

BIPOLAR LSI AND SUPPORT PRODUCTS
High Performance Bus Interface Circuits
The Am29800 Family

DISTINCTIVE CHARACTERISTICS

- Standard I/O pin-out organization
- 48mA Commercial I_{OL}
- 32mA Mil I_{OL}
- Standard clock and output enable pin-outs
- 24-pin slim 0.3 inch wide DIP package
- IMOX Speed
  - 7.5ns typical CP to Y for registers
  - 4.0ns typical D to Y for buffers
- Wide data paths and flexible control
  - 10 bits for video or wide addresses
  - 9 bits for byte plus parity buses
  - 8-bit with multiple enables
- 100% Product assurance screening to MIL-STD-883 requirements

FUNCTIONAL DESCRIPTION

The Am29800 Family provides a completely standardized functional family of registers, latches, buffers, transceivers and parity check-and-regenerate functions optimized for bus interface applications. Each is packaged in the standard 24-pin x 0.3″ wide DIP package to allow LSI functionality in the minimum board area. Board layout is eased by the standardization of inputs on the left and outputs on the right, directly across from each other. Output drive levels are standardized at 48mA Commercial and 32mA Military.

All functions are implemented in AMD's new proprietary IMOX™ (Implanted Micro OXide) process to provide the optimum in speed power product. Typical benchmark speeds are 7.5ns typical CP-to-Y for registers, and 4.0ns typical D-to-Y for buffers.

The basic 29800 Family functions are available in 10-bit, 9-bit and 8-bit configurations with broad control flexibility aimed at minimizing the SSI/MSI content of LSI systems. The 10-bit devices make it easy to interface data plus controls or for 2 parts to interface 20-bit address lines. The 9 bits function are ideal for byte plus parity bus structures. The parity check-and-regenerate functions are designed for interfacing non-parity peripherals to parity organized buses.

All of the functional types have the pin-out format shown below.

STANDARDIZED PIN-OUTS FOR EASY BOARD LAYOUT

BIPOLAR LSI AND SUPPORT PRODUCTS
High Performance Bus Interface Circuits
The Am29800 Family

Am29821/822/823/824/825/826

- High-speed parallel registers with positive edge-triggered D-type flip-flops
  - Noninverting CP-Y t_{PD} = 7.5ns typ
  - Inverting CP-Y t_{PD} = 7.5ns typ
- Buffered common Clock Enable ($\overline{EN}$)
- Buffered common asynchronous Clear input ($\overline{CLR}$)
- Three-state outputs glitch free during power-up and down
- Outputs have Schottky clamp to ground
- 48mA Commercial I_{OL}, 32mA MIL I_{OL}
- High capacitance load capability
- Low capacitance inputs and outputs
- I_{OH} specified 2.0V and 2.4V
- 24-pin 0.3" space saving package

FUNCTIONAL DESCRIPTION

The Am29820 Series bus interface registers are designed to eliminate the extra packages required to buffer existing registers and provide extra data width for wider address/data paths or buses carrying parity. The Am29821 and Am29822 are buffered, 10-bit wide version of the popular '374 function. The Am29823 and Am29824 are 9-bit wide buffered registers with Clock Enable ($\overline{EN}$) and Clear ($\overline{CLR}$) – ideal for parity bus interfacing in high performance microprogrammed systems. The Am29825 and Am29826 are 8-bit buffered registers with all the '823/4 controls plus multiple enables ($\overline{OE}_1$, $\overline{OE}_2$, $\overline{OE}_3$) to allow multiuser control of the interface, e.g., $\overline{CS}$, DMA, and RD/$\overline{WR}$. They are ideal for use as an output port requiring high I_{OL}/I_{OH}.

All of the Am29800 high performance interface family are designed for high capacitance load drive capability while providing low capacitance bus loading at both inputs and outputs. All inputs are Schottky diode inputs, and all outputs are designed for low capacitance bus loading in the high impedance state.

- 24-pin 0.3″ space saving package

FUNCTIONAL DESCRIPTION

The Am29827 and Am29828 10-bit bus buffers and Am29860 Series bus transceivers provide high performance bus interface buffering for wide data/address paths or buses carrying parity. The 10-bit buffers and 9-bit transceivers have NOR-ed output enables for maximum control flexibility. All buffer and transceiver data inputs have 200mV minimum input hysteresis to provide improved noise rejection.

All of the Am29800 high performance interface family are designed for high capacitance load drive capability while providing low capacitance bus loading at both inputs and outputs. All inputs are Schottky diode inputs, and all outputs are designed for low capacitance bus loading in the high impedance state.

- High speed bidirectional transceivers for 8-bit non-parity to 9-bit with parity ports
  - Noninverting data t_{PD} = 6.0ns typ
  - Inverting data t_{PD} = 6.0ns typ
  - Parity generate t_{PD} = 9.0ns typ
- High speed parity generation for Transmit mode
- High speed parity fault detection for Receive mode
- Clearable, open-collector output, Fault Flag register
- 200mV minimum input hysteresis
- Three-state outputs glitch-free during power-up and down
- Outputs have Schottky clamp to ground
- 48mA Commercial I_{OL}, 32mA MIL I_{OL}
- High capacitance load capability
- Low capacitance inputs and outputs
- I_{OH} specified 2.0V and 2.4V
- 24-pin 0.3″ space saving package

FUNCTIONAL DESCRIPTION

The Am29833 and Am29834 bidirectional transceivers are designed to interface an 8-bit data path without parity to a byte-parity 9-bit data path. All outputs – R_i, T_i and PARITY – have high I_{OL} drive capability and are ideal for device-to-bus or bus-to-bus interfacing.

The internal $\overline{FAULT}$ flag register is configured as a "one's catcher" to capture and hold any odd-parity fault occurring at the rising edge of the clock, CP. A registered $\overline{FAULT}$ output remains LOW until cleared. Also, the $\overline{FAULT}$ output is an open-collector output for wired-OR configurations where byte-parity is used for 16-bit or wider data fuses or where multiple port flags are wired-OR tied together.

All of the Am29800 high performance interface familiy are designed for high capacitance load drive capability while providing low capacitance bus loading at both inputs and outputs. All inputs are Schottky diode inputs, and all outputs are designed for low capacitance bus loading in the high impedance state.

S4521

32 BIT DRIVER

Features

- ☐ Drives Up to 32 Devices
- ☐ Cascadable
- ☐ On Chip Oscillator
- ☐ Requires Only 3 Control Lines
- ☐ CMOS Construction For:
  Wide Supply Range
  High Noise Immunity
  Wide Temperature Range

Applications:

- ☐ Liquid Crystal Displays
- ☐ LED and Incandescent Displays
- ☐ Solenoids
- ☐ Print Head Drives
- ☐ DC and Stepping Motors
- ☐ Relays

General Description

The AMI S4521 is an MOS/LSI circuit that drives a variety of output devices, usually under microprocessor control. This device requires only three control lines due to its serial input construction. It latches the data to be output, relieving the microprocessor from the task of generating the required waveform, or it may be used to bring data directly to the drivers. The part acts as a versatile peripheral to drive displays, motors, relays and solenoids within its output limitations. It is especially well suited to driving liquid crystal displays, with a backplane A.C. signal option that is provided. The A.C. frequency of the backplane output that can be user supplied or generated by attaching a capacitor to the LCDϕ input, which controls the frequency of the internal oscillator. One circuit will drive up to 32 devices and more can be driven by cascading several drivers together.

S4534

10 BIT, HIGH VOLTAGE HIGH CURRENT DRIVER

Features
- ☐ Outputs Capable of 60 Volt Swings at 25mA
- ☐ Drives Up to 10 Devices
- ☐ Cascadable
- ☐ Requires Only 4 Control Lines

Applications:
- ☐ Vacuum Fluorescent Displays
- ☐ LED and Incandescent Displays
- ☐ Solenoids
- ☐ Print Head Drives
- ☐ DC and Stepping Motors
- ☐ Relays

General Description
The AMI S4534 is a high voltage, high current MOS/LSI circuit that drives a variety of output devices, usually under microprocessor control, by converting low level signals such as TTL, and CMOS to high voltage, high current drive signals. This device requires only four control lines due to its serial input construction. It latches the data to be output, or it may be used to bring data directly to the driver. The part acts as a versatile peripheral to drive displays, motors, relays and solenoids within its output limitations of a 60 volt swing and up to 50mA per drive. It is especially well suited to drive vacuum fluorescent displays due to its high voltage output capability. One circuit will drive up to 10 devices and more can be driven by cascading several drivers together.

LPC-10 SPEECH SYNTHESIZER WITH ON-CHIP 20K SPEECH DATA ROM

Features

- ☐ Simple Digital Interface
- ☐ CMOS Switched-Capacitor Filter Technology
- ☐ Automatic Powerdown
- ☐ 5-8 Volts Single Power Supply Operation
- ☐ Direct Loudspeaker Drive
- ☐ 20mW Audio Output
- ☐ 20K Bits Speech ROM
- ☐ Low Data Rate
- ☐ Up to 32 Word Vocabulary

General Description

The S3610 LPC-10 Speech Synthesizer generates speech of high quality and intelligibility from LPC (Linear Predictive Coding) data stored in an internal 20K bit ROM. The simple digital interface consists of 5 word-select lines, a strobe input to load the address data and initiate operation, and a busy output signal. At the end of enunciation the chip automatically goes into the powerdown mode until a new word select address is strobed in. The data rate from the speech ROM into the synthesizer is 2.0K bits/sec max. Typically the average data rate will be reduced to about 1.2K bits/sec. by means of the data rate reduction techniques used internally.

S3620

LPC-10 SPEECH SYNTHESIZER

Features

- ☐ Simple Microprocessor Interface
- ☐ CMOS Switched-Capacitor Filter Technology
- ☐ Automatic Powerdown
- ☐ 5-8 Volts Single Power Supply Operation
- ☐ Direct Loudspeaker Drive
- ☐ 20mW Audio Output
- ☐ Low Data Rate

General Description

The S3620 LPC-10 Speech Synthesizer generates speech of high quality and intelligibility from LPC (Linear Predictive Coding) data stored in an external memory. The digital interface circuitry is fully microprocessor compatible and allows the processor to load the data with or without a DMA controller. The loading takes place on a handshake basis, and in the absence of a response from the processor the synthesizer automatically shuts down and goes into the powerdown mode. A busy signal allows the processor to sense the status of the synthesizer.

ANALOG DEVICES

Quad 12-Bit Microprocessor-Compatible D/A Converter

AD390*

FEATURES
Four Complete 12-Bit DACs in One IC Package
Linearity Error ±1/2LSB T_{min} – T_{max} (AD390K, T)
Factory-Trimmed Gain and Offset
Buffered Voltage Output
Monotonicity Guaranteed Over Full Temperature Range
Double-Buffered Data Latches
Includes Reference and Buffer
Fast Settling: 8µs max to ±1/2LSB
Low Cost

PRODUCT DESCRIPTION

The AD390 contains four 12-bit high speed voltage-output digital-to-analog converters in a compact 28-pin hybrid package. The design is based on a proprietary latched 12-bit DAC chip which reduces chip count and provides high reliability. The AD390 is ideal for systems requiring digital control of many analog voltages where board space is at a premium. Such applications include automatic test equipment, process controllers, and vector-scan displays.

The AD390 is laser-trimmed to ±1/2LSB max nonlinearity (AD390KD, TD) and absolute accuracy of ±0.05 percent of full scale. The high initial accuracy is made possible by the use of thin-film scaling resistors on the monolithic DAC chips. The internal buried zener voltage reference provides excellent temperature drift characteristics (20ppm/°C) and an initial tolerance of ±0.03% maximum. The internal reference buffer allows a single common reference to be used for multiple AD390 devices in large systems.

The individual DACs are accessed by the $\overline{CS1}$ through $\overline{CS4}$ control inputs and the $\overline{A0}$ and $\overline{A1}$ lines. These control signals permit the registers of the four DACs to be loaded sequentially and the outputs to be simultaneously updated.

The AD390 outputs are calibrated for a ±10V output range with positive-true offset binary input coding. A 0 to +10V version is available on special order.

The AD390 is packaged in a 28-lead ceramic package and is specified for operation over the 0 to +70°C and −55°C to +125°C temperature range.

ORDERING GUIDE

Model	Temperature Range	Gain Error 25°	Linearity Error $T_{min}-T_{max}$
AD390JD	0 to +70°C	±4LSB	±3/4LSB
AD390KD	0 to +70°C	±2LSB	±1/2LSB
AD390SD	−55°C to +125°C	±4LSB	±3/4LSB
AD390TD	−55°C to +125°C	±2LSB	±1/2LSB

*Covered by patent numbers 3,803,590; 3,890,611; 3,932,863; 3,978,473; 4,020,486 and other patents pending.

ANALOG DEVICES

DACPORT™ Low Cost Complete μP-Compatible 8-Bit DAC

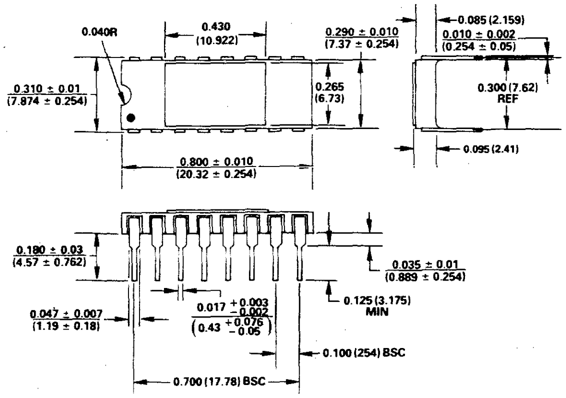
AD558*

FEATURES
Complete 8-Bit DAC
Voltage Output – 2 Calibrated Ranges
Internal Precision Band-Gap Reference
Single-Supply Operation: +5V to +15V
Full Microprocessor Interface
Fast: 1μs Voltage Settling to ±1/2LSB
Low Power: 75mW
No User Trims
Guaranteed Monotonic Over Temperature
All Errors Specified T_{min} to T_{max}
Small 16-Pin DIP Package
Single Laser-Wafer-Trimmed Chip for Hybrids
Low Cost

PRODUCT DESCRIPTION
The AD558 DACPORT is a complete voltage-output 8-bit digital-to-analog converter, including output amplifier, full microprocessor interface and precision voltage reference on a single monolithic chip. No external components or trims are required to interface, with full accuracy, an 8-bit data bus to an analog system.

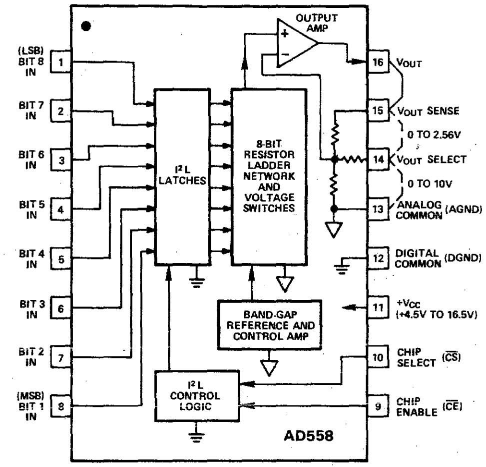
The performance and versatility of the DACPORT is a result of several recently-developed monolithic bipolar technologies. The complete microprocessor interface and control logic is implemented with integrated injection logic (I^2L), an extremely dense and low-power logic structure that is process-compatible with linear bipolar fabrication. The internal precision voltage reference is the patented low-voltage band-gap circuit which permits full-accuracy performance on a single +5V to +15V power supply. Thin-film silicon-chromium resistors provide the stability required for guaranteed monotonic operation over the entire operating temperature range (all grades), while recent advances in laser-wafer-trimming of these thin-film resistors permit absolute calibration at the factory to within ±1LSB; thus no user-trims for gain or offset are required. A new circuit design provides voltage settling to ±1/2LSB for a full-scale step in 800ns.

OUTLINE DIMENSIONS
Dimensions shown in inches and (mm).



*Covered by U.S. Patent Nos. 3,887,863; 3,685,045; 4,323,795; Patents Pending. DACPORT is a trademark of Analog Devices, Inc.

AD558 FUNCTIONAL BLOCK DIAGRAM



PRODUCT HIGHLIGHTS
1. The 8-bit I^2L input register and fully microprocessor-compatible control logic allow the AD558 to be directly connected to 8- or 16-bit data buses and operated with standard control signals. The latch may be disabled for direct DAC interfacing.
2. The laser-trimmed on-chip SiCr thin-film resistors are calibrated for absolute accuracy and linearity at the factory. Therefore, no user trims are necessary for full rated accuracy over the operating temperature range.
3. The inclusion of a precision low-voltage band-gap reference eliminates the need to specify and apply a separate reference source.
4. The voltage-switching structure of the AD558 DAC section along with a high-speed output amplifier and laser-trimed resistors give the user a choice of 0V to +2.56V or 0V to +10V output ranges, selectable by pin-strapping. Circuitry is internally compensated for minimum settling time on both ranges; typically settling to ±1/2LSB for a full-scale 2.55 volt step in 800ns.
5. The AD558 is designed and specified to operate from single +4.5V to +16.5V power supply.

AD558 ORDERING GUIDE

Model	Temperature	Relative Accuracy Error Max T_{min} to T_{max}	Full-Scale Error, Max T_{min} to T_{max}
AD558JN	0 to +70°C	±1/2LSB	±2.5LSB
AD558KN	0 to +70°C	±1/4LSB	±1LSB
AD558JD	0 to +70°C	±1/2LSB	±2.5LSB
AD558KD	0 to +70°C	±1/4LSB	±1LSB
AD558SD	−55°C to +125°C	±3/4LSB	±2.5LSB
AD558TD	−55°C to +125°C	±3/8LSB	±1LSB

ANALOG DEVICES

Microprocessor-Compatible Voltage Output 12-Bit D/A Converter

AD667

FEATURES

- Single Chip Construction
- Double-Buffered Latch for 8-Bit µP-Compatibility
- On Chip Output Amplifier
- High Stability Buried Zener Reference On Chip
- Monotonicity Guaranteed Over Temperature
- Linearity Guaranteed Over Temperature: 1/2LSB max (AD667K)
- Guaranteed for Operation with ±12V or ±15V Supplies
- Low Power
- TTL/5V CMOS Compatible Logic Inputs
- Low Cost

PRODUCT DESCRIPTION

The AD667 is a complete voltage output 12-bit digital-to analog converter including a high stability buried zener voltage reference, an output amplifier and double-buffered input latch on a single chip. The converter uses 12 precision high speed bipolar current steering switches and a laser trimmed thin film resistor network to provide fast settling time and high accuracy.

Microprocessor compatibility is achieved by the on-chip double-buffered latch. The design of the input latch allows direct interface to 4-, 8-, 12-, or 16-bit buses. The 12 bits of data from the first rank of latches can then be transferred to the second rank, avoiding generation of spurious analog output values. The latch responds to strobe pulses as short as 100ns, allowing use with the fastest available microprocessors.

The functional completeness and high performance in the AD667 results from a combination of advanced switch design, high speed bipolar manufacturing process, and the proven laser wafer-trimming (LWT) technology. The AD667 is trimmed at the wafer level and is specified to ±1/4LSB maximum linearity error (K grade) at 25°C and ±1/2LSB over the full operating temperature range.

The subsurface (buried) Zener diode on the chip provides a low-noise voltage reference which has long-term stability and temperature drift characteristics comparable to the best discrete reference diodes. The laser trimming process which provides the excellent linearity is also used to trim both the absolute value of the reference as well as its temperature coefficient. The AD667 is thus well suited for wide temperature range performance with ±1/2LSB maximum linearity error and guaranteed monotonicity over the full temperature range. Typical full scale gain T.C. is 10ppm/°C.

The AD667 is available in four performance grades. The AD667J and K are specified for use over the 0 to +70°C temperature range and is available in a 28-pin hermetically-sealed, ceramic DIP. The AD667S grade is specified for the -55°C to +125°C range and is available in the ceramic package.

ANALOG DEVICES

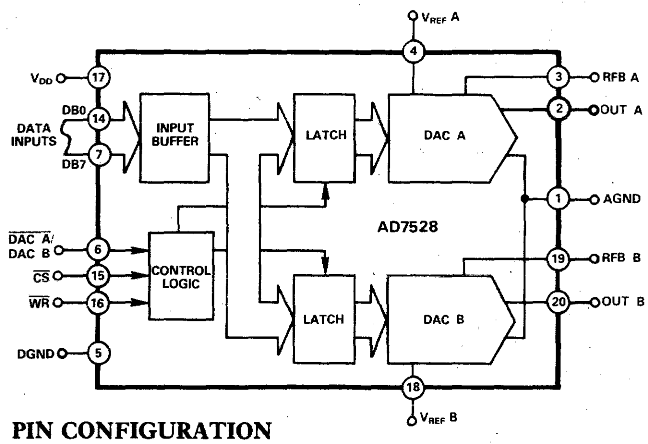
CMOS Dual 8-Bit Buffered Multiplying DAC

AD7528

FEATURES
On-Chip Latches for Both DACs
+5V to +15V Operation
DACs Matched to 1%
Four Quadrant Multiplication
TTL/CMOS Compatible
Latch Free (Protection Schottkys not Required)

APPLICATIONS
Digital Control of:
- Gain/Attenuation
- Filter Parameters
- Stereo Audio Circuits
- X–Y Graphics

AD7528 FUNCTIONAL BLOCK DIAGRAM



GENERAL DESCRIPTION
The AD7528 is a monolithic dual 8-bit digital/analog converter produced in a small 0.3" wide 20-pin DIP, featuring excellent DAC-to-DAC matching.

Separate on-chip latches are provided for each DAC to allow easy microprocessor interface.

Data is transferred into either of the two DAC data latches via a common 8-bit TTL/CMOS compatible input port. Control input DAC A/DAC B determines which DAC is to be loaded. The AD7528's load cycle is similar to the write cycle of a random access memory and the device is bus compatible with most 8-bit microprocessors, including 6800, 8080, 8085, Z80.

The device operates from a +5V to +15V power supply, dissipating only 20mW of power.

Both DACs offer excellent four quadrant multiplication characteristics with a separate reference input and feedback resistor for each DAC.

ANALOG DEVICES

LC²MOS High Speed 12-Bit Voltage DAC

AD7240

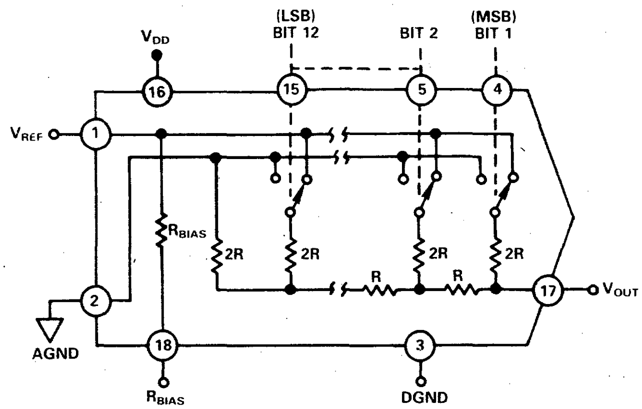
FEATURES

- Fast Voltage Settling Time: 550ns to 0.01%
- Total Unadjusted Error: 1LSB max
- Single Supply Operation
- Latch Up Proof (No Protection Schottky Required)
- Superb Differential Nonlinearity: 1/2LSB max over Temperature
- Low Power Dissipation: 30mW

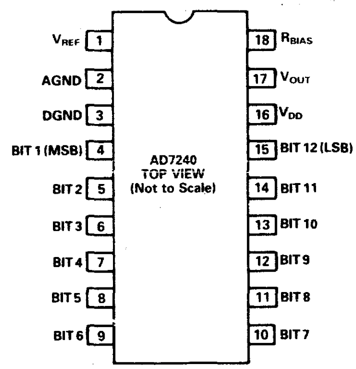
APPLICATIONS

- Battery Powered Instrumentation
- High Speed A/D Converters
- Programmable Gain Amplifiers
- Vector Graphics
- S/D Converters

AD7240 FUNCTIONAL BLOCK DIAGRAM



PIN CONFIGURATION



GENERAL DESCRIPTION

The Analog Devices AD7240 is a fast settling (550ns typically to 1/2LSB) 12-bit voltage output digital to analog converter. It is fabricated using an advanced high speed Linear Compatible CMOS process (LC²MOS) which has been specifically developed to allow high speed digital logic circuits and precision analog circuits to be integrated on the same chip.

The AD7240 operates with single +15 volts V_{DD} supply and exhibits exceptionally fast settling times due to the small (and code independent) value of capacitance at the output of the DAC.

The AD7240 also gives superior performance to other CMOS DACs when configured in the current steering mode as a multiplying DAC.

ORDERING INFORMATION

ANALOG DEVICES

CMOS 12-Bit Buffered Multiplying DAC

AD7545

FEATURES
- 12-Bit Resolution
- Low Gain T.C.: 2ppm/°C typ
- Fast TTL Compatible Data Latches
- Single +5V to +15V Supply
- Small 20-Pin 0.3″ DIP
- Latch Free (Schottky Protection Diode Not Required)
- Low Cost
- Ideal for Battery Operated Equipment

GENERAL DESCRIPTION

The AD7545 is a monolithic 12-bit CMOS multiplying DAC with on-board data latches. It is loaded by a single 12-bit wide word and interfaces directly to most 12- and 16-bit bus systems. Data is loaded into the input latches under the control of the $\overline{CS}$ and $\overline{WR}$ inputs; tying these control inputs low makes the input latches transparent allowing direct unbuffered operation of the DAC.

The AD7545 is particularly suitable for single supply operation and applications with wide temperature variations.

The AD7545 can be used with any supply voltage from +5V to +15V. With CMOS logic levels at the inputs the device dissipates less than 0.5mW for V_{DD} = +5V.

ANALOG DEVICES

LC² MOS 8-Bit μP Compatible 12-Bit DAC

AD7548

FEATURES
8-Bit Bus Compatible 12-Bit DAC
All Grades 12-Bit Monotonic Over Full Temperature Ranges
Operation Specified at +5V, +12V or +15V Power Supply
Low Gain Drift of 5ppm/°C Maximum
Full 4 Quadrant Multiplication
Small 20-Pin Package

APPLICATIONS
8-Bit Microprocessor Based Control Systems
Programmable Amplifiers
Function Generation
Servo Control

GENERAL DESCRIPTION
The AD7548 is a 12-bit monolithic CMOS D/A converter for use with 8-bit bus microprocessors. Data is loaded in two bytes to input holding registers as shown in the block diagram opposite. The AD7548 can be configured to accept either left- or right-justified data, least significant byte or most significant byte first, using standard TTL compatible control inputs.

A separate load DAC control input allows the user the choice of updating the analog output coincident with loading new data to the DAC input register or at any time after the data loading event. This feature is especially important in multi-DAC systems where simultaneous update of all DACs is required.

The new Linear Compatible CMOS (LC² MOS) process used in the manufacture of the AD7548 allows precision thin-film linear circuitry and high-speed low-power CMOS logic to be integrated on the same small chip. The high-speed logic allows direct interfacing to most of the popular 8-bit microprocessors.

ANALOG DEVICES

14-Bit, 200kHz Digital-to-Analog Converter

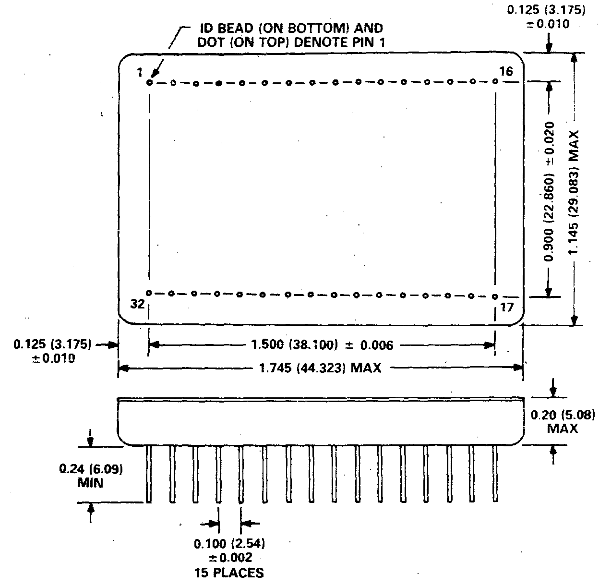
HDD-1409

FEATURES
- 14-Bit Resolution
- 200kHz Word Rates
- RZ Gated Output
- 32-Pin DIP

APPLICATIONS
- FDM/TDM Transmultiplexers
- Digital Signal Processing
- PCM Systems
- Digital Audio

OUTLINE DIMENSIONS

Dimensions shown in inches and mm



GENERAL DESCRIPTION

The HDD-1409KM D/A converter is a voltage-output, 32-pin hybrid digital-to-analog converter complete with input registers, current-output D/A, switching circuits, and output amplifier. The unit is capable of converting 14-bit digital inputs into gated analog output voltages at update rates from dc through 200kHz.

Monolithic ICs and hybrid microelectronic packaging have been combined in a grounded metal case hybrid which provides cost, space, and power savings for the system designer. The HDD-1409 is a complete solution for converting high-resolution digital data into "clean" analog voltages and accomplishes it with maximum power dissipation of only 600 milliwatts.

The HDD-1409 D/A has been characterized with a companion A/D converter, the HAS-1409KM, to emphasize the superior ac performance which makes the A/D – D/A combination especially attractive for use in Frequency Division Multiplex/Time Division Multiplex (FDM/TDM) transmultiplexer systems. But the design concepts and versatility which are incorporated into it also make the HDD-1409 useful in Pulse Code Modulation (PCM) and other digital signal processing applications.

The analog output voltage range is ±5V; output impedance is 600 ohms, ideal for filter matching. The D/A output operates in a return-to-zero (RZ) mode, which provides deglitching and allows selecting the optimum duty cycle for FDM/TDM and PCM applications.

Small size, low power, and multiple functions in a single package make the HDD-1409 D/A converter attractive for a wide range of data processing uses.

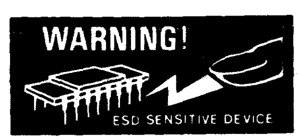
HDD-1409 PIN DESIGNATIONS

PIN	FUNCTION	PIN	FUNCTION
1	SIGNAL	17	DIGITAL GROUND
2	$\overline{\text{SIGNAL}}$	18	BIT 8
3	GATE	19	BIT 7
4	DIGITAL GROUND	20	BIT 6
5	ANALOG GROUND	21	BIT 5
6	N/C	22	BIT 4
7	+5V	23	BIT 3
8	DIGITAL GROUND	24	BIT 2
9	LOW STROBE	25	$\overline{\text{BIT 1 (MSB)}}$
10	BIT 14 (LSB)	26	HIGH STROBE
11	BIT 13	27	−15V
12	BIT 12	28	+15V
13	BIT 11	29	ANALOG OUTPUT
14	BIT 10	30	ANALOG GROUND
15	BIT 9	31	ANALOG GROUND
16	DIGITAL GROUND	32	ANALOG GROUND

NOTES:
WHEN USING WITH HAS-1409 A/D, CONNECT $\overline{\text{BIT 1 (MSB)}}$ OF A/D (PIN 22) to BIT 1 (MSB) OF HDD-1409 D/A (PIN 25).
TO USE HDD-1409 D/A AS STAND-ALONE DEVICE WITH OFFSET BINARY INPUT, APPLY BIT 1 DIGITAL INPUT SIGNAL TO $\overline{\text{SIGNAL}}$ (PIN 1) AND CONNECT SIGNAL (PIN 2) TO $\overline{\text{BIT 1 (MSB)}}$ (PIN 25).
TO LOAD 14-BIT DATA FULLY PARALLEL, CONNECT HIGH STROBE (PIN 26) AND LOW STROBE (PIN 9) TOGETHER EXTERNALLY.

CAUTION:

ESD (Electro-Static-Discharge) sensitive device. The digital control inputs are zener protected; however, permanent damage may occur on unconnected devices subject to high energy electrostatic fields. Unused devices must be stored in conductive foam or shunts. The foam should be discharged to the destination socket before devices are removed.



ANALOG DEVICES

Ultra High-Speed IC D/A Converter

AD9768

FEATURES

5ns Settling Time
100MHz Update Rate
20mA Output Current
ECL-Compatible
40MHz Multiplying Mode

APPLICATIONS

Raster Scan & Vector Graphic Displays
High-Speed Waveform Generation
Digital VCOs
Ultra-Fast Digital Attenuators

GENERAL DESCRIPTION

The Analog Devices AD9768SD D/A converter is a monolithic current-output converter which can accept 8 bits of ECL-level digital input voltages and convert them into analog signals at update rates as high as 100MHz. In addition to its use as a standard D/A converter, it can also be utilized as a two-quadrant multiplying D/A at multiplying bandwidths as high as 40MHz.

An inherently low glitch design is used, and the complementary current outputs are suitable for driving transmission lines directly. Nominal full-scale output is 20mA, which corresponds to a 1-volt drop across a 50Ω load, or ±1 volt across 100Ω returned to +1 volt. The actual output current is determined by the on-chip reference voltage ($V_{REF} \approx -1.26V$) and an external current setting resistor, R_{SET}.

Full-scale output current I_{OUT} with digital "1" at all inputs is calculated with the equation:

$$I_{OUT} = 4 \times \frac{V_{RET} - V_{REF}}{R_{SET}}$$

The setting resistor R_{SET} and the output load resistor should both have low temperature coefficients. A complementary $\overline{I_{OUT}}$ is also provided.

The reference voltage source is a modified bandgap type and is nominally −1.26 volts. This reference supply requires no external regulation. To reduce the possibility of noise generation and/or instability, pin 15 (REFERENCE OUT) can be decoupled using a high-quality ceramic chip capacitor. Stabilization of the internal loop amplifier is by a single capacitor connected from pin 17 (COMPENSATION) to ground. The minimum value for this capacitor is 3900pF, although a 0.01μF ceramic chip capacitor is recommended.

The incredible speed characteristics of the AD9768SD D/A converter make it attractive for a wide range of high-speed applications. The ability of the unit to operate as a two-quadrant multiplying D/A converter adds another dimension to its usefulness and makes the AD9768SD a truly versatile device.

ANALOG DEVICES

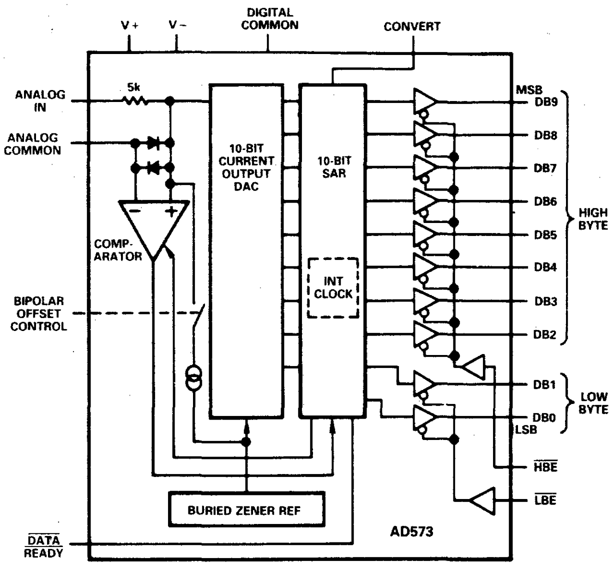
Fast, Complete 10-Bit A/D Converter with Microprocessor Interface

AD573*

FEATURES

- Complete 10-Bit A/D Converter with Reference, Clock and Comparator
- Full 8- or 16-Bit Microprocessor Bus Interface
- Fast Successive Approximation Conversion – 20μs
- No Missing Codes Over Temperature
- Operates on +5V and −12V to −15V Supplies
- Low Cost Monolithic Construction

AD573 FUNCTIONAL BLOCK DIAGRAM



PRODUCT DESCRIPTION

The AD573 is a complete 10-bit successive approximation analog to digital converter consisting of a DAC, voltage reference, clock, comparator, successive approximation register (SAR) and 3 state output buffers–all fabricated on a single chip. No external components are required to perform a full accuracy 10-bit conversion in 20μs.

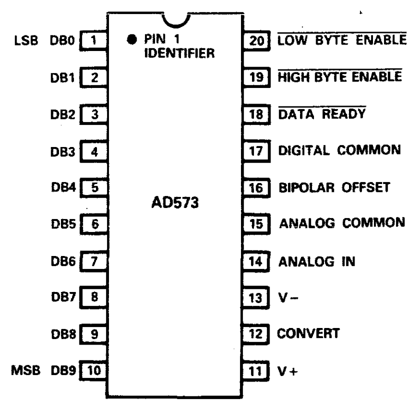
The AD573 incorporates the most advanced integrated circuit design and processing technology available today. The successive approximation function is implemented with I^2L (integrated injection logic). Laser trimming of the high stability SiCr thin film resistor ladder network at the wafer stage (LWT) insures high accuracy, which is maintained with a temperature compensated sub-surface Zener reference.

Operating on supplies of +5V and −12V to −15V, the AD573 will accept analog inputs of 0 to +10V or −5V to +5V. A positive pulse on the CONVERT line initiates the 20μs conversion cycle. $\overline{\text{DATA READY}}$ indicates completion of the conversion. $\overline{\text{HIGH BYTE ENABLE}}$ ($\overline{\text{HBE}}$) and $\overline{\text{LOW BYTE ENABLE}}$ ($\overline{\text{LBE}}$) control the 8-bit and 2-bit three state output buffers.

The AD573 is available in two versions for the 0 to +70°C temperature range, the AD573J and AD573K. The AD573S guarantees 10-bit relative accuracy and no missing codes from −55°C to +125°C.

Two package configurations are offered. The AD573J and AD573K are also available in a 20-pin plastic DIP. All versions are offered in a 20-pin hermetically sealed ceramic DIP.

AD573 PINOUT



AD573 ORDERING GUIDE

Model	Package Option	Temperature Range	Relative Accuracy
AD573JN	20-Pin Plastic DIP	0 to +70°C	±1LSB max
AD573KN	20-Pin Plastic DIP	0 to +70°C	±1/2LSB max
AD573JD	20-Pin Ceramic DIP	0 to +70°C	±1LSB max
AD573KD	20-Pin Ceramic DIP	0 to +70°C	±1/2LSB max
AD573SD	20-Pin Ceramic DIP	−55°C to +125°C	±1LSB max

AD574A

FEATURES

- Complete 12-Bit A/D Converter with Reference and Clock
- Full 8- or 16-Bit Microprocessor Bus Interface
- 250ns Bus Access Time
- Guaranteed Linearity Over Temperature
  - 0 to +70°C – AD574AJ, AK, AL
  - −55°C to +125°C – AD574AS, AT, AU
- No Missing Codes Over Temperature
- Fast Successive Approximation Conversion – 25μs
- Buried Zener Reference for Long-Term Stability and Low Gain T.C. 10ppm/°C max AD574AL
  12.5ppm/°C max AD574AU
- Low Profile 28-Pin Ceramic DIP
- Low Power: 390mW
- Low Cost

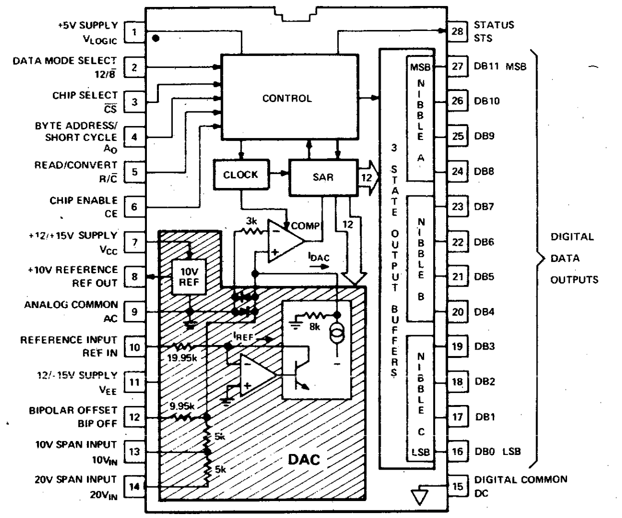
PRODUCT DESCRIPTION

The AD574A is a complete 12-bit successive-approximation analog-to-digital converter with 3-state output buffer circuitry for direct interface to an 8-, 12-or 16-bit microprocessor bus. The AD574A design is implemented with two LSI chips each containing both analog and digital circuitry, resulting in the maximum performance and flexibility at the lowest cost.

One chip is the high performance AD565A 12-bit DAC and voltage reference. It contains the high speed current output switching circuitry, laser-trimmed thin film resistor network, low T.C. buried zener reference and the precision input scaling and bipolar offset resistors. This chip is laser-trimmed at the wafer stage (LWT) to adjust ladder network linearity, voltage reference tolerance and temperature coefficient, and the calibration accuracy of input scaling and bipolar offset resistors.

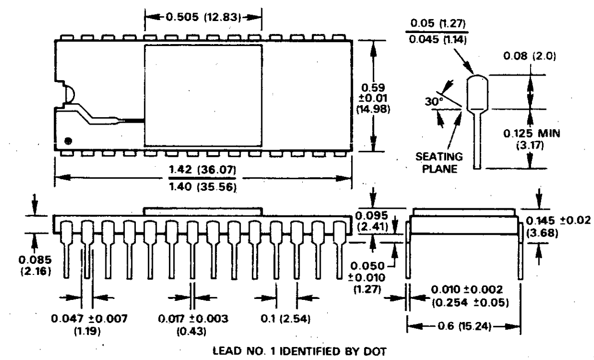
The second chip uses the proven LCI (linear-compatible integrated injection logic) process to provide the low-power I^2L successive-approximation register, converter control circuitry, clock, bus interface, and the high performance latching comparator. The precision, low-drift comparator is adjusted for initial input offset error at the wafer stage by the "zener-zap" technique which trims the comparator input stage to 1/10 LSB typical error. This form of trimming, while cumbersome for complex ladder networks, is an attractive alternative to thin film resistor trimming for a simple offset adjustment and eliminates the need for thin film processing for this portion of the circuitry.

AD574A FUNCTIONAL BLOCK DIAGRAM AND PINOUT



AD574A PACKAGE OUTLINE

Dimensions shown in inches and (mm).



The AD574A is available in six different grades. The AD574AJ, AK, and AL grades are specified for operation over the 0 to +70°C temperature range. The AD574AS, AT, and AU are specified for the −55°C to +125°C range. All grades are packaged in a low-profile, 0.600 inch wide, 28-pin hermetically-sealed ceramic DIP.

AD574A ORDERING GUIDE

Model	Temp. Range	Linearity Error Max (T_{min} to T_{max})	Resolution No Missing Codes (T_{min} to T_{max})	Max Full Scale T.C. (ppm/°C)
AD574AJD	0 to +70°C	±1LSB	11 Bits	50.0
AD574AKD	0 to +70°C	±1/2LSB	12 Bits	27.0
AD574ALD	0 to +70°C	±1/2LSB	12 Bits	10.0
AD574ASD	−55°C to +125°C	±1LSB	11 Bits	50.0
AD574ATD	−55°C to +125°C	±1LSB	12 Bits	25.0
AD574AUD	−55°C to +125°C	±1LSB	12 Bits	12.5

ANALOG DEVICES

CMOS µP Compatible 10-Bit Plus Sign ADC

AD7571

FEATURES

- 10-Bit Plus Sign Resolution
- No Missed Codes Over Full Temperature Range
- Conversion Time 80µs
- Differential Analog Voltage Inputs, ±10V Range
- Serial and Parallel Data Outputs
- Easy Interface to Most Microprocessors
- Internal Clock Oscillator
- Single Supply Operation for Positive-Only Signals
- Monolithic Construction

GENERAL DESCRIPTION

The AD7571 is a high speed, low cost 10-bit plus sign CMOS A/D converter which uses the successive approximation technique to provide a conversion time of 80µs. The device is designed for easy microprocessor interface allowing full parallel or double byte reading over three-state outputs. Conversion results are also available in serial form allowing opto-isolated operation using as few as two wires for the interconnect.

A new differential analog input configuration is used in the AD7571, increasing the common-mode rejection performance and allowing the analog zero input voltage to be offset from true analog ground. Analog input voltage range is ±10V using a single positive reference. With positive-only input signals the AD7571 can be operated from a single positive power supply.

AD7573

INTERFACE

Analog Devices

FEATURES

- 10-Bit Resolution
- No Missing Codes Over Full Temperature Range
- Conversion Time 80μs
- 0V to +10.24V Analog Input Voltage Range with Reference Voltage of +5.12V
- 10-Bit Parallel Data Output
- Easy Interface to Most Microprocessors
- Internal Clock Oscillator
- Single Supply Operation
- Monolithic

GENERAL DESCRIPTION

The AD7573 is a high speed, low cost 10-bit CMOS A/D converter which uses the successive approximation technique to provide a conversion time of 80μs. The device is designed for easy microprocessor interface using two standard control signals; $\overline{CS}$ (decoded device address) and $\overline{RD}$ ($\overline{READ}$/WRITE control), for conversion start and data read operations. Conversion results are available via a 10-bit wide three-state output bus.

The analog input voltage range is from 0V to +10.24V when using a reference voltage of +5.12V. Single +15V power supply operation is possible with all logic inputs and outputs being CMOS compatible. Using +5V/+15V supplies allows control inputs and data outputs to be TTL/CMOS compatible. The device is packaged in a small 20-pin 0.3" wide DIP.

ANALOG DEVICES

Complete, High Resolution 16-Bit A/D Converter

AD ADC71/AD ADC72

FEATURES

Complete 16-Bit Converter With Reference and Clock
±0.003% Maximum Nonlinearity
No Missing Codes to 14 Bits Over Full Temp Range
Fast Conversion – 35μs (14 Bit)
Short Cycle Capability
Parallel or Serial Logic Outputs
Low Power: 850mW Typical
Industry Standard Pin Out

PRODUCT DESCRIPTION

The AD ADC71 and AD ADC72 are high resolution 16-bit hybrid IC analog to digital converters including reference, clock, and laser-trimmed thin-film components. The package is a compact 32-pin bottom-brazed ceramic (AD ADC71) or hermetic ceramic (AD ADC72) DIP. The thin-film scaling resistors allow analog input ranges of ±2.5V, ±5V, ±10V, 0 to +5V, 0 to +10V, and 0 to +20V.

Important performance characteristics of the devices are maximum linearity error of ±0.003% of FSR (AD ADC71K, AD ADC72K and B), and maximum conversion time of 50μs. This performance is due to innovative design and the use of proprietary monolithic D/A converter chips. Laser-trimmed thin-film resistors provide the linearity and wide temperature range for no missing codes.

The AD ADC71 and AD ADC72 provide data in both parallel and serial form with corresponding clock and status output. All digital inputs and outputs are TTL compatible.

PRODUCT HIGHLIGHTS

1. The AD ADC71 and AD ADC72 provide 16-bit resolution with maximum linearity error less than ±0.003% (±0.006% for J and A grades) at 25°C.
2. Conversion time is 45μs typical to 14 bits with short cycle capability.
3. The AD ADC72 (KD, BD) have no missing codes (to 14 bits) over the full specification temperature range.
4. Two binary codes are available on the AD ADC71 and AD ADC72 output. They are complementary straight binary (CSB) for unipolar input voltage ranges and complementary offset binary (COB) for bipolar input ranges. Complementary two's complement (CTC) coding may be obtained by inverting pin 1 (MSB).
5. The proprietary chips used in this hybrid design provide excellent stability over temperature and lower chip count for improved reliability.

ANALOG DEVICES

14-Bit, 125kHz Analog-to-Digital Converter

HAS-1409

FEATURES
14-Bit Resolution
125kHz Word Rates
Internal Track-and-Hold
40-Pin DIP

APPLICATIONS
FDM/TDM Transmultiplexers
CAT/NMR Scanners
PCM Systems
Digital Audio

GENERAL DESCRIPTION

The HAS-1409KM and HAS-1409AKM hybrid A/D converters offer designers performance characteristics which have never before been available.

Now, for the first time, high resolution and high speed come together in a hybrid package which includes an internal track-and-hold. The HAS-1409 units have resolutions of 14 bits, are capable of word rates up to 125kHz, and are complete with track-and-hold; all of these features are housed in a single 40-pin DIP package which dissipates only two watts.

The HAS-1409KM includes an internal clock, which allows the converter to be operated at any word rate from dc through 120kHz; the HAS-1409AKM is designed for applications which use an external system clock whose frequency establishes the user's optimum word rate, up to 125kHz.

The HAS-1409 A/D has been characterized with a companion D/A converter, the HDD-1409KM, to emphasize the superior ac performance needed for use in Frequency Division Multiplex/Time Division Multiplex (FDM/TDM) transmultiplexer systems. Although specifically designed for these kinds of applications, it can also be used for other digital signal processing such as Computer Aided Tomography (CAT) and Nuclear Magnetic Resonance (NMR) scanners, and Pulse Code Modulation (PCM).

Conventional data converters often display errors at midscale which make them inadequate for use in the types of systems cited above. The unique Digitally Corrected Subranging technique pioneered by Analog Devices, used with other proprietary techniques, virtually cancels midscale errors in the HAS-1409, thereby eliminating a major source of system errors.

The logic outputs are TTL-compatible and are presented as 14 bits of parallel data. Buffer output registers and a 3-state format provide dual advantages of good drive and bus compatibility.

ANALOG DEVICES

Voltage-to-Frequency and Frequency-to-Voltage Converter

AD650

FEATURES
V/F Conversion to 1MHz
Reliable Monolithic Construction
Very Low Nonlinearity
- **0.002% typ at 10kHz**
- **0.005% typ at 100kHz**
- **0.07% typ at 1MHz**

Input Offset Trimmable to Zero
CMOS or TTL Compatible
Unipolar, Bipolar, or Differential V/F
V/F or F/V Conversion

PRODUCT DESCRIPTION
The AD650 V/F/V (voltage-to-frequency or frequency-to-voltage converter) provides a combination of high frequency operation and low nonlinearity previously unavailable in monolithic form. The inherent monotonicity of the V/F transfer function makes the AD650 useful as a high-resolution analog-to-digital converter. A flexible input configuration allows a wide variety of input voltage and current formats to be used, and an open-collector output with separate digital ground allows simple interfacing to either standard logic families or opto-couplers.

The linearity error of the AD650 is typically 20ppm (0.002% of full scale) and 50ppm (0.005%) maximum at 10kHz full scale. This corresponds to approximately 14-bit linearity in an analog-to-digital converter circuit. Higher full-scale frequencies or longer count intervals can be used for higher resolution conversions. The AD650 has a useful dynamic range of six decades, allowing extremely high resolution measurements. Even at 1MHz full scale, linearity is guaranteed less than 1000ppm (0.1%) on the AD650KN, BD and SD grades.

In addition to analog-to-digital conversion, the AD650 can be used in isolated analog signal transmission applications, phased-locked-loop circuits, and precision stepper motor speed controllers. In the F/V mode, the AD650 can be used in precision tachometer and FM demodulator circuits.

The input signal range and full-scale output frequency are user-programmable with two external capacitors and one resistor. Input offset voltage can be trimmed to zero with an external potentiometer.

The AD650JN and AD650KN are offered in a plastic 14-pin DIP package and are specified for the commerical (0 to +70°C) temperature range. For industrial temperature range (−25°C to +85°C) applications, the AD650AD and AD650BD are offered in a ceramic package. The AD650SD is specified for the full −55°C to +125°C extended temperature range.

ANALOG DEVICES

Voltage References

INTEGRATED CIRCUIT REFERENCES

The accuracy of all measurements is determined by the reference employed. Analog Devices' references use buffered low TC precision zener diodes or patented laser wafer trimmed monolithic bandgap circuitry. Both include output operational amplifiers for optimum load regulation.

The AD2720 precision hybrid reference provides the highest initial accuracy and lowest temperature coefficient. The proprietary temperature compensated design and active laser trimming result in ultra high precision performance previously available only in oven-regulated modules.

AD584 V_{OUT} = 10.000V or 7.500V or 5.000V or 2.500V

The AD584 is a unique bandgap reference. Depending on user requirements it may be connected to provide any one of four standard voltages without additional external parts.

ANALOG DEVICES

High Speed Sample-and-Hold Amplifier

AD585

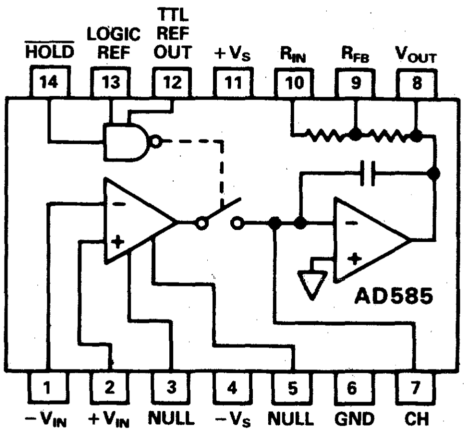
FEATURES

Fast 2.5μs Acquisition Time to ±0.01%
Low Droop Rate: 0.5mV/ms
Low Offset: 1mV
Sample/Hold Offset Step: 1mV
Aperture Jitter: 0.5ns
Military Temperature Range: −55°C to +125°C
Internal Hold Capacitor

APPLICATIONS

Data Acquisition Systems
Data Distribution Systems
Analog Delay & Storage
Peak Amplitude Measurements

AD585 FUNCTIONAL BLOCK DIAGRAM



PRODUCT DESCRIPTION

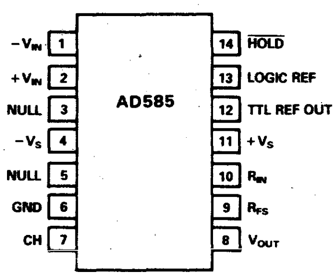
The AD585 is a monolithic sample-and-hold circuit consisting of a high performance operational amplifier in series with an ultra-low leakage analog switch and a FET input integrating amplifier. An internal holding capacitor and connections to the internal feedback resistors, completes the sample and hold.

With the analog switch closed, the AD585 functions like a standard op amp; any feedback network may be connected around the device to control gain and frequency response. With the switch open, the capacitor holds the output at its previous level.

The AD585 offers performance previously unavailable in monolithic sample-and-hold amplifiers. The combination of a fast acquisition time (2.5μs to 0.01%) and low offset step (1mV) are suitable for high speed 12-bit data acquisition systems.

The device is available in two versions: the "J" specified for operation over the 0 to +70°C commercial temperature range and the "S" specified over the full extended temperature range −55°C to +125°C.

PIN CONFIGURATION



PRODUCT HIGHLIGHTS

1. The droop rate is only 0.5mV/ms so that it may be used in slower high accuracy systems without the loss of accuracy.
2. The fast acquisition time and low aperture make it suitable for very high speed data acquisition systems.
3. The AD585 has internal pretrimmed application resistors for applications versatility.
4. The AD585 is complete with an internal hold capacitor for ease of use and capacitance can be added externally to achieve higher accuracy.

Medical Electronics

GENERAL DESCRIPTION

The Analog Devices HTS-0010 Track-and-Hold is another example of Analog's continuing efforts to advance the state of the art in high-speed circuits.

The HTS-0010 adds breadth to a line of devices which offers designers the industry's widest range of track-and-hold and sample-and-hold units.

Its pinouts are similar to its predecessor HTS-0025 Track-and-Hold, but it provides enchanced performance in many of the characteristics established by that device. Two pins which are unused on the HTS-0025 are used on the HTS-0010, but with those exceptions, the two devices have identical pin assignments. This plug-in compatibility gives designers remarkable flexibility in selecting those parameters which are optimum for their applications.

The HTS-0010 Track-and-Hold (T/H) uses many of the proven design concepts which have made the HTS-0025 T/H the standard of comparison for high-speed circuits of this type. A dc-coupled Schottky diode bridge is driven by a high impedance buffer amplifier and followed by a low impedance output amplifier to achieve the best possible combination of speed and drive capabilities.

All models of the HTS-0010 are housed in a standard 24-pin metal DIP. The unit operating over a temperature range of 0 to +70°C is HTS-0010KD; the unit for a range of −55°C to +100°C is HTS-0010SD.

GENERAL DESCRIPTION

The Analog Devices HTC-0500 Track/Sample Hold is a remarkable combination of speed and low power dissipation in a 14-pin DIP. Its low cost makes it extremely attractive for a wide range of applications which were often uneconomical until now.

Exceptional speed and minimum power in a small, cost-effective package are not the only characteristics which make this unit worth serious consideration for a variety of uses. The innovative design ideas which have been included make it possible for the user to vary the gain of this inverting amplifier.

In many instances, Track/Sample-Hold devices may allow the user to decrease the gain, but increasing the gain is impossible. This is because the majority of these units close the feedback loop internally.

The HTC-0500, however, gives the designer flexibility when it is incorporated into its system application because it can be varied around its normal unity gain. In fact, as shown in Figure 1, the user must close the feedback loop externally with a strap to get proper operation.

The HTC-0500 is a perfect choice for use with Analog Devices' converters such as the HAS-1202, AD578, and AD579 in applications which do not require the speed of the model HTC-0300 Track-and-Hold, but require higher speed than the ADSHC-85.

The standard unit is housed in a metal dual in-line package; its model number is HTC-0500AM. A temperature range of −55°C to +125°C is available with model HTC-0500SM.

Fast, Complete, 16-Channel µP Compatible 12-Bit Data Acquisition System

AD364

ADVANCED TECHNICAL DATA

FEATURES
- Complete Data Acquisition System in 2-Package IC Form
- Full 8- or 16-Bit Microprocessor Bus Interface
- 16 Single-Ended or 8 Differential Channels with Switchable Mode Control
- True 12-Bit Operation: Nonlinearity ≤±0.012%
- Guaranteed No Missing Codes Over Specified Temperature Range
- High Throughput Rate: 20kHz
- Fast Successive Approximation Conversion: 25µs
- Buried Zener Reference for Long-Term Stability and Low Gain TC
- Small Size: Requires Only 2.8 Square Inches
- Short-Cycle Capability
- Low Power: 1.4 Watts
- Extended Temperature Range: -55°C to +125°C

PRODUCT DESCRIPTION

The AD364 is a complete 16 channel, microprocessor compatible, 12-bit data acquisition system in integrated circuit form. The AD364 design is implemented with linear compatible LSI chips, active laser trimming and hybrid technology resulting in maximum performance and flexibility.

The AD364 consists of two separate functional blocks, each in a hermetically sealed dual-in-line package. The analog input section contains two eight-channel multiplexers, a differential amplifier, a sample-and-hold, a channel address register and control logic. The multiplexers may be connected to the differential amplifier in either an 8-channel differential or 16-channel single-ended configuration. A unique feature of the AD364 is an internal user-controllable analog switch that connects the multiplexers in either a single-ended or differential mode. This allows a single device to perform in either mode without hard-wire programming and permits a mixture of single-ended and differential sources to be interfaced to an AD364 by dynamically switching the input mode control.

The ADC section contains a complete 12-bit successive approximation ADC, including internal clock, precision 10 volt reference, comparator and bus interface. The ADC uses the newly-developed LCI (Linear-Compatible Integrated Injection Logic) process to provide the low power logic necessary to make a high speed 12-bit ADC and 3-state output buffer circuitry for direct interface to an 8-, 12- or 16-bit microprocessor bus.

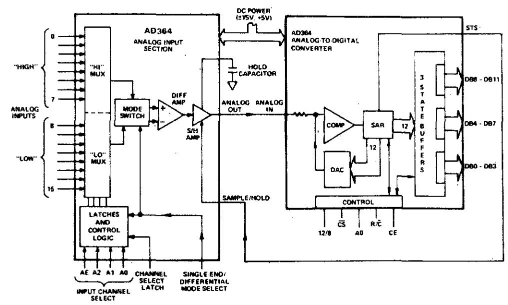
AD364KD	±0.012%	0 to +70°C
AD364SD	±0.024%	-55°C to +125°C
AD364TD	±0.024%	-55°C to +125°C

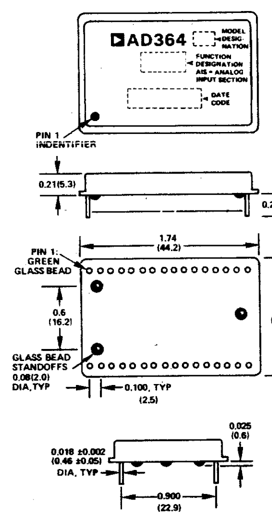
AD364 FUNCTIONAL BLOCK DIAGRAM



OUTLINE DIMENSIONS PACKAGE SPECIFICATIONS

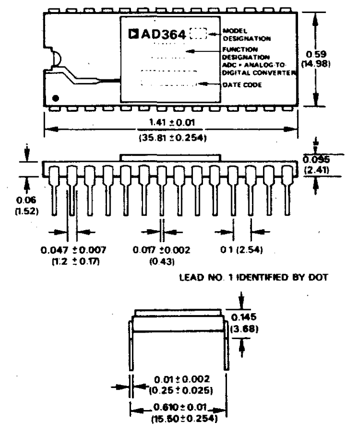
Dimensions shown in inches and (mm).

ANALOG INPUT SECTION

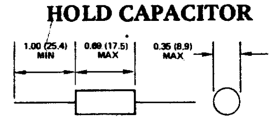


NOTES:
1) PACKAGE: KOVAR WITH 100µIN. MIN., NICKEL PLATE
2) PINS: KOVAR WITH 50µIN. MIN 24K GOLD PLATE
3) PACKAGE AND PINS MEET ALL REQUIREMENTS OF MIL-STD-883
4) TOLERANCES, UNLESS OTHERWISE NOTED:
a) .XX: ±.01 (.25)
b) .XXX: ±.005 (.13)

ANALOG-TO-DIGITAL CONVERTER

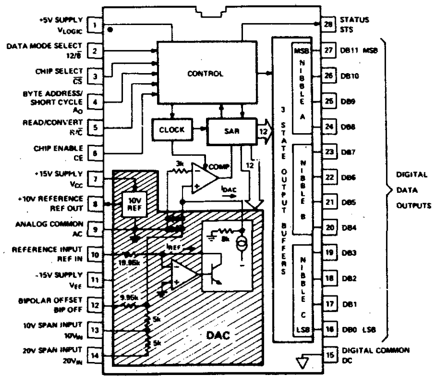


HOLD CAPACITOR



*THIS DIMENSION IS FOR POLYSTYRENE CAPACITOR SUPPLIED WITH J AND K GRADES.

MAX BODY LENGTH OF TEFLON CAPACITOR SUPPLIED WITH S AND T GRADES IS 1.00".



ONE TECHNOLOGY WAY • P.O. BOX 280 • NORWOOD, MA 02062 • (617) 329-4700

Sample/Track-Hold Amplifiers

IC SAMPLE-HOLD AMPLIFIERS

The AD582, AD583 and AD585 are monolithic sample-and-hold amplifiers with high performance internal amplifiers and a low leakage analog switch. An external hold capacitor is used with the AD582 and AD583, while the AD585 includes an on-chip hold capacitor.

The AD582 is the lowest cost SHA; yet it can replace many modular and hybrid units. For faster acquisition time or greater precision, the AD583 and AD585 are recommended.

Greater speed is provided by the HTC-0500, with an acquisition time of 700ns. The highest speed IC track-and-holds are the HTC-0300, HTC-0300A and HTS-0025. These units have acquisition times, respectively, of 170ns, 150ns and 30ns.

The HTC-0500, HTC-0300 and HTC-0300A are used with fast ADC's such as the HAS Series, the AD578, or AD579. The HTS-0025 is optimized for use with "video" ADC's and is also an excellent choice for use as a deglitcher at the output of high-speed current output DAC's. The ADSHC-85 is a second source for a generic industry-standard device.

SPECIFICATIONS (typical @ +25°C unless otherwise noted)

Model	Open Loop Gain RL=2kΩ k min	Output V_{min}/mA min	Gain Bandwidth MHz	Acquisition Time (0.1%)[1]	Aperture Time ns	Aperture Uncertainty	Droop Rate mV/ms	Oper. Temp[2]	Package

BURR-BROWN®

MILITARY PRODUCTS

Burr-Brown's Military products meet the demand for high quality products for high reliability applications. They feature exceptional electrical performance from −55°C to +125°C, Hi-Rel manufacture, MIL-STD-883 class B screening, and reasonable prices. They are designed to conservative and stringent MIL-M-38510 requirements, and are produced on a separate manufacturing line, which exceeds Burr-Brown's standard lines' quality. MIL-M-38510 and MIL-STD-883 processes and controls are used throughout.

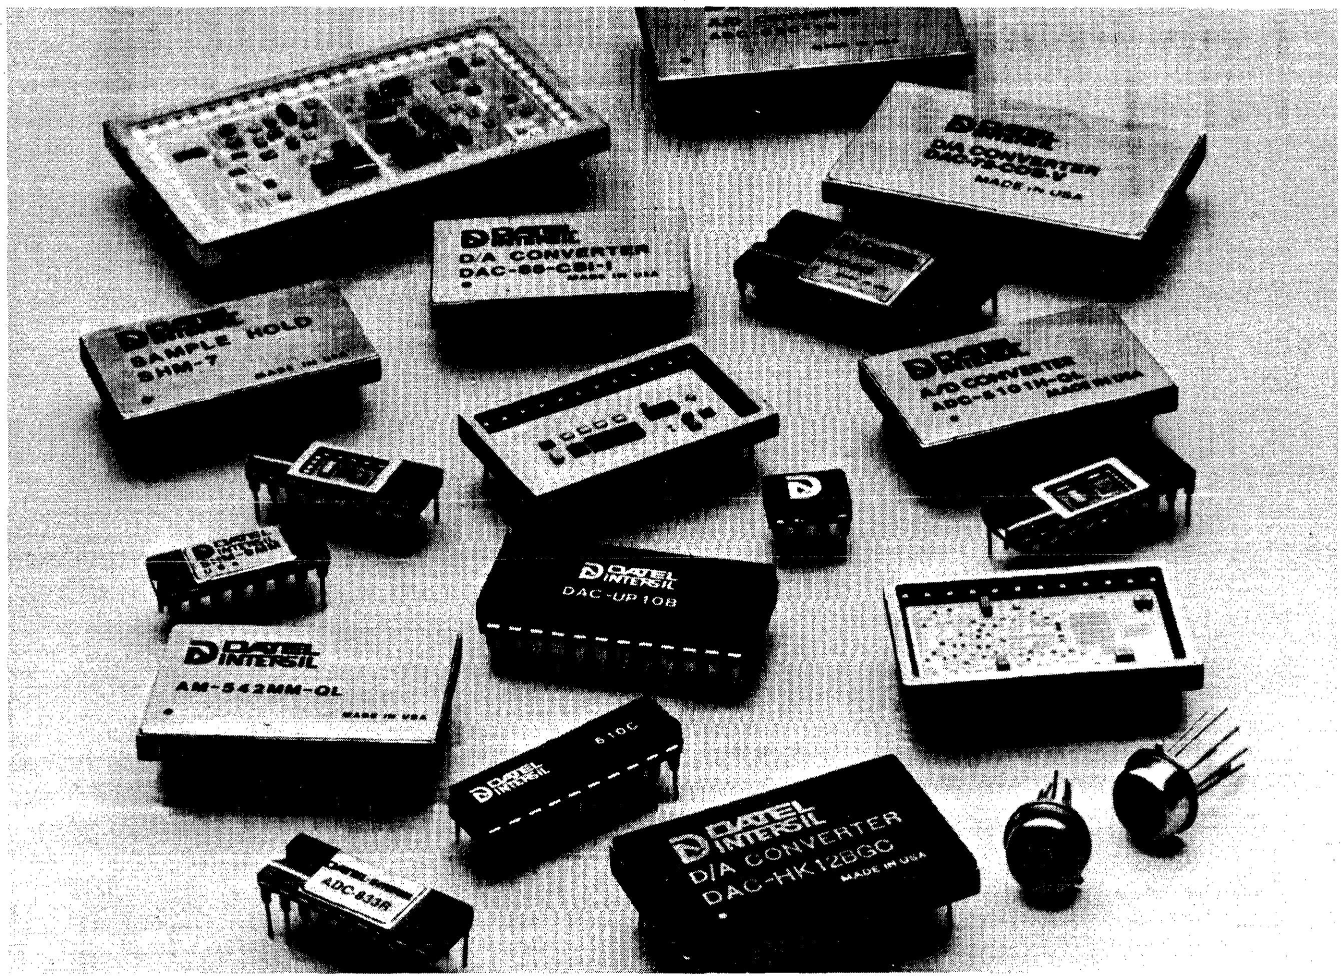
DATEL

Data Conversion Products



Datel is located in Mansfield, Massachusetts, approximately 35 miles from Boston. The modern, 120,000-square-foot facility houses our administrative offices, our components and systems engineering groups, modular and systems production facilities, and the most modern thin-film-hybrid production facility in the industry.

Datel offers one of the broadest lines of data-conversion products in the industry. Included are A/D and D/A converters, sample-and-holds, operational and instrumentation amplifiers, and data-acquisition systems — all packaged using the latest in thin-film, hybrid-microelectronic-circuit manufacturing technologies.

Datel also offers fast delivery. On standard products, delivery typically runs from stock to four weeks and from six to eight weeks for full military-grade products with Class 883B screening.

Datel is dedicated to maintaining its position as an international leader in data-conversion technology. You can depend on Datel-Intersil for a steady flow of new products to meet the growing demand for high-performance data-acquisition products.

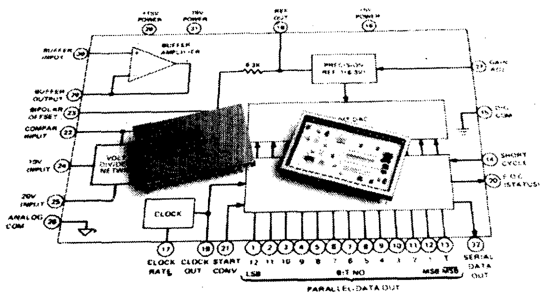
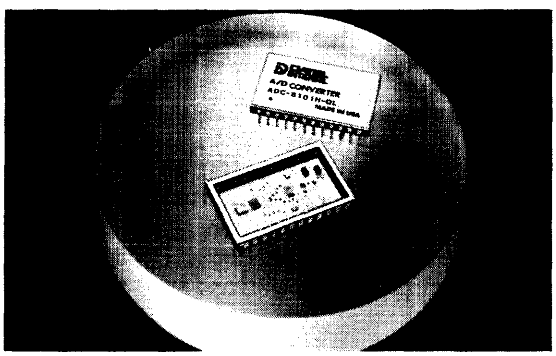
New Products from Datel



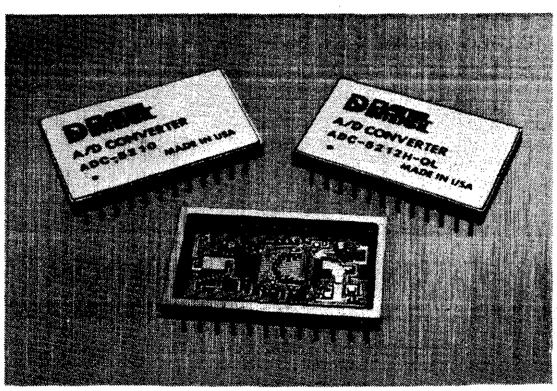
ADC-810, ADC-811
Ultra-fast, 12-bit Hybrid Analog to Digital Converters

The ADC-810 and ADC-811 are ultra-fast, hybrid, successive approximation, 12-bit analog to digital converters. The ADC-810 achieves a maximum conversion time of 2 μsec. Conversion time for the ADC-811 is 4 μsec maximum, which is the only difference between the two. Both models are pin-compatible with industry-standard ADC-85/87 converters, offering increased speed, high accuracy and reliability. Models are available subjected to 100% screening to MIL-STD-883B.



ADC-5101 high speed, 8-bit A/D offers high temperature operation at low cost

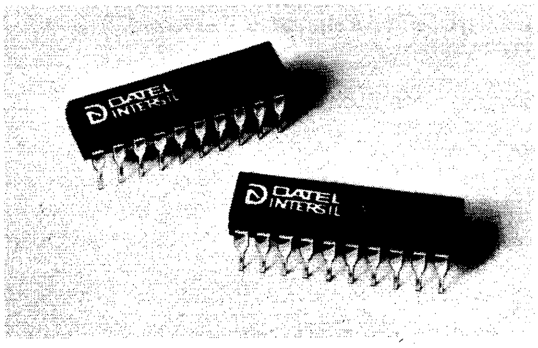
The ADC-5101 is a high speed, adjustment-free, 8-bit A/D converter. Pin compatible with standard ADC-5101 converters, these devices offer high accuracy and high speed over the full military operating temperature range of −55°C to +125°C. Designed for operation without external adjustment circuits, the ADC-5101 accomplishes an 8-bit conversion in only 900 ns maximum. Models are available subjected to 100% screening to MIL-STD-883 Class B.



ADC-5210 series adjustment-free 12-bit A/D features high accuracy over military temperature range

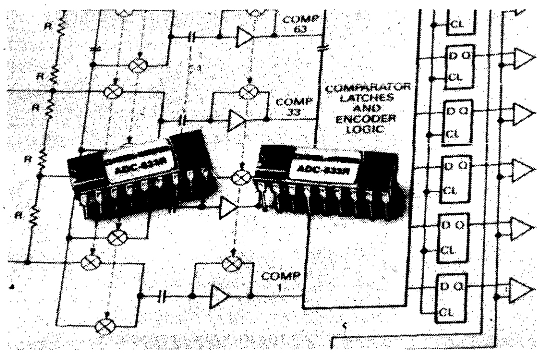
The ADC-5210 series are high performance, 12-bit successive approximation A/D converters. Completely pin and function compatible with standard ADC-5210 devices, these models offer significatly improved high-temperature operation at lower cost. Full scale absolute accuracy error is a maximum of ± 0.05% FSR at + 25°C and only ± 0.2% FSR over the full military operating temperature range of −55°C to + 125°C; an improvement of 10 LSBs over the error specified on competing devices. MIL-STD-883 screening is available.

DATEL 11 CABOT BOULEVARD, MANSFIELD, MA 02048 / TEL. (617) 339-9341 / TWX 710-346-1953 / TLX 951340



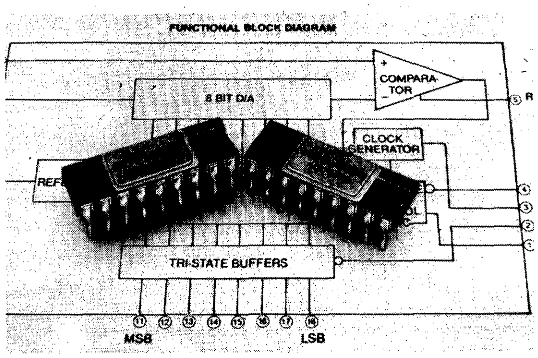
ADC-830 microprocessor compatible 8-bit A/D converter

DATEL's ADC-830 is a low-cost, monolithic 8-bit A/D converter designed to operate directly with the 8080A control bus via three-state outputs. The device appears as a memory location or I/O port to the microprocessor and thus does not require interfacing logic. Using the successive approximation technique and a modified potentiometric resistor ladder, the ADC-830 achieves an 8-bit conversion in 100 μs with a maximum total adjusted error of only ± ½ LSB. Its combination of low cost, small size, and interface versatility make the ADC-830 an ideal choice for many process control and instrumentation applications.



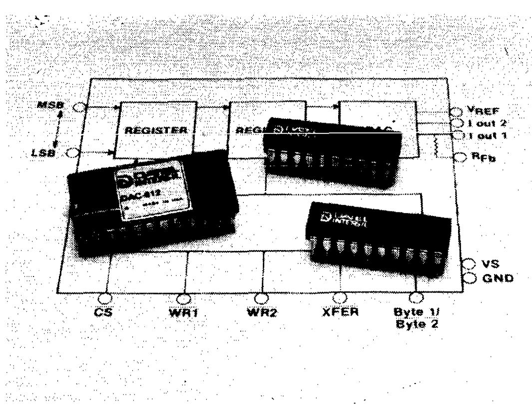
ADC-833 6-bit A/D features video speed at low power

The ADC-833 is a low-power, video-speed, 6-bit flash A/D manufactured with CMOS/SOS technology. The device is capable of digitizing an analog input signal at conversion rates up to 15MHz while its power consumption is only 200mW. The analog input voltage range is +2.5V to +10V, and typical differential linearity error is only ± ½ LSB. Outputs are buffered three-state and include an overflow output which allows the user to cascade two units to achieve 7-bit resolution.



ADC-847 Microprocessor Compatible, 8-Bit A/D Converter

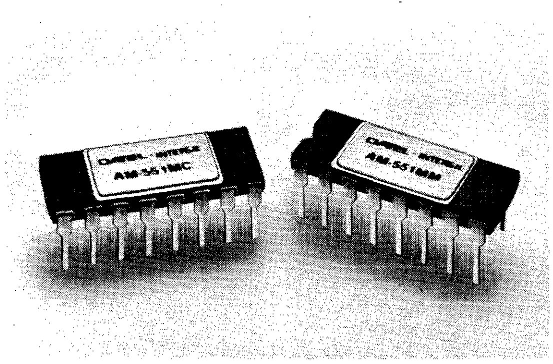
The ADC-847 is a low cost, monolithic, 8-bit A/D converter designed to interface directly to a microprocessor via three-state outputs. Utilizing the successive approximation technique, the ADC-847 completes an 8-bit conversion in 9 μS with a maximum linearity error as low as ± ¼ LSB. The ADC-847 includes, an internal clock generator, reference circuit, successive approximation register, comparator, three-state buffers, 8 bit D/A converter and interface and control logic, making it an ideal choice for many process control and instrumentation applications. The ADC-847 is available for operation over the commercial, 0°C to + 70°C and military, –55°C to + 125°C temperature ranges and is packaged in either an 18 pin plastic or ceramic DIP.



DAC-608/610/612 Low Cost, Double-Buffered Microprocessor Compatible D/A Converters

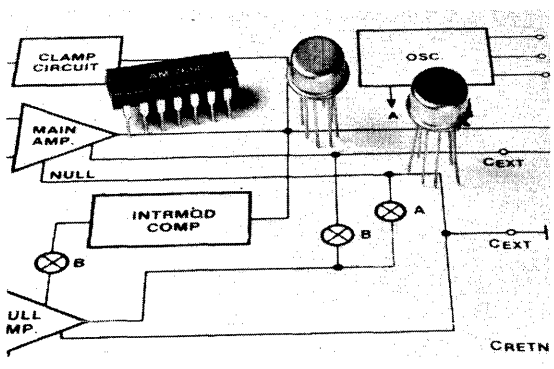
The DAC-608, DAC-610 and DAC-612 are low cost monolithic 8, 10 and 12 bit multiplying D/A converters, designed to interface directly with most popular microprocessors. Double-Buffered inputs allow the converters to output an analog voltage corresponding to one digital word while holding the next. The converters consist of an input register, a D/A register, control logic and D/A converter. Settling time is 1 μS for the DAC-608 and DAC-612 and 500 nS for the DAC-610. The reference input of these converters is selectable over a range of ±10V and may also be used as the analog input for four quadrant multiplication applications.

DATEL 11 CABOT BOULEVARD, MANSFIELD, MA 02048 / TEL. (617) 339-9341 / TWX 710-346-1953 / TLX 951340



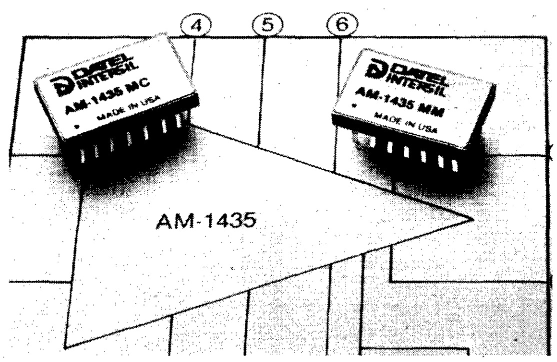
AM-551 Low Cost, Hybrid Programmable Instrumentation Amplifier

DATEL's AM-551 is a low cost, high performance, programmable gain nstrumentation amplifier manufactured with hybrid thin-film technology. Gain range is 1 to 1000 and is set externally by a single resistor and simple pin-strapping. Settling time is 2 μsec for a 20V output step to 0.01% accuracy, with a slew rate of 23V/μsec and a small signal bandwidth of 400 kHz. Applications include remote amplification of low-level signals produced by thermocouples, strain gages and RTD's, high performance data acquisition systems and remote instrumentation systems.



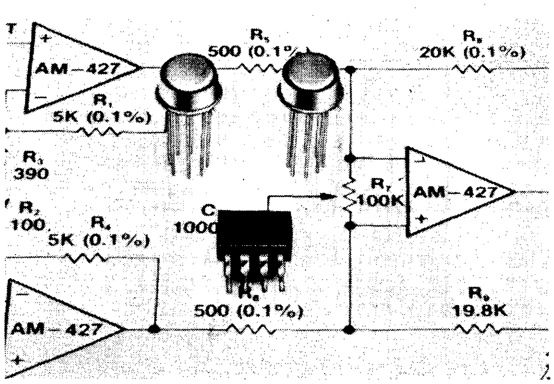
AM-7650 new, low cost chopper stabilized operational amplifier features ultra-low offcost voltage and drift

DATEL's AM-7650 is a low cost, high performance chopper stabilized amplifier featuring exceptionally low offset voltage and input bias specifications combined with excellent bandwidth and speed characteristics. Input offset voltage is typically ± 0.7 μV with an input offset voltage drift as low as 0.01 μV/°C. The AM-7650 achieves its low offset by comparing the inverting and non-inverting input voltages in a nulling amplifier, which is nulled by alternate clock phases from the internal clock oscillator. The 14 pin DIP version also includes a provision for the use of an external clock if an application requires. These devices are internally compensated for unity-gain operation.



AM-1435 Ultra High Speed, Wideband, Hybrid Operational Amplifier

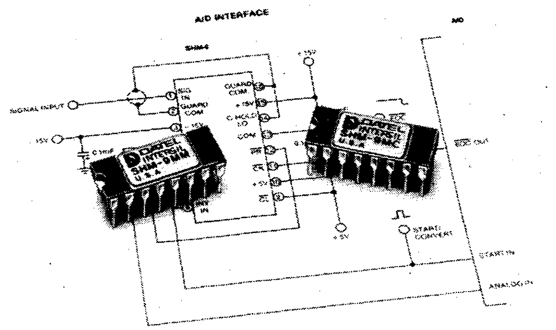
DATEL's AM-1435 is an ultra-fast settling, wide-band operational amplifier. The AM-1435 achieves a settling time of only 70 nsec for a 10V step to 0.01% accuracy. High speed performance is optimized with high open loop gain, flat frequency response beyond 10 kHz and a roll-off of 6 dB/octave to beyond 100 MHz. Gain bandwidth product is typically 1GHz and slew rate is 300V/μsec. All models are packaged in hermetically sealed ceramic cases, with full screening to MIL-STD-883 level B available.



AM-427 Ultra-Low Noise Monolithic Operational Amplifier

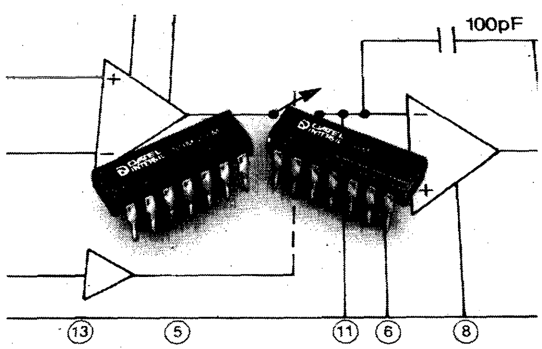
The AM-427 is a low cost, ultra-low noise operational amplifier which is designed for instrumentation grade signal conditioning where low noise, low offset voltage and low offset voltage drift are required. The AM-427 combines exceptional DC performance with ultra-low noise operation. Maximum input noise voltage density and input noise current density at 10 HZ are 5.5 nV/√Hz and 0.4 pA/√Hz respectively. The AM-427 is available for operation over the industrial, −25°C to +85°C and military, −55°C to +125°C temperature ranges and is packaged in either an 8 pin TO-99 or an 8 pin ceramic DIP.

DATEL 11 CABOT BOULEVARD, MANSFIELD, MA 02048 / TEL. (617) 339-9341 / TWX 710-346-1953 / TLX 951340



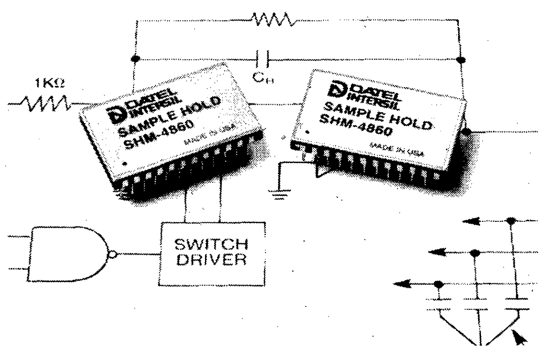
Low cost functionally complete hybrid sample-hold features .01% accuracy SHM-9

The SHM-9 is a complete, self-contained sample-hold amplifier that combines high performance versatility with low cost. The SHM-9 includes a bipolar input amplifier, a low-leakage electronic switch, a FET output amplifier, a precision 1000 pF hold capacitor and logic control circuitry. The internal control circuitry allows the SHM-9 to be interfaced with virtually any A/D converter using the converter's Start/Convert and E.O.C. (status) signals. Active laser trimming of highly stable thin-film resistor networks minimizes offset and sample-to-hold offset errors, eliminating the need for external adjustment circuits.



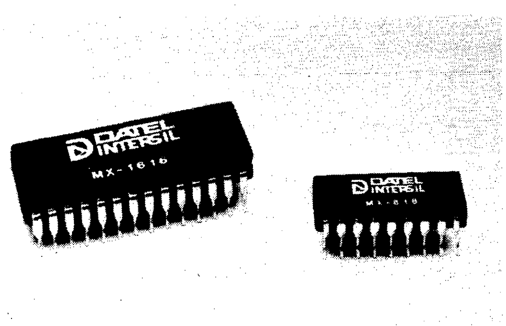
SHM-20, Fast, High Performance Sample and Hold Features Internal Hold Capacitor.

The SHM-20 is a complete monolithic sample and hold amplifier which includes an internal 100 pF MOS capacitor. Features include an acquisition time of typically 1.0 µS for a 10V input step to 0.01%. Aperture uncertainty is typically 1 nS and droop rate is as low as 0.08 µV/µS. Primarily designed for high speed analog signal processing applications, the SHM-20 combines monolithic reliability and size with high performance versatility and low cost. The SHM-20 is available for operation over the commercial, 0°C to +70°C and military, −55°C to +125°C temperature ranges and is packaged in a 14 pin ceramic DIP.



SHM-4860 new 0.01% Hybrid Sample-Hold features 200 nsec acquisition time

DATEL's SHM-4860 is a high-speed, high resolution sample-hold amplifier manufactured with modern hybrid technology. Designed mainly for precision, high speed analog signal processing applications, the SHM-4860 acquires a 10V input change to ±0.01% in only 200 nsec max. Maximum sample-to-hold settling time is 100 nsec to ±0.01% with an aperture uncertainty of typically ±50 psec. Feedthrough attenuation is typically 74 dB. The digital inputs of the SHM-4860 are TTL compatible.



8 and 16 Channel Multiplexers Feature High Speed, High Accuracy, MX-1616, MX-818

DATEL's MX-1616 and MX-818 are high speed, high performance analog multiplexers featuring transfer accuracies of 0.01% at sampling rates of up to 2.5 MHz over ±10V single ranges. The MX-1616 is user programmable either as a single-ended 16-channel or as a differential 8 channel multiplexer while the MX-818 is programmable as either a single-ended 8 channel or differential 4-channel multiplexer. All models feature an inhibit function, break-before-make switching and a maximum ON resistance of only 750Ω.

Hybrid military products

Datel is a recognized industry leader in the design and manufacture of thin film hybrid data conversion products which meet the most demanding reliability requirements for military and aerospace applications per MIL-specifications. Datel data conversion products are currently used in a wide number of military and aerospace flight systems and in high reliability ground support and test systems. Datel's modern 120,000 square foot manufacturing facility in Mansfield, Massachusetts includes the most automated and advanced manufacturing, test and calibration equipment available in the industry. This capability, supported by a Quality Assurance Program with full emphasis on product quality assurance and reliability, provides an experienced and reliable source for data converter products to the screening and qualification requirements of Methods 5004, 5005, and 5008 of MIL-STD-883B in compliance with MIL-M-38510 (specified by Datel as "Q.L." devices).

The Quality Assurance operation at Datel monitors all areas of manufacturing and test, controls manufacturing and screening standards, maintains lot traceability procedures, and sets material standards to assure product quality. All purchased and internally manufactured components are procured or manufactured to precise specification control drawings. All components are 100% electrically tested and 100% visually inspected either by the vendors or internally within Datel facilities. Assembly and test processes and work stations are carefully monitored by Quality Assurance using fully documented procedures to guarantee high standards of workmanship and quality in all of Datel's products.

Datel products with the suffix "Q.L." are fully screened in accordance with Methods 5004 and 5008 of MIL-STD-883B as amended by MIL-M-38510. The following list briefly summarizes Datel's hybrid military products.

ANALOG TO DIGITAL CONVERTERS

	MODEL NO.	RESOLUTION	CONVERSION TIME	LINEARITY	OPERATING TEMP. RANGE (°C)
	ADC-HC12BMM	12 bits	300 μsec	± ½ LSB	−55 to +125
	ADC-HC12BMM-QL	12 bits	300 μsec	± ½ LSB	−55 to +125
	ADC-HS12BMM	12 bits	9 μsec	± ½ LSB	−55 to +125

HARRIS

HI-200

Dual SPST CMOS Analog Switch

FEATURES

- ANALOG VOLTAGE RANGE ±15V
- ANALOG CURRENT RANGE 80mA
- TURN-ON TIME 240ns
- LOW R_{ON} 55Ω
- LOW POWER DISSIPATION 15mW
- TTL/CMOS COMPATIBLE

APPLICATIONS

- HIGH FREQUENCY ANALOG SWITCHING
- SAMPLE AND HOLD CIRCUITS
- DIGITAL FILTERS
- OP AMP GAIN SWITCHING NETWORKS

DESCRIPTION

HI-200 is a monolithic device comprising two independently selectable SPST switches which feature fast switching speeds (290ns) combined with low power dissipation (15mW at 25°C). Each switch provides low "ON" resistance operation for input signal voltages up to the supply rails and for signal currents up to 80mA. Employing Dielectric Isolation and CMOS processing, HI-200 operates without any applications problems induced by latch-up or SCR mode phenomena.

All devices provide break-before-make switching and are TTL and CMOS compatible for maximum application versatility. HI-200 is an ideal component for use in high frequency analog switching. Typical applications include signal path switching, sample and hold circuit, digital filters, and op amp gain switching networks.

HI-200 is available in DIP and metal (TO-100) cans. HI-200-2 is specified from -55°C to +125°C while HI-200-5 operates from 0°C to +75°C. HI-200 is functionally and pin compatible with other available "200 series" switches.

NOTES:
1. V_{OUT} = ±10V I_{OUT} = 1mA
2. Digital Inputs Are MOS Gates - Typical Leakage is Less Than 1nA
3. V_{AH} = 4.0V
4. V_A = +5V, R_L = 1KΩ, C_L = 10pF, V_S = 3VRMS, f = 100kHz
5. V_A = +3V or V_A = OV For Both Switches
6. Refer to leakage current measurement diagram on page (3-8)

** Note: HI-200-4 has same specifications as HI-200-5 over the temperature range -20°C to +85°C.

HARRIS

HI-201

Quad SPST CMOS Analog Switch

FEATURES

- ANALOG VOLTAGE RANGE ±15V
- ANALOG CURRENT RANGE 80mA
- TURN-ON TIME 185ns
- LOW R_{ON} 55 Ω
- LOW POWER DISSIPATION 15mW
- TTL/CMOS COMPATIBLE

APPLICATIONS

- HIGH FREQUENCY ANALOG SWITCHING
- SAMPLE AND HOLD CIRCUITS
- DIGITAL FILTERS
- OP AMP GAIN SWITCHING NETWORKS

DESCRIPTION

HI-201 is a monolithic device comprising four independently selectable SPST switches which feature fast switching speeds (185ns) combined with low power dissipation (15mW at 25°C). Each switch provides low "ON" resistance operation for input signal voltages up to the supply rails and for signal currents up to 80mA. Employing Dielectric Isolation and CMOS processing, HI-201 operates without any applications problems induced by latch-up or SCR-mode phenomena.

All devices provide break-before-make switching and are TTL and CMOS compatible for maximum application versatility. HI-201 is an ideal component for use in high frequency analog switching. Typical applications include signal path switching, sample and hold circuit, digital filters, and op amp gain switching networks.

HI-201 is available in a 16 lead dual-in-line package. HI-201-2 is specified from -55°C to +125°C while HI-201-5 operates from 0°C to +75°C. HI-201 is functionally and pin compatible with other available "200 series" switches.

4. V_A = +5V, R_L = 1KΩ, C_L = 10pF, V_S = 3VRMS, f = 100kHz
5. V_A = +3V or V_A = 0V For Both Switches
6. Refer to leakage current measurement diagram on page (3-8)

** Note: HI-200-4 has same specifications as HI-200-5 over the temperature range -20°C to +85°C.

HARRIS

HI-201

Quad SPST CMOS Analog Switch

FEATURES

- ANALOG VOLTAGE RANGE ±15V
- ANALOG CURRENT RANGE 80mA
- TURN-ON TIME 185ns
- LOW R_{ON} 55Ω
- LOW POWER DISSIPATION 15mW
- TTL/CMOS COMPATIBLE

APPLICATIONS

- HIGH FREQUENCY ANALOG SWITCHING
- SAMPLE AND HOLD CIRCUITS
- DIGITAL FILTERS
- OP AMP GAIN SWITCHING NETWORKS

DESCRIPTION

HI-201 is a monolithic device comprising four independently selectable SPST switches which feature fast switching speeds (185ns) combined with low power dissipation (15mW at 25°C). Each switch provides low "ON" resistance operation for input signal voltages up to the supply rails and for signal currents up to 80mA. Employing Dielectric Isolation and CMOS processing, HI-201 operates without any applications problems induced by latch-up or SCR-mode phenomena.

All devices provide break-before-make switching and are TTL and CMOS compatible for maximum application versatility. HI-201 is an ideal component for use in high frequency analog switching. Typical applications include signal path switching, sample and hold circuit, digital filters, and op amp gain switching networks.

HI-201 is available in a 16 lead dual-in-line package. HI-201-2 is specified from -55°C to +125°C while HI-201-5 operates from 0°C to +75°C. HI-201 is functionally and pin compatible with other available "200 series" switches.

HARRIS

HI-201HS

High Speed Quad SPST CMOS Analog Switch

Preliminary

FEATURES

- ANALOG VOLTAGE RANGE ±15V
- ANALOG CURRENT RANGE 80mA
- TURN-ON TIME 30ns
- LOW R_{ON} 30Ω
- LOW POWER DISSIPATION 120mW
- TTL COMPATIBLE
- LOW CHARGE INJECTION 10pC

APPLICATIONS

- HIGH FREQUENCY ANALOG SWITCHING
- SAMPLE AND HOLD CIRCUITS
- DIGITAL FILTERS
- OP AMP GAIN SWITCHING NETWORKS

DESCRIPTION

The Harris HI-201HS is a monolithic CMOS analog switch featuring very fast switching speeds and low ON resistance. The device consists of four independently selectable SPST switches and is identical in pinout to the HI-201 quad switch.

Fabricated using the Harris dielectric isolation technology, this TTL compatible device offers improved performance over previously available CMOS analog switches. Featuring switching speeds of 50ns max., low ON resistance of 50Ω max., and wide analog signal range of ±15V, the HI-201HS is designed for any application where improved switching performance, particularly switching speed, is required.

The HI-201HS is available in a 16 lead dual-in-line package. The HI-201HS-2 is specified for the temperature range of -55°C to +125°C and the HI-201HS-5 operates from 0°C to +75°C.

NOTES:

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
2. V_{OUT} = ±10V, I_{OUT} = 1mA
3. R_L = 1kΩ, C_L = 35pF, V_{IN} = +10V, V_A = +5V
4. V_A = 5V, R_L = 1KΩ, C_L = 10pF, V_S = 3 VRMS, f = 100kHz
5. V_A = 5V, R_L = 1kΩ, f = 100kHz, V_{IN} = $2V_{p-p}$
6. C_L = 1000pF, V_{IN} = 0V, R_{IN} = 0Ω; $\Delta Q = C_L \times \Delta V_O$
7. V_A = 5V or V_A = 0 for all switches.

HARRIS

HI-300 thru HI-307

CMOS Analog Switches

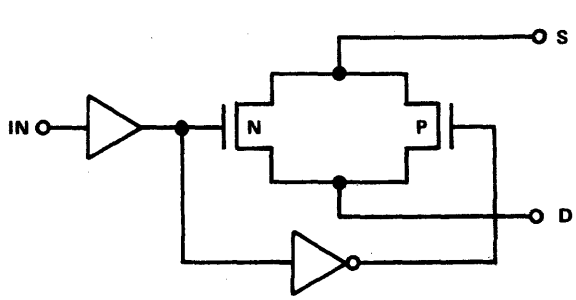
FEATURES

- ANALOG SIGNAL RANGE (±15V SUPPLIES) ±15V
- LOW LEAKAGE (TYP. @ 25°C) 40pA
- LOW LEAKAGE (TYP. @ 125°C) 1nA
- LOW ON RESISTANCE (TYP. @ 25°C) 35Ω
- BREAK-BEFORE-MAKE DELAY (TYP.) 60ns
- CHARGE INJECTION 30pC
- TTL, CMOS COMPATIBLE
- SYMETRICAL SWITCH ELEMENTS
- LOW OPERATING POWER 1.0mW
  (TYP. FOR HI-300 - 303)

APPLICATIONS

- SAMPLE AND HOLD i.e. LOW LEAKAGE SWITCHING
- OP AMP GAIN SWITCHING i.e. LOW ON RESISTANCE
- PORTABLE, BATTERY OPERATED CIRCUITS
- LOW LEVEL SWITCHING CIRCUITS
- DUAL OR SINGLE SUPPLY SYSTEMS

FUNCTIONAL DIAGRAM



TYPICAL SWITCH 300 SERIES

DESCRIPTION

The HI-300 through HI-307 series of switches are monolithic devices fabricated using CMOS technology and the Harris dielectric isolation process. These switches feature break-before-make switching, (HI-301, 303, 305 & 307 only), low and nearly constant ON resistance over the full analog signal range, and low power dissipation, (a few milliwatts for the HI-300-303, a few hundred microwatts for the HI-304-307).

The HI-300-303 are TTL compatible and have a logic "0" condition with an input less than 0.8V and a logic "1" condition with an input greater than 4.0V. The HI-304-307 switches are CMOS compatible and have a low state with an input less than 3.5V and a high state with an input greater than 11V. (See pinouts for switch conditions with a logic "1" input.)

All the devices are available in a 14 pin epoxy or ceramic DIP. The HI-300, 301, 304 and 305 are also available in a 10 pin metal can. Each of the switch types are available in either the -55°C to +125°C or 0°C to +75°C operating ranges.

ELECTRICAL CHARACTERISTICS NOTES:

1. As with all semiconductors, stresses listed under "Absolute Maximum Ratings" may be applied to devices (one at a time) without resulting in permanent damage. This is a stress rating only. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. The conditions listed under "Electrical Characteristics" are the only conditions recommended for satisfactory operation.
2. $V_S = \pm 10V$, $I_{OUT} = -10mA$ On resistance derived from the voltage measured across the switch under the above conditions.
3. $V_S = \pm 14V, V_D = \mp 14V$.
4. $V_S = V_D = \pm 14V$.
5. The digital inputs are diode protected MOS gates and typical leakages of 1nA or less can be expected.
6. $V_S = 1V_{RMS}$, f = 500kHz, C_L = 15pF, R_L = 1k. $C_L = C_{FIXTURE} + C_{PROBE}$, "Off Isolation" = 20logVS/VD.
7. V_S = 0V, C_L = 10,000pF, Logic Drive = 5V pulse. (HI-300 -303) Switches are symmetrical; S and D may be interchanged. Logic Drive = 15V (HI-304-307)
8. V_{IN} = 4V (one input) (all other inputs = 0V)
9. V_{IN} = 0.8V (all inputs).
10. V_{IN} = 15V (all inputs).
11. V_{IN} = 0V (all inputs).
12. To drive from DTL/TTL circuits, pull-up resistors to +5V supply are recommended.

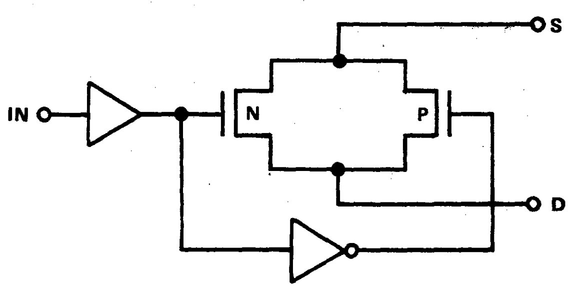
FUNCTIONAL DIAGRAM



TYPICAL SWITCH - 300 SERIES

DESCRIPTION

The HI-381 through HI-390 series of switches are monolithic devices fabricated using CMOS technology and the Harris dielectric isolation process. These devices are TTL compatible and are available in four switching configurations. (See device pinout for particular switching function with a logic "1" input.)

These switches feature low leakage and supply currents, low and nearly constant ON resistance over the analog signal range, break-before-make switching and low power dissipation.

The HI-381 and HI-387 switches are available in a 14 pin epoxy or ceramic DIP or10 pin metal can. The HI-384 and HI-390 are available in a 16 pin epoxy or ceramic DIP. Each of the individual switch types are available in the -55°C to +125°C and 0°C to +75°C operating ranges.

ELECTRICAL CHARACTERISTICS NOTES :

1. As with all semiconductors, stresses listed under "Absolute Maximum Ratings" may be applied to devices (one at a time) without resulting in permanent damage. This is a stress rating only. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. The conditions listed under "Electrical Characteristics" are the only conditions recommended for satisfactory operation.
2. $V_S = \pm 10V$, $I_{OUT} = -10mA$ on resistance derived from the voltage measured across the switch under the above conditions.
3. $V_S = \pm 14V$, $V_D = \mp 14V$.
4. $V_S = V_D = \pm 14V$.
5. The digital inputs are diode protected MOS gates and typical leakages of 1nA or less can be expected.
6. $V_S = 1V_{RMS}$, f = 500kHz, C_L = 15pF, R_L = 1k, $C_L = C_{FIXTURE} + C_{PROBE}$, "off isolation" = $20\log V_S/V_D$.
7. V_S = 0V, C_L = 10,000pF, Logic Drive = 5V pulse. Switches are symmetrical; S and D may be interchanged.
8. V_{IN} = 4V. (one input) (all other inputs = 0)
9. V_{IN} = 0.8V. (all inputs)
10. To drive from DTL/TTL circuits, pull-up resistors to +5V Supply are recommended.

TEST CIRCUITS

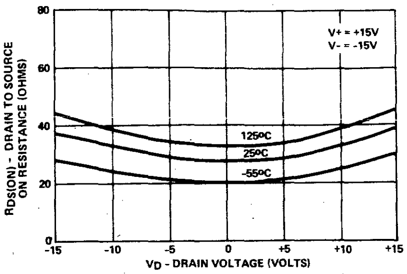
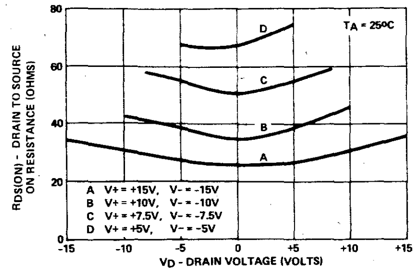
TYPICAL PERFORMANCE CURVES

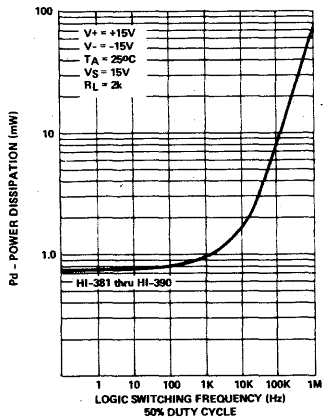
$R_{DS(ON)}$ VS. V_D AND TEMPERATURE



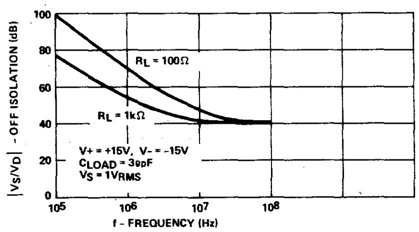
$R_{DS(ON)}$ VS. V_D AND POWER SUPPLY VOLTAGE



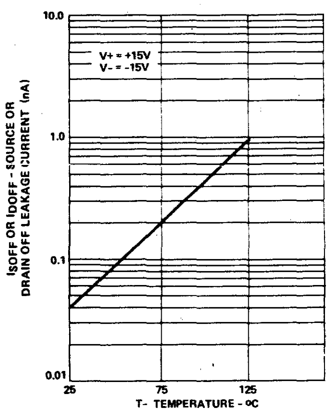
DEVICE POWER DISSIPATION VS. SWITCHING FREQUENCY SINGLE LOGIC INPUT



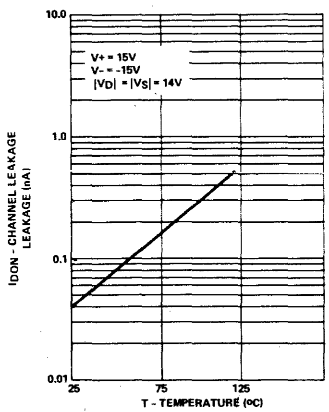
OFF ISOLATION VS. FREQUENCY



I_{SOFF} OR I_{DOFF} VS. TEMPERATURE*

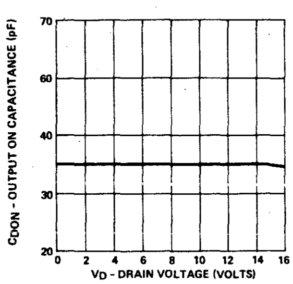


I_{DON} VS. TEMPERATURE*

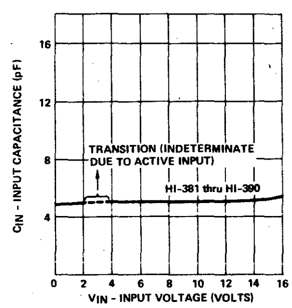


* The net leakage into the source or drain is the n-channel leakage minus the p-channel leakage. This difference can be positive, negative, or zero depending on the analog voltage and temperature, and will vary greatly from unit to unit.

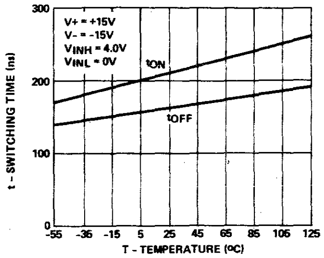
OUTPUT ON CAPACITANCE VS. DRAIN VOLTAGE



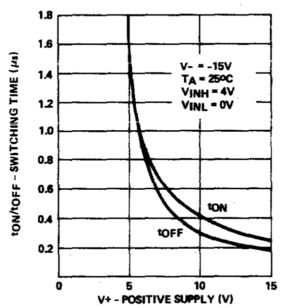
DIGITAL INPUT CAPACITANCE VS. INPUT VOLTAGE



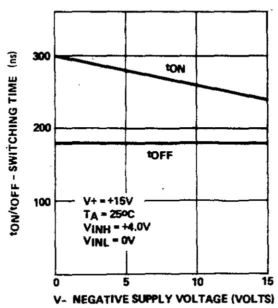
SWITCHING TIME VS. TEMPERATURE
HI-381 thru HI-390



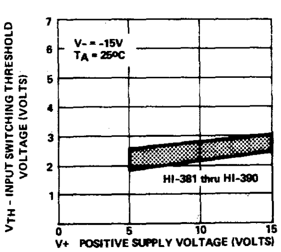
SWITCHING TIME VS. POSITIVE SUPPLY VOLTAGE
HI-381 thru HI-390



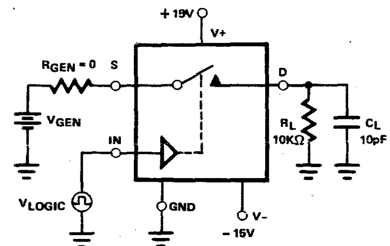
SWITCHING TIME VS. NEGATIVE SUPPLY VOLTAGE
HI-381 thru HI-390



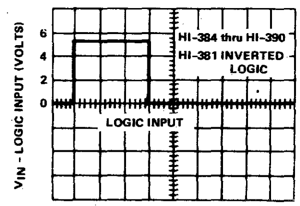
INPUT SWITCHING THRESHOLD VS. POSITIVE SUPPLY VOLTAGE
HI-381 thru HI-390

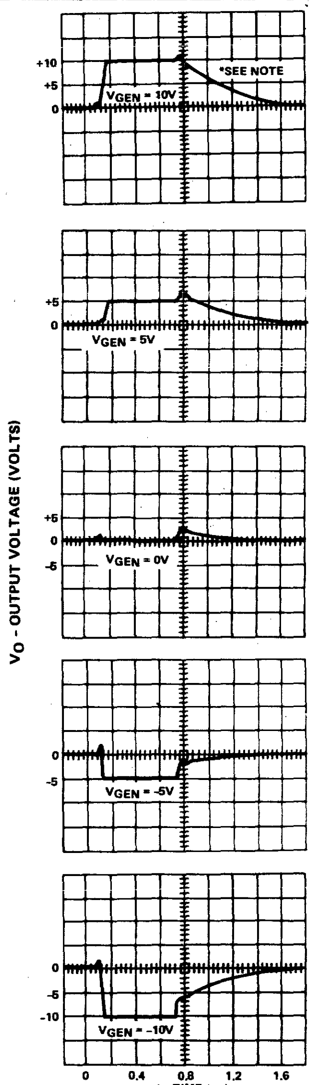


Typical delay, rise, fall, settling times, and switching transients in this circuit.



If R_{GEN}, R_L or C_L is increased, there will be proportional increases in rise and/or fall RC times.





* NOTE: The turn-off time is primarily limited here by the RC time constant (100ns) of the load.

HARRIS

HI-5040 thru HI-5051 HI-5046A and HI-5047A

CMOS Analog Switches

FEATURES

- WIDE ANALOG SIGNAL RANGE ±15V
- LOW "ON" RESISTANCE (TYP) 25Ω
- HIGH CURRENT CAPABILITY (TYP) 80mA
- BREAK-BEFORE-MAKE SWITCHING
  - TURN-ON TIME (TYP) 370ns
  - TURN-OFF TIME (TYP) 280ns
- NO LATCH-UP
- INPUT MOS GATES ARE PROTECTED FROM ELECTROSTATIC DISCHARGE
- DTL, TTL, CMOS, PMOS COMPATIBLE

APPLICATIONS

- HIGH FREQUENCY SWITCHING
- SAMPLE AND HOLD
- DIGITAL FILTERS
- OP AMP GAIN SWITCHING

DESCRIPTION

This family of CMOS analog switches offers low-resistance switching performance for analog voltages up to the supply rails and for signal currents up to 80mA. "ON" resistance is low and stays reasonably constant over the full range of operating signal voltage and current. R_{ON} remains exceptionally constant for input voltages between +5V and -5V and currents up to 50mA. Switch impedance also changes very little over temperature, particularly between 0°C and +75°C. R_{ON} is nominally 25 ohms for HI-5048 through HI-5051 and HI-5046A/5047A and 50Ω for HI-5040 through HI-5047.

All devices provide break-before-make switching and are TTL and CMOS compatible for maximum application versatility. Performance is further enhanced by Dielectric Isolation processing which insures latch-free operation with very low input and output leakage currents (0.8nA at 25°C). This family of switches also features very low power operation (1.5mW at 25°C).

There are 14 devices in this switch series which are differentiated by type of switch action and value of R_{ON} (see Functional diagram). All devices are available in 16 pin D.I.P. packages. The HI-5040/5050 switches can directly replace IH-5040 series devices and are functionally compatible with the DG 180/190 family. Each switch type is available in the -55°C to +125°C and 0°C to +75°C performance grades.

HI-506/HI-507

Single 16/Differential 8 Channel CMOS Analog Multiplexers

FEATURES

- LOW ON RESISTANCE (TYP.) 170Ω
- WIDE ANALOG SIGNAL RANGE ±15V
- DIRECTLY TTL/CMOS COMPATIBLE 2.4V (LOGIC "1")
- ACCESS TIME (TYP.) 300ns
- HIGH CURRENT CAPABILITY (TYP.) 50mA
- BREAK-BEFORE-MAKE SWITCHING
- NO LATCH-UP

APPLICATIONS

- DATA ACQUISITION SYSTEMS
- PRECISION INSTRUMENTATION
- DEMULTIPLEXING
- SELECTOR SWITCH

DESCRIPTION

These monolithic CMOS multiplexers each include an array of eight analog switches, a digital decode circuit for channel selection, a voltage reference for logic thresholds, and an ENABLE input for device selection when several multiplexers are present.

The Dielectric Isolation (DI) process used in fabrication of these devices eliminates the problem of latchup. Also, DI offers much lower substrate leakage and parasitic capacitance than conventional junction-isolated CMOS (See Application Note 521). With the low ON resistance (180Ω typical), this allows low static error, fast channel switching rates, and fast settling.

Switches are guaranteed to break-before-make, so two channels are never shorted together.

The switching threshold for each digital input is established by an internal +5V reference, providing a guaranteed minimum 2.4V for "1" and maximum 0.8V for "0". This allows direct interface without pullup resistors to signals from most logic families: CMOS, TTL, DTL and some PMOS. For protection against transient overvoltage, the digital inputs include a series 200Ω resistor and a diode clamp to each supply.

The HI-506 is a sixteen channel single-ended multiplexer, and the HI-507 is an eight channel differential version. Each device is packaged in a 28 pin DIP. The recommended supply voltage is ±15V, and reasonable performance is available down to ±7V; however, a power-up reset routine may be required for operation below ±10V. For more information, request Harris Analog Tech Brief # 20.

The HI-506/507 are specified for operation from 0°C to +70°C. The "-2" versions are specified from -55°C to +125°C. "Dash 8" (-8) designates -2 parts which have been screened per Mil-Std-883/Method 5004/Class B.

HI-506A/HI-507A

16 Channel CMOS Analog Multiplexer with Overvoltage Protection

FEATURES

- ANALOG/DIGITAL OVERVOLTAGE PROTECTION
- FAIL SAFE WITH POWER LOSS (NO LATCHUP)
- BREAK-BEFORE-MAKE SWITCHING
- DTL/TTL AND CMOS COMPATIBLE
- ANALOG SIGNAL RANGE ±15V
- ACCESS TIME (TYP.) 500ns
- SUPPLY CURRENT AT 1MHz ADDRESS TOGGLE (TYP.) 4mA
- STANDBY POWER (TYP.) 7.5mW

APPLICATIONS

- DATA ACQUISITION
- INDUSTRIAL CONTROLS
- TELEMETRY

DESCRIPTION

The HI-506A and HI-507A are dielectrically isolated CMOS analog multiplexers incorporating an important feature; they withstand analog input voltages much greater than the supplies. This is essential in any system where the analog inputs originate outside the equipment. They can withstand a continuous input up to 10 volts greater than either supply, which eliminates the possibility of damage when supplies are off, but input signals are present. Equally important they can withstand brief input transient spikes of several hundred volts; which otherwise would require complex external protection networks. Necessarily, ON resistance is somewhat higher than similar unprotected devices, but very low leakage currents combine to produce low errors. Application Notes 520 and 521 further explain these features.

The HI-506A-2 and HI-507A-2 are specified over -55°C to +125°C while the -5 versions are specified over 0°C to +75°C.

HARRIS

HI-506L/HI-507L

Single 16/Differential 8 Channel CMOS Analog Multiplexers With Latches And Overvoltage Protection

FEATURES

- Analog Overvoltage protection
- Resettable Latches ($\overline{RS}$)
- TTL/DTL and CMOS Compatible
- Failsafe for conditions of Overvoltage & Loss of Power
- No SCR Latch-up
- Break-before-make switching
- Microprocessor Bus compatible
- Very low leakage - $I_{D(off)} \leq$ 8nA (typ) over full temp range
- Access time - t_A = 500nS (typ)
- Minimum write pulse width ($\overline{WR}$) = 300 nS
- OFF isolation = −100dB, typ @ 10kHz

DESCRIPTION

These monolithic CMOS multiplexers feature on-board address latches, plus overvoltage protection for the analog inputs and the output as well. Each mode accomodates digital inputs for channel selection and an Enable input for device selection under program control. In addition, Write ($\overline{WR}$) and Reset ($\overline{RS}$) inputs allow the program to store or clear the channel address.

The overvoltage performance of these multiplexers is particularly useful in redundant systems, where the inputs and output should present a very high impedance when power is off. This is achieved by a switch cell with three MOSFET's in series, rather than the conventional single transmission gate design.

Each channel can withstand a DC overvoltage up to a magnitude of 10VDC greater than the power supply (or to ± 25VDC with power off). An OFF channel remains OFF for this condition. If the channel is ON, the output voltage is clamped below the supply rail, which protects the load circuit.

The HI-506L offers 16 single-ended channels, and the HI-507L is an 8 channel differential version. The recommended supply voltages are ± 15V, through operation at reduced levels or with a single supply may also be implemented. The package is a 28 pin ceramic or plastic DIP.

Each product is specified for the commercial temperature range (0°C to +75°C, −5 suffix) and the military range (−55°C to +125°C, −2 suffix). Military parts screened per MIL-STD-883 method 5004, Class B are offered with a "−8" suffix.

DESCRIPTION AND APPLICATION

The switch cell of the HI-506L/507L has a different structure than earlier Harris designs (HI-506, HI506A). The new switch (Figure 2) consists of an N-channel, P-channel and N-channel MOSFET in series, as opposed to the transmission gate configuration with an N and P-channel device in parallel. The series N-P-N switch offers higher Off Isolation with power off, and better fault performance. Channel overvoltage protection is inherent since one of the three MOSFETs turn off in the presence of overvoltage. this turn-off process begins well below the supply rail so the V_{IN} range is less than the power supply range. Electrical performance is guaranteed to ±10V for each channel, and the usable range extends above ±11 Volts.

The address inputs A_0, A_1, A_2, A_3, and ENABLE are latched into an internal buffer when $\overline{WR}$ goes high. Each latch output is level shifted into the decode section, which activates the appropriate channel. The device may be reset (all channels OFF) by taking $\overline{RS}$ low. Usually, $\overline{RS}$ is tied to the system RESET line, to assure that all channels are OFF following a turn-on of power. The reset function overrides all others, just as $\overline{WR}$ overrides the address inputs (A_0-A_3 and EN are ignored when $\overline{WR}$ is high). With $\overline{WR}$ low and $\overline{RS}$ high, the switches respond immediately to a change in channel address; i.e. the latches are "transparent". Refer to Figure 1.

HARRIS

HI-508/HI-509

Single 8/Differential 4 Channel CMOS Analog Multiplexer

FEATURES

- FAST ACCESS 220ns
- FAST SETTLING (0.01%) 600ns
- LOW R_{ON} 180 Ω
- BREAK-BEFORE-MAKE SWITCHING
- NO LATCH-UP
- TTL/CMOS COMPATIBLE 2.4V (LOGIC "1")

APPLICATIONS

- PRECISION INSTRUMENTS
- DATA ACQUISITION SYSTEMS
- TELEMETRY

DESCRIPTION

These monolithic CMOS multiplexers each include an array of eight analog switches, a digital decode circuit for channel selection, a voltage reference for logic thresholds, and an ENABLE input for device selection when several multiplexers are present.

The Dielectric Isolation (DI) process used in fabrication of these devices eliminates the problem of latch-up. Also, DI offers much lower substrate leakage and parasitic capacitance than conventional junction-isolated CMOS (see Application Note 521). Combined with the low ON resistance (180Ω typical), these benefits allow low static error, fast channel switching rates, and fast settling.

Switches are guaranteed to break-before-make, so two channels are never shorted together.

The switching threshold for each digital input is established by an internal +5V reference, providing a guaranteed min. 2.4V for "1" and max. 0.8V for "0". This allows direct interface without pull-up resistors to signals from most logic families: CMOS, TTL, DTL, and some PMOS. For protection against transient overvoltage, the digital inputs include a series 200Ω resistor and a diode clamp to each supply.

The HI-508 is an eight channel single-ended multiplexer, and the HI-509 is a four channel differential version. The recommended supply voltage is ±15V; however, reasonable performance is available down to ±7V. Each device is packaged in a 16 pin DIP.

The HI-508/509-5 are specified for operation from 0°C to 70°C. The "-2" versions are specified from -55°C to +125°C. "Dash 8" (-8) designates -2 parts which have been screened per MIL-STD-883/Method 5004/Class B.

I-, Negative Supply Current (Note 5)	Full			1			1	mA
P_D, Power Dissipation	Full			45			45	mW

NOTES:
1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operation under any of these conditions is not necessarily implied.
2. Ten nanoamps is the practical limit for high speed measurement in the production test environment. Actually, I_S (off) is below 100pA for most devices, at 25°C.
3. Digital input leakage is primarily due to the clamp diodes (see Schematic). Typical leakage is less than 1nA at 25°C.
4. V_{EN} = 0.8V, R_1 = 1K, C_1 = 15pF, V_S = 7V_{RMS}, f = 500kHz. Worst case isolation occurs on channel 4 (HI-508) and channels 4, 8 (HI-509), due to proximity of the output pins.
5. V_{EN} = 0V or 5V. All V_A = 0.
6. If an overvoltage condition is anticipated (analog input exceeds either power supply voltage), the HARRIS HI-508A/509A multiplexers are recommended.

HI-508A/509A

8 Channel CMOS Analog Multiplexers with Overvoltage Protection

FEATURES

- ANALOG/DIGITAL OVERVOLTAGE PROTECTION
- FAIL SAFE WITH POWER LOSS (NO LATCHUP)
- BREAK-BEFORE-MAKE SWITCHING
- DTL/TTL AND CMOS COMPATIBLE
- ANALOG SIGNAL RANGE ±15V
- ACCESS TIME (TYP.) 500ns
- SUPPLY CURRENT AT 1MHz ADDRESS TOGGLE (TYP.) 4mA
- STANDBY POWER (TYP.) 7.5mW

APPLICATIONS

- DATA ACQUISITION
- INDUSTRIAL CONTROLS
- TELEMETRY

DESCRIPTION

The HI-508A and HI-509A are dielectrically isolated CMOS analog multiplexers incorporating an important feature; they withstand analog input voltages much greater than the supplies. This is essential in any system where the analog inputs originate outside the equipment. They can withstand a continuous input up to 10 volts greater than either supply, which eliminates the possibility of damage when supplies are off, but input signals are present. Equally important, they can withstand brief input transient spikes of several hundred volts; which otherwise would require complex external protection networks. Necesarily, ON resistance is somewhat higher than similar unprotected devices, but very low leakage currents combine to produce low errors. Application Notes 520 and 521 further explain these features.

The HI-508A-2 and HI-509A-2 are specified over -55°C to +125°C while the -5 versions are specified over 0°C to +75°C.

HI-508L/HI-509L

Single 8/Differential 4 Channel CMOS Analog Multiplexers With Latches And Overvoltage Protection

FEATURES

- Analog Overvoltage protection
- Resettable Latches ($\overline{RS}$)
- TTL/DTL and CMOS Compatible
- Failsafe for conditions of Overvoltage & Loss of Power
- No SCR Latch-up
- Break-before-make switching
- Microprocessor Bus compatible
- Very low leakage - $I_{D(off)} \leq$ 8nA (typ) over full temp range
- Access time - t_A = 500nS (typ)
- Minimum write pulse width ($\overline{WR}$) = 300 nS
- OFF isolation = −100dB, typ @ 10kHz

DESCRIPTION

These monolithic CMOS multiplexers feature on-board address latches, plus over-voltage protection for the analog inputs and the output as well. Each mode accomodates digital inputs for channel selection and an Enable input for device selection under program control. In addition, Write ($\overline{WR}$) and Reset ($\overline{RS}$) inputs allow the program to store or clear the channel address.

The overvoltage performance of these multiplexers is particularly useful in redundant systems, where the inputs and output should present a very high impedance when power is off. This is achieved by a switch cell with three MOSFET's in series, rather thant he conventional single transmission gate design.

Each channel can withstand a DC overvoltage up to a magnitude of 10VDC greater than the power supply (or to ± 25VDC with power off). An OFF channel remains OFF for this condition. If the channel is ON, the output voltage is clamped below the supply rail, which protects the load circuit.

The HI-508L offers 8 single-ended channels, and the HI-509L is a 4 channel differential version. The recommended supply voltages are ± 15V, through operation at reduced levels or with a single supply may also be implemented. The package is an 18 pin ceramic or epoxy DIP.

Each product is specified for the commercial temperature range (0°C to +75°C, −5 suffix) and the military range (−55°C to +125°C, −2 suffix). Military parts screened per MIL-STD-883 method 5004, Class B are offered with a "−8" suffix.

DESCRIPTION AND APPLICATION

The switch cell of the HI-508L/509L has a different structure than earlier Harris designs (HI-508, HI508A). The new switch (Figure 3) consists of an N-channel, P-channel and N-channel MOSFET in series, as opposed to the transmission gate configuration with an N and P-channel device in parallel. The series N-P-N switch offers higher Off Isolation with power off, and better fault performance. Channel overvoltage protection is inherent since one of the three MOSFETs turn off in the presence of overvoltage. this turn-off process begins well below the supply rail so the V_{IN} range is less than the power supply range. Electrical performance is guaranteed to ±10V for each channel, and the usable range extends above ±11 Volts.

The address inputs A_0, A_1, A_2, and ENABLE are latched into an internal buffer when $\overline{WR}$ goes high. Each latch output is level shifted into the decode section, which activates the appropriate channel. The device may be reset (all channels OFF) by taking $\overline{RS}$ low. Usually, $\overline{RS}$ is tied to the system RESET line, to assure that all channels are OFF following a turn-on of power. The reset function overrides all others, just as $\overline{WR}$ overrides the address inputs (A_0-A_2 and EN are ignored when $\overline{WR}$ is high). With $\overline{WR}$ low and $\overline{RS}$ high, the switches respond immediately to a change in channel address; i.e., the latches are "transparent". Refer to Figure 1.

HARRIS

HI-1818A/1828A

Low Resistance 8 Channel CMOS Analog Multiplexers

FEATURES

• SIGNAL RANGE	±15V
• "ON" RESISTANCE (TYP.)	250Ω
• INPUT LEAKAGE AT +125°C (TYP.)	20nA
• ACCESS TIME (TYP.)	350ns
• POWER CONSUMPTION (TYP.)	5mW
• DTL/TTL COMPATIBLE ADDRESS	
• -55°C to +125°C OPERATION	

APPLICATIONS

- DATA ACQUISITION SYSTEMS
- PRECISION INSTRUMENTATION
- DEMULTIPLEXING
- SELECTOR SWITCH

DESCRIPTION

The HI-1818A/1828A are monolithic high performance CMOS analog multiplexers offering built-in channel selection decoding plus an inhibit (enable) input for disabling all channels. Dielectric Isolation (DI) processing is used for enhanced reliability and performance (see Application Note 521). Substrate leakage and parasitic capacitance are much lower, resulting in extremely low static errors and high throughput rates. Low output leakage (typically 0.1nA) and low channel ON resistance (250 Ω) assure optimum performance in low level or current mode applications.

The 1818A is a single-ended 8 channel multiplexer, while the HI-1828A is a differential 4 channel version. Either device is ideally suited for medical instrumentation, telemetry systems, and microprocessor based data acquisition systems.

The HI-1818A-2 and HI-1828A are specified over -55°C to +125°C, while the -5 versions are specified over 0°C to +75°C.

HI-516

16 Channel/Differential 8 Channel CMOS High Speed Analog Multiplexer

FEATURES

- ACCESS TIME (TYP) 100ns
- SETTLING TIME (TYP TO 0.01%) 800ns
- LOW LEAKAGE I_S OFF 10pA; I_D OFF 35pA
- LOW CAPACITANCE C_S OFF 2.5pF; C_D OFF 18pF
- HIGH OFF ISOLATION AT 1MHz 80dB
- LOW CHARGE INJECTION 0.3pC
- SINGLE ENDED TO DIFFERENTIAL SELECTABLE (SDS)
- LOGIC LEVEL SELECTABLE (LLS)

APPLICATIONS

- DATA ACQUISITION SYSTEMS
- PRECISION INSTRUMENTATION
- INDUSTRIAL CONTROL

DESCRIPTION

The HI-516 is a monolithic dielectrically isolated, high speed, high performance CMOS analog multiplexer. It offers unique built-in channel selection decoding plus an inhibit input for disabling all channels. The dual function of address input A_3 enables the HI-516 to be user programmed either as a single ended 16-channel multiplexer, by connecting 'out A' to 'out B' and using A_3 as a digital address input, or as an 8-channel differential multiplexer by connecting A_3 to the V^- supply. The substrate leakages and parasitic capacitances are reduced substantially using the Harris dielectric isolation process to achieve optimum performances in both high and low level signal applications. The low output leakage current (I_D Off $< 100pA$ @ 25°C) and fast settling (t_{SETTLE} = 800ns to 0.01%) characteristics of the device make it an ideal choice for high speed data acquisition systems, precision instrumentation, and industrial process controls.

The HI-516 is available in a 28 lead dual-in-line package. HI-516-5 is specified for operation over 0°C to +75°C, and the HI-516-2 over -55°C to +125°C. Processing to MIL-STD-883A, Class B screening is available by selecting the HI-516-8.

HARRIS

HI-518

8 Channel/Differential 4 Channel CMOS High Speed Analog Multiplexer

FEATURES

- ACCESS TIME (TYP) 80ns
- SETTLING TIME (0.1%) 250ns
- LOW LEAKAGE I_S (OFF) 50pA
  I_D (OFF) 100pA
- LOW CAPACITANCE (TYP) C_S (OFF) 2pF
  C_D (OFF) 10pF
- HIGH OFF ISOLATION @ (1MHz) 75dB
- SINGLE ENDED TO DIFFERENTIAL MODE SELECTABLE (SDS)
- LOGIC LEVEL SELECTABLE (LLS)
- LOW CHARGE INJECTION 0.3pC

APPLICATIONS

- DATA ACQUISITION SYSTEMS
- INDUSTRIAL CONTROLS
- TELEMETRY

DESCRIPTION

The HI-518 is a monolithic, high performance, high speed Analog Multiplexer, constructed utilizing the Harris Dielectrically isolated CMOS process.

This device has the added feature that it can be user programmed either as a single ended 8-channel multiplexer by connecting 'out A' to 'out B' and using A2 as a digital address input, or as a 4-channel differential multiplexer by connecting A2 to the V^- supply.

TTL or CMOS compatibility is also selectable. Low leakage current, I_D off < 100pA @ 25°C, and fast settling, 250ns to 0.1%, characteristics of this device make it an ideal choice for high speed data acquisition systems, precision instrumentation and industrial process controls.

The HI-518 is available in an 18 lead Dual-in-Line Package. The HI-518-5 is specified for operation over 0°C to +75°C, and the HI-518-2 over -55°C to +125°C. Processing to MIL-STD-883A Class B screening is available by selecting the HI-518-8.

HARRIS

HI-524

4 Channel Video Multiplexer

FEATURES

- CROSSTALK (10MHz) > 60dB
- FAST ACCESS TIME 150ns
- FAST SETTLING TIME (0.01%) 600ns
- TTL COMPATIBLE

APPLICATIONS

WIDEBAND SWITCHING

- RADAR
- TV VIDEO
- ECM

DESCRIPTION

The HI-524 is a four channel CMOS analog multiplexer designed to process single-ended video signals with bandwidths up to 10MHz. The chip includes a 1 of 4 decoder for channel selection and an Enable input to inhibit all channels (chip select).

Three CMOS transmission gates are used in each channel, as compared to the single gate in more conventional CMOS multiplexers. This provides a double barrier to the unwanted coupling of signals from each input to the output. In addition, Dielectric Isolation (DI) processing helps to insure that Crosstalk exceeds 60dB at 10MHz.

The HI-524 is designed to operate into a wideband buffer amplifier such as the HARRIS HA-5190. The multiplexer chip includes two "on" switches in series, for use as a feedback element with the amplifier. This feedback resistance matches and tracks the channel R_{ON} resistance, to minimize the amplifier V_{OS} and its variation with temperature.

The HI-524 is well suited to the rapid switching of video signals in telemetry, instrumentation, radar and video systems. It is packaged in an 18 pin ceramic DIP and operates on ±15V supplies.

The performance levels available are: HI1-524-2, -55°C to +125°C operating range; HI1-524-5, 0°C to +75°C operating range and HI1-524-8, -55°C to +125°C operating range plus 100% screening per MIL-STD-883/Method 5004/Class B. Chips for hybrid applications are designated HI0-524-6.

HI-539

Monolithic, Four Channel, Low Level, Differential Multiplexer

FEATURES

- DIFFERENTIAL PERFORMANCE, TYP.:
  - LOW ΔR_{ON}, +125°C — 5.5Ω
  - LOW $\Delta I_{D(ON)}$, +125°C — 0.6nA
  - LOW Δ(CHARGE INJECTION) — 0.1pC
  - LOW CROSSTALK — -120dB
- SETTLING TIME, ±0.01% — 900ns
- WIDE SUPPLY RANGE — ±5V TO ±18V
- BREAK-BEFORE-MAKE SWITCHING
- NO LATCH-UP

APPLICATIONS

- LOW LEVEL DATA ACQUISITION
- PRECISION INSTRUMENTATION
- TEST SYSTEMS

DESCRIPTION

The Harris HI-539 is a monolithic, four channel, differential multiplexer. Two digital inputs are provided for channel selection, plus an Enable input to disconnect all channels.

Performance is guaranteed for each channel over the range ± 10V, but is optimized for low level differential signals. Leakage current, for example, which varies slightly with input voltage, has its distribution centered at zero for zero input volts.

In most monolithic multiplexers, the net differential offset due to thermal effects becomes significant for low level signals. This problem is minimized in the HI-539 by symmetrical placement of critical circuitry with respect to the few heat producing devices.

The HI-539 will be offered in both commercial and military temperature ranges, with screening available for MIL-STD-883, Class B. Supply voltages are ± 15V and power consumption is only 2.5mW. The package is a 16 pin ceramic DIP.

NOTES

1. See Test Circuits #2, 3, 4. The condition ±10V means:

   $I_{S(OFF)}$ and $I_{D(OFF)}$: (V_S = +10V, V_D = -10V), then (V_S = -10V, V_D = +10V)

   $I_{D(ON)}$: (+10V, then -10V)

2. ΔV_{OS} (Exclusive of thermocouple effects) = $R_{ON}\,\Delta I_{D(ON)} + I_{D(ON)}\,\Delta R_{ON}$.

   See Applications section for discussion of additional V_{OS} error.

3. V_{IN} = 1kHz, 15V_{p-p} on all but the selected channel. See Test Circuit #9.

4. Calculated from typical Single-Ended Crosstalk performance.

HARRIS

HI-562A

12 Bit High Speed Monolithic Digital-to-Analog Converter

FEATURES

- OUTPUT CURRENT 2mA, F.S.
- MONOLITHIC CONSTRUCTION
- EXTREMELY FAST SETTLING 300ns TO 0.01% (TYP.)
- LOW GAIN DRIFT ±10ppm/°C (MAX.)
- EXCELLENT LINEARITY ±1/2 LSB (MAX.)
- DESIGNED FOR MINIMUM GLITCHES
- MONOTONIC OVER TEMPERATURE
- NOTE: HI-562A IS RECOMMENDED FOR NEW DESIGNS

APPLICATIONS

- CRT DISPLAY GENERATION
- HIGH SPEED A/D CONVERTERS
- VIDEO SIGNAL RECONSTRUCTION
- WAVEFORM SYNTHESIZERS
- HIGH SPEED DATA ACQUISITION
- HIGH-REL APPLICATIONS
- PRECISION INSTRUMENTS

DESCRIPTION

The Harris HI-562A is the first monolithic digital-to-analog converter to combine both ultra-high speed performance and 12-bit accuracy on the same chip. The HI-562A's fast output current settling of 300ns to 0.01% is achieved using dielectric isolation processing to reduce internal parasitics for fast rise and fall times during switching. Output glitches are minimized in the HI-562A by incorporating equally weighted current sources switched into an R-2R ladder network for symmetrical turn-ON and turn-OFF switching times. This creates within the chip a very uniform constant thermal distribution for excellent linearity and also completely eliminates thermal transients during switching. High stability thin film resistor processing together with laser trimming provide the HI-562A with guaranteed true 12-bit linearity to within ±1/2 LSB maximum at +25°C for -4 and -5 parts, and to within ±1/4 LSB maximum at +25°C for -2 and -8 parts. The HI-562A is recommended as a replacement for higher cost hybrid and modular units for increased reliability and accuracy in applications such as CRT displays, precision instruments and data acquisition systems requiring throughput rates as a high as 3.3 MHz for full range transitions. Its small size makes it an ideal choice as the heart of high speed A/D converter designs or as a building block in high speed or high resolution industrial process control systems. The HI-562A is also ideally suited for aircraft and space instrumentation where operation over a wide temperature range is required.

The HI-562A-5 is specified for operation over 0°C to +75°C, the HI-562A-4 over -25°C to +85°C and the HI-562A-2 and HI-562A-8 over -55°C to +125°C. Processing MIL-STD-883A Class B screening is available by selecting the HI-562A-8. All are available in a hermetically sealed 24-lead dual-in-line package.

HARRIS

HI-565A

High Speed Monolithic Digital to Analog Converter with Reference

FEATURES

- DAC AND REFERENCE ON A SINGLE CHIP
- PIN COMPATIBLE WITH AD565A
- VERY HIGH SPEED: SETTLES TO 1/2 LSB IN 250ns, MAX. FULL SCALE SWITCHING TIME 30ns, TYP.
- GUARANTEED FOR OPERATION WITH ±12V SUPPLIES
- MONOTONICITY GUARANTEED OVER TEMPERATURE
- 1/2 LSB MAX NONLINEARITY GUARANTEED OVER TEMPERATURE
- LOW GAIN DRIFT (MAX, DAC PLUS REFERENCE) 25ppm/°C
- LOW POWER DISSIPATION 250mW

APPLICATIONS

- CRT DISPLAYS
- HIGH SPEED A/D CONVERTERS
- SIGNAL RECONSTRUCTION
- WAVEFORM SYNTHESIS

DESCRIPTION

The HI-565A is a fast, 12 bit current output, digital to analog converter. The monolithic chip includes a precision voltage reference, thin-film R-2R ladder, reference control amplifier and twelve high-speed bipolar current switches.

The Harris Semiconductor dielectric isolation process provides latch-free operation while minimizing stray capacitance and leakage currents, to produce an excellent combination of speed and accuracy. Also, ground currents are minimized to produce a low and constant current through the ground terminal, which reduces error due to code-dependent ground currents.

HI-565A dice are laser trimmed for a maximum integral nonlinearity error of ±1/4 LSB at +25°C. In addition, the low noise buried zener reference is trimmed both for absolute value and minimum temperature coefficient.

The HI-565A is offered in both commercial and military grades. For high-reliability requirements, additional 100% screening per Mil-Std. 883, Method 5004, Class B is available. See Ordering Information.

Package is a 24 pin side-brazed ceramic or plastic DIP. Power requirement is 250mW, typical with ±15V supplies.

HARRIS

HI-5610

10 Bit High Speed Monolithic Digital-to-Analog Converter

FEATURES

- MONOLITHIC CONSTRUCTION
- EXTREMELY FAST SETTLING . . . . 85ns TO ½LSB TYP.
- LOW GAIN DRIFT . . . . ±5ppm/°C TYP.
- EXCELLENT LINEARITY OVER TEMPERATURE . . . . ± ½LSB MAX.
- DESIGNED FOR MINIMUM GLITCHES
- MONOTONIC OVER TEMPERATURE

APPLICATIONS

- CRT DISPLAY GENERATION
- HIGH SPEED A/D CONVERTERS
- VIDEO SIGNAL RECONSTRUCTION
- WAVEFORM SYNTHESIZERS
- HIGH SPEED DATA ACQUISITION
- HIGH RELIABILITY APPLICATIONS
- PRECISION INSTRUMENTS

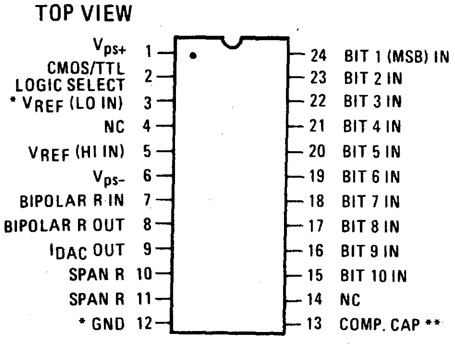
DESCRIPTION

The HI-5610 is an ultra-high speed 10 bit monolithic current output digital-to-analog converter. The fast output current settling of 85ns to ½LSB of its final value is achieved using dielectric isolation processing to reduce internal parasitics for fast rise and fall times during switching. Output glitches are minimized in the HI-5610 by incorporating equally weighted current sources switched into an R-2R ladder network for symmetrical turn-on and turn-off switching times. This creates within the chip a very uniform and constant thermal distribution for excellent linearity and also eliminates thermal transients during switching. High stability thin film resistor processing, together with laser trimming provide the HI-5610 with true 10 bit linearity to within ± ½LSB maximum over operating temperature range. The HI-5610's low offset and gain drift over the operating temperature range assures that its absolute accuracy when referred to a fixed 10V reference will not deviate more than ± 1LSB for both unipolar and bipolar operation.

The HI-5610 is recommended as a replacement for nigh cost hybrid and modular units for increased reliability and accuracy in applications such as CRT Displays, precision instruments and data acquisition system requiring through-put rates as high as 12MHz for full range transitions. Its small size makes it an ideal choice as the essential part of high speed A/D converter designs or as a building block in high speed or high resolution industrial process control systems. The HI-5610 is also ideally suited for aircraft and space instrumentation where operation over a wide temperature range is required.

The HI-5610-5 is specified for operation over 0°C to +75°C, the HI-5610-2 and HI-5610-8 over -55°C to +125°C. Processing to MIL-STD-883A class B screening is available by selecting the HI-5610-8. All are available in a hermetically sealed 24 lead dual-in-line package.

PINOUT



* Pin 3 connected to bottom case for high frequency shielding.

** For high speed operation, connect 0.01μF between Pin 13 and GND. Otherwise, leave Pin 13 open.

(10)	Full		30			30		mA

NOTES:

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operation under any of these conditions is not necessarily implied.
2. The HI-5610 accepts digital input codes in binary format and may be user connected for any one of three binary codes. Straight binary, offset binary, or two's complement binary. (See operating instructions).
3. For TTL and DTL compatibility connect +5V to pin 1 and ground pin 2. The $V_{ps}+$ tolerance is ±10% for HI-5610-2,-8. And ±5% for HI-5610-5.
4. For CMOS compatibility based on $V_{ps}+ \geq +8V$, (switching thresholds equal $V_{ps}+/2$), connect pins 1 and 2. For CMOS levels below +8V, connect pin 2 to ground only (this provides a threshold of approximately +1.4V).
5. See definitions.
6. Using an external op amp with internal span resistors and 24.9Ω ±1% external trim resistors in place of potentiometers R1 and R2. These errors are adjustable to zero using R1 and R2. (See operating instructions.)
7. Using an external op amp and internal span resistors. (See operating instructions for connections.)
8. Specified for digital input in all '1's or all '0's.
9. FSR is "Full Scale Range" and is 5V for ±2.5V range, 2.5V for ±1.25V range, etc., or 5mA (±20%) for current output.
10. After 30 seconds warm-up.

HARRIS

HI-5618A/5618B

8 Bit High Speed Digital-to-Analog Converters

INTERFACE

Harris Semiconductor

FEATURES

- VERY FAST SETTLING CURRENT OUTPUT 65ns
- MINIMUM NONLINEARITY ERROR
  - HI-5618A ±1/4 LSB MAX
  - HI-5618B ±1/2 LSB MAX
- LOW POWER OPERATION 340mW TYP
- ON-CHIP RESISTORS FOR GAIN AND BIPOLAR OFFSET
- GUARANTEED MONOTONIC OVER TEMPERATURE
- CMOS, TTL, OR DTL COMPATIBLE

APPLICATIONS

- HIGH SPEED PROCESS CONTROL
- CRT DISPLAY GENERATION
- HIGH SPEED A/D CONVERSION
- WAVEFORM SYNTHESIS
- HIGH RELIABILITY APPLICATIONS
- VIDEO SIGNAL RECONSTRUCTION

DESCRIPTION

The HI-5618A/B are very high speed 8 bit current output D/A converters. These monolithic devices are fabricated with dielectrically isolated bipolar processing, which reduces internal parasitic capacitance to allow fast rise and fall times. This achieves a typical full scale settling time of 65ns to ±1/2 LSB. Output glitches are minimized by incorporation of equally weighted current sources, switched to either an R-2R ladder network or ground for symmetrical turn ON and turn OFF times. High stability thin film resistors provide excellent accuracy without trimming. For example, the HI-5618A has ±1/4 LSB maximum nonlinearity error at +25°C, with ±3/8 LSB guaranteed over the full operating temperature range.

The HI-5618A/B are recommended for any application requiring high speed and accurate conversions. They can be used in CRT displays and systems requiring throughput rates as high as 20MHz for full scale transitions. Other applications include high speed process control, defense systems, avionics, and space instrumentation.

The HI-5618A-5 and HI-5618B-5 are specified for operation from 0°C to +75°C. The "-2" versions are specified from -55°C to +125°C. "Dash 8" (-8) designates parts which have been screened per MIL-STD-883, Method 5004/Class B.

Power requirements are +5V and -15V. Package is an 18 pin DIP, in plastic or ceramic.

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operation under any of these conditions is not necessarily implied.
2. The HI-5618 accepts digital input codes in binary format and may be user connected for any one of three binary codes. Straight binary, offset binary, or two's complement binary. (See operating instructions)
3. For TTL and DTL compatibility connect +5V to pin 1 and ground pin 2. The $V_{ps}+$ tolerance is ± 10% for HI-5618A/B -2, -8; and ± 5% for HI-5618A/B-5.
4. For CMOS compatibility based on $V_{ps}+ \geqslant +8V$, (switching thresholds equal $V_{ps}+/2$), connect pins 1 and 2. For CMOS levels below +8V, connect pin 2 to ground only (this provides a threshold of approximately +1.4V).
5. See definitions.
6. These errors may be adjusted to zero using external potentiometers R_1, R_2, R_3. R_1 and R_2 each provide more than ± 3 LSB's adjustment. (See Operating Instructions). The specifications listed under initial accuracy are based on use of an external op amp, internal span and offset resistors, and 100 Ω ± 1% resistors, in place of R_1 and R_2.
7. Using an external op amp with the internal span and offset resistors. See Operating Instructions.
8. Specified for all "1's" or all "0's" digital input.
9. FSR is "Full Scale Range", i.e., 20V for ± 10V range; 10V for ± 5V range, etc. Nominal full scale output current is 5mA.
10. After 30 seconds warm-up.
11. See Test Circuit, Figure 3.
12. See Test Circuit , Figure 4.

HARRIS

HI-5680

12 Bit Low Cost Monolithic Digital-to-Analog Converter

FEATURES

- DAC 80 ALTERNATE SOURCE
- MONOLITHIC CONSTRUCTION (SINGLE CHIP)
- FAST SETTLING
- GUARANTEED MONOTONIC 0°C to 75°C
- WAFER LASER TRIMMED
- APPLICATIONS RESISTORS ON-CHIP
- ON-BOARD REFERENCE
- DIELECTRIC ISOLATION (DI) PROCESSING
- ±12V POWER SUPPLY OPERATION

APPLICATIONS

- HIGH SPEED A/D CONVERTERS
- PRECISION INSTRUMENTATION
- CRT DISPLAY GENERATION

DESCRIPTION

The HI-5680 is a monolithic, direct replacement for the popular DAC80-CBI, DAC80Z-CBI, and DAC85C-CBI, incorporating the best features of each. Single chip construction, along with several design innovations, make the HI-5680 the optimum choice for low cost, high reliability applications.

Harris' unique Dielectric Isolation(DI) processing reduces internal parasitics, resulting in fast switching times and minimum glitch. On-board span resistors are provided for good tracking over temperature, and are laser trimmed to high accuracy. These may be used with the on-board op-amp (voltage output models; HI-5680V), or with a user supplied external amplifier (HI-5680I).

Internally, the HI-5680 eliminates code dependent ground currents by routing current from the positive supply to the internal ground node, as determined by an auxiliary R-2R ladder. This results in a cancellation of code dependent ground currents allowing virtually zero variation in current through the package common, pin 21.

The HI-5680 is available in both current and voltage output models which are guaranteed over the 0°C to +75°C temperature range. All models include a buried zener reference featuring low temperature coefficient. In addition, the voltage output models include an on-board output amplifier. Both versions operate with a +5V logic supply and a $\pm V_S$ in the range of ±(11.4V to 16.5V).

NOTES:

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operation under any of these conditions is not necessarily implied.
2. Adjustable to zero using external potentiometers.
3. See definitions.
4. FSR is "full scale range" and is 20V for ±10V range, 10V for ±5V range, etc., or 2mA (±20%) for current output.
5. The HI-5680 will operate with supply voltages as low as ±11.4V. It is recommended that output voltage range −10V to +10V not be used if the supply voltages are less than ±12.5V.

DIGITAL INPUTS

The HI-5680 accepts digital input codes in complementary binary, complementary offset binary, and complementary two's complement binary.

DIGITAL INPUT	ANALOG OUTPUT		
	Complementary Binary	Complementary Offset Binary	Complementary Two's Complement*
MSB LSB			
000...000	+ Full Scale	+ Full Scale	– LSB
100...000	Mid Scale-1LSB	–1 LSB	+Full Scale
111...111	Zero	– Full Scale	Zero
011...111	+½ Full Scale	Zero	– Full Scale

*Invert MSB with external inverter to obtain CTC Coding

SETTLING TIME

That interval between application of a digital step input, and final entry of the analog output within a specified window about the settled value. Harris Semicondutor usually specifies a unipolar 10V full scale step, to be measured from 50% of the input digital transition, and a window of ±½ LSB about the final value. The device output is then rated according to the worst (longest settling) case: low to high, or high to low.

DRIFT

GAIN DRIFT – The change in full scale analog output over the specified temperature range expressed in parts per million of full scale per °C (ppm of FSR/°C). Gain error is measured with respect to +25°C at high (T_H) and low (T_L) temperatures. Gain drift is calculated for both high (T_H –25°C) and low ranges (+25°C–T_L) by dividing the gain error by the respective change in temperature. The specification is the larger of the two representing worst case drift.

OFFSET DRIFT – The change in analog output with all bits OFF over the specified temperature range expressed in parts per million of full scale range per °C (ppm of FSR/°C). Offset error is measured with respect to +25°C at high (T_H) and low (T_L) temperatures. Offset Drift is calculated for both high (T_H –25°C) and low (+25°C –T_L) ranges by dividing the offset error by the respective change in temperature. The specification given is the larger of the two, representing worst-case drift.

ACCURACY

INTEGRAL NONLINEARITY – The maximum deviation of the actual transfer characteristic from an ideal straight line. The ideal line is positioned according to "end-point linearity" for D/A converter products from Harris Semiconductor, i.e. the line is drawn between the end-points of the actual transfer characteristic (codes 00...0 and 11...1).

DIFFERENTIAL NONLINEARITY – The difference between one LSB and the output voltage change corresponding to any two consecutive codes. A Differential Nonlinearity of ±1 LSB or less guarantees monotonicity.

MONOTONICITY – The property of a D/A converter's transfer function which guarantees that the output derivative will not change sign in response to a sequence of increasing (or decreasing) input codes. That is, the only output response to a code change is to remain constant, increase for increasing code, or decrease for decreasing code.

POWER SUPPLY SENSITIVITY

Power Supply Sensitivity is a measure of the change in gain and offset of the D/A converter resulting from a change in –15V, or +15V supplies. It is specified under DC conditions and expressed as parts per million of full scale range per percent of change in power supply (ppm of FSR/%).

COMPLIANCE

Compliance voltage is the maximum output voltage range that can be tolerated and still maintain its specified accuracy. Compliance limit implies functional operation only and makes no claims to accuracy.

GLITCH

A glitch on the output of a D/A converter is a transient spike resulting from inequal internal ON–OFF switching times. Worst case glitches usually occur at half-scale or the major carry code transition from 011...1 to 100...0 or vice versa. For example, if turn ON is greater than turn OFF for 011...1 to 100...0, an intermediate state of 000...0 exists, such that, the output momentarily glitches toward zero output. Matched switching times and fast switching will reduce glitches considerably. (Measured as one half the product of duration and amplitude.)

DECOUPLING AND GROUNDING

For best accuracy and high frequency performance, the grounding and decoupling scheme shown in Figure 1 should be used. Decoupling capacitors should be connected close to the HI-5680 (preferrably to the device pins) and should be tantalum or electrolytic bypassed with ceramic types for best high frequency noise rejection.

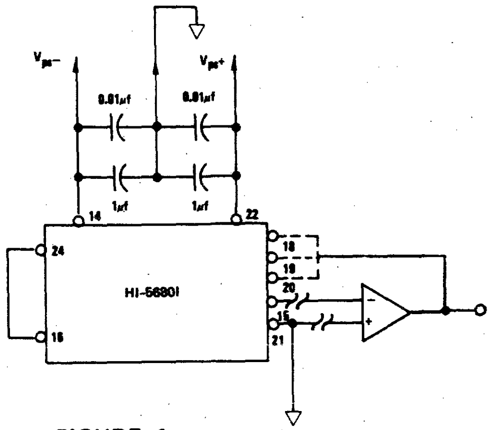

FIGURE 1

REFERENCE SUPPLY

An internal 6.3Volt reference is provided on board all HI-5680 models. This voltage (pin 24) is accurate to ±2% and must be connected to the reference input (pin 16) for specified operation. This reference may be used externally, provided current drain is limited to 2.5mA. An external buffer amplifier is recommended if this reference is to be used to drive other system components. Otherwise, variations in the load driven by the reference will result in gain variations of the HI-5680. All gain adjustments should be made under constant load conditions.

VOLTAGE OUTPUT HI-5680V

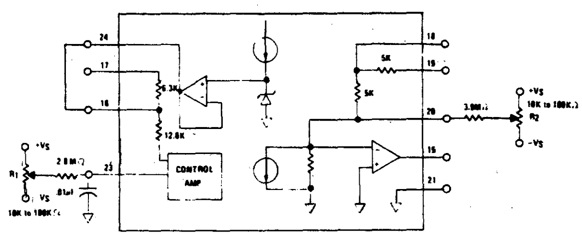

FIGURE 2

RANGE CONNECTIONS

	Range	Connect PIN 15	PIN 17	PIN 19
Unipolar	0 to +5V	18	N.C.	20
	0 to +10V	18	N.C.	N.C.
Bipolar	± 2.5V	18	20	20
	±5V	18	20	N.C.
	±10V	19	20	15

CURRENT OUTPUT HI-5680I

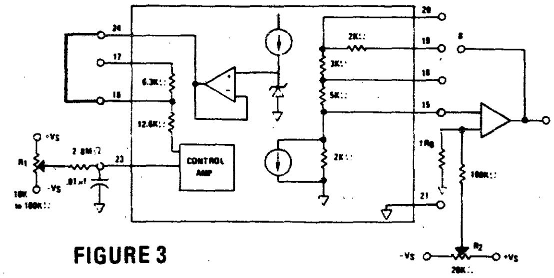

FIGURE 3

EXTERNAL AMPLIFIER CONNECTIONS

To use the HI-5680I with an external amplifier, connect as follows:

Range	Pin 17 to	Pin 18 to	Pin 19 to	Pin 20 to
0 to +10V	N.C.	B	18*	19*
0 to +5V	N.C.	B	15	N.C.
±10V	15	N.C.	B	N.C.
±5V	15	B	18*	19*
±2.5V	15	B	15	N.C.

*these connections help reduce stray capacitance in the feedback loop.
†R_B should equal the DAC's output resistance, which is 2KΩ // $R_{FEEDBACK}$.

GAIN AND OFFSET CALIBRATION

(Applies to Figure 2 and 3.)

UNIPOLAR CALIBRATION

Step 1: Offset
- Turn all bits OFF (11...1)
- Adjust R_2 for zero volts out

Step 2: Gain
- Turn all bits ON (00...0)
- Adjust R_1 for FS-1LSB
- That Is:
  - 4.9988 for 0 to +5V range
  - 9.9976 for 0 to +10V range

BIPOLAR CALIBRATION

Step 1: Offset
- Turn all bits OFF (11...1)
- Adjust R_2 for Negative FS
- That Is:
  - −10V for ±10V range
  - −5V for ±5V range
  - −2.5V for ±2.5 range

Step 2: Gain
- Turn all bits ON (00...0)
- Adjust R_1 for positive FS-1LSB
- That Is:
  - +9.9951V for ±10V range
  - +4.9976V for ±5V range
  - +2.4988V for ±2.5V range

This Bipolar procedure adjusts the output range end points. The maximum error at zero (half scale) will not exceed the Linearity error. See the "Accuracy" specifications.

HARRIS

HI-5685

High Performance Monolithic 12 Bit Digital-to-Analog Converter

FEATURES

- DAC 85 ALTERNATE SOURCE
- MONOLITHIC CONSTRUCTION (SINGLE CHIP)
- FAST SETTLING
- GUARANTEED MONOTONIC −25°C TO +85°C
- WAFER LASER TRIMMED
- APPLICATIONS RESISTORS ON-CHIP
- ON-BOARD REFERENCE
- DIELECTRIC ISOLATION (DI) PROCESSING
- ±12V POWER SUPPLY OPERATION

APPLICATIONS

- HIGH SPEED A/D CONVERTERS
- PRECISION INSTRUMENTATION
- CRT DISPLAY GENERATION

DESCRIPTION

The HI-5685 is a monolithic direct replacement for the popular DAC85-CBI and the ADDAC85LD-CBI. Single chip construction along with several design innovations make the HI-5685 the optimum choice for low cost, high reliability applications.

Harris' unique Dielectric Isolation (DI) processing reduces internal parasitics resulting in fast switching times and minimum glitch. On board span resistors are provided for good tracking over temperature, and are laser trimmed to high accuracy. These may be used with the on-board op-amp (voltage output models; HI-5685V), or with a user supplied external amplifier (HI-5685I).

Internally, the HI-5685 eliminates code dependent ground currents by routing current from the positive supply to the internal ground node, as determined by an auxiliary R-2R ladder. This results in a cancellation of code dependent ground currents allowing virtually zero variation in current through the package common, pin 21.

The HI-5685 and HI-5685A are available in both current and voltage output models which are guaranteed over the −25°C to +85°C temperature range. All models include a buried zener reference featuring low temperature coefficient. In addition, the voltage output models include an on-board output amplifier. Both versions operate with a +5V logic supply and a $\pm V_S$ in the range of ±(11.4V to 16.5V).

The HI-5685A offers exceptionally low drift over temperature. Gain drift is a maximum ±10ppm/°C, over −25°C to +85°C.

2. Adjustable to zero using external potentiometers.
3. See Definitions.
4. FSR is "full scale range" and is 20V for ±10V range, 10V for ±5V range, etc., or 2mA (±20%) for current output.
5. The HI-5685 will operate with supply voltages as low as ±11.4V. It is recommended that output voltage range −10V to +10V not be used if the supply voltages are less than ±12.5V.

HARRIS

HI-5687

Wide Temperature Range Monolithic 12 Bit Digital-to-Analog Converter

FEATURES

- DAC 87 ALTERNATE SOURCE
- MONOLITHIC CONSTRUCTION (SINGLE CHIP)
- FAST SETTLING
- GUARANTEED SPECIFICATIONS -55°C to 125°C
- WAFER LASER TRIMMED
- APPLICATIONS RESISTORS ON-CHIP
- ON-BOARD REFERENCE
- DIELECTRIC ISOLATION (DI) PROCESSING
- ±12V POWER SUPPLY OPERATION
- MIL STD 883 PROCESSING AVAILABLE

APPLICATIONS

- HIGH SPEED A/D CONVERTERS
- PRECISION INSTRUMENTATION
- CRT DISPLAY GENERATION

DESCRIPTION

The HI-5687 is a monolithic direct replacement for the popular DAC87-CBI wide temperature range d-to-a converter. Single chip construction, along with several design innovations make the HI-5687 the optimum choice for low cost, high reliability applications.

Harris' unique Dielectric Isolation (DI) processing reduces internal parasitics resulting in fast switching times and minimum glitch. On board span resistors are provided for good tracking over temperature, and are laser trimmed to high accuracy. These may be used with the on-board op-amp (voltage output models; HI-5687V), or with a user supplied external amplifier (HI-5687I).

Internally, the HI-5687 eliminates code dependent ground currents by routing current from the positive supply to the internal ground mode, as determined by an auxiliary R-2R ladder. This results in a cancellation of code dependent ground currents allowing virtually zero variation in current through the package common, pin 21.

The HI-5687 is available in both current and voltage output models which are 100% tested over the -55°C to +125°C temperature range. All models include a buried zener reference featuring low temperature coefficient. In addition, the voltage output models include an on-board output amplifier. Both versions operate with a +5V logic supply and a $\pm V_S$ in the range of ±(11.4V to 16.5V).

Processing to MIL-STD-883A CLASS B is available. See Ordering Information.

HARRIS

HI-DAC16B/C

16-Bit D to A Converter

FEATURES

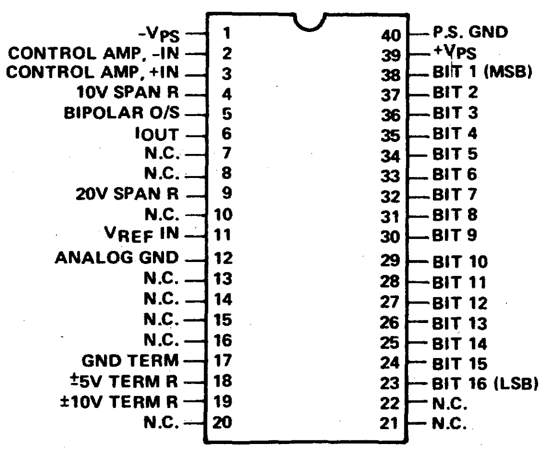
- 16 BIT RESOLUTION
- MONOLITHIC DI BIPOLAR CONSTRUCTION
- FAST SETTLING TIME 1 μs TO .003%FS
- LOW DIFF. NONLIN. DRIFT ± 0.3ppm/°C
- LOW GAIN DRIFT ± 1ppm/°C
- ON-CHIP SPAN & OFFSET RESISTORS
- TTL/5V-CMOS COMPATIBLE
- LOW UNIPOLAR OFFSET ≤ 1/2LSB@ +25°C
- LOW UNIPOLAR OFFSET T.C. ± 0.2ppm/°C
- EXCELLENT STABILITY

APPLICATIONS

- HIGH RESOLUTION CONTROL SYSTEMS
- HIGH FIDELITY AUDIO RECONSTRUCTION
- PRECISION FUNCTION GENERATION AND INSTRUMENTATION

PINOUT

TOP VIEW



DESCRIPTION

The HARRIS HI-DAC16 is a 16-bit, current output D/A converter. Single chip construction includes thin-film application resistors for use with an external op amp. These permit standard output voltage ranges of 0 to +5V, 0 to +10V, ±2.5V, ±5V and ±10V.

Reference and span resistors have adjacent placement on the chip for optimum match and thermal tracking. Futhermore, this layout feature helps minimize the superposition error caused by self-heating of the span resistor, reducing it to less than 1/10LSB. This and other design innovations have produced exceptionally stable operation over temperature. Typical temperature coefficients are ± 1ppm/°C for gain error and 0.3ppm/°C for differential non-linearity error.

The internal architecture is an extension of the earlier HI-562 with several major improvements. All code dependent ground currents are steered to a separate non-critical path, namely, power supply ground. This feature allows the precision ground of the converter to be sensed with virtually zero voltage drop referred to system ground. The result is the complete elimination of non-linearities due to code dependent ground currents while yielding an extremely low unipolar offset of less than 1/2LSB. Because of this separation, the user may route the precision ground some distance to the system ground without degrading converter accuracy.

The HARRIS HI-DAC16 delivers a stable, accurate output without sacrifice in speed. Settling time to within ±0.003% is one microsecond. Overall performance of this monolithic device should be attractive for applications such as high fidelity audio and high-resolution control systems.

Typical power requirement is 450 MW, from the +15V and -15V supplies combined. The package is a 40 pin ceramic DIP. Two accuracy grades are offered.

HARRIS

HI-5660

High Speed Monolithic Digital-to-Analog Converter

FEATURES

- MONOLITHIC CONSTRUCTION
- FAST SETTLING (TO ±1/2 LSB) 350ns
- ±1/2 LSB MAX. NONLINEARITY GUARANTEED OVER TEMPERATURE
- INTERNAL CANCELLATION OF GROUND CURRENT
- EXCELLENT POWER SUPPLY REJECTION 1ppm/%PS
- LOW COST

APPLICATIONS

- HIGH SPEED A/D CONVERTERS
- CRT DISPLAYS
- WAVEFORM SYNTHESIS

DESCRIPTION

The HI-5660 is a current output, 12 bit monolithic digital-to-analog converter. It offers high speed plus enhanced accuracy, through internal cancellation of ground currents.

Electrical performance is similar to that of the AD566A. Pinouts are identical except for pin 1, which requires a +5V supply (versus no connection on the AD566A).

Fabrication of the HI-5660 features the Harris bipolar dielectric isolation process, which eliminates latchup and minimizes parasitic capacitance and leakage currents. The chip includes nichrome thin-film resistors, laser trimmed at the wafer level to a maximum linearity error of ±1/4 LSB at +25°C.

Near zero current in the Analog Ground terminal simplifies use of the HI-5660 by minimizing noise and offsets between the package and the system analog ground. This is accomplished by adding a complement current to the internal ground from an auxiliary R-2R ladder, and then supplying the resultant DC current from the positive power supply.

The Harris HA-1608 +10V precision reference is recommended for use with the HI-5660 in non-multiplying applications.

The HI-5660 is offered in two accuracy grades each for the commercial and military temperature ranges. Package is a 24 pin plastic or ceramic DIP, and power requirements are +15V, -15V.

HARRIS

HI-7541

12 Bit Multiplying Monolithic Digital-to-Analog Converter

FEATURES

- FULL FOUR QUADRANT MULTIPLICATION
- .01% RELATIVE ACCURACY OVER TEMPERATURE
- LOW OUTPUT CAPACITANCE 100pF MAX
- TTL/CMOS COMPATIBLE
- MONOLITHIC CONSTRUCTION
- VERY LOW OUTPUT LEAKAGE CURRENT ±100nA MAX
- LOW GAIN ERROR 0.1%

APPLICATIONS

- PROGRAMMABLE GAIN AMPLIFIERS
- PROGRAMMABLE FUNCTION GENERATION

DESCRIPTION

The Harris HI-7541 is a 12-Bit Monolithic Digital to Analog converter, offering full four quadrant multiplying capability. The chip features dielectrically isolated CMOS technology to assure fast settling time and freedom from latch-up. Included are thin film ladder and applications resistors, laser trimmed for accuracy over the full operating temperature range.

The HI-7541 is recommended as a high performance direct replacement for the AD7541 device. It operates on a single +15V supply and is available in an 18-pin ceramic package as well as in dice form. Screening to MIL-STD-883 method 5004 class B is available.

HARRIS

HA-2420/2425

Fast Sample and Hold

FEATURES

- LOW DROOP RATE (C_H = 1000pF) 5μV/ms
- FAST ACQUISITION TIME (10V STEP TO .01%) 5μs
- HIGH SLEW RATE 7V/μs
- BANDWIDTH 2.5MHz
- LOW EFFECTIVE APERTURE DELAY TIME 30ns
- TTL COMPATIBLE CONTROL INPUT

APPLICATIONS

- A TO D CONVERSION SYSTEMS
- D TO A DEGLITCHER
- AUTO ZERO SYSTEMS
- PEAK DETECTOR
- GATED OP AMP

DESCRIPTION

The HA-2420/2425 is a monolithic circuit consisting of a high performance operational amplifier with its output in series with an ultra-low leakage analog switch and a MOSFET input unity gain amplifier.

With an external holding capacitor connected to the switch output, a versatile, high performance sample-and-hold or track-and-hold circuit is formed. When the switch is closed, the device behaves as an operational amplifier, and any of the standard op amp feedback networks may be connected around the device to control gain, frequency response, etc. When the switch is opened the output will remain at its last level.

Performance as a sample-and-hold compares very favorably with other monolithic, hybrid, modular, and discrete circuits. Accuracy to better than 0.01% is achievable over the temperature range. Fast acquisition is coupled with superior droop characteristics, even at high temperatures. High slew rate, wide bandwidth, and low acquisition time produce excellent dynamic characteristics. The ability to operate at gains greater than 1 frequently eliminates the need for external scaling amplifiers.

The device may also be used as a versatile operational amplifier with a gated output for applications such as analog switches, peak holding circuits, etc.

HA-5320

High Speed Precision Monolithic Sample and Hold Amplifier

FEATURES

• GAIN, dc	2 x 10^6 V/V
• ACQUISITION TIME	1.0 µs (0.01%)
• DROOP RATE	0.08 µV/µs (25°C)
	17 µV/µs (FULL TEMP)
• APERTURE TIME	25ns
• PEDESTAL ERROR	1.0 mV

- INTERNAL HOLD CAPACITOR
- FULLY DIFFERENTIAL INPUT
- TTL COMPATIBLE

APPLICATIONS

- PRECISION DATA ACQUISITION SYSTEMS
- D/A CONVERTER DEGLITCHING
- AUTO-ZERO CIRCUITS
- PEAK DETECTORS

DESCRIPTION

The HA-5320 was designed for use in precision, high speed data acquisition systems.

The circuit consists of an input transconductance amplifier capable of providing large amounts of charging current, a low leakage analog switch, and an output integrating amplifier. The analog switch sees virtual ground as its load; therefore, charge injection on the hold capacitor is constant over the entire input/output voltage range. The pedestal voltage resulting from this charge injection can be adjusted to zero by use of the offset adjust inputs. The device includes a hold capacitor. However, if improved droop rate is required at the expense of acquisition time, additional hold capacitance may be added externally.

This monolithic device is manufactured using the Harris dielectric isolation process, minimizing stray capacitance and eliminating SCR's. This allows higher speed and latch-free operation. The HA-5320 requires ±15V, and is available in a ceramic or plastic 14-pin DIP.

- STATUS MONITORING SYSTEMS
- PROCESS CONTROL SYSTEMS
- INSTRUMENTATION
- HIGH RELIABILITY DAS's

DESCRIPTION

The HI-5712/5712A is a 12-bit successive approximation analog-to-digital converter (ADC) intended for high-speed, high-performance data conversion applications. An 8μs conversion time for an accurate 12 bit conversion with low gain and offset temperature coefficients are among its many features. Numerous functions can be software controlled to meet a variety of ADC requirements.

The highly flexible input design accepts user programmed unipolar and bipolar inputs of: 0 to +10V, 0 to +20V, ±5V and ±10V full scale signal levels. The internal precision +10V reference delivers up to 10mA of output current with ultra high temperature stability. This reference is intended for biasing the ADC reference input, although other configurations can be implemented. A remote sense line is provided for applications requiring usage of the precision reference elsewhere in the system.

The output code select line and the short cycle control inputs are latched internally for microprocessor compatibility and provide selection of either binary or 2's complement output code, and resolution of 6, 8, 10 or 12 bits, respectively. A flexible interface is provided for 8, 12 and 16 bit systems via the chip select line and the word length control pins. The latter allows independent tri-state enabling of parallel output bits 1-8 and 9-12. A serial data output line is provided for applications requiring remote data transmission.

The HI-5712/5712A is manufactured with hermetically sealed leadless chip carriers (LCC's) mounted to both sides of a multi-layer ceramic substrate which results in a compact 40 pin dual-in-line package. The HI-5712A is intended for military, industrial and instrumentation applications. MIL-STD-883 class B and high reliability commercial grades are both available as standard products.

NOTES:
1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operation under any of these conditions is not necessarily implied.
2. See Fiqure 2 for connections. The initial errors are adjustable to zero by using external trim potentiometers as shown in Figure 3, and 4.
3. The HI-5712A will operate at these speeds (for 12 bit conversion), but parametric performance is not guaranteed.
4. See operating instructions for details.
5. After 60 seconds warm-up.
6. See definitions.
7. These terminals will be used in the future for additional functions. Do not make connections to these pins in your system.
8. TTL compatibility guaranteed.

PIN FUNCTIONS AND DESCRIPTIONS

PIN	SYMBOL	DESCRIPTION
1	V_{PS}-	-15V Power Supply Terminal
2	NC	No Connection See Note 7
3	NC	No Connection See Note 7
4	BIPOLAR OFFSET	Connect to V_{REF} for Bipolar Input Mode. See Operating Instructions for Details.
5	20V FS	20V Full Scale Analog Input
6	10V FS	10V Full Scale Analog Input
7	ANALOG GND	Analog Power Supply Return
8	ENABLE BIT 9-12	Output "Three State" Control. An Input "0" Enables Bits 9 through 12, whereas a "1" Switches these Bits to a High Impedance State.
9	ENABLE BIT 1-8	Output "Three State" Control. An Input "0" Enables Bits 1 through 8, whereas a "1" Switches these Bits to a High Impedance State.
10	SERIAL OUT	NRZ Serial Data Output. To be used in Conjunction with Clock Out for Remote Data Transmission
11	SHORT CY B	See Description for Pin 12
12	SHORT CY A	Digital Inputs Applied to short cycle A and B selects a conversion of 6, 8, 10, or 12-bits:

BITS	SHORT CY A	SHORT CY B
6	0	0
8	0	1
10	1	0
12	1	1

PIN	SYMBOL	DESCRIPTION
13	CLOCK OUT	SAR Clock Output. Used for Decoding Serial Out Data
14	BIT 12	Output Data Bit (LSB)
15	BIT 11	Output Data Bit
16	BIT 10	Output Data Bit
17	BIT 9	Output Data Bit
18	BIT 8	Output Data Bit
19	BIT 7	Output Data Bit
20	DIGITAL GND	Digital Power Supply Return
21	V_{LOGIC}	+5V Power Supply Terminal
22	BIT 6	Output Data Bit
23	BIT 5	Output Data Bit
24	BIT 4	Output Data Bit
25	BIT 3	Output Data Bit
26	BIT 2	Output Data Bit
27	BIT 1	Output Data Bit (MSB)
28	NC	No Connection. See Note 7.
29	CLOCK IN	An External Clock Signal Applied to this Input Overrides the Internal Clock.
30	MSB/$\overline{MSB}$ SEL	Digital Input Pin. A "1" Applied to this Terminal Selects a Straight Binary or Offset Binary Output Code. A "0" Inverts the MSB to Yield a 2's Complement Binary Output Code.
31	START CONV	Digital Input Pin. A High to Low Transition Initiates the ADC Conversion Cycle.
32	STATUS	Digital Output Pin. A "1" Indicates that the ADC is Busy, While a "0" Denotes that Conversion is Completed and Data is Ready for Retrieval.

PIN	SYMBOL	DESCRIPTION
33	CHIP ENABLE	Digital Input Pin. A "1" Forces the Output Data, Serial Out and Status Terminals to a High Impedance State and the ADC is Disabled. A "0" Enables these ADC Functions.
34	RLS	Reference Low Sense.
35	ZERO ADJ	External Zero Adjustment Pin, See Operating Instructions for Details.

PIN	SYMBOL	DESCRIPTION
36	NC	No Connection. See Note 7.
37	V_{REF} IN	+10V Reference Input to ADC.
38	V_{REF} OUT	Internal +10V Reference Output, Normally Connected to V_{REF} IN (Pin 37).
39	V_{REF} SENSE	Internal +10V Reference Sensing Terminal, Normally connected to V_{REF} Out (Pin 38). See Operating Instructions for Details.
40	V_{ps+}	+15V Power Supply Terminal.

APPLYING THE HI-5712/5712A

OPERATING INSTRUCTIONS

Conventional ADC systems provide maximum performance when the analog and digital ground lines are tied together at the ADC terminals. This minimizes analog interference due to digital switching noise. For optimum performance, this external grounding procedure should be followed in HI-5712/5712A installations to reinforce the unit's internal analog-to-digital ground connections. Under no circumstances should the Reference Low Sense (RLS) terminal (Pin 34) be connected to system ground.

In practice, the Reference Low Sense (RLS) terminal (Pin 34) normally is connected to zero adjust (or error amplifier) input terminal (Pin 35), either directly or through an appropriate resistor network. See figures 3 and 4.

On the HI-5712/5712A substrate, the power supply lines to each active component are bypassed to ground with 0.01 μF chip capacitors for high frequency noise rejection. For best accuracy, the grounding and decoupling schemes shown in Figures 3 and 4 are recommended. The 10μF bypass capacitors shown should be connected as close as possible to the HI-5712/5712A, preferably at the device pin.

For applications where usage of potentiometers is highly undesirable, the trim pots shown in Figures 3 and 4 can either be deleted or replaced by precision fixed resistors. (Delete R_3 and R_4; replace R_1 with 25 ohms). When precision fixed resistors are used, the initial offset error and gain error contributions are as specified in page 2.

NOTE: The HI-5712/5712A may latch up if the device is enabled before applying power. Disabling the device following power turn on will remedy this situation. Care supplies do not excessively overshoot their final value during turn on.

CONTROL AND INTERFACE

The HI-5712/5712A features a versatile set of controlling functions which allows a wide variety of applications, including microprocessor bus interfacing.

When the chip enable is set to low, the internal registers are enabled, and the output data lines can be enabled via the output enable control lines. The conversion cycle is initiated at the falling edge of the start conversion pulse. At this time, the MSB/$\overline{\text{MSB}}$ Select, Short Cycle A, and Short Cycle B control information is latched into the internal registers. The status line is also forced into an active high state indicating that a conversion is taking place. At the end of the conversion cycle the status line will be set to low to signify that the data is ready at the tri-state buffers. The various timing relationships are shown in Figure 1.

There are two distinct modes of operation, namely, continuous conversion and single step conversion. Continuous conversion can be easily achieved by connecting the Status line to the Start Convert pin. In this application, an indecision state may occur during the initial power-on conditions. Normal operation is restored by pulsing the chip enable pin to logic high for a period greater than 100 ns.

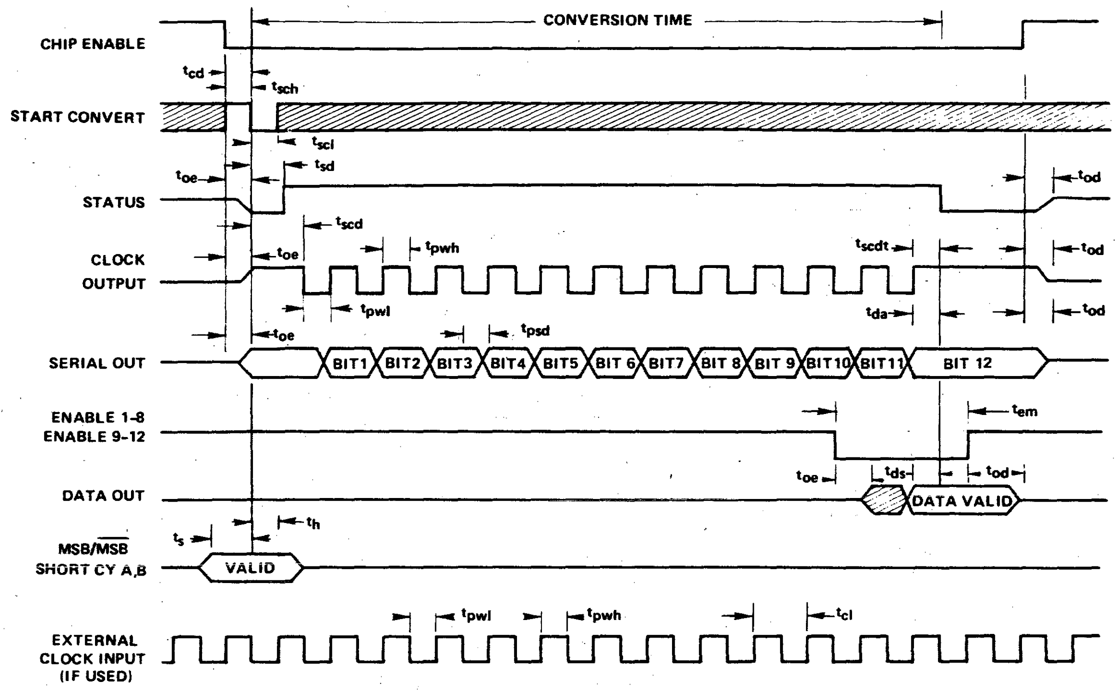

FIGURE 1. HI-5712/5712A TIMING DIAGRAM

REMOTE DATA TRANSMISSION

The Serial Data Out is mainly used for remote data transmission, where only a limited number of wires are available.

Serial Output is bit by bit (MSB first, LSB last) in a NRZ (nonreturn-to-zero) format. It changes state only at the positive going edges of the Clock Out, and remains valid during the whole clock period. Parallel data can be constructed by clocking the serial data into a receiving shift register.

In order to minimize transmission error, the negative-going edge of the clock should be used to clock data into the remote shift register. The parallel data will be valid once the status line returns to low. The clocking scheme is shown in Figure 1.

CALIBRATION PROCEDURE- Refer to Calibration Chart and to Figures 3 and 4 for appropriate analog input connections, value of bias resistor, and MSB/$\overline{MSB}$ select.

STEP 1 OFFSET ADJUSTMENT

- Set analog input to the appropriate value for offset adjustment.
- Adjust R3 for dither between codes shown in calibration chart.

STEP 2 GAIN ADJUSTMENT

- Set analog input to the appropriate value for gain adjustment.
- Adjust R1 for dither between codes shown in calibration chart.

NOTE: This calibration procedure insures that the transfer characteristic produced by connecting the midpoints of all quantization intervals passes through the origin.

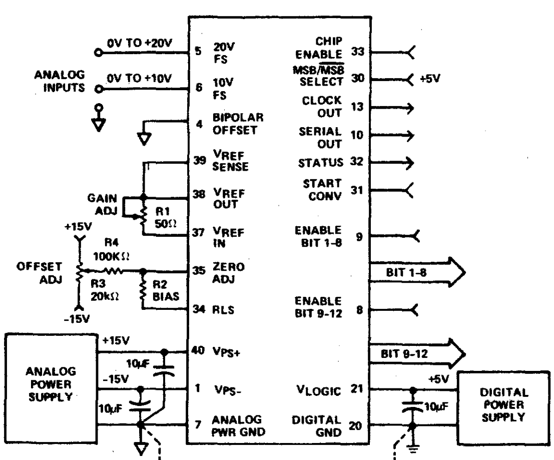

FIGURE 3. UNIPOLAR INPUT CONNECTIONS - STRAIGHT BINARY OUTPUT CODE

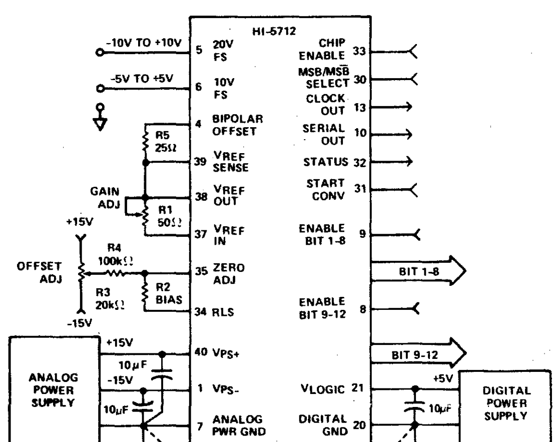

FIGURE 4. BIPOLAR INPUT CONNECTIONS

HARRIS

HI-574A

Fast, Complete 12-Bit A/D Converter with Microprocessor Interface

FEATURES

- COMPLETE 12 BIT A/D CONVERTER WITH REFERENCE AND CLOCK.
- FULL 8-, 12- or 16- BIT MICROPROCESSOR BUS INTERFACE.
- 150 nS BUS ACCESS TIME
- NO MISSING CODES OVER TEMPERATURE
- MINIMAL SETUP TIME FOR CONTROL SIGNALS
- 25 μS MAXIMUM CONVERSION TIME
- LOW NOISE, VIA CURRENT-MODE SIGNAL TRANSMISSION BETWEEN CHIPS
- BYTE ENABLE/SHORT CYCLE (A_0 INPUT)
  - GUARANTEES BREAK – BEFORE – MAKE ACTION, ELIMINATING BUS CONTENTION DURING READ OPERATION. LATCHED BY THE START CONVERT INPUT (TO SET THE CONVERSION LENGTH).
- IMPROVED SECOND SOURCE FOR AD574A AND HS574
- ±12V TO ±15V OPERATION

APPLICATIONS

- MILITARY AND INDUSTRIAL DATA ACQUISITION SYSTEMS
- ELECTRONIC TEST AND SCIENTIFIC INSTRUMENTATION.
- PROCESS CONTROL SYSTEMS.

DESCRIPTION

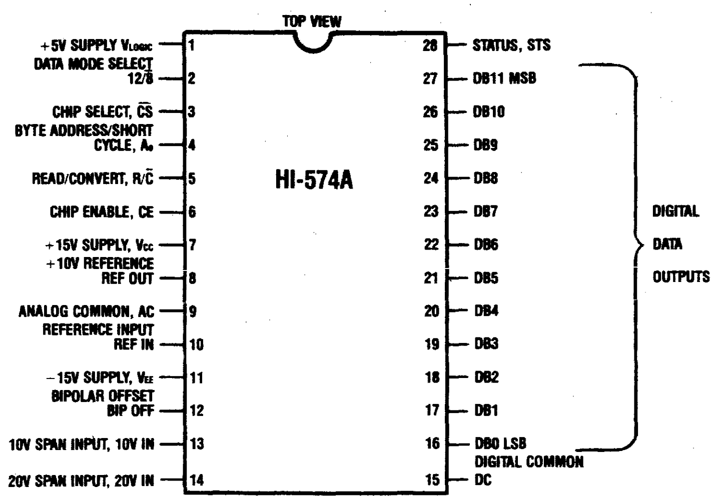
The HI-574A is a complete 12 bit Analog-to-Digital Converter, including a +10V reference, clock, three-state outputs and a digital interface for microprocessor control. Successive approximation conversion is performed by two monolithic dice housed in a 28-pin package. The bipolar analog die features the Harris Dielectric Isolation process, which provides enhanced AC performance and freedom from latch-up.

Custom design of each IC (bipolar analog and CMOS digital) has yielded improved performance over existing versions of this converter. The voltage comparator features high PSRR plus a high speed current-mode latch, and provides precise decisions down to 0.1 LSB of input overdrive. More than 2X reduction in noise has been achieved by using current instead of voltage for transmission of all signals between the analog and digital IC's. Also, the clock oscillator is current-controlled for excellent stability over temperature. The oscillator is trimmed for a nominal conversion time of 20 ± 1 μs.

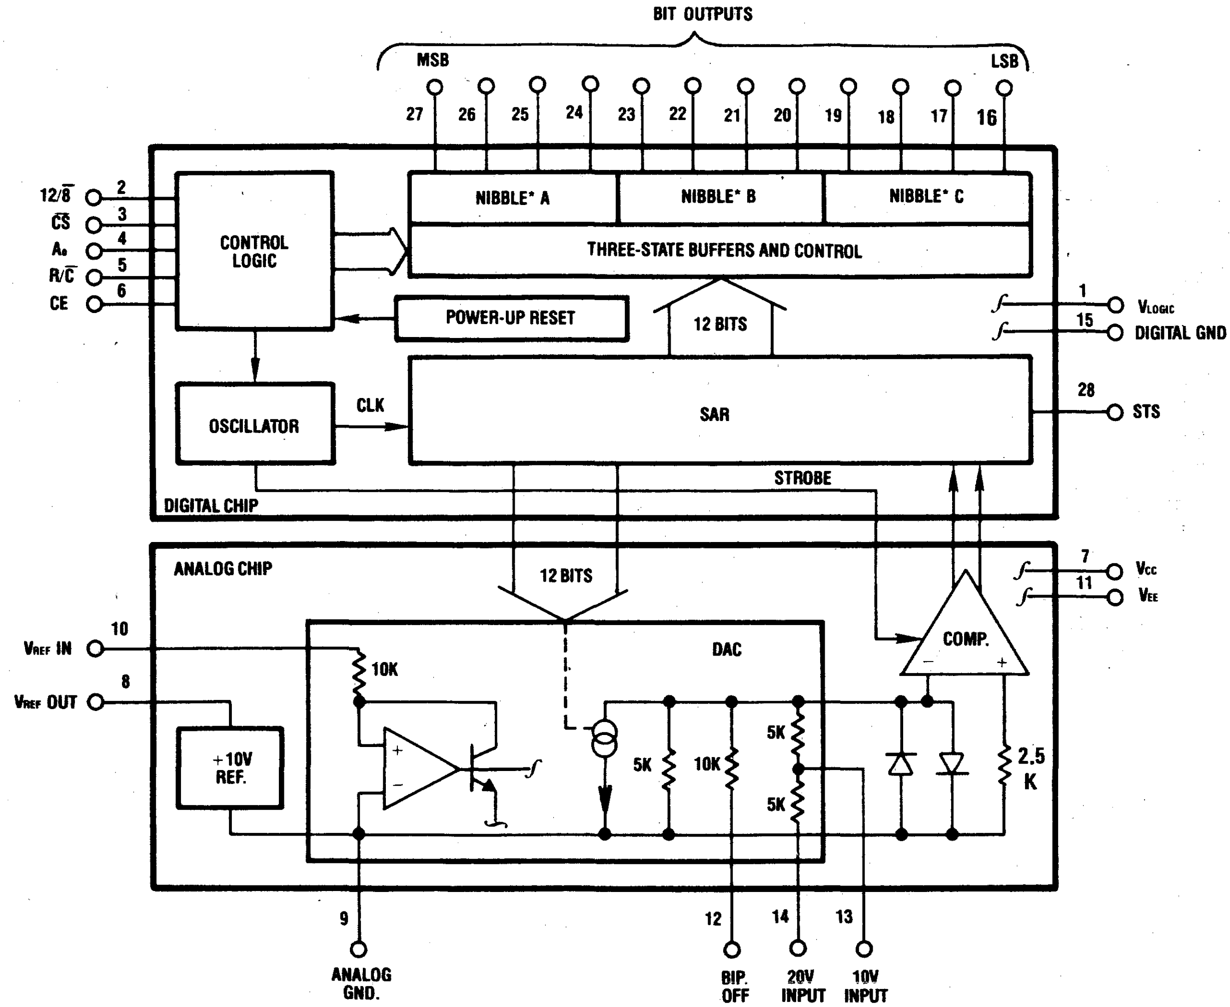
The HI-574A offers standard unipolar and bipolar input ranges, laser trimmed for specified linearity, gain and offset accuracy. The buried zener reference circuit is trimmed for minimum temperature coefficient.

Power requirements are +5V and ±12V to ±15V, with typical dissipation of 515 mW. Three electrical grades each are offered for the commercial and military temperature ranges. All models are packaged in a 28 pin side-brazed, ceramic DIP. In addition, parts are available with screening per MIL-STD-883 Method 5004, Class B.

PINOUT



CAUTION: These devices are sensitive to electronic discharge. Proper I.C. handling procedures should be followed.



*("NIBBLE" IS A 4 BIT DIGITAL WORD.)

HI1-574AUD/883B	−55 to +125°C	±1 LSB	12 Bits	12.5

DEFINITIONS OF SPECIFICATIONS

LINEARITY ERROR

Linearity error refers to the deviation of each individual code from a line drawn from "zero" through "full scale". The point used as "zero" occurs ½LSB (1.22mV for 10 volt span) before the first code transition (all zeros to only the LSB "on"). "Full scale" is defined as a level 1½LSB beyond the last code transition (to all ones). The deviation of a code from the true straight line is measured from the middle of each particular code.

The HI-574AK, AL, AT, and AU grades are guaranteed for maximum nonlinearity of ±½LSB. For these grades, this means that an analog value which falls exactly in the center of a given code width will result in the correct digital output code. Values nearer the upper or lower transition of the code width may produce the next upper or lower digital output code. The HI-574AJ and AS grades are guaranteed to ±1LSB max error. For these grades, an analog value which falls within a given code width will result in either the correct code for that region or either adjacent one.

Note that the linearity error is not user-adjustable.

DIFFERENTIAL LINEARITY ERROR
(NO MISSING CODES)

A specification which guarantees no missing codes requires that every code combination appear in a monotonic increasing sequence as the analog input level is increased. Thus every code must have a finite width. For the HI-574AK, AL, AT, and AU grades, which guarantee no missing codes to 12-bit resolution, all 4096 codes must be present over the entire operating temperature ranges. The HI-574AJ and AS grades guarantee no missing codes to 11-bit resolution over temperature; this means that all code combinations of the upper 11 bits must be present; in practice very few of the 12-bit codes are missing.

UNIPOLAR OFFSET

The first transition should occur at a level ½LSB above analog common. Unipolar offset is defined as the deviation of the actual transition from that point. This offset can be adjusted as discussed on the following pages. The unipolar offset temperature coefficient specifies the maximum change of the transition point over temperature, with or without external adjustment.

BIPOLAR OFFSET

Similarly, in the bipolar mode, the major carry transition (0111 1111 1111 to 1000 0000 0000) should occur for an analog value ½LSB below analog common. The bipolar offset error and temperature coefficient specify the initial deviation and maximum change in the error over temperature.

FULL SCALE CALIBRATION ERROR

The last transition (from 1111 1111 1110 to 1111 1111 1111) should occur for an analog value 1½LSB below the nominal full scale (9.9963 volts for 10.000 volts full scale). The full scale calibration error is the deviation of the actual level at the last transition from the ideal level. This error, which is typically 0.05 to 0.1% of full scale, can be trimmed out as shown in Figure 5. The full scale calibration error over temperature is given with and without the initial error trimmed out. The temperature coefficients for each grade indicate the maximum change in the full scale gain from the initial value using the internal 10 volt reference.

TEMPERATURE COEFFICIENTS

The temperature coefficients for full-scale calibration, unipolar offset, and bipolar offset specify the maximum change from the initial (25°C) value to the value at T_{min} or T_{max}.

POWER SUPPLY REJECTION

The standard specifications for the HI-574A assume use of +5.00 and ±15.00 or ±12.00 volt supplies. The only effect of power supply error on the performance of the device will be a small change in the full scale calibration. This will result in a linear change in all lower order codes. The specifications show the maximum change in calibration from the initial value with the supplies at the various limits.

CODE WIDTH

A fundamental quantity for A/D converter specifications is the code width. This is defined as the range of analog input values for which a given digital output code will occur. The nominal value of a code width is equivalent to 1 least significant bit (LSB) of the full scale range or 2.44mV out of 10 volts for a 12-bit ADC.

QUANTIZATION UNCERTAINTY

Analog-to-digital converters exhibit an inherent quantization uncertainty of ±½LSB. This uncertainty is a fundamental characteristic of the quantization process and cannot be reduced for a converter of given resolution.

LEFT-JUSTIFIED DATA

The data format used in the HI-574A is left-justified. This means that the data represents the analog input as a fraction of full-scale, ranging from 0 to $\frac{4095}{4096}$. This implies a binary point to the left of the MSB.

APPLYING THE HI-574A

For each application of this converter, the ground connections, power supply bypassing, analog signal source, digital timing and signal routing on the circuit board must be optimized to assure maximum performance. These areas are reviewed in the following sections, along with basic operating modes and calibration requirements.

PHYSICAL MOUNTING AND LAYOUT CONSIDERATIONS

Layout –

Unwanted, parasitic circuit components, (L, R, and C) can make 12 bit accuracy impossible, even with a perfect A/D converter. The best policy is to eliminate or minimize these parasitics through proper circuit layout, rather than try to quantify their effects.

The recommended construction is a double-sided printed circuit board with a ground plane on the component side. Other techniques, such as wire-wrapping or point-to-point wiring on vectorboard, will have an unpredictable effect on accuracy.

In general, sensitive analog signals should be routed between ground traces and kept well away from digital lines. If analog and digital lines must cross, they should do so at right angles.

Power Supplies

Supply voltages to the HI-574A (+15V, −15V and +5V) must be "quiet" and well regulated. Voltage spikes on these lines can affect the converter's accuracy, causing several LSB's to flicker when a constant input is applied. Digital noise and spikes from a switching power supply are especially troublesome. If switching supplies must be used, outputs should be carefully filtered to assure "quiet" DC voltage at the converter terminals.

Further, a bypass capacitor pair on each supply voltage terminal is necessary to counter the effect of variations in supply current. Connect one pair from pin 1 to 15 (V_{LOGIC} supply), one from pin 7 to 9 (V_{CC} to Analog Common) and one from pin 11 to 9 (V_{EE} to Analog Common). For each capacitor pair, a 10μF tantalum type in parallel with a 0.1μF ceramic type is recommended.

Ground Connections

The typical HI-574A ground currents are 5.5mADC into pin 9 (Analog Ground) and 7mADC out of pin 15 (Digital Common). These pins should be tied together at the package to guarantee specified performance for the converter. In addition, a wide PC trace should run directly from pin 9 to (usually) 15V common, and from pin 15 to (usually) the +5V Logic Common. If the converter is located some distance from the system's "single point" ground, make only these connections to pins 9 and 15: Tie them together at the package, and back to the system ground with a single path. This path should have low resistance since it will carry about 1.5mA of DC current. (Code dependent currents flow in the V_{CC}, V_{EE} and V_{LOGIC} terminals, but not through the HI-574A's Analog Common or Digital Common).

HARRIS

HI-5900

Analog Data Acquisition Signal Processor

FEATURES

- INPUT OVERVOLTAGE PROTECTION
- 50kHz THROUGHPUT
- 12-BIT ACCURACY
- OUTPUT TRACK/HOLD AMPLIFIER
- ZERO OFFSET ADJUSTMENT
- DIFFERENTIAL INPUT CHANNELS
- SOFTWARE CONTROLLED GAIN AND CHANNEL SELECT
- 85dB CMRR
- COMPACT 32 PIN DIP
- MIL-STD-883 SCREENING AVAILABLE

APPLICATIONS

- HIGH PERFORMANCE DATA ACQUISITION
- MILITARY SYSTEMS

DESCRIPTION

The HI-5900 comprises "front end" components of a data acquisition system including an eight channel differential multiplexer, programmable gain instrumentation amplifier (PGA), and Track and Hold amplifier. Adding a timing circuit and one A to D converter yields a complete data acquisition system. A 50kHz channel-to-channel throughput rate is achieved when the HI-5900 is used with a fast 12 bit A to D converter such as HARRIS HI-5712.

Each output line of the input multiplexer is buffered by a high-quality non-inverting amplifier. This isolates each line from source resistances external to the 5900, preserving the high CMRR of the instrumentation amplifier block. Also, the buffers provide a high input impedance for each channel.

The PGA, which includes an op amp, a monolithic resistor network and a four channel differential multiplexer, offers precision inverting gain values of -1, -2, -4, and -8. The voltage gain is selected by a two bit digital word. The output of the PGA drives the Track and Hold amplifier, and the ground side of the PGA is isolated by a buffer amplifier to maintain a high CMRR.

The output Track/Hold amplifier is a monolithic device, internally connected for non-inverting unity gain. In the sample mode is operates as a high performance buffer amplifier. With an external holding capacitor, it may be switched to HOLD with an effective aperture delay time of 30ns.

The packaging technique involves monolithic chips mounted in leadless chip carriers (LCC's) and soldered to both sides of a multilayer ceramic substrate. Each LCC may undergo reliability screening such as MIL-STD-883, Method 5004/Class B, before assembly on the substrate. The resulting package is a compact 32 pin DIP.

The HI-5900 is offered as a high performance front-end section for military and industrial data acquisition systems. It is designed for interface with computers and is well suited for high-rel applications.

- COMPACT 32 PIN DIP
- MIL-STD-883 SCREENING AVAILABLE

APPLICATIONS

- MULTI-CHANNEL DATA ACQUISITION SYSTEMS
- STATUS MONITORING SYSTEMS
- PROCESS CONTROL SYSTEMS
- INSTRUMENTATION
- HIGH RELIABILITY DAS's

DESCRIPTION

The HI-5901 is a data acquisiton front end subsystem intended for multisensor based high-level applications, requiring conversion of analog input data to digital form for computer processing. It provides sixteen single-ended or pseudo-differential channels of fault-protected multiplexed inputs, programmable gains of-1,-2,-4,-8 and a buffered track and hold output block compatible with any commercially available A/D converter. All these functions are digitally selectable through appropriate coding of seven control terminals. Input channel expansion can be easily implemented through addition of external multiplexers and proper utilization of the enable-command pin.

Being self-contained units except for the holding capacitor, they facilitate user applications and eliminate the need for selection of high-priced precision resistors or labor intensive adjustments to achieve the accuracy levels specified.

This product provides channel to channel throughput rates of 50kHz at ±10 volt signal range when used in connection with a fast 12 bit A/D converter such as the HI-5712. In addition, it offers excellent input characteristics such as low input offset voltage with offset nulling capability, low input currents, very high input impedance, and very low crosstalk. Typical acquisition time and gain error are 9 microseconds and ±0.01%, respectively. The internal track and hold amplifier features an effective aperture delay time of 30ns and a droop rate of 5nV/μsec. Total power dissipation is only 250mW.

A complete high-speed and high precision data acquisition system with 15 bits of dynamic range can be easily implemented with only three components: the HI-5901, the HI-5712, and an offset nulling DAC. Board space required is 3 square inches and total weight is less than 25 grams.

The manufacturing technique adopted for the HI-5901 involves monolithic dice packaged in leadless chip carriers (LCC's) and soldered to both sides of a multilayer ceramic substrate. The resulting product is a compact and easy-to-use 32 pin DIP.

The HI-5901 is intended for military, aerospace, industrial and instrumentation applications. MIL-STD-883 Class B and high reliability commercial grades are both available as standard products.

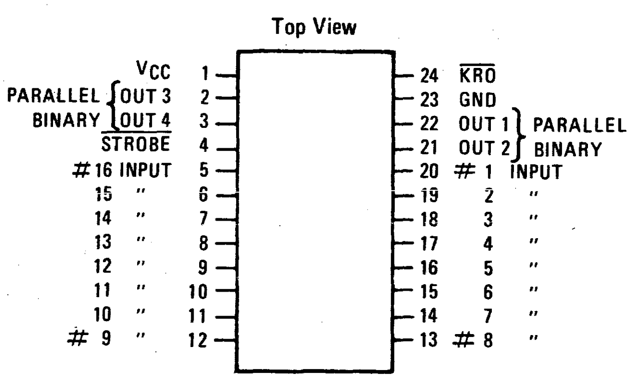
- CONTROL PANELS

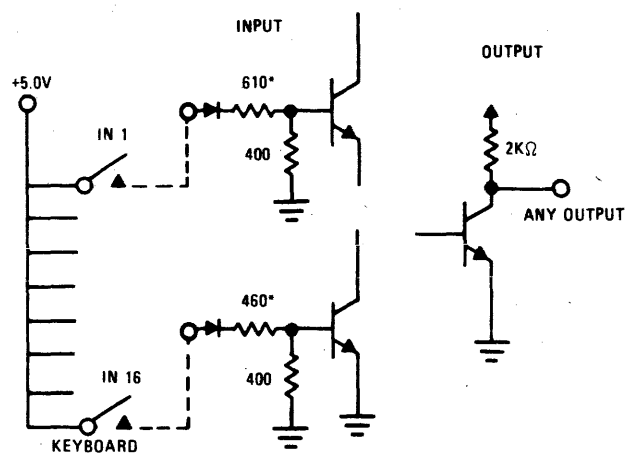
DESCRIPTION

The HD-0165 Keyboard Encoder is a 16 line to four-bit parallel encoder intended for use with manual data entry devices such as calculator or typewriter keyboards. In addition to the encoding function, there is a Strobe output and a Key Rollover output which energizes whenever two or more inputs are energized simultaneously. Any four-bit code can be implemented by proper wiring of the input lines. Inputs are normally wired through the key switches to the +5.0V power supply. Full typewriter keyboard encoding up to eight bits can be accomplished with two Encoder circuits by the use of double pole key switches or single pole switches with two isolation diodes per key. Outputs will interface with all popular DTL and TTL logic families. The circuit is packaged in a hermetic 24-pin dual-in-line package and operates over the temperature range of 0°C to +75°C.

PINOUT



EQUIVALENT CIRCUITS



* EQUIVALENT RESISTORS FOR OTHER INPUTS ARE BETWEEN THESE TWO VALUES

ABSOLUTE MAXIMUM RATINGS

Supply Voltage	+7.0V	Output Current	30mA
Input Voltage	+5.5V	Storage Temperature	-65° to $+150^{\circ}C$
Output Voltage	+5.5V	Operating Temperature (Case)	$0^{\circ}C$ to $+75^{\circ}C$

ELECTRICAL CHARACTERISTICS

Test Conditions: $V_{CC} = +5.0V \pm 5\%$
$T_{Case} = 0^{\circ}C$ to $+75^{\circ}C$
Unless otherwise specified

	PARAMETER		SYM.	LIMITS MIN.	TYP.	MAX.	UNITS	TEST CONDITIONS
	Input Current	"1"	I_{IH}			17	mA	$V_{IN} = +5.0V$
D.C.	Output Voltage	"0"	V_{OL}		+0.2	+0.4	V	$V_{IH} = +4.5V$ $I_{OL} = 10mA$
						+0.4		$V_{IH} = +3.75V$ $I_{OL} = 3.2mA$
		"1"	V_{OH}	+2.4	+4.0			V_{IL} = Open Circuit, $I_{OH} = -240\mu A$
	Power Supply Current	Operating	I_{CC}			52	mA	One Input at +5.25V
		Maximum	I_{CCM}			88	mA	All Inputs at +5.25V
A.C.	Skew Time (Note 1)		T_{SK}		80	200	ns	$T_{Case} = 25^{\circ}C$, $V_{CC} = V_{IN} = +5.0V$, $C_L < 50pF$

NOTE: (1) Skew time is the maximum time differential between propagation delay times of any outputs including strobe and K_{RO}.

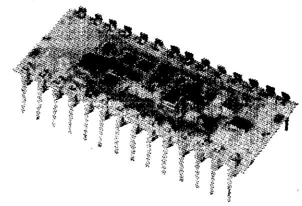
8 Channel, 12 Bit DAS with μP Interface

HS 9410 Series

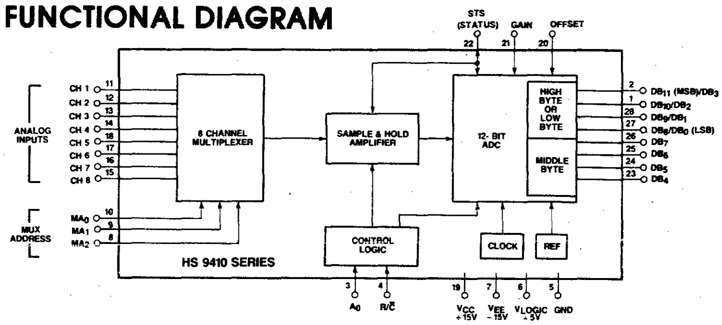


$99 (100's)

FEATURES

- Complete 8 Channel, 12-Bit Data Acquisition System with MUX, S/H, REF, Clock and three-state outputs
- Full 8- or 16-Bit Microprocessor Bus Interface
- Guaranteed Linearity Over Temperature
- High Throughput Rate: 30kHz
- Hermetic 28-pin Metal or Low Cost Epoxy DIP
- Low Power: 900mW

FUNCTIONAL DIAGRAM



SPECIFICATIONS

Resolution	12 Bits
Number of Channels	8 Single Ended
Throughput Rate	30 kHz
Power Supply	±15V, +5V
Package	28-pin DIP

Add letter suffix as required above.

***0.4% AQL** All units have full burn-in at +85°C. Acceptable quality level (AQL) of 0.4% means that Hybrid Systems guarantees that there will be no rejects in a sample lot of 100 pieces. That's more than twice as tough as it has to be — even for military applications. Specifications subject to change without notice.

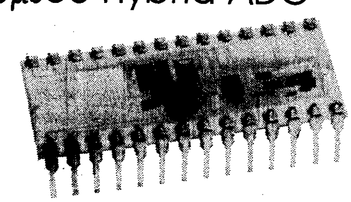
Industry Standard 574

12-Bit, 30μsec Hybrid ADC

$34.50 (100's)



FEATURES

- Complete 12-Bit A/D Converter
- 30μSec Conversion Time
- Power 400mW
- No Missing Codes
- μP BUS Compatible
- Commercial and MIL-STD-883B Processing
- Hermetic, 28-pin DIP, Metal Package

*Also available LD110/111/114 (not recommended for new designs), and ICL7126 (recommended use ICL7136).

Integrating Analog-to-Digital Converters for Data Acquisition

Type	Single Chip	Two Chip System***	
Model	ICL7109	ICL8052A/8068 ICL7104-14	ICL8052A/8068 ICL7104-16
Resolution	±12-Bit Binary	±14-Bit	±16-Bit
Accuracy	±1 Count	±1 Count	±1 Count
Microprocessor Compatible	Yes	Yes	Yes
Output	Programmable: 1. Latched parallel 3 state Binary 2. Controlled 2-8 bit bytes	Programmable: 1. Latched parallel 3 state Binary 2. Controlled 2-8 Bit Byte for ICL7104-12/14 3-8 Bit Byte for ICL7104-16	
Control Lines	Run/Hold, Busy, Byte Enables, Mode, Load, Send Enable, Out of Range		
Conversion Time	10ms	80ms	330ms
UART Compatible	Yes	Yes	Yes
Noise (Typical)	15μV	2μV (8068)	2μV (8068)
Input Current	10pA	30pA (8052)	30pA (8052)
Input Voltage Range	+400mV to +4.1V	+100mV to +10V	+200mV to −10V

***ICL8052/8068 and ICL8053 can be combined as analog portion of dual-slope A/D converter under μp control. See ICL8052/8068 and ICL 7104-16 for performance characteristics.

Quad Current Switches ICL8018/8019/8020

High speed precision current switches for use in current summing D/A converters. Can be purchased individually or in matched sets with accuracies of 0.01% (ICL8018), 0.1% (ICL8019), or 1.0% (ICL8020)

**C_{STO} = 0.01 µF

Monolithic Voltage Converter—The ICL7660

Converts positive voltage into negative over a range of + 1.5V through + 10V. May be cascaded for higher negative output voltages, paralleled for greater output current, used as a positive voltage multiplier, or any combination of the above. Typical supply current is 170 µA, and output source resistance is 55Ω at T_A = 25°C and I_O = 20 mA

Notes:
1. Switch Resistance under worst case analog voltage.
2. Positive logic LO ("0") or HI ("1") voltage at driver input necessary to turn switch on.
3. Logic "0" or "1" can be arbitrarily assigned for double-throw switches.
4. Switch resistance under best case analog voltage.

INTERSIL

Counters, Timers and Display Drivers

Part Number	Circuit Description	Package	Crystal Frequency	Output
ICM7207 ICM7207A	Frequency counter timebase.	14-Pin DIP 14-Pin DIP	6.5536 MHz 5.2488 MHz	0.01, 0.1, or 1-second count window plus store, reset and MUX.
ICM7208	7-digit unit counter. With addition of 7207 the circuit becomes a complete timer-frequency counter.	28-Pin DIP	—	LED display drive
ICM7211 ICM7212	Four-digit display decoder drivers; ICM7211 is LCD; ICM7212 is LED; Non-multiplexed for low noise, BCD input, decoded display drive output.	40-Pin DIP (plastic)	—	Four-digit, seven-segment direct display drive; LED or LCD
ICM7216 ICM7226	Eight-digit universal counter measures frequency, period, frequency ratio, time interval, units; on-board time base.	28-Pin DIP 40-Pin DIP (Cerdip or plastic)	1 or 10 MHz	Eight-digit-common anode or common cathode direct LED drive; BCD output
ICM7217 ICM7227	Four-digit CMOS up/down counter; presettable start/count and compare register; for hard-wired or microprocessor control applications; cascadable.	28-Pin Cerdip or plastic	—	Four-digit, seven-segment common anode or common cathode direct LED display drive; equal, zero, carry/borrow
ICM7218A/D ICM7218E	LED display driver system with 8x8 memory; numeric or dot (1 of 64) decoding; microprocessor compatible.	28-Pin DIP 40-Pin DIP (Cerdip or plastic)	—	Eight-digit, seven-segment plus decimal point; common cathode or common anode
ICM7224 ICM7225	4½-digit high speed counter/decoder/driver, 25 MHz typ; ICM7224 is LCD, ICM7225 is LED; direct display drive, cascadable.	40-Pin DIP (plastic)	—	4½-digit seven-segment direct display driver; LED or LCD
ICM7231	8-digit CMOS multiplexed LCD driver. Parallel input.	40-Pin DIP (plastic)	—	Eight-digit, seven-segment plus two flags per digit
ICM7232	10½-digit CMOS multiplexed LCD driver. Serial input.	40-Pin DIP (plastic)	—	10½-digit, seven-segment plus two flags per digit
ICM7233	4-character CMOS multiplexed LCD driver. Parallel alphanumeric (6-bit ASCII) input.	40-Pin DIP (plastic)	—	Four-character, 16-segment plus colon
ICM7234	5-character CMOS multiplexed LCD driver. Serial alphanumeric (6-bit ASCII) input.	40-Pin DIP (plastic)	—	Five-character, 16-segment plus colon
ICM7235/A	4-digit CMOS decoder/driver for direct drive vacuum fluorescent displays. BCD input.	40-Pin DIP (plastic)	—	Four-digit, seven-segment, vacuum fluorescent display drive; either HEX or CODE B
ICM7235M/AM	Same as above but microprocessor compatible.			
ICM7236	4½-digit high speed CMOS counter/decoder/driver for vacuum fluorescent displays; 25 MHz typ. counting speed.	40-Pin DIP (plastic)	—	4½-digit, seven-segment, vacuum fluorescent display drive
ICM7236A	Same as above but counting to 15959.	40-Pin DIP (plastic)	—	4½-digit, seven-segment, vacuum fluorescent display drive
ICM7240 ICM7250 ICM7260	Programmable CMOS counter/timers using external RC time base. Programmable from µs to years.	16-Pin DIP	External	Timed output
ICM7242	Fixed CMOS counter/timer. Uses external RC time base; sequence timing from µs to minutes.	8-Pin DIP	External	Timed output
ICM7243	8-character multiplexed LED display driver with alphanumeric (6-bit ASCII) input.	40-Pin Cerdip	—	Eight-character, 14/16-segment common cathode alphanumeric LED display drive
ICM7281	LCD Dot Matrix Column Driver	40-Pin DIP	—	Up to 256 x 256 dots
ICM7555 ICM7556	Single or dual CMOS version of industry-standard 555 timer; 80 µA typ. supply current; 500 kHz guaranteed; 2-18V power supply.	8-Pin DIP 14-Pin DIP	—	

INTERSIL

ADC0801–ADC0804
8-Bit Microprocessor Compatible A/D Converters

FEATURES

- MCS-48 and MCS-80/85 bus compatible–no interfacing logic required
- Conversion time < 100μs
- Easy interface to all microprocessors
- Will operate "stand alone"
- Differential analog voltage inputs
- Works with bandgap voltage references
- TTL compatible inputs and outputs
- On-chip clock generator
- 0V to 5V analog voltage input range (single +5V supply)
- No zero-adjust required

GENERAL DESCRIPTION

The ADC0801 family are CMOS 8-bit successive approximation A/D converters which use a modified potentiometric ladder, and are designed to operate with the 8080A control bus via three-state outputs. These converters appear to the processor as memory locations or I/O ports, hence no interfacing logic is required.

The differential analog voltage input has good common-mode-rejection, and permits offsetting the analog zero-input-voltage value. In addition, the voltage reference input can be adjusted to allow encoding any smaller analog voltage span to the full 8 bits of resolution.

The ADC0801 family is available in the industry standard 20 pin CERDIP package.

ICL7106/7107

3½-Digit Single Chip A/D Converter

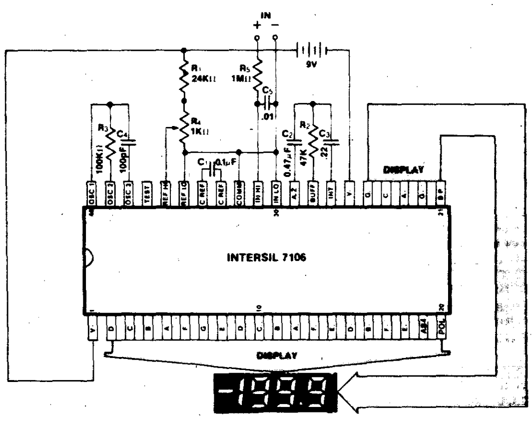
FEATURES

- **Guaranteed zero reading for 0 volts input on all scales.**
- **True polarity at zero for precise null detection.**
- **1 pA typical input current.**
- **True differential input and reference.**
- **Direct display drive - no external components required. — LCD ICL7106**
  — LED ICL7107
- **Low noise - less than 15μV p-p.**
- **On-chip clock and reference.**
- **Low power dissipation - typically less than 10mW.**
- **No additional active circuits required.**
- **Evaluation Kit available.**

GENERAL DESCRIPTION

The Intersil ICL7106 and 7107 are high performance, low power 3½-digit A/D converters containing all the necessary active devices on a single CMOS I.C. Included are seven-segment decoders, display drivers, reference, and a clock. The 7106 is designed to interface with a liquid crystal display (LCD) and includes a backplane drive; the 7107 will directly drive an instrument-size light emitting diode (LED) display.

The 7106 and 7107 bring together an unprecedented combination of high accuracy, versatility, and true economy. High accuracy like auto-zero to less than 10μV, zero drift of less than 1μV/°C, input bias current of 10 pA max., and roll-over error of less than one count. The versatility of true differential input and reference is useful in all systems, but gives the designer an uncommon advantage when measuring load cells, strain gauges and other bridge-type transducers. And finally the true economy of single power supply operation (7106), enabling a high performance panel meter to be built with the addition of only 7 passive components and a display.



ICL7106 with Liquid Crystal Display

ICL7109 12 Bit Binary A/D Converter for Microprocessor Interfaces

FEATURES

- **12 bit binary (plus polarity and overrange) dual slope integrating analog-to-digital converter.**
- **Byte-organized TTL-compatible three-state outputs and UART handshake mode for simple parallel or serial interfacing to microprocessor systems.**
- **RUN/HOLD input and STATUS output can be used to monitor and control conversion timing.**
- **True differential input and differential reference.**
- **Low noise — typically 15μV p-p.**
- **1pA typical input current.**
- **Operates at up to 30 conversions per second.**
- **On-chip oscillator operates with inexpensive 3.58MHz TV crystal giving 7.5 conversions per second for 60Hz rejection. May also be operated as RC oscillator for other clock frequencies.**
- **Fabricated using MAX-CMOS™ technology combining analog and digital functions on a single low power LSI CMOS chip.**
- **All inputs fully protected against static discharge; no special handling precautions necessary.**

GENERAL DESCRIPTION

The ICL7109 is a high performance, low power integrating A/D converter designed to easily interface with microprocessors.

The output data (12 bits, polarity and overrange) may be directly accessed under control of two byte enable inputs and a chip select input for a simple parallel bus interface. A UART handshake mode is provided to allow the ICL7109 to work with industry-standard UARTs in providing serial data transmission, ideal for remote data logging applications. The RUN/HOLD input and STATUS output allow monitoring and control of conversion timing.

The ICL7109 provides the user with the high accuracy, low noise, low drift, versatility and economy of the dual-slope integrating A/D converter. Features like true differential input and reference, drift of less than 1μV/°C, maximum input bias current of 10pA, and typical power consumption of 20mW make the ICL7109 an attractive per-channel alternative to analog multiplexing for many data acquisition applications.

PIN CONFIGURATION AND TEST CIRCUIT:

INTERSIL

ICL7115

Fast CMOS Monolithic 14-Bit A/D Converter

FEATURES

- **14-bit linearity and resolution (0.003%)**
- **No missing codes**
- **Microprocessor compatible byte-organized buffered outputs**
- **Fast conversion (40μs)**
- **Auto-zeroed comparator for low offset voltage**
- **Low linearity and gain tempco (1ppm/°C, 4ppm/°C)**
- **Low power consumption (60mW)**
- **No gain or offset adjustment necessary (0.006% FS)**
- **Provides 3% useable overrange**
- **FORCE/SENSE and separate digital and analog ground pins for increased system accuracy**

GENERAL DESCRIPTION

The ICL7115 is the first monolithic 14-bit accurate, fast successive approximation A/D converter. It uses thin film resistors and CMOS circuitry with an on-chip PROM calibration table circuit to achieve 14-bit linearity without laser trimming. Special design techniques used in the DAC and comparator result in high speed, while the fully static silicon-gate CMOS circuitry keeps the power dissipation very low.

Microprocessor bus interfacing is made easy by the use of standard WRite and ReaD cycle timing and control signals, combined with Chip Select and Address pins. The digital output pins are byte-organized and three-state gated for bus interface to 8, 12, and 16-bit systems.

The ICL7115 provides separate Analog and Digital grounds. Analog ground, voltage reference and input voltage pins are separated into force and sense lines for increased system accuracy. Operating with ±5V supplies, the ICL7115 accepts 0V to +5V input with a −5V reference or 0V to −5V input with a +5V reference.

The ICL7115 is available in several versions with different accuracies, temperature ranges and packages. A Leadless Chip Carrier (LCC) package is also available; consult factory.

GENERAL DESCRIPTION

The Intersil ICL7129 is a very high-performance 4½-digit analog-to-digital converter that directly drives a multiplexed liquid crystal display. This single-chip CMOS integrated circuit requires only a few passive components and a reference to operate. And it is ideal for high-resolution hand-held digital multimeter applications.

The performance of the ICL7129 has not been equaled before in a single-chip A/D converter. The successive integration technique used in the ICL7129 results in accuracy better than 0.005% of full-scale and resolution down to 10μV/count.

The ICL7129, drawing only 1mA from a 9V battery, is well suited for battery powered instruments. Provision has been made for the detection and indication of a "LOW BATTERY" condition. Autoranging instruments can be made with the ICL7129 which provides overrange and underrange outputs and 10:1 range changing input. The ICL7129 instantly checks for continuity, giving both a visual indication and a logic level output which can enable an external audible signal. These features and the high performance of the ICL7129 make it an extremely versatile and accurate instrument-on-a-chip.

INTERSIL

ICL7134

14-Bit μP-Compatible Multiplying D/A Converter

FEATURES

- **14-bit linearity (0.003% FSR)**
- **No gain adjustment necessary**
- **Microprocessor-compatible with double buffered inputs**
- **Bipolar application requires no extra adjustments or external resistors**
- **Output current settling-time 3μs max (0.9μs typ)**
- **Low linearity and gain temperature coefficients**
- **Low power dissipation**
- **Full four-quadrant multiplication**
- **Full temperature range operation**

GENERAL DESCRIPTION

The ICL7134 combines a four-quadrant multiplying DAC using thin film resistors and CMOS circuitry with an on-chip PROM-controlled correction circuit to achieve true 14-bit linearity without laser trimming.

Microprocessor bus interfacing is eased by standard memory WRite cycle timing and control signal use. Two input buffer registers are separately loaded with the 8 least significant bits (LS register) and the 6 most significant bits (MS register). Their contents are then transferred to the 14-bit DAC register, which controls the output switches. The DAC register can also be loaded directly from the data inputs, in which case the registers are transparent.

The ICL7134 is supplied in two versions. The ICL7134U is programmed for unipolar operation while the ICL7134B is programmed for bipolar applications. The V_{REF} input to the most significant bit of the DAC is separated from the reference input to the remainder of the ladder. For unipolar use, the two reference inputs are tied together, while for bipolar operation, the polarity of the MSB reference is reversed, giving the DAC a true 2's complement input transfer function. Two resistors which facilitate the reference inversion are included on the chip, so only an external op-amp is needed. The PROM is coded to correct for errors in these resistors as well as the inversion of the MSB.

Long Term Stability			1000 Hours, +125°C (Note 3)		10		ppm/√month

Note 1: Full-Scale Range (FSR) is 10V for unipolar mode, 20V (±10V) for bipolar mode.
Note 2: Using internal feedback and reference inverting resistors.
Note 3: Guaranteed by design, not 100% tested in production.

INTERSIL

ICL7135

Precision 4½ Digit Single Chip A/D Converter

FEATURES

- **Accuracy guaranteed to ±1 count over entire ±20,000 counts (2.0000 volts full scale)**
- **Guaranteed zero reading for 0 volts input**
- **1 pA typical input current**
- **True differential input**
- **True polarity at zero count for precise null detection**
- **Single reference voltage required**
- **Over-range and under-range signals available for auto-ranging capability**
- **All outputs TTL compatible**
- **Blinking display gives visual indication of over-range**
- **Six auxiliary inputs/outputs are available for interfacing to UARTs, microprocessors or other complex circuitry**
- **Multiplexed BCD output versatility**

GENERAL DESCRIPTION

The Intersil ICL7135 precision A/D converter, with its multiplexed BCD output and digit drivers, combines dual-slope conversion reliability with ±1 in 20,000 count accuracy and is ideally suited for the visual display DVM/DPM market. The 2.0000V full scale capability, auto-zero and auto-polarity are combined with true ratiometric operation, almost ideal differential linearity and true differential input. All necessary active devices are contained on a single CMOS I.C., with the exception of display drivers, reference, and a clock.

The Intersil ICL7135 brings together an unprecedented combination of high accuracy, versatility, and true economy. High accuracy like auto-zero to less than 10μV, zero drift of less than 1μV/°C, input bias current of 10 pA max., and rollover error of less than one count. The versatility of multiplexed BCD outputs is increased by the addition of several pins which allow it to operate in more sophisticated systems. These include STROBE, OVERRANGE, UNDERRANGE, RUN/HOLD and BUSY lines, making it possible to interface the circuit to a microprocessor or UART.

Clock	Clock Freq. (Note 4)			DC	2000	1200	kHz

Note 1: Tested in 4-1/2 digit (20,000 count) circuit shown in Fig. 1, clock frequency 120kHz.
Note 2: Tested with a low dielectric absorption integrating capacitor. See Component Selection Section.
Note 3: The temperature range can be extended to +70°C and beyond as long as the auto-zero and reference capacitors are increased to absorb the higher leakage of the ICL7135.
Note 4: This specification relates to the clock frequency range over which the ICL7135 will correctly perform its various functions. See "Max Clock Frequency" below for limitations on the clock frequency range in a system.

INTERSIL

ICL7136

3½-Digit Low Power A/D Converter

FEATURES

- **First-reading recovery from overrange gives immediate "OHMS" measurement**
- **Guaranteed zero reading for 0V input**
- **True polarity at zero for precise null detection**
- **1pA typical input current**
- **True differential input and reference**
- **Direct LCD display drive — no external components required**
- **Pin compatible with the ICL7106, ICL7126**
- **Low noise — 15μVp-p without hysteresis or overrange hangover**
- **On-chip clock and reference**
- **Low power dissipation, guaranteed less than 1mW — gives 8,000 hours typical 9V battery life**
- **No additional active circuits required**
- **Evaluation Kit available (ICL7136EV/Kit)**

GENERAL DESCRIPTION

The Intersil ICL7136 is a high performance, very low power 3½-digit A/D converter. All the necessary active devices are contained on a single CMOS IC, including seven-segment decoders, display drivers, reference, and clock. The 7136 is designed to interface with a liquid crystal display (LCD) and includes a backplane drive. The supply current is under 100μA, ideally suited for 9V battery operation.

The 7136 brings together an unprecedented combination of high accuracy, versatility, and true economy. High accuracy, like auto-zero to less than 10μV, zero drift of less than 1μV/°C, input bias current of 10pA max., and rollover error of less than one count. The versatility of true differential input and reference is useful in all systems, but gives the designer an uncommon advantage when measuring load cells, strain gauges and other bridge-type transducers. And finally the true economy of single power supply operation allows a high performance panel meter to be built with the addition of only 7 passive components and a display.

The ICL7136 is an improved version of the ICL7126, eliminating the overrange hangover and hysteresis effects, and should be used in its place in all applications. It can also be used as a plug-in replacement for the ICL7106 in a wide variety of applications, changing only the passive components.

TYPICAL APPLICATIONS (Continued)

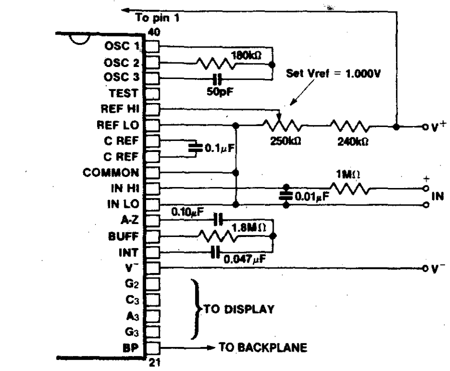

Figure 11. Recommended Component Values for 2.000V Full-Scale, 3 Readings/Sec. For 1 reading/sec, change C_{INT}, R_{OSC} to values of Figure 10.

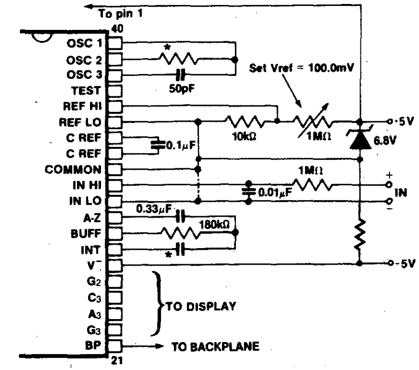

Figure 12. 7136 with Zener Diode Reference. Since low TC zeners have breakdown voltages ~6.8V, diode must be placed across the total supply (10V). As in the case of Figure 11, IN LO may be tied to COMMON.

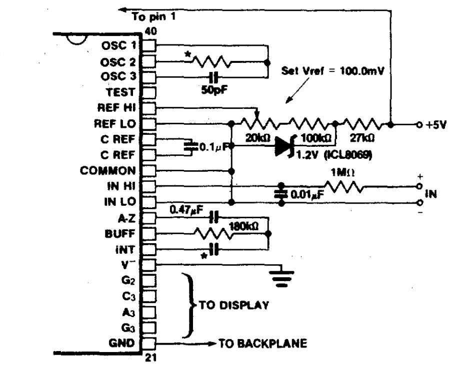

Figure 13. 7136 Operated from Single +5V Supply. An external reference must be used in this application, since the voltage between V^+ and V^- is insufficient for correct operation of the internal reference.

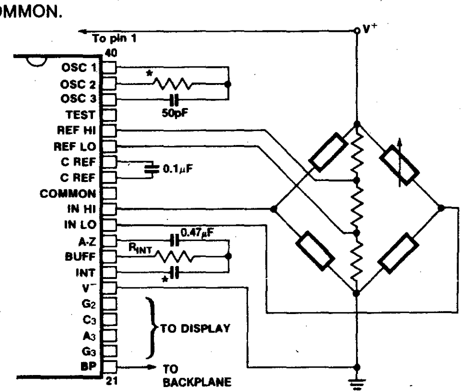

Figure 14. 7136 Measuring Ratiometric Values of Quad Load Cell. The resistor values within the bridge are determined by the desired sensitivity.

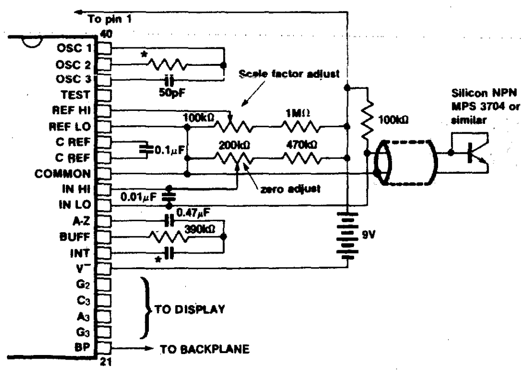

Figure 15. 7136 used as a Digital Centigrade Thermometer. A silicon diode-connected transistor has a temperature coefficient of about −2mV/°C. Calibration is achieved by placing the sensing transistor in ice water and adjusting the zeroing potentiometer for a 000.0 reading. The sensor should then be placed in boiling water and the scale-factor potentiometer adjusted for a 100.0 reading. See ICL8073/4 and AD590 data sheets for alternative circuits.

ICL7145

16-Bit μP-Compatible Multiplying D/A Converter

FEATURES

- 16-bit resolution
- High linearity—0.003% FSR
- Microprocessor compatible with buffered inputs
- Bipolar application requires no external resistors
- Output current settling time 3μs max (1.0μs typ)
- Low linearity and gain temperature coefficients (1ppm/°C typ)
- Low power dissipation
- Full four-quadrant multiplication
- Full temperature range operation

GENERAL DESCRIPTION

The ICL7145 combines a four-quadrant multiplying DAC using thin film resistors and CMOS circuitry with an on-chip PROM-controlled correction circuit to achieve 0.003% linearity without laser trimming.

Microprocessor bus interfacing is eased by standard memory $\overline{WR}$ite cycle timing and control signal use. The input buffer register is loaded with the 16-bit input, and directly controls the output switches. The register is transparent if $\overline{WR}$ and $\overline{CS}$ are held low.

The ICL7145 is designed and programmed for bipolar operation. There is an offset resistor to the output with a reference input which should be connected to $-V_{REF}$, giving the DAC a true 2's complement input transfer function. Two extra resistors to facilitate the reference inversion are included on the chip, so that only an external op amp is needed.

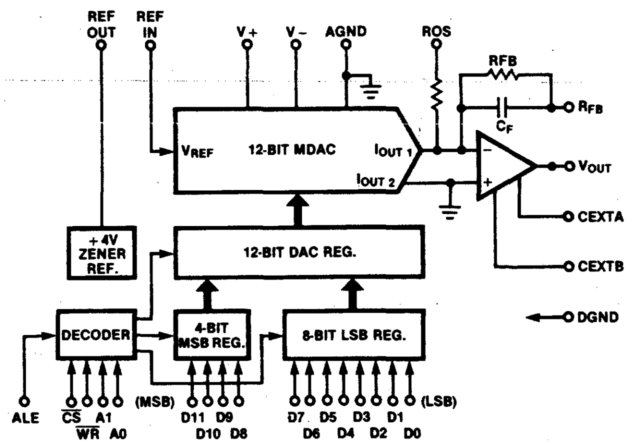
GENERAL DESCRIPTION

The ICL7146 is the first of a series of complete 12-Bit CMOS DAC's. These DAC's feature all of the needed support circuitry to interface to processors and give a voltage output. Contained on the chip are two levels of latches for double buffers, a trimmed reference, a latch controller, and an output buffer amplifier. All devices are accurately trimmed for both gain and offset so that no external trimming is required.

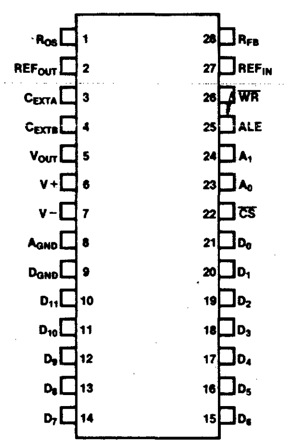
CMOS circuitry is used to keep the power dissipation low, and with all devices contained on a single chip, significant board size reductions are possible. As an alternative to this, many more analog channels could be added to a board and still decrease power consumption. Intersil's patented autostabilized op amp construction eliminates drifts in the zero offset and provides a fast (7 μs) settling time.

Processor interface is double-buffered with all 12-bits being brought out. The first level of latches is divided into 4 and 8 bit bytes with a 12 bit wide second buffer. Data can be directly entered into any of the three buffers or the buffers can be operated separately.

BLOCK DIAGRAM



PIN CONFIGURATION



its output value. Neither of these conditions are acceptable in a wide variety of applications. Hence the need for double buffering.

Buffer control is handled by a decoder to ease processor interface requirements. Operation of the decoder is shown in the truth table.

ICL7667
Dual Power MOS Driver

FEATURES

- 1.5A Peak Output Current
- Fast Rise and Fall Times
  — 40ns with 1000pF load
- Wide Supply Voltage Range
  — V_{CC} = 4.5 to 20V
- Low Power Consumption
  — 4mW with inputs low
  — 120mW with inputs high
- TTL/CMOS Input Compatible Power Driver
  — R_{OUT} = 6Ω
- Direct Interface with Common Switching Regulators
- Pin Equivalent to DS0026/DS0056

TYPICAL APPLICATIONS

- Switching Power Supplies
- DC/DC Converters
- Motor Controllers

GENERAL DESCRIPTION

The ICL7667 is a dual monolithic high-speed driver designed to convert TTL level signals into high current outputs at voltages up to 20V. Its high speed and 1.5A peak current output enable it to drive large capacitive loads with high slew rates and low propagation delays. With an output voltage swing only millivolts less than the supply voltage and a maximum supply voltage of 20V, the ICL7667 is well suited for driving power MOSFETs in high frequency switching regulators. The ICL7667's high current (1.5A peak) outputs minimize power losses in the power MOSFETs by rapidly charging and discharging the gate capacitances, while the ICL7667's inputs are TTL compatible and can be directly driven by common switching regulator IC's.

INTERSIL

ICM7209
CMOS Clock Generator

FEATURES
- High frequency operation — 10MHz guaranteed
- Easy to use oscillator — requires only a quartz crystal and two capacitors
- Bipolar, MOS and CMOS compatibility
- High output drive capability — 5 x TTL fanout with 10ns rise and fall times
- Low power — 50mW at 10MHz
- Choice of two output frequencies — osc., and osc. ÷8 frequencies
- Disable control for both outputs
- Wide industrial temperature range — −20°C to +85°C
- All inputs fully protected — circuits may be handled without any special precautions

GENERAL DESCRIPTION
The Intersil ICM7209 is a versatile CMOS clock generator capable of driving a number of 5 volt systems with a variety of input requirements. When used to drive up to 5 TTL gates, the typical rise and fall times are 10ns.

The ICM7209 consists of an oscillator, a buffered output equal to the oscillator frequency and a second buffered output having an output frequency one-eighth that of the oscillator. The guaranteed maximum oscillator frequency is 10MHz. Connecting the DISABLE terminal to the negative supply forces the ÷8 output into the '0' state and the output 1 into the '1' state.

Output Low State	V_{OL}	Either OUT 1 or OUT ÷8 simulated 5 x TTL loads			0.4	V
Output High State	V_{OH}	Either OUT 1 or OUT ÷8 simulated 5 x TTL loads	4.0	4.9		V
Output Rise Time (Note 3)	t_r	Either OUT 1 or OUT ÷8 simulated 5 x TTL loads		10	25	ns
Output Fall Time (Note 3)	t_f	Either OUT 1 or OUT ÷8 simulated 5 x TTL loads		10	25	ns
Minimum OSC Frequency for ÷8 Output	f_{osc}	Note 2	2			MHz
Output ÷8 duty cycle		Any operating frequency Low state : High state		7:9		
Oscillator Transconductance	gm		80	200		μmho

NOTE 1: The power dissipation is a function of the oscillator frequency (1st ORDER EFFECT see curve) but is also effected to a small extent by the oscillator tank components.

NOTE 2: The ÷8 circuitry uses a dynamic scheme. As with any dynamic system, information or data is stored on very small nodal capacitances instead of latches (static systems) and there is a lower cutoff frequency of operation. Dynamic dividers are used in the ICM7209 to significantly improve high frequency performance and to decrease power consumption.

NOTE 3: Rise and fall times are defined between the output levels of 0.5 and 2.4 volts.

ICM7243

8-Character 14-/16-Segment Alphanumeric LED Display Driver

FEATURES

- **14- and 16-segment fonts with decimal point**
- **Mask programmable for other font-sets up to 64 characters**
- **Microprocessor compatible**
- **Directly drives small common cathode displays**
- **Cascadable without additional hardware**
- **Standby feature turns display off; puts chip in low power mode**
- **Serial entry or random entry of data into display**
- **Single +5V operation**
- **Character and segment drivers, all MUX scan circuitry, 8×6 static memory and 64-character ASCII font generator included on-chip**

GENERAL DESCRIPTION

The ICM7243 is an 8-character alphanumeric display driver and controller which provides all the circuitry required to interface a microprocessor or digital system to a 14- or 16-segment display. It is primarily intended for use in microprocessor systems, where it offloads the processor and minimizes hardware and software overhead. Incorporated on-chip are a 64-character ASCII decoder, an 8×6 memory, the high power character and segment drivers, and the multiplex scan circuitry.

Six-bit ASCII data to be displayed is written into the memory directly from the microprocessor data bus. Data location depends upon the selection of either **Serial** (MODE = 1) or **Random** (MODE = 0). In the **Serial Access** mode the first entry is stored in the lowest location and displayed in the "left-most" character position. Each subsequent entry is automatically stored in the next higher location and displayed to the immediate "right" of the previous entry. A DISPlay FULL signal is provided after 8 entries; this signal can be used for cascading. A $\overline{\text{CLeaR}}$ pin is provided to clear the memory and reset the location counter. The **Random Access** mode allows the processor to select the memory address and display digit for each input word.

The character multiplex scan runs whenever data is not being entered. It scans the memory and CHARacter drivers, and ensures that the decoding from memory to display is done in the proper sequence. Intercharacter blanking is provided to avoid display ghosting.

APPLICATIONS (Continued)

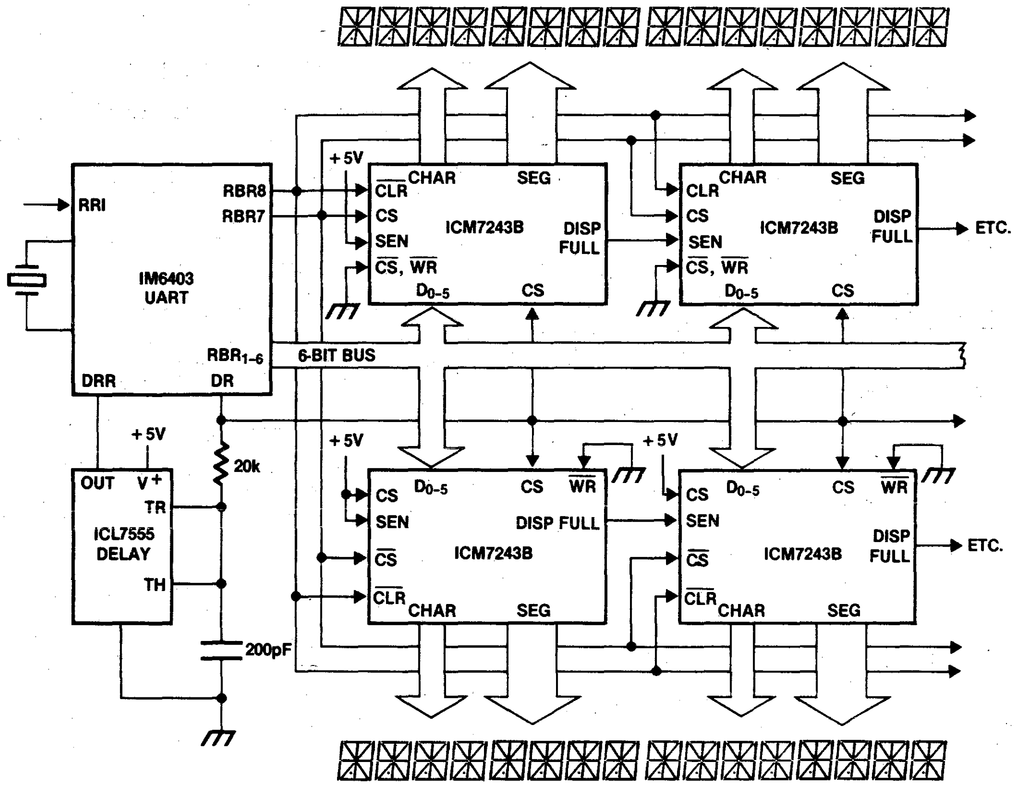

Figure 2. Driving Two Rows of Characters from a Serial Input. UART converts data stream to parallel bytes. Bit 7 of each word sets which row data will be entered into. Bit 8 will blank and reset whole display if low. Each MODE pin should be tied high. ICM7243A can also be used, with inverter on RBR7 for one row.

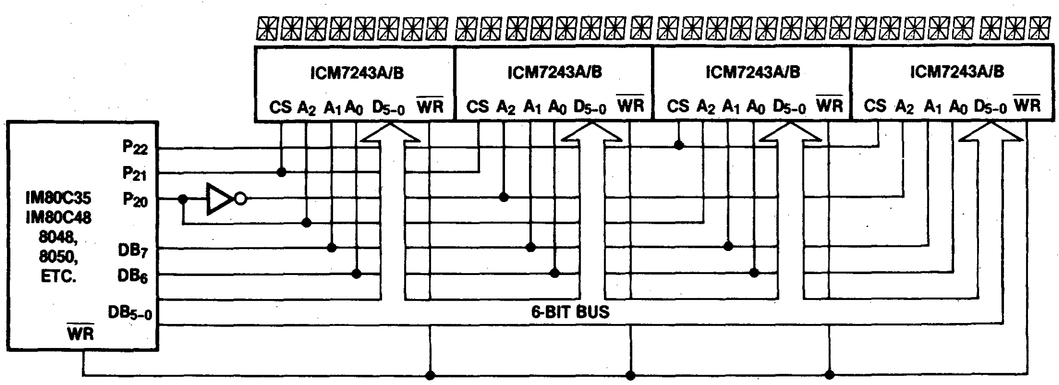

Figure 3. Random Access 32-Character Display in MCS-48 system. One port line controls A_2, other two are CS lines. 8-bit data bus drives 6 data and 2 address lines. MODE should be GrouNDed on each part.

INTERSIL

ICM7281
LCD Column Driver

FEATURES

- LCD Dot Matrix Column Driver
- 40 High Voltage LCD Column Drive Outputs For Up to 8 5xN Characters per IC
- Easy Interface
  —Serial Input Shift Register With parallel latch and carry outputs
- Directly Compatible with ICM7280 Row Driver
  —Up to 10 ICM7281's can be driven by an ICM7280 with no external components
- Low Resistance Outputs
  —Can drive both columns and rows of LCD graphics displays
- Will Drive 1.5V Threshold LCDs with Only Single 5V Supply
  —Can drive up to 4.5V threshold LCDs with 15V V_{DISP}

GENERAL DESCRIPTION

The ICM7281 LCD Dot Matrix Column Driver is designed to convert a serial data stream into drive signals for a multiplexed dot matrix LCD. Easily cascadable, up to 10 ICM7281's can be driven by one ICM7280 Intelligent Row Driver to make an 80 character dot matrix display. The ICM7281 also serves as both a Row Driver and Column Driver in LCD dot matrix graphics displays. The low output resistance and the 15V drive capability make it well suited for graphics displays with up to 256 x 256 dots (with 10pF/dot capacitance).

The ICM7281 consists of a 40 bit shift register, a 40 bit latch and 40 level-shifters/drivers. The 4 display drive voltages are generated externally, usually by a Row Driver. A serial data interface is used to minimize the number of pins needed for digital interfacing. Two data Carry Outputs are included for cascading several ICM7281's to drive large LCD displays.

ORDERING INFORMATION

No. Of Columns	Package	Order Number
30	40 Pin Plastic	ICM7281IPL
40	Dice	ICM7281I/D
40	52-64 Pin Plastic Flatpack	—

TYPICAL APPLICATIONS

- Column Drivers for Dot Matrix Alphanumeric Displays using ICM7280 Row Driver
- Row and Column Drivers for LCD Dot Matrix Graphics Displays
- Segment Driver for LCD Bargraphs and Annunciators
- Serial Input I/O Expander

GE INTERSIL

IH5040-IH5051 Family High Level CMOS Analog Gates

FEATURES

- Switches Greater Than 20Vpp Signals With ±15V Supplies
- Quiescent Current Less Than 1μA
- Overvoltage Protection to ±25V
- Break-Before-Make Switching t_{off} 200 nsec, t_{on} 300 nsec Typical
- T^2L, DTL, CMOS, PMOS Compatible
- Non-Latching With Supply Turn-Off
- Low $r_{DS(on)}$ – 35Ω
- New DPDT & 4PST Configurations
- Complete Monolithic Construction IH5040 through IH5047

FUNCTIONAL DIAGRAM

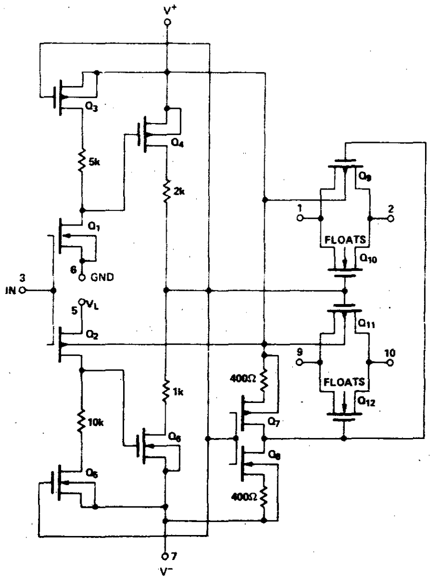

FIGURE 1. TYPICAL DRIVER, GATE – IH5042

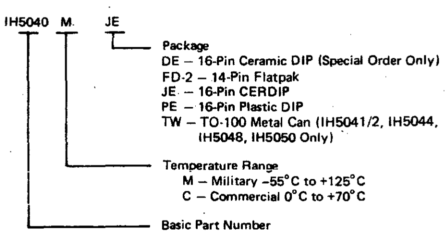
ORDERING INFORMATION



GENERAL DESCRIPTION

The IH5040 family of solid state analog gates are designed using an improved, high voltage CMOS monolithic technology. These devices provide ease-of-use and performance advantages not previously available from solid state switches. This improved CMOS technology provides input overvoltage capability to ±25 volts without damage to the device, and destructive latch-up of solid state analog gates has been eliminated. Early CMOS gates were destroyed when power supplies were removed with an input signal present. The IH5040 CMOS technology has eliminated this serious systems problem.

Key performance advantages of the 5040 series are TTL compatibility and ultra low-power operation. The quiescent current requirement is less than 1μA. Also designed into the 5040 is guaranteed Break-Before-Make switching, which is accomplished by extending the t_{on} time (300 nsec TYP.) so that it exceeds t_{off} time (200 nsec TYP.). This insures that an ON channel will be turned OFF before an OFF channel can turn ON. This eliminates the need for external logic required to avoid channel to channel shorting during switching.

Many of the 5040 series improve upon and are pin-for-pin and electrical replacements for other solid state switches.

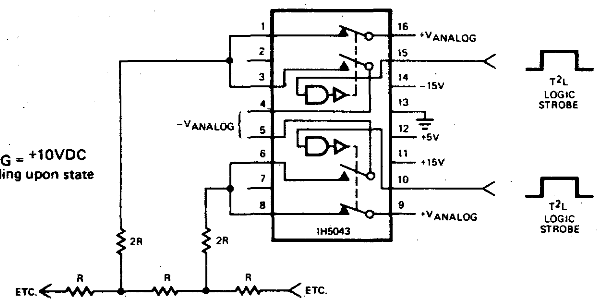
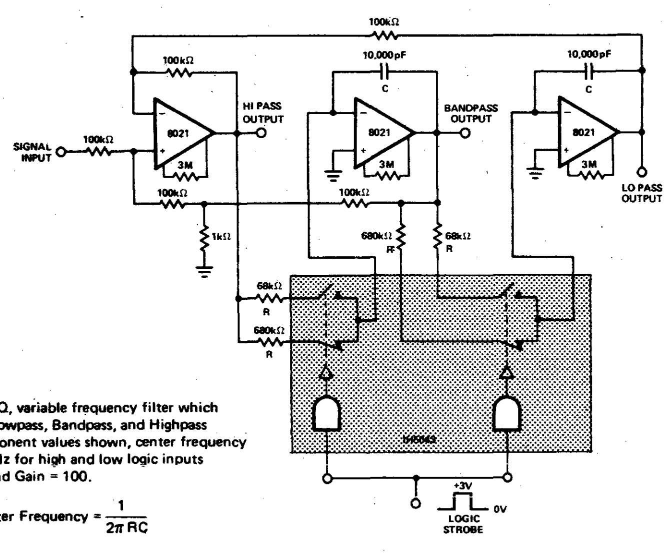
USING THE CMOS SWITCH TO DRIVE
AN R/2R LADDER NETWORK (2 LEGS)



EXAMPLE: If $-V_{ANALOG} = -10VDC$ and $+V_{ANALOG} = +10VDC$ then Ladder Legs are switched between ±10VDC, depending upon state of Logic Strobe.

DIGITALLY TUNED
LOW POWER ACTIVE FILTER



Constant gain, constant Q, variable frequency filter which provides simultaneous Lowpass, Bandpass, and Highpass outputs. With the component values shown, center frequency will be 235Hz and 23.5Hz for high and low logic inputs respectively, Q = 100, and Gain = 100.

$$f_n = \text{Center Frequency} = \frac{1}{2\pi RC}$$

IH5108

8-Channel Fault Protected CMOS Analog Multiplexer

FEATURES

- Ultra low leakage— $I_{D(off)} \leq 100pA$
- Power supply quiescent current less than 1mA
- ±13V analog signal range
- No SCR latchup
- Break-before-make switching
- Pin compatible with DG508, HI508 and AD7508
- All channels OFF ($I_{ILK} \leq 100nA$) when power OFF, for analog signals up to ±25V
- Any channel turns OFF ($I_{ILK} \leq 100nA$) if input exceeds supply rails by up to ±25V. Throughput always < ±14V (±15V supplies)
- TTL and CMOS compatible binary Address and ENable inputs

GENERAL DESCRIPTION

The IH5108 is a dielectrically isolated CMOS monolithic analog multiplexer, designed as a plug-in replacement for the DG508 and similar devices, but adding fault protection to the standard performance. A unique serial MOSFET switch ensures that an OFF channel will remain OFF when the input exceeds the supply rails by up to ±25V, even with the supply voltage at zero. Further, an ON channel will be limited to a throughput of about 1.5V less than the supply rails, thus affording protection to any following circuitry such as op amps, D/A converters, etc. Cross talk onto "good" channels is also prevented.

A binary 3-bit address code together with the ENable input allows selection of any one channel or none at all. These 4 inputs are all TTL compatible for easy logic interface; the ENable input also facilitates MUX expansion and cascading.

INTERSIL

IH5140 Family High Level CMOS Analog Gates

FEATURES

- Super fast break before make switching t_{on} 80ns typ, t_{off} 50ns typ (SPST switches)
- Power supply currents less than 1μA
- OFF leakages less than 100pA @ 25°C guaranteed
- Non-latching with supply turn-off
- Single monolithic CMOS chip
- Plug-in replacements for IH5040 family and part of the DG180 family to upgrade speed and leakage
- Greater than 1MHz toggle rate
- Switches greater than 20Vp-p signals with ±15V supplies
- T^2L, CMOS direct compatibility

GENERAL DESCRIPTION

The IH5140 Family of CMOS monolithic switches utilizes Intersil's latch-free junction isolated processing to build the fastest switches now available. These switches can be toggled at a rate of greater than 1 MHz with super fast t_{on} times (80ns typical) and faster t_{off} times (50ns typical), guaranteeing break before make switching. This family of switches therefore combines the speed of the hybrid FET DG 180 Family with the reliability and low power consumption of a monolithic CMOS construction.

OFF leakages are guaranteed to be less than 100pA at 25°C. No quiescent power is dissipated in either the ON or the OFF state of the switch. Maximum power supply current is 1μA from any supply and typical quiescent currents are in the 10nA range which makes these devices ideal for portable equipment and military applications.

The IH5140 Family is completely compatible with TTL (5V) logic, TTL open collector logic and CMOS logic gates. It is pin compatible with Intersil's IH5040 Family and part of the DG180/190 Famiiy as shown in the switching state diagrams.

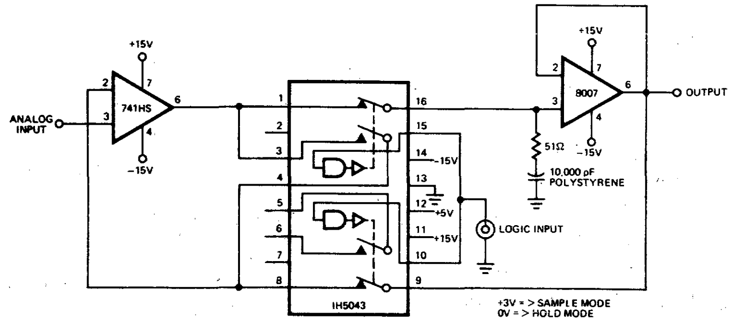
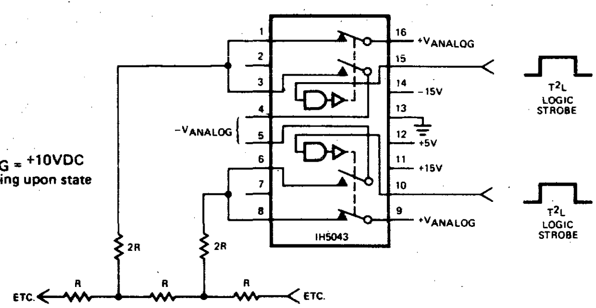
APPLICATIONS

IMPROVED SAMPLE & HOLD
USING IH5043

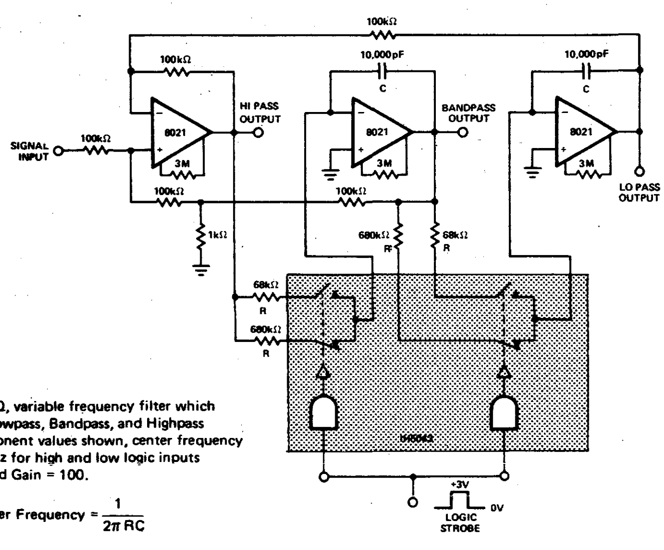


USING THE CMOS SWITCH TO DRIVE
AN R/2R LADDER NETWORK (2 LEGS)



EXAMPLE: If $-V_{ANALOG} = -10VDC$ and $+V_{ANALOG} = +10VDC$ then Ladder Legs are switched between ±10VDC, depending upon state of Logic Strobe.

DIGITALLY TUNED
LOW POWER ACTIVE FILTER



Constant gain, constant Q, variable frequency filter which provides simultaneous Lowpass, Bandpass, and Highpass outputs. With the component values shown, center frequency will be 235Hz and 23.5Hz for high and low logic inputs respectively, Q = 100, and Gain = 100.

$$f_n = \text{Center Frequency} = \frac{1}{2\pi RC}$$

INTERSIL

IH5108

8-Channel Fault Protected CMOS Analog Multiplexer

FEATURES

- Ultra low leakage—$I_{D(off)} \leq$ 100pA
- Power supply quiescent current less than 1mA
- ±13V analog signal range
- No SCR latchup
- Break-before-make switching
- Pin compatible with DG508, HI508 and AD7508
- All channels OFF ($I_{ILK} \leq$ 100nA) when power OFF, for analog signals up to ±25V
- Any channel turns OFF ($I_{ILK} \leq$ 100nA) if input exceeds supply rails by up to ±25V. Throughput always < ±14V (±15V supplies)
- TTL and CMOS compatible binary Address and ENable inputs

GENERAL DESCRIPTION

The IH5108 is a dielectrically isolated CMOS monolithic analog multiplexer, designed as a plug-in replacement for the DG508 and similar devices, but adding fault protection to the standard performance. A unique serial MOSFET switch ensures that an OFF channel will remain OFF when the input exceeds the supply rails by up to ±25V, even with the supply voltage at zero. Further, an ON channel will be limited to a throughput of about 1.5V less than the supply rails, thus affording protection to any following circuitry such as op amps, D/A converters, etc. Cross talk onto "good" channels is also prevented.

A binary 3-bit address code together with the ENable input allows selection of any one channel or none at all. These 4 inputs are all TTL compatible for easy logic interface; the ENable input also facilitates MUX expansion and cascading.

DG200/IH5200
CMOS Dual SPST Analog Switches

FEATURES
- Switches Greater Than 28Vpp Signals With ± 15V Supplies
- Break-Before-Make Switching t_{off} 250 nsec, t_{on} 700nsec Typical
- T^2L, DTL, CMOS, PMOS Compatible
- Non-Latching With Supply Turn-Off
- Complete Monolithic Construction
- Industry Standard (DG200)
- Improved Performance Version (IH5200)

GENERAL DESCRIPTION
The DG200/IH5200 solid state analog gates are designed using an improved, high voltage CMOS monolithic technology. They provide ease-of-use and performance advantages not previously available from solid state switches. Destructive latch-up of solid state analog gates has been eliminated by INTERSIL's CMOS technology.

The DG200 is completely spec and pin-out compatible with the industry standard device, while the IH5200 offers significantly enhanced specifications with respect to ON and OFF leakage currents, switching times, and supply current.

IH5341
CMOS Monolithic RF/Video Switch

FEATURES

- $r_{ds(on)} < 75\Omega$, flat from DC to 100MHz (< 3dB)
- "OFF" isolation > 60dB @ 10MHz
- Cross coupling isolation > 60dB @ 10MHz
- Directly compatible with TTL, CMOS
- Wide operating power supply range
- Power supply current < 1μA
- "Break-before-Make" switching
- Fast switching (80ns/150ns typ)

ORDERING INFORMATION

PART NUMBER	TEMPERATURE RANGE	PACKAGE
IH5341CPD	0 to +70°C	14-Pin DIP
IH5341ITW	−20°C to +85°C	TO-100
IH5341MTW	−55°C to +125°C	TO-100

GENERAL DESCRIPTION

The IH5341 is a dual SPST, CMOS monolithic switch which uses a "Series/Shunt" ("T" switch) configuration to obtain high "OFF" isolation while maintaining good frequency response in the "ON" condition.

Construction of remote and portable video equipment with extended battery life is facilitated by the extremely low current requirements. Switching speeds are typical $t_{on} = 150ns$ and $t_{off} = 80ns$, and guaranteed "Break-before-Make" switching.

Switch "ON" resistance is typically 40Ω-50Ω with ±15V power supplies, increasing to typically 175Ω for ±5V supplies. The devices are available in TO-100 and 14-pin epoxy DIP packages.

INTERSIL

IH6108
8-Channel CMOS Analog Multiplexer

FEATURES
- Ultra Low Leakage — $I_{D(off)} \leq 100pA$
- $r_{DS(on)} < 400$ ohms over full signal and temperature range
- Power supply quiescent current less than 100μA
- ±14V analog signal range
- No SCR latchup
- Break-before-make switching
- Binary Address control (3 Address inputs control 8 channels)
- TTL and CMOS compatible strobe control
- Pin compatible with DG508, HI-508 & AD7508

GENERAL DESCRIPTION
The IH6108 is a CMOS monolithic, one of 8 multiplexer. The part is a plug-in replacement for the DG508. Three line binary decoding is used so that the 8 channels can be controlled by 3 Address inputs; additionally a fourth input is provided to use as a system enable. When the ENable input is high (5V) the channels are sequenced by the 3 line Address inputs, and when low (0V) all channels are off. The 3 Address inputs are controlled by TTL logic or CMOS logic elements, a "0" corresponding to any voltage greater than 2.4V. Note that the ENable input (EN) must be taken to 5V to enable the system and less than 0.8V to disable the system.

INTERSIL

IH6116

16-Channel CMOS Analog Multiplexer

FEATURES

- **Pin compatible with DG506, HI-506 & AD7506**
- **Ultra Low Leakage — $I_{D(off)} \leq$ 100pA**
- **±11 analog signal range**
- **$r_{DS(on)}$ <700 ohms over full signal and temperature range**
- **Break-before-make switching**
- **TTL and CMOS compatible Address control**
- **Binary Address control (4 Address inputs control 16 channels)**
- **Two tier submultiplexing to facilitate expandability**
- **Power supply quiescent current less than 100μA**
- **No SCR latchup**

GENERAL DESCRIPTION

The IH6116 is a CMOS monolithic, one of 16 multiplexer. The part is a plug-in replacement for the DG506. Four line binary decoding is used so that the 16 channels can be controlled by 4 Address inputs; additionally a fifth input is provided to use as system enable. When the ENable input is high (5V) the channels are sequenced by the 4 line Address inputs, and when low (0V), all channels are off. The 4 Address inputs are controlled by TTL logic or CMOS logic elements with a "0" corresponding to any voltage less than 0.8V and a "1" corresponding to any voltage greater than 3.0V. Note that the ENable input must be taken to 5V to enable the system and less than 0,8V to disable the system.

INTERSIL

IH6208

4-Channel Differential CMOS Analog Multiplexer

FEATURES

- **Ultra low leakage — $I_{D(off)} \leq$ 100pA**
- **$r_{DS(on)}$ < 400 ohms over full signal and temperature range**
- **Power supply quiescent current less than 100μA**
- **±14V analog signal range**
- **No SCR latch up**
- **Break-before-make switching**
- **Binary Address control (2 Address inputs control 2 out of 8 channels)**
- **TTL and CMOS compatible Address control**
- **Pin compatible with HI509, DG509 & AD7509**

GENERAL DESCRIPTION

The IH6208 is a monolithic 2 of 8 CMOS multiplexer. The part is a plug-in replacement for the DG509. Two line binary decoding is used so that the 8 channels can be controlled in pairs by the binary inputs; additionally a third input is provided to use as a system enable. When the ENable input is high (5V) the channels are sequenced by the 2 line binary inputs, and when low (0V) all channels are off. The 2 Address inputs are controlled by TTL logic or CMOS logic elements with a "0" corresponding to any voltage less than 0.8V and a "1" corresponding to any voltage greater than 2.4V. Note that the ENable input must be taken to 5V to enable the system, and less than 0.8V to disable the system.

IH6216

8-Channel Differential CMOS Analog Multiplexer

FEATURES

- Pin compatible with HI507, DG507 & AD7507
- ±11V analog signal range
- $r_{DS(on)}$ < 700 ohms over full signal and temperature range
- Break-before-make switching
- TTL and CMOS compatible Address control
- Binary Address control (3 Address inputs control 2 out of 16 channels)
- Two tier submultiplexing to facilitate expandability
- Power supply quiescent current less than 100μA
- No SCR latch up
- Very low leakage $I_{D(off)} \leq$ 100pA

GENERAL DESCRIPTION

The IH6216 is a CMOS monolithic 2 of 16 multiplexer. The part is a plug-in replacement for the DG507. Three line binary decoding is used so that the 16 channels can be controlled in pairs by the binary inputs; additionally a fourth input is provided to use as a system enable. When the ENable input is high (5V) the channels are sequenced by the 3 line binary inputs, and when low (0V) all channels are off. The 3 Address inputs are controlled by TTL logic or CMOS logic elements with a "0" corresponding to any voltage less than 0.8V and a "1" corresponding to any voltage greater than 3.0V. Note that the ENable input must be taken to 5V to enable the system and less than 0.8V to disable the system.

INTERSIL

IM6402/IM6403 Universal Asynchronous Receiver Transmitter (UART)

FEATURES

- Low Power — Less Than 10mW Typ. at 2MHz
- Operation Up to 4MHz Clock (IM6402A)
- Programmable Word Length, Stop Bits and Parity
- Automatic Data Formatting and Status Generation
- Compatible with Industry Standard UART's (IM6402)
- On-Chip Oscillator with External Crystal (IM6403)
- Operating Voltage —
  IM6402-1/03-1: 5V
  IM6402A/03A: 4-11V
  IM6402/03: 5V

GENERAL DESCRIPTION

The IM6402 and IM6403 are CMOS/LSI UART's for interfacing computers or microprocessors to asynchronous serial data channels. The receiver converts serial start, data, parity and stop bits to parallel data verifying proper code transmission, parity, and stop bits. The transmitter converts parallel data into serial form and automatically adds start, parity, and stop bits.

The data word length can be 5, 6, 7 or 8 bits. Parity may be odd or even, and parity checking and generation can be inhibited. The stop bits may be one or two (or one and one-half when transmitting 5 bit code). Serial data format is shown in Figure 6.

The IM6402 and IM6403 can be used in a wide range of applications including modems, printers, peripherals and remote data acquisition systems. CMOS/LSI technology permits clock frequencies up to 4.0MHz (250K Baud), an improvement of 10 to 1 over previous PMOS UART designs. Power requirements, by comparison, are reduced from 670mW to 10mW. Status logic increases flexibility and simplifies the user interface.

The IM6402 differs from the IM6403 in the use of five device pins as indicated in Table 1 and Figure 1.

The Micro Networks Division of Unitrode Corporation is an established world leader in the design, development and manufacturing of high-performance, thin and thick-film, hybrid microcircuits for data acquisition/conversion applications. We are the largest supplier of such devices for military/aerospace applications, and are rapidly developing new processing technologies that will enable us to extend our reputation for quality and reliability to the high volume commercial/industrial marketplace. In the first half of 1984, for example, we will introduce the MN565A 12-bit D/A - our first monolithic data converter.

✓ = **New Product**

1. For units with an external clock, the table shows the minimum conversion time that will result in specified accuracy. For units with internal clock, maximum conversion time is given.
2. No Missing Codes for 14 bits guaranteed over temperature.
3. No Missing Codes for 14 bits guaranteed at +25°C. No Missing Codes for 13 bits guaranteed over temperature.
4. No Missing Codes for 15 bits guaranteed over temperature.
5. The serial-parallel conversion technique does not require a clock.
6. No Missing Codes for 10 bits guaranteed at +200°C.

✔ = New Product

1. Full scale change settling to ± ½LSB.
2. Current-output devices have no output op amps
3. Monotonicity for 14 bits guaranteed over temperature.
4. Latch timing parameters: minimum setup time 50nsec, maximum hold time 0nsec, minimum latch enable pulse width 60nsec.
5. Latch timing parameters: minimum setup time 40nsec, maximum hold time 0nsec, minimum latch enable pulse width 60nsec.
6. Monotonicity guaranteed at 25°C.
7. Internal output op amp.
8. Produces standard 1Vp-p video signal when driving 75Ω load.

MITEL

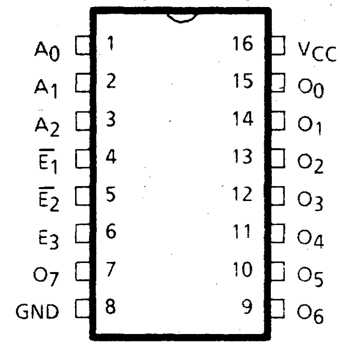
MD54/74HCT138R
1 of 8 Octal Decoder/Demultiplexer
Preliminary Information

October '83

Features

- High latch-up immunity
- High current outputs can drive 15 LSTTL loads
- Low power ISO-CMOS technology
- Meets or exceeds all proposed JEDEC 40.2 specifications
- Fully TTL compatible inputs and outputs
- Pin compatible with 54/74LS138 types

CONNECTION DIAGRAM
DIP (TOP VIEW)



Description

This ISO-CMOS, MSI circuit is designed for use in high speed memory and peripheral address decoding systems. The MD54/74HCT138 will decode 3 binary inputs (A_0, A_1,A_2) to select one of eight mutually exclusive outputs (O_0 - O_7). Three enable inputs, two active LOW ($\overline{E}_1$, $\overline{E}_2$) and one active HIGH (E_3), reduce the need for external gates in an expanded system. A 1 of 32 decoder requires only four of these devices and one external inverter. The enable inputs can be used as the data input for demultiplexing applications.

Ordering Information

MD54HCT138RCB, Cerdip
-55°C to 125°C
with MIL 883B option

MD74HCT138RE, Plastic Dip

MD54/74HCT139R

Dual 1 of 4 Decoder/Demultiplexer

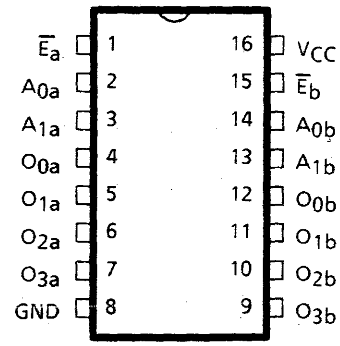
Preliminary Information

October '83

Features

- High latch-up immunity
- High current outputs can drive 15 LSTTL loads
- Low power ISO-CMOS technology
- Meets or exceeds all proposed JEDEC 40.2 specifications
- Fully TTL compatible inputs and outputs
- Pin compatible with 54/74LS139 types

CONNECTION DIAGRAM
DIP (TOP VIEW)



Ordering Information

-55°C to 125°C
with MIL 883B option

MD74HCT139RE, Plastic Dip
-40°C to 85°C

Description

This ISO-CMOS, MSI circuit is designed for use in high speed memory and peripheral, address decoding systems. The MD54/74HCT139 will decode 2 binary inputs (A_0, A_1) to select one of four mutually exclusive outputs (O_0 - O_3). The enable inputs, active LOW ($\overline{E}_a$, $\overline{E}_b$) independantly control the two separate 1 of 4 decoder/demultiplexers.

FLOPPY DISK READ AMPLIFIER

The MC3470 is a monolithic READ Amplifier System for obtaining digital information from floppy disk storage. It is designed to accept the differential ac signal produced by the magnetic head and produce a digital output pulse that corresponds to each peak of the input signal. The gain stage amplifies the input waveform and applies it to an external filter network, enabling the active differentiator and time domain filter to produce the desired output.

- Combines All the Active Circuitry To Perform the Floppy Disk Read Amplifier Function in One Circuit
- Guaranteed Maximum Peak Shift of 2.0% — MC3470A
- Improved (Positive) Gain T_C and Tolerance
- Improved Input Common Mode

FLOPPY DISK
WRITE CONTROLLERS

SILICON MONOLITHIC
INTEGRATED CIRCUIT

FLOPPY DISK WRITE CONTROLLER

The MC3469 and MC3471 are monolithic WRITE Current Controllers designed to provide the entire interface between floppy disk heads and the head control and write data signals for straddle-erase or tunnel-erase heads.

Provisions are made for selecting a range of accurately controlled write currents and for head selection during both read and write operation. Additionally, provisions are included for externally adjusting degauss period and inner/outer trace compensation.

The MC3471 provides the erase delay and inhibit functions required to interface with tunnel-erase heads.

- Head Selection — Current Steering Through Write Head and Erase Coil in Write Mode
- Provides High Impedance (Read Data Enable) during Read Mode
- Head Current (Write) Guaranteed Using Laser Trimmed Internal Resistor (3.0 mA using R_{ext} = 10 kΩ)
- IRW Select Input Provides for Inner/Outer Track Compensation
- Degauss Period Externally Adjustable
- Minimizes External Components
- MC3471 Provides On-Chip Adjustable Erase Delays

OCTAL THREE-STATE BUFFER/LATCH

This series of devices combines four features usually found desirable in bus-oriented systems: 1) High impedance logic inputs insure that these devices do not seriously load the bus; 2) Three-state logic configuration allows buffers not being utilized to be effectively removed from the bus; 3) Schottky technology allows for high-speed operation; 4) 48 mA drive capability.

- Inverting and Non-Inverting Options of Data
- SN74S373 Function Pinouts
- Eight Transparent Latches/Buffers in a Single Package
- Full Parallel-Access for Loading and Reloading
- Buffered Control Inputs
- All Inputs Have Hysteresis to Improve Noise Rejection
- High Speed — 8.0 ns (Typ)
- Three-State Logic Configuration
- Single +5 V Power Supply Requirement
- Compatible with 74S Logic or M6800 Microprocessor Systems
- High Impedance PNP Inputs Assure Minimal Loading of the Bus

QUAD SINGLE-ENDED LINE DRIVER

The MC3481 and MC3485 are quad single-ended line drivers specifically designed to meet the IBM 360/370 I/O specification (GA22-6974-3).

Output levels are guaranteed over the full range of output load and fault conditions. Compliance with the IBM requirements for fault protection, flagging, and power up/power down protection for the bus make this an ideal line driver for party line operations.

- Separate Enable and Fault Flags — MC3481
- Common Enable and Fault Flag — MC3485
- Power Up/Down Does Not Disturb Bus
- Schottky Circuitry for High-Speed — PNP Inputs
- Internal Bootstraps for Faster Rise Times
- Driver Output Current Foldback Protection
- MC3485 has LS Totem Pole Driver Output

GPIB INSTRUMENTATION BUS INTERFACE
MC3447

BIDIRECTIONAL INSTRUMENTATION BUS (GPIB) TRANSCEIVER

This bidirectional bus transceiver is intended as the interface between TTL or MOS logic and the IEEE Standard Instrumentation Bus (488-1978, often referred to as GPIB). The required bus termination is internally provided.

Low power consumption has been achieved by trading a minimum of speed for low current drain on non-critical channels. A fast channel is provided for critical ATN and EOI paths.

Each driver/receiver pair forms the complete interface between the bus and an instrument. Either the driver or the receiver of each channel is enabled by a Send/Receive input with the disabled output of the pair forced to a high impedance state. The receivers have input hysteresis to improve noise margin, and their input loading follows the bus standard specifications.

- Low Power – Average Power Supply Current = 30 mA Listening, 75 mA Talking
- Eight Driver/Receiver Pairs
- Three-State Outputs
- High Impedance Inputs
- Receiver Hysteresis – 600 mV (Typ)
- Fast Propagation Times – 15–20 ns (Typ)
- TTL Compatible Receiver Outputs
- Single +5 Volt Supply
- Open Collector Driver Output with Terminations
- Power Up/Power Down Protection (No Invalid Information Transmitted to Bus)
- No Bus Loading When Power is Removed From Device
- Required Termination Characteristics Provided

LASER TRIMMED HIGH-SPEED 12-BIT D/A CONVERTER

SILICON MONOLITHIC INTEGRATED CIRCUIT

COMPLETE 12-BIT HIGH-SPEED MONOLITHIC D/A CONVERTER

The MC3412/3512 is a monolithic 12-bit resolution D/A converter. It contains a high stability bandgap reference capable of supplying 1.5 mA externally, trimmed to ±0.25% maximum error. Active laser trimming of thin film ladder network, reference, span, bipolar offset, and bandgap resistors at wafer level provide accuracy and linearity of better than ±½ LSB. An innovative bit switching scheme provide fast settling time yet enables selection of CMOS or TTL thresholds. TTL threshold levels are retained over a wide V_{CC} range from 13.5 to 16.5 volts. Precision internal span resistors allow output voltage options of 0 to 5.0 V, 0 to 10 V, ±2.5 V, ±5.0 V, and ±10 V. 12-bit accuracy and a fast settling time of typically 200 ns (to ±½ LSB) make this converter ideal for applications such as a fast A/D building block or display driver.

- True 12-Bit Linearity: ±½ LSB Max
- Fast Settling Time: ±½ LSB in 200 ns Typ
- Fully Monotonic Over Temperature Range
- High-Stability Bandgap Voltage Reference On Chip
- Linearity Guaranteed Over Temperature
- Low Power Consumption: 210 mW
- Pinout Compatible with AD563 and AD565
- Selectable Digital Thresholds
- Internal Span Resistors for Generating Output Voltage

CASE 732

MPU-BUS-COMPATIBLE 8-BIT D-TO-A CONVERTER

The MC6890 is a self-contained, bus-compatible, 8 bit (±0.19% accuracy) D-to-A converter system capable of interfacing directly with 8-bit microprocessors.

Available in both commercial and military temperature ranges, this monolithic converter contains master/slave registers to prevent transparency to data transitions during active enable; a laser-trimmed, low-TC, 2.5 V precision bandgap reference; and high stability, laser-trimmed, thin-film resistors for both reference input and output span and bipolar offset control.

A reset pin provides for overriding stored data and forcing I_{out} to zero.

- Direct Data Bus Link with All Popular TTL Level MPU's
- ±1/2 LSB Nonlinearity Over Temperature
- Fast Settling Time: 200 ns Typ
- Internal 2.5-V Precision Laser-Trimmed Voltage Reference (May Also Be Used Externally)
- Minimum $\overline{\text{Enable}}$ Pulse Width: 70 ns
- Fast $\overline{\text{Enable}}$: 10 ns Maximum Data Hold Time
- $\overline{\text{Reset}}$ Pin to Override Data
- Output Voltage Ranges: +5, +10, +20, or ±2.5, ±5, ±10 Volts
- Low Power: 90 mW Typ
- +5 V and −5 V to −15 V Supplies

D-A CONVERTERS — HIGH SPEED

MC10318 series — A high speed 8-bit D/A converter capable of data conversion rates in excess of 25 MHz. It is intended for applications in high speed instrumentation and communication equipment, graphics displays, storage oscilloscopes, radar processing, and TV broadcast systems. The inputs are compatible with MECL 10,000 series logic, while the complementary current outputs have 51 mA full scale capability. Monotonic over the full temperature range, the outputs typically settle in 10 ns.

T_A = 0 to 70°C

DATA CONVERSION

MC10315L MC10317L

Advance Information

HIGH SPEED 7-BIT ANALOG-TO-DIGITAL FLASH CONVERTER

SILICON MONOLITHIC INTEGRATED CIRCUIT

SEVEN-BIT PARALLEL HIGH SPEED A/D CONVERTER (WITH OVERRANGE)

The MC10315L/MC10317L is a 7-bit high speed parallel A/D converter which employs ECL processing. The device consists of 128 parallel latched comparators across a high quality input reference network. The 128 comparator outputs are then fed to a 128-to-7 encoder and latched to the outputs which are ECL compatible. An overrange bit is provided to allow overrange sensing, or to facilitate the connection of an MC10315L and MC10317L in parallel to produce an 8-bit A/D converter. The MC10315L and MC10317L are identical devices except for the method of overranging used, which simplifies the utilization of two 7-bit converters to produce an 8-bit conversion. (See ordering information and technical description.)

Applications include video display and radar signal processing, high speed instrumentation, and TV broadcast video encoding.

- 7-Bit Resolution/8-Bit Accuracy Plus Overrange
- Direct Interconnection for 8-Bit Conversion
- 15 MHz Sampling Rate
- Wide Range of Input Voltage: ±2.0 Volts
- Low Input Capacitance: ≤70 pF
- 1.2 Watt Power Dissipation
- No Sample and Hold Required for Video Bandwidth Signals
- Standard 24-Pin Package

SP9770

TEN BIT HIGH SPEED D TO A CONVERTER

The Plessey SP9770 10-bit D/A converter is capable of converting a digital signal into a analog voltage at a rate of over 75 mega-bits per second (MBPS). An inherently low glitch desing is used and the complementary current outputs are suitable for direct transmission line drive. Included on the chip is a high performance voltage reference and reference amplifier.

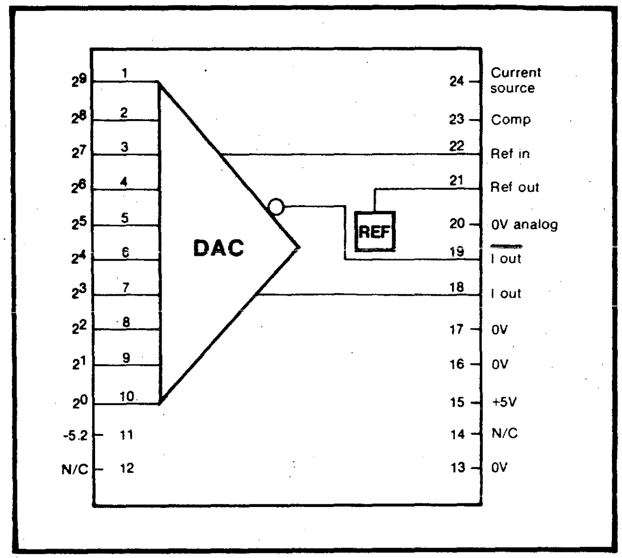

Fig. 1 SP9770 pin connections

FEATURES

- 12ns Settling time
- 10 bits to ±1/2 LSB absolute and differential non linearity
- 75 MBPS Update rate
- Current output
- ECL standard inputs
- Complementary outputs, 20 mA full scale
- Reference tempco. typically 40 ppm/°C
- DAC usable in multiplying mode to 25MHz
- 24 lead, 0.6 pitch package

ABSOLUTE MAXIMUM RATINGS

Postitive supply voltage	+ 5.5V
Negative supply voltage	—5.7V
Operating temperature range	—30°C to 85°C
Storage temperature	—55°C to 125°C
Lead temperature (soldering 60 sec)	300°C
Digital input voltage	0 to VEE
Min current set resistance	R SET 150Ω
Output reference supply	0 to +1V

OPERATING NOTES

The pinout of the device is shown in Fig. 1. External components are limited to the current setting resistor and decoupling capacitors.
The DAC has current outputs, with a nominal full scale of 20mA, corresponding with a 1 volt drop across a 50 ohm load.
The actual output current is determined by the on-chip reference voltage and an off-chip current setting resistor. Output current, I out, is given by

$$I_{OUT} = 4 \times \frac{V_{REF}}{R_{SET}}$$

A complementary $\overline{I_{OUT}}$ is also provided. The setting resistor, R_{SET}, is typically 240 ohms, giving a full scale output current of 20.75mA, and should have a temperature coefficient similar to that of the output load resistor.

Note 1

Pin 17 should be connected to a reference supply at the most positive voltages required, with the load and Rset pin 24 returned similarly to this reference. Conveniently the reference is ground, but this limits the output to negative excursions only. Refer to figure 3.

The reference voltage source is nominally — 1.28 volts and is of a modified bandgap type. Samples show average temperature coefficients of 40ppm/°C over the range — 55°C to 125°C.

The reference supply is internally compensated; however, to reduce the possibility of instability or noise generation, pin 21 shouls be decoupled to pin 23 with 2nF ceramic chip capacitor. The current loop technique (Fig 2) has been used with a high performance loop amplifier. The current is set by an external resistor as described above. Stabilization of the loop amplifier is achieved by a single capacitor from pin 23 to ground. Minimum value is 3900pF, although a 20nF chip ceramic is recommended.

Multiplying operation of the DAC is available in two modes, either a voltage applied in place of the reference, or a current supplied via the current source pin. In the former case the 3dB bandwidth os 250kHz, while in the latter, operational use is typically 25MHz. A suggested circuit is shown ib Fig. 4.

Measurement of Settling Time

Oscilloscopes, whether real time or sampling do not have sufficiently low input VSWR or on-screen resolution for precise settling time measurements. A measurement technique has been devised, shown diagrammatically in Fig. 4, in which the DAC can settle into nearly ideal 50 ohm load, with minimal interconnection paths; this also very closely related to the practical use of the device. Precision settling time measurements can be performed with a high speed comparator, conveniently a dual device, such as the SP9687, with a minimal delay time, in this case about 2ns. Two references are set up to detect the DAC output settling within a window, conveniently defined as the settling to ground of the output.

The lower comparator detects when the DAC output has settled within 1/2 LSB of the final settling point, while the upper device when switched in checks that there is no overshoot. In fact, the settling is very well behaved, and after correction for comparator delay, the results consistently show a DAC settling time of 12ns, defined from the 50% point of the DAC input switching waveform. No correction has been made for the excess loading capacitance at the output node, so these results are considered to be conservative.

NOTES:

(1) *Devices recommended for new designs are indicated in **bold face** type.
(2) See individual data sheets for package and temperature designations.
(3) Analog voltage range is a function of supply voltages. Where a FET switch is PMOS or CMOS, r_{DS} is also a function of Supply Voltage and Analog Voltage. See individual data sheets for more detail.
(4) Input reference voltage of 2.5 V is required (see data sheets).
(5) See data sheet for switch state of differential switches.
(6) Current Driven Device I_{INH} = 1 mA.
(7) For truth table see data sheet.
(8) The appropriate switching characteristic for multiplexers is $t_{transition}$, not t_{ON}, t_{OFF}.
(9) Device normally operates with resistor to +10V.

Drivers for MOSFET Switches

These drivers were designed to function as a level shifter and buffer between low level logic and the control gate of FET analog switches. Output voltage ratings are as high as 50V.

Basic Part Number (Note 2)			Function and Uses	at Rated Current(s)	OFF Level $V_{(OUT)OFF}$ at Rated Current or $I_{(OUT)OFF}$ at Rated Voltage	Input Logic for V_{OUT} (low)	V_{INL} (V)	V_{INH} (V) (I_{INH}) (mA)	Optimum Supply Voltage (V) V_1	V_2	V_L	V_R	Switching Time (µs) t_{ON}	t_{OFF}

Multiple FET Switches

Siliconix P-Channel MOSFET & DMOS Switches are available for such applications as sequential switching (commutation), signal processing, modulation, and A-to-D conversion. The MOSFET is normally OFF. These devices are also available with Siliconix drivers in a single package.

Fast CMOS Gate Arrays

The Siliconix family of CMOS gate arrays has been specifically designed to offer a fast and easy way to design your own custom integrated circuits. These FAST CMOS gate arrays offer virtually all the benefits of a full custom design at a fraction of the cost and time usually associated with full custom development programs.

Designing with our "State-of-the Art" silicon gate process is as easy as designing with standard "Off-the-Shelf" components. All the information necessary for you to begin your custom IC is contained in our design manual.

No Previous IC Design Experience Necessary

Our design manual walks you through the complete design process. All the information necessary to take your conceptual design through the breadboard stage to the final prototype evaluation is discussed, with numerous examples given. Over 100 macrocells are included in the manual to assist in converting your logic diagrams to the gate level. Our applications engineers are always available to answer any questions you may have concerning the design and integration of your gate array. Included in the design manual are 200X layout sheets, macrocell planning sheets, test planning sheets, and other tools developed by IC design experts.

A Wide Selection of Arrays to Choose From

Siliconix currently offers two families of oxide-isolated, silicon-gate arrays. Each family consists of seven different chips ranging in size from 360 to 1500 gates. A complete table of the arrays is shown in Table 1. The array family is determined by the process that is employed to fabricate the chips. The ISO-3 and ISO-5 refer to the design rules used for the gate masking step. Typical gate delays for each series are shown in Table 2 for V_{DD} of 5 volts.

Designation	Chip Size	Total Cells	Gate Equivalent	I/O Buffers	Bonding Pads
ISO5A/ISO3A	118x140	240	360	36	46
ISO5B/ISO3B	132x167	360	540	48	58
ISO5C/ISO3C	159x167	480	720	54	64
ISO5D/ISO3D	161x208	640	960	62	72
ISO5E/ISO3E	188x208	800	1200	68	78
ISO5F/ISO3F	188x244	1000	1500	76	86
ISO5G/ISO3G	214x244	1200	1800	84	92

TABLE 2

Macrocells

Our design manual contains over 100 characterized, pre-designed macrocells for virtually all SSI functions. When these macrocells are used, all contact opening and metal routing within the cell is done automatically, eliminating the possibility of error when the function is implemented. The following example of the implementation of an exclusive-OR gate should help illustrate this point. The schematic is shown for reference only and is not necessary for the implementation of the function. The macrocell for an exclusive-OR gate is found in the design manual listing for exclusive-OR gates. Note that several different versions can be implemented. The macrocell chosen for this example is XO1A, as illustrated in Figure 3.

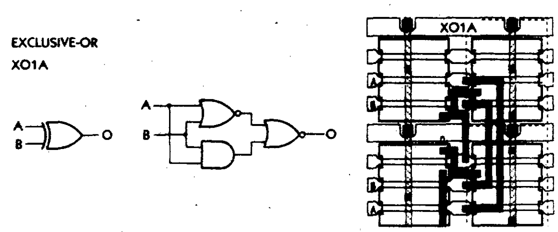

Figure 3

Input/Output Buffers

The ISO series has very powerful I/O buffers designed to be direct TTL-compatible, capable of sinking 6mA at 0.4V or 24mA at 2.5V (V_{DD} = 5.0V). Each p-buffer can source 2mA at 4.6V or 10mA at 2.5V. There are three transistors (one single and one double) in each buffer device which can be connected as desired for any particular application. All the output devices are fully guardbanded.

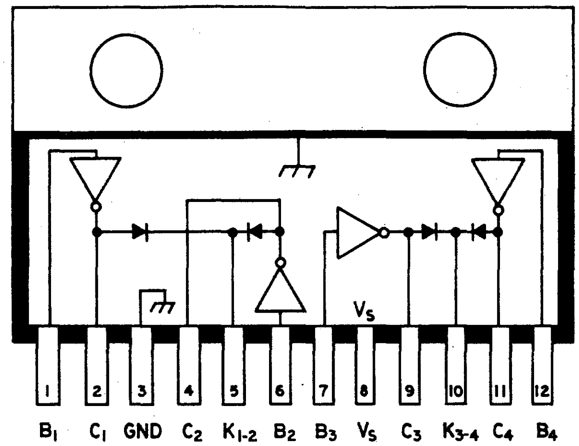
QUAD HIGH-CURRENT DARLINGTON SWITCH ICs

UDN-2878W AND UDN-2879W QUAD HIGH-CURRENT DARLINGTON SWITCHES

FEATURES

- Output Currents to 4 A
- Output Voltages to 80 V
- Loads to 1280 W
- TTL, DTL, or CMOS Compatible Inputs
- Internal Clamp Diodes
- Plastic Single In-Line Package
- Heat-Sink Tab



DWG. NO. A-11,974

THESE QUAD DARLINGTON ARRAYS are designed to serve as interface between low-level logic and peripheral power devices such as solenoids, motors, incandescent displays, heaters, and similar loads of up to 320 W per channel. Both integrated circuits include transient-suppression diodes that enable use with inductive loads. The input logic is compatible with most TTL, DTL, LS TTL, and 5 V CMOS logic.

For maximum power-handling capability, all drivers are supplied in a 12-pin single in-line power-tab package. The tab is at ground potential and needs no insulation. External heat sinks are usually required for proper operation of these devices.

Similar integrated circuits (Types UDN-2068B and UDN-2069B) are available in 16-pin dual in-line packages for operation with load currents of up to 1.5 A per channel. They are described in the most recent issue of Sprague Engineering Bulletin 29305.

Device	Sustaining Voltage	Output Voltage	Output Current
UDN-2878W	35 V	50 V	4 A
UDN-2878W-2	35 V	50 V	3 A
UDN-2879W	50 V	80 V	4 A
UDN-2879W-2	50 V	80 V	3 A

PARTIAL SCHEMATIC

SPRAGUE® THE MARK OF RELIABILITY a Penn Central unit

FULL-BRIDGE MOTOR DRIVER INTEGRATED CIRCUITS

UDN-2952B AND UDN-2952W FULL-BRIDGE MOTOR DRIVERS

FEATURES

- Output Currents to ±3.5A
- Output Voltages to 40V
- Adjustable Short-Circuit Protection
- Thermal Protection
- Internal Clamp Diodes
- TTL, DTL, PMOS, CMOS Compatible
- DIP or SIP Packaging

FULL-BRIDGE MOTOR-DRIVER integrated circuits, Types UDN-2952B and UDN-2952W combine low-level logic circuitry and Darlington output power drivers for bidirectional control of d-c motors or solenoids operating with continuous load currents of up to 2A and peak start-up currents as high as 3.5A.

These monolithic integrated circuits have extensive circuit protection. Both drivers have thermal shutdown networks that disable motor drive if the package power dissipation ratings are exceeded. Internal diode transient suppression is provided on-chip. Output-current limiting is determined by the user's selection of a sensing resistor.

The Type UDN-2952B full-bridge power driver is supplied in a 16-pin dual in-line plastic package with copper heat-sink contact tabs. The lead configuration enables easy attachment of a heat sink while fitting a standard integrated circuit socket or printed wiring board layout. Type UDN-2952W, for higher power requirements, is in a 12-pin single in-line power tab package. The tab is at ground potential and needs no insulation.

Advance Product Information

TSC426/427/428
Dual Power MOSFET Driver
• 1.5 Amp Peak Drive Current
• 50 ns Rise Time

General Description

The TSC426/427/428 are dual high speed power MOSFET drivers. Each device converts CMOS/TTL input levels to a high voltage level drive signal. Switching times of 50 ns are typical with 1000 pf loads. Peak output drive current is 1.5 amp. Delay times have been matched for both inverting and non-inverting stages.

The TSC428 contains an inverting and non-inverting driver. The TSC426 is inverting and TSC427 non-inverting.

Features

- CMOS Construction for Low Current Drain ..... 6 mA
- High Output Voltage .... V_S -0.05 V
- High Peak Current Drive .... 1.5 A
- High Speed Switching (C_H = 1000 pF) .... 50 ns
- Available as Inverting/Non-Inverting Driver
- Wide Supply Voltage Operation .... 4.5 to 20 V
- TTL/CMOS Compatible Input Drive
- Pin-Out Equivalent to DS0026

TELEDYNE SEMICONDUCTOR

TSC700A
Four Digit LED Display Decoder and Driver
High Segment Drive Current

General Description

The TSC700A drives common anode LED displays with 28 high current, open-drain N channel output transistors. Four seven segment LED displays may be driven. Drive current is guaranteed to be 11 mA minimum. This is twice the minimum drive current available from comparable devices and will provide high LED luminance. High luminous intensity is an important factor when a dark contrasting background is unavailable or the LED is viewed at a distance. The TSC700A current capability makes it an ideal large character LED driver.

Four data bit inputs and four digit select signals permit interfacing to multiplexed BCD or binary output devices. The four bit data input is decoded into the seven segment alphanumeric code known as "Code B". A 0 to 9, —, E, H, L, P or "blank" reading may be displayed.

An added feature includes a brightness control input that adjusts segment drive current. The control pin may also be used as a digital display enable. The TSC700A is an improved pin compatible and functional equivalent to the ICM7212A and TSC7212A.

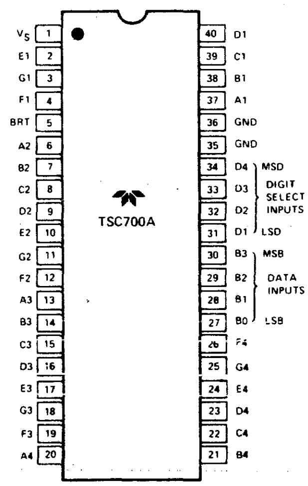
Ordering Information

Part No.	Package	Temp. Range	LED Segment Current	Output Code
TSC700AMJL	40 Pin CerDIP	-55°C to +125°C	14 mA	Code B
TSC700AIJL	40 Pin CerDIP	-25°C to +85°C	14 mA	Code B
TSC700 AMJL/883	40 Pin CerDIP	-55°C to +125°C	14 mA	Code B
TSC700A/Y	CHIP	25°C	14 mA	Code B

Features

- High Drive Current for High Luminance LED Display
- Guaranteed High LED Segment Current 11 mA Minimum
- 28 Common Anode LED Drivers (4 Digits)
- Code B Output Format ... 0 to 9, —, E, H, L, P, "blank"
- BCD/Binary Input to Seven Segment LED Code
- Four Separate Digit Selects for Multiplexed Input
- Digital or Analog Brightness Control
- Digital Display Enable
- Low Thermal Resistance Package
- Military Temperature Range Devices Available
- Pin Compatible With TSC7212A, ICM7212A

Pin Configuration



If Brightness Control is not needed, connect BRT (pin 5) to Vs.

TSC701AM
Bus Compatible Four Digit LED Display Driver
• High Segment Drive Current
• Input Data Latches

INTERFACE

Teledyne Semiconductor

General Description

The TSC701AM is a CMOS direct drive, four digit, seven segment LED display decoder and driver. The device is bus compatible making microprocessor controlled displays possible. Two chip select signals control data and digit select code latching prior to decoding and display. External data latches are unnecessary.

The TSC701AM drives common anode LED displays with 28 high current, open-drain N channel output transistors. Four seven segment LED displays may be driven. Drive current is guaranteed to be 11 mA minimum (18 mA TYP). This is twice the minimum drive current available from comparable devices and will provide high LED luminance. High luminous intensity is an important factor when a dark contrasting background is unavailable or the LED is viewed at a distance. The TSC701AM current capability makes it an ideal large character LED driver.

Four data bit inputs and four digit select signals permit interfacing to multiplexed BCD or binary output devices. The four bit data input is decoded into the seven segment alphanumeric code known as "Code B". A 0 to 9, —, E, H, L, P or "blank" reading may be displayed.

An added feature is the brightness control input that adjusts segment drive current. The control pin may also be used as a digital display enable. The TSC701AM is an improved pin compatible and functional equivalent to the ICM7212AM.

Features

- 28 Current Limited Outputs Drive Common-Anode LEDs at 18 mA Per Segment.
- Input and Digit Select Data Latches.
- Brightness Input Allows Potentiometer Control of LED Segment Current. Pin Also Serves as Digital Display Enable.
- Input and Digit Select Data Latches.
- Pin Compatible and Functionally Equivalent to ICM7212AM.
- Input Decoded to Seven Segment Code B Output (0 to 9, —, E, H, L, P, "Blank")

TSC7109
12-Bit Plus Sign Integrating A/D Converter
• BUS Compatible
• Serial Data Transmission w/UART

General Description

The TSC7109 is a 12-bit plus sign CMOS low power A/D Converter. The single CMOS IC contains all the necessary active devices to interface with microprocessors.

In direct mode, Chip Select and High/Low Byte Enables control parallel bus interface. In the handshake mode the TSC7109 will operate with industry standard UART's in controlling serial data transmission, ideal for remote data logging. Control and monitoring of conversion timing is provided by the RUN/$\overline{\text{HOLD}}$ and STATUS outputs. The TSC7109 requires only the addition of eight passive components plus a crystal to operate as a dual slope integrating A/D converter. The TSC7109 has features that make it an attractive per-channel alternative to analog multiplexing for many data acquisition applications. These features include typical input bias current of 1 pA, drift of less than 1 μV/°C, input noise typically 15 μV p-p, and auto-zero. True differential input and reference allows the measurement of bridge-type transducers such as load cells, strain gauges and temperature transducers.

For applications requiring more resolution see the TSC800, 15-bit plus sign data sheet.

Ordering Information

Part No.	Package	Temp. Range
TSC7109CPL	40-Pin Plastic Dip	0°C to + 70°C
TSC7109BCPL	40-Pin Plastic Dip	0°C to +70°C
TSC7109IJL	40-Pin CerDIP	-25°C to +85°C
TSC7109BIJL	40-Pin CerDIP	-25°C to +85°C
TSC7109MJL	40-Pin CerDIP	-55°C to +125°C

Features

- 12-Bit Plus Sign Integrating A/D Converter with Overrange Indication
- Sign Magnitude Coding Format
- True Differential Signal Input and Differential Reference Input
- Low Noise — Typically 15 μVp-p
- High Normal Mode Noise and Line Frequency Rejection
- 1 pA Typical Input Current
- No Zero Adjustment
- TTL Compatible Byte Organized Tri-State Outputs
- UART Handshake Mode for Simple Serial Data Transmission
- Direct Bus Connection for 8 or 16-Bit Bus — 3.58 mHz Crystal Provides 7.5 Conversions Per Second for 60 Hz Rejection — External RC Network Provides up to 30 Conversions Per Second
- Power Dissipation Typically Less Than 20 mW
- Internal Voltage Reference

Part No.	Package	Temp. Range
TSC7109CBQ	60-Pin Plastic Flat Package: Formed Leads	0°C to +70°C
TSC7109CSQ	60-Pin Plastic Flat Package: Unformed Leads	0°C to +70°C
Devices Available with 160 Hour, +125°C Burn-In		
TSC7109CPL/BI	40-Pin Plastic Dip	0°C to +70°C
TSC7109IJL/BI	40-Pin CerDIP	-25°C to +85°C

 TELEDYNE SEMICONDUCTOR

TELEDYNE SEMICONDUCTOR

TSC7135
4 1/2 Digit Precision Analog-to-Digital Converter

General Description

The TSC7135 4 1/2 digit analog converter offers 50 ppm (1 part in 20,000) resolution with a maximum linearity error of 1 count. An auto-zero cycle reduces the zero error to below 10 μV and zero drift to 0.5 μV/°C. Source impedance error sources are minimized by a 10 pA maximum input current. Rollover error is limited to ± 1 count.

By combining the TSC7135 with a TSC7211A (LCD), TSC7212A (LED) or TSC700A (High LED Segment Current) driver a 4 1/2 digit display DVM or DPM can be constructed. Overrange and underrange signals support automatic range switching and special display blanking/flashing applications.

Micro-processor based measurement systems are supported by the TSC7135 Busy, Strobe and Run/HOLD control signals. Remote data acquisition systems with data transfer via UARTs are also possible. The additional control pins and multiplexed BCD outputs make the TSC7135 the ideal converter for display or μ-processor based measurement systems.

Ordering Information

Part No.	Package	Temperature Range
TSC7135CJI	28-Pin CerDIP	0°C to +70°C
TSC7135CPI	28-Pin Plastic	0°C to +70°C
TSC7135CBQ	60-Pin Plastic Flat Package w/ Formed Leads	0°C to +70°C
TSC7135CSQ	60-Pin Plastic Flat Package w/ Unformed Leads	0°C to +70°C

Features

- Low Rollover Error .... ± 1 Count Maximum
- Guaranteed ± 1 Count Maximum Error
- Guaranteed Zero Reading for 0 V Input
- True Polarity Indication at Zero for Null Detection
- Multiplexed BCD Data Output
- TTL Compatible Outputs
- Differential Input
- Control Signals Permit Interface to UARTS and μ-Processors
- Auto-ranging Supported with Over and Underrange Signals
- Blinking Display Visually Indicates Overrange Condition
- Low Input Current .... 1 pA
- Low Zero Reading Drift .... 2 μV/°C
- Interface to TSC7211A, TSC7212A, and TSC700A Display Drivers
- Available in Compact Flat Package

Pin Configuration

Preliminary

TSC7650
Precision Chopper-Stabilized Operational Amplifier
• 0.7 μV Offset Voltage
• 50 nV/° C Offset Voltage Drift

General Description

The TSC7650 CMOS chopper-stabilized operational amplifier practically removes offset voltage error terms from system error calculations. The 5 μV maximum V_{OS} specification, for example, represents a fifteen times improvement over the industry standard OPO7E. The 50 nV/° C offset drift specification is over twenty-five times lower than the OPO7E. The increased performance eliminates V_{OS} trim procedures, periodic potentiometer adjustment and the reliability problems caused by damaged trimmers.

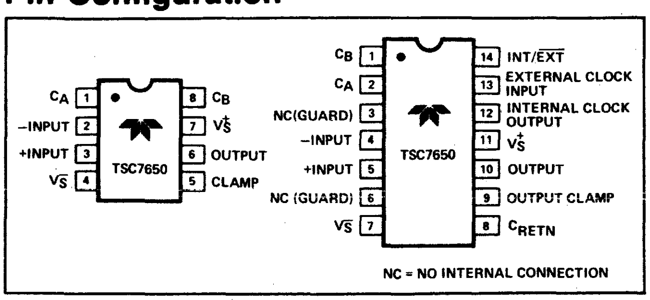
The TSC7650 performance advantages are achieved without the additional manufacturing complexity and cost incurred with laser or "zener zap" V_{OS} trim techniques. The TSC7650 is one of the lowest cost precision operational amplifiers available.

The TSC7650 nulling scheme corrects both dc V_{OS} errors and V_{OS} drift errors with temperature. A nulling amplifier alternately corrects its own V_{OS} errors and the main amplifier V_{OS} error. Offset nulling voltages are stored on two user supplied external capacitors. The capacitors connect to the internal amplifier V_{OS} null points. The main amplifier input signal is never switched. Switching spikes are not present at the TSC7650 output. The null scheme keeps V_{OS} errors low throughout the operating temperature range. Laser and "zener zap" trimming can correct for V_{OS} at only one temperature.

The nulling circuit oscillator and control circuits are integrated on chip. Only two external V_{OS} error storage capacitors are required. The TSC7650 operates as a conventional operational amplifier with vastly improved input specifications. The low V_{OS} and V_{OS} drift errors make the TSC7650 ideal for thermocouple, thermistor, and strain gauge applications. Low dc errors and high open loop gain make the TSC7650 an excellent preamplifier for precision analog to digital converters like the TSC7135 and TSC800.

The 14-pin dual in line package (DIP) has an external oscillator input to drive the nulling circuitry for optimum noise performance. Both the 8 and 14-pin DIP have an output voltage clamp circuit to minimize overload recovery time.

Pin Configuration



Features

- Low Input Offset Voltage .... 0.7 μV
- Low Input Offset Voltage Drift .... 0.05 μV/° C Max.
- Low Input Bias Current .... 10 pA Max.
- High Impedance Differential CMOS Inputs ..... 10^{12} Ω
- High Open Loop Voltage Gain .... 120 dB Min.
- Low Input Noise Voltage .... 2.0 μVp-p
- High Slew Rate .... 2.5 V/μs
- Low Power Operation .... 20 mW
- Output Clamp Speeds Recovery Time
- Compensated Internally for Stable Unity Gain Operation
- Direct Replacement for ICL7650
- Available in 8-Pin Dip

Preliminary

TSC7660 DC to DC Voltage Converter

General Description

The TSC7660 DC to DC converter will generate a negative voltage from a positive source. With two external capacitors the TSC7660 will convert a 1.5 V to 10.0 V input signal to -1.5 V to -10.0 V level. The TSC7660 easily generates -5 V in +5 V digital systems.

Many analog to digital converters, digital to analog converters, operational amplifiers, and multiplexers require negative supply voltages. The TSC7660 allows +5 V digital logic systems to incorporate these analog components without adding an additional main power source. The TSC7660 can lower total system cost, ease engineering development and save space, power and weight.

The TSC7660 charges a capacitor to the applied supply voltage. Internal analog gates connect the capacitor across the output. Charge is transferred to an output storage capacitor completing the voltage conversion. Operation requires only two external capacitors for supply voltage <6.5 V.

Contained on-chip are a series DC power supply regulator, RC oscillator, voltage level translator, four output power MOS switches, and a unique logic element which senses the most negative voltage in the device and ensures that the output N-channel switches are not forward biased. This assures latch-up free operation.

The oscillator, when unloaded, oscillates at a nominal frequency of 10 kHz for an input supply voltage of 5.0 volts. This frequency can be lowered by the addition of an external capacitor to the "OSC" terminal, or the oscillator may be overdriven by an external clock.

The "LV" terminal may be tied to GROUND to bypass the internal series regulator and improve low voltage (LV) operation. At medium to high voltages (+3.5 to +10.0 volts), the LV pin is left floating to prevent device latchup.

Features

- Converts +5 V Logic Supply to ±5 V System
- Wide Input Voltage Range .... 1.5 V to 10.0 V
- Efficient Voltage Conversion 99.9%
- Excellent Power Efficiency 98%
- Low Supply Current .... 500 μA Max.
- Cascade for Output Voltage Multiplication
- Low Cost and Easy to Use
  — Only 2 External Capacitors Required

Ordering Information

Part No.	Package	Temperature Range

TELEDYNE SEMICONDUCTOR

TSC800
15-Bit Plus Sign Integrating Analog to Digital Converter
• BUS Compatible
• UART Interface

General Description

The TSC800 is a 15-bit plus sign integrating analog to digital converter. The TSC800 improves the conventional two cycle dual slope conversion cycle by incorporating system zero and integrator output zero phases. Offset error sources are automatically zeroed and overrange recovery time is reduced. The integrating conversion technique is immune to the noise spikes that introduce conversion errors in successive approximation converters.

The externally adjustable clock allows integration periods which are integral multiples of 50 Hz or 60 Hz for maximum power-line noise rejection. By using the 2.4576 MHz crystal oscillator mode (2.5 CONV/SEC) 50, 60 and 400 Hz signals are rejected.

Micro-processor interface signals support single byte (16-bit) or two byte (8-bit) parallel data transfers. A "handshake" operating mode supports serial data transmission via a UART. A serial count output is derivable by gating the clock signal with data valid (DVD). The count output pulses may be used in serial fiber optic transmission systems.

The high impedance differential inputs, 5 pA input leakage current, 16-bit dynamic range and interface control signals make the high resolution TSC800 the ideal analog to digital converter for process control, data logging and "intelligent" measurement systems.

Features

- 15 Bit Resolution Plus Sign Bit
  - 96 dB Dynamic Range
- Integrating Dual Slope Converter
  - Monotonic
  - Eliminate 50/60 Hz "Line" Interference
  - High Noise Immunity
  - Auto Zero Cycle Eliminates Trimming
  - Incorporates Integrator Zero Cycle for Fast Overload Recovery
- Three State Data Bit/Sign Outputs
  - 8 or 16 Bit Parallel Data Transfer to μ-Processor Bus
- UART Control Signals
  - Serial Data Transmission
  - "Handshake" Data Transfer
  - Distributed Control Systems
  - Fiber Optic Transmission Systems
- Easy Conversion Cycle Monitoring and Control
  - Data Valid Output Signal
  - Continuous or Convert on Command Operation
- High Impedance Differential Input
  - 15 pA Maximum Input Current
- Low Input Noise
  - 15 μ V_{p-p}
- On Chip Crystal Oscillator for 2.5 Conversions/Sec.
  - f_{xtal} = 2.4576 MHz
  - 100 mSEC Integration Period Rejects 50, 60, 400 Hz Interference Signals
- Convenient ±5 V Supply Operation
  - Low Power Dissipation .... 20 mW
- Static Discharge Protected Inputs
- Available in 60-Pin Flat Package

TELEDYNE SEMICONDUCTOR

TSC805
Auto-Ranging Instrumentation Analog-to-Digital Converter
• 3 1/2 Digit Resolution
• Tri-Plex LCD Drive
• AC & DC Measurements

Advance Product Information

General Description

The TSC805 is a 3 1/2 digit integrating analog-to-digital converter with tri-plex LCD display drive and automatic ranging. The CMOS TSC805 contains all the logic and analog switches needed to manufacture an auto-ranging instrument for ohms and voltage measurements.

The auto-ranging feature automatically selects the proper display decimal point location. Auto-ranging is available during ohms (high and low voltage) and voltage (AC & DC) measurements. Auto-ranging eliminates expensive range switches in hand-held DMM designs and makes compact meters easier and less costly to design. Auto-ranging instruments are easy to operate and are ideal for non-technical end users. The auto-range feature may be bypassed allowing decimal point selection and input attenuator selection control through a single line input.

The TSC805 includes an AC to DC converter for AC audio frequency range measurements. Only inexpensive external diodes/resistors/capacitors are required.

A complete LCD annunciator set visually describes the TSC805 meter function and measurement range during ohms, voltage and current operation. AC or DC measurements are indicated. A low battery detection circuit also sets a low battery warning display annunciator.

Features

- Auto-Ranging on volts (AC & DC) and Ohms Scale
- Automatic Sign, Function and Unit Display
- AC to DC Voltage Converter on Chip
- Low Voltage Ohms Range Option
- Continuity Detection & "Buzzer" Drive Output
- 3 1/2 Digit Resolution on 200 mV Full-Scale Range
- Low Noise Input Stage .... 15 μVp-p
- Precision Internal Reference .... 50 ppm/°C Max.
- Triplex LCD Drivers On Chip
- Low Battery Detection & LCD Annunciator
- Convenient 9 V Battery Operation
- Low Power Consumption .... 10 mW
- Compact 60-Pin Flat Package

The "low ohms" measurement option allows in circuit resistance measurements by preventing semiconductor junctions from being forward biased. A zero ohms adjust is included to compensate for lead resistance.

A continuity buzzer output is activated with inputs less than 5% of full-scale. An overrange input also enables the buzzer and flashes the MSD display. Offering single 9 V battery operation, 10 mW power consumption, a precision internal voltage reference (50 ppm/°C max. TC) and available in a compact 60-pin flat package the TSC805 is ideal for portable instruments.

TSC826
LCD Bar Graph Display Analog-to-Digital Converter
• 2.5% Resolution
• 1 mW Power Dissipation
• Direct LCD Drive

Advance Product Information

General Description

The TSC826 is a CMOS analog-to-digital converter that directly drives liquid crystal bar graph displays. LCD drivers are on-chip for forty data segment, zero, polarity, and overrange annunciators. A backplane oscillator and driver are included. All active components are on-chip for a 2.5% resolution bar graph display. Up to 16 conversions per second are possible.

An auto-zero cycle guarantees a zero display for zero volt input. No adjustment potentiometers are needed. The precision internal reference with a 35 ppm/°C temperature coefficient virtually eliminates full scale errors over temperature.

The CMOS TSC826 draws less than 100 μA from a 9 V battery guaranteeing long life in portable applications. Available in a 60-pin flat package compact portable designs with multiple bar graph indicators are possible.

Features

- Bar Graph Data Display . . . 40 Segments plus zero
- Overrange Plus Polarity Indication
- Precision On-Chip Reference . . . 35 ppm/°C
- Auto-Zero Cycle Eliminates Zero Adjust Potentiometer
- Low Power Consumption . . . 1 mW
- Differential Analog Input
- LCD Drivers and Backplane Oscillator
- 9 V Battery Operation
- 20 mV Full-Scale Operation
- Compact Flat Package

TSC9403
TSC9404
Serial Input/16-Bit Parallel Output Peripheral Driver
• High Voltage, High Current Outputs

General Description

The Teledyne Semiconductor TSC9403 and TSC9404 are serial input, 16-bit parallel output shift registers. High output power MOS switching transistors make the TSC9403 and TSC9404 ideal interface circuits between microprocessor I/O ports and high current/voltage peripherals. The CMOS construction limits quiescent power dissipation to 20 mW.

The TSC9403 common source, open drain MOS outputs sustain 20 V in the OFF state and maintain leakage currents under 100 μA. The TSC9404 outputs are rated at 15 V. The 16 parallel outputs will continuously sink 60 mA. ($V_{SAT} \leq 0.5$ V).

Successive connection of serial data outputs to serial data inputs make longer length serial to parallel conversions possible. Device cascading makes the TSC9403 and TSC9404 ideal thermal printhead or high resolution LED bar graph drivers.

description

The TLC540 and TLC541 are LinCMOS™ A/D peripherals built around an 8-bit switched-capacitor successive-approximation A/D converter. They are designed for serial interface to a microprocessor or peripheral via a three-state output with up to four control inputs [including independent System Clock, I/O Clock, Chip Select ($\overline{CS}$), and Address Input]. A 4-megahertz system clock for the TLC540 and a 2.1-megahertz system clock for the TLC541 with a design that includes simultaneous read/write operation allow high-speed data transfers and sample rates of up to 71,910 samples per second for the TLC540 and 29,144 samples per second for the TLC541. In addition to the high-speed converter and versatile control logic, there is an on-chip 12-channel analog multiplexer that can be used to sample any one of 11 inputs or an internal "self-test" voltage, and a sample-and-hold that can operate automatically or under processor control.

The converters incorporated in the TLC540 and TLC541 feature differential high-impedance reference inputs that facilitate ratiometric conversion, scaling, and analog circuitry isolation from logic and supply noises. A totally switched-capacitor design allows guaranteed low-error (±0.5 LSB) conversion in 10 microseconds for the TLC540 and 19 microseconds for the TLC541 over the full operating temperature range.

The TLC540M and the TLC541M are characterized for operation over the full military temperature range of −55 °C to 125 °C. The TLC540I and the TLC541I are characterized for operation from −40 °C to 85 °C.

Clock transition time (see Note 5)	System	$f_{CLK(SYS)} \le 1048$ kHz			30			30	ns
		$f_{CLK(SYS)} > 1048$ kHz			20			20	
	I/O	$f_{CLK(I/O)} \le 525$ kHz			100			100	ns
		$f_{CLK(I/O)} > 525$ kHz			40			40	
Operating free-air temperature, T_A		TLC540M, TLC541M	−55		125	−55		125	°C
		TLC540I, TLC541I	−40		85	−40		85	

NOTES: 3. Analog input voltages greater than that applied to REF+ convert as all "1"s (11111111), while input voltages less than that applied to REF− convert as all "0"s (00000000). For proper operation, REF+ voltage must be at least 1 volt higher than REF− voltage. Also, adjusted errors may increase as this differential reference voltage falls below 4.75 volts.
4. To minimize errors caused by noise at the Chip Select input, the internal circuitry waits for two system clock cycles (or less) after a chip select falling edge is detected before responding to control input signals. Therefore, no attempt should be made to clock-in address data until the chip select setup time has elapsed.
5. This is the time required for the clock input signal to fall from V_{IH} min to V_{IL} max or to rise from V_{IL} max to V_{IH} min.

TYPES TLC540M, TLC540I, TLC541M, TLC541I 8-BIT ANALOG-TO-DIGITAL PERIPHERALS WITH SERIAL CONTROL AND 11 INPUTS

electrical characteristics over recommended operating temperature range, $V_{CC} = V_{REF+} = 4.75$ V to 5.5 V (unless otherwise noted), $f_{CLK(I/O)} = 2.028$ MHz for TLC540 or $f_{CLK(I/O)} = 0.525$ MHz for TLC541

PARAMETER			TEST CONDITIONS		MIN	TYP†	MAX	UNIT
V_{OH}	High-level output voltage (pin 16)		$V_{CC} = 4.75$ V,	$I_{OH} = 360$ μA	2.4			V

		Control inputs				5	15	

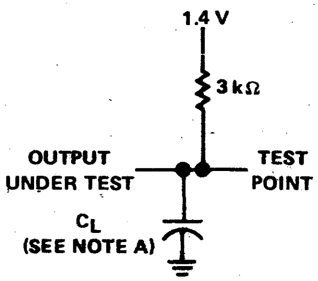
†All typical values are at $T_A = 25°C$.

operating characteristics over recommended operating free-air temperature range, $V_{CC} = V_{REF+} = 4.75$ V to 5.5 V, $f_{CLK(I/O)} = 2.048$ MHz for TLC540 or 0.525 MHz for TLC541, $f_{CLK(SYS)} = 4$ MHz for TLC540 or 2.097 MHz for TLC541.

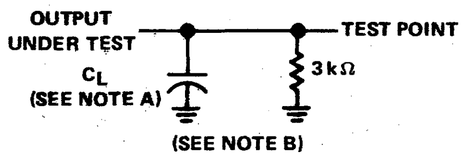
PARAMETER		TEST CONDITIONS	TLC540			TLC541			UNIT
			MIN	TYP	MAX	MIN	TYP	MAX	
	Linearity error	See Note 6			±0.5			±0.5	LSB
	Zero error	See Note 7			±0.5			±0.5	LSB
	Full-scale error	See Note 7			±0.5			±0.5	LSB
	Total unadjusted error	See Note 8			±0.5			±0.5	LSB
	Self-test output code	input address = 1011 (A11) (See Note 9)	01111101 (125)		10000011 (131)	01111101 (125)		10000011 (131)	
t_{conv}	Conversion time				10			19	μs
t_{acq}	Channel acquisition time				4			4	I/O clock cycles
t_v	Time output data remains valid after I/O clock↓	See Parameter Measurement Information	10			10			ns
t_d	Delay time, I/O clock↓ to data output valid				200			400	ns
t_{acc}	Output access time (delay to valid output after chip select↓)		1		3	1		3	System clock cycles
t_{en}	Output enable time				150			150	ns
t_{dis}	Output disable time				150			150	ns
$t_{r(bus)}$	Data bus rise time				300			300	ns
$t_{f(bus)}$	Data bus fall time				300			300	ns

NOTES: 6. Linearity error is the maximum deviation from the best straight line through the A/D transfer characteristics.
7. Zero Error is the difference between the output of an ideal and an actual A/D for zero input voltage; full-scale error is that same difference for full-scale input voltage.
8. Total Unadjusted Error is the sum of linearity, zero, and full-scale errors.
9. Both the input address and the output codes are expressed in positive logic.

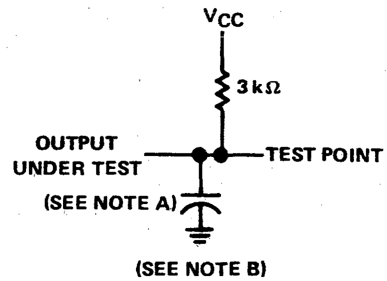
PARAMETER MEASUREMENT INFORMATION



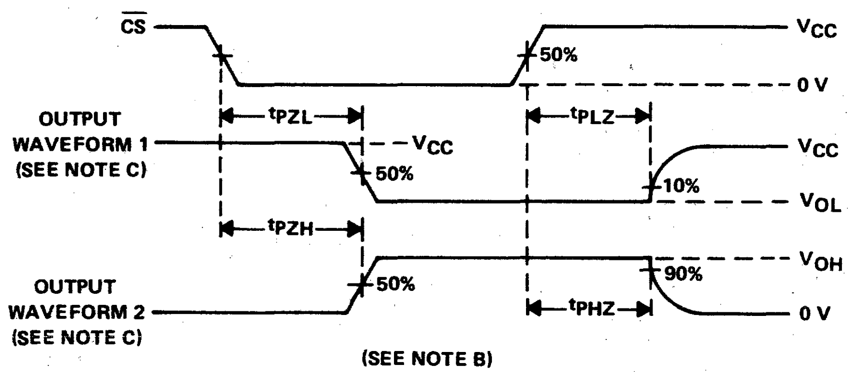
LOAD CIRCUIT FOR t_d, t_{acc}, t_r, t_f



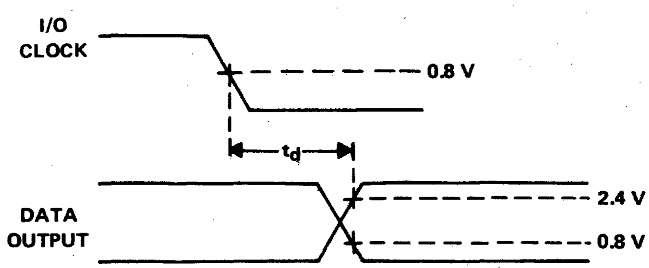
LOAD CIRCUIT FOR t_{PZH} AND t_{PHZ}



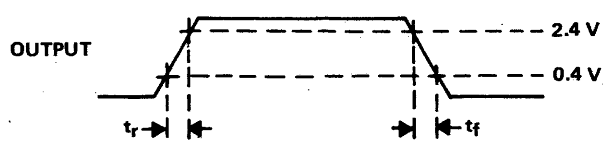
LOAD CIRCUIT FOR t_{PZL} AND t_{PLZ}



VOLTAGE WAVEFORMS FOR ENABLE AND DISABLE TIMES



VOLTAGE WAVEFORM FOR DELAY TIME



VOLTAGE WAVEFORM FOR RISE AND FALL TIMES

NOTES: A. C_L = 50 pF for TLC540 and 100 pF for TLC541
B. $t_{en} = t_{PZH}$ or t_{PZL}, $t_{dis} = t_{PHZ}$ or t_{PLZ}
C. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.

TYPES TLC540M, TLC540I, TLC541M, TLC541I 8-BIT ANALOG-TO-DIGITAL PERIPHERALS WITH SERIAL CONTROL AND 11 INPUTS

principles of operation

The TLC540 and TLC541 are each complete data acquisition systems on a single chip. They include such functions as analog multiplexer, sample-and-hold, 8-bit A/D converter, data and control registers, and control logic. For flexibility and access speed, there are four control inputs [two clocks, chip select ($\overline{CS}$), and address]. These control inputs and a TTL-compatible 3-state output are intended for serial communications with a microprocessor or microcomputer. With judicious interface timing, with TLC540 a conversion can be completed in 10 microseconds, while complete input-conversion-output cycles are being repeated every 14 microseconds. With TLC541 a conversion can be completed in 19 microseconds, while complete input-conversion-output cycles are repeated every 35 microseconds. Furthermore, this fast conversion can be executed on any of 11 inputs or its built-in "self-test," and in any order desired by the controlling processor.

Though they can be operated "tied" together, the System Clock and I/O Clock are normally used independently, with no special phase or speed relationship to be considered. This allows integrated circuit operation to continue independent of serial Input/Output timing, permitting manipulation of the I/O Clock as desired for a wide range of software and hardware needs.

The I/O Clock, Data Input, and Data Output are controlled by $\overline{CS}$. It floats the 3-state output and shuts off signals to other control inputs while it is high. This allows any pins except pin 15 to share lines with other integrated circuits. A normal control sequence is as follows: (1) $\overline{CS}$ goes low; (2) a new positive-logic multiplexer address is clocked in through the address input on the first four I/O Clock rising edges while previous conversion results are brought out on the first seven I/O Clock falling edges. Input and output most-significant bits (MSB) are first, with the output MSB available at the start of the cycle; (3) the on-chip sample-and-hold begins sampling a newly addressed input after the 4th falling edge, and goes into the hold mode on the 8th falling I/O Clock edge just before conversion; (4) $\overline{CS}$ must then go high or the I/O Clock must remain low for at least 40 system clock cycles to allow conversion. A new address may then be loaded or the previous conversion results read any time $\overline{CS}$ is brought low, but it should be noted that any pending conversion may stop.

The instant that the TLC540 or TLC541 holds a sample of the analog input, conversion can be determined under software control (or by external logic), by keeping the 8th I/O Clock cycle high. Any output data will have already been shifted out, and TLC540 or TLC541 will continue sampling a new analog input. At the desired time, the I/O Clock signal can then be lowered freezing the voltage and turning off all analog inputs. In this manner, signals can be sampled at precise intervals for a wide range of comparison or processing applications, in much the same manner as a strobe light is used to determine engine speed.

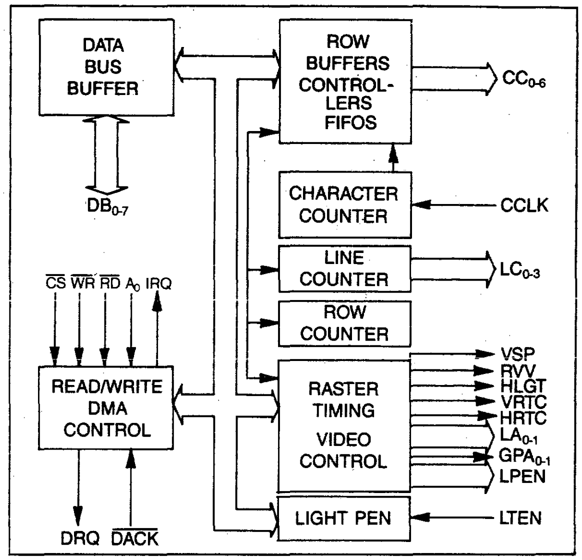
NEW PRODUCT BULLETIN

Programmable CRT Controller WD8275

FEATURES

- PROGRAMMABLE CHARACTER/SCREEN FORMAT
  - 1-16 LINES PER ROW
  - 1-64 ROWS PER FRAME
  - 1-80 CHARACTERS PER ROW
- SIX FIELD ATTRIBUTES
  - BLINK
  - HIGHLIGHT
  - REVERSE VIDEO
  - UNDERLINE
  - 2-USER PROGRAMMABLE
- ELEVEN CHARACTER ATTRIBUTES
  - RIGHT ANGLE LINE GRAPHIC SYMBOLS
- FOUR CURSOR CONTROLS
  - BLINK/NONBLINK UNDERLINE
  - BLINK/NONBLINK REVERSE VIDEO BLOCK
- LIGHT PEN DETECTION
- REQUIRES +5 VOLT ONLY
- 40 PIN CERDIP AND PLASTIC PACKAGES
- COMPATIBLE WITH INTEL D8275/P8275



WD 8275 BLOCK DIAGRAM

DESCRIPTION

The WD8275 programmable CRT Controller is a single chip device used to interface raster scan displays with microcomputer systems. Its function is to re-fresh the display by buffering data from main memory and by tracking the display position on the screen. The design flexibility will allow simple interface to raster scan CRT's with a minimum of external hardware/software overhead.

PROPOSED APPLICATIONS

May be used in a wide variety of terminal applications both romote and resident to the computer system. Additionally, this is an ideal device for Light Pen applications. It is available in 2MHZ and 3MHZ versions (CCLK).

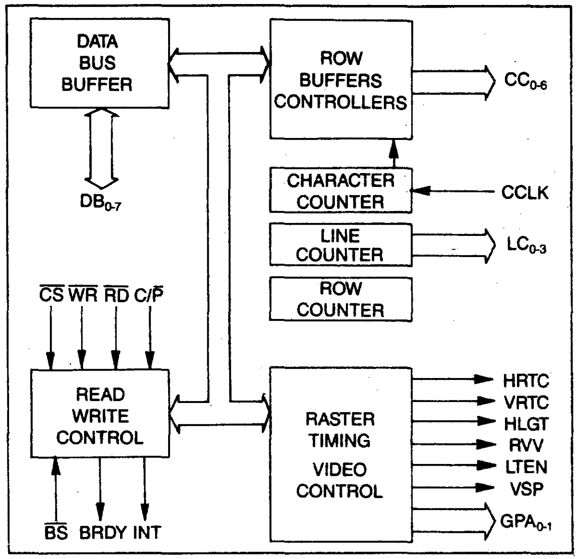
Small System CRT Controller WD8276

FEATURES

- PROGRAMMABLE CHARACTER/SCREEN FORMAT
  - 1-16 LINES PER ROW
  - 1-64 ROWS PER FRAME
  - 1-80 CHARACTERS PER ROW
- SIX FIELD ATTRIBUTES
  - BLINK
  - HIGHLIGHT
  - REVERSE VIDEO
  - UNDERLINE
  - 2-USER PROGRAMMABLE
- FOUR CURSOR CONTROLS
  - BLINK/NONBLINK UNDERLINE
  - BLINK/NONBLINK REVERSE VIDEO BLOCK
- REQUIRES +5 VOLT ONLY
- 40 PIN CERDIP AND PLASTIC PACKAGES
- COMPATIBLE WITH INTEL D8276/P8276



WD8276 BLOCK DIAGRAM

DESCRIPTION

The WD8276 Small System CRT Controller is a single chip device used to interface a raster scan CRT display with a microcomputer in minimum device count systems. It contains the necessary building blocks to refresh the display through character buffering and display position tracking. The flexible design allows simple interface between CRT display and system data bus with a minimum of external hardware.

PROPOSED APPLICATIONS

An ideal, low cost device for both terminal and small computer system designs. It is available in both 2MHZ and 3MHZ versions (CCLK).

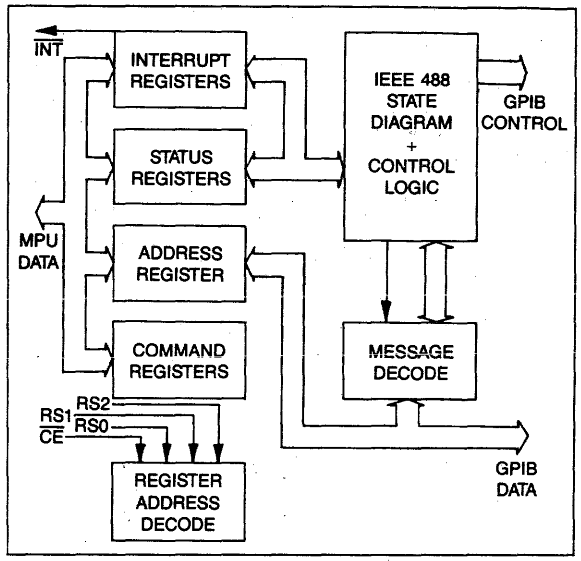
General Purpose Interface Bus (GPIB) Controller WD9914

FEATURES

- IEEE STD 488 (1975/8) COMPATIBLE
- TALKER/LISTENER FUNCTIONS WITH EXTENDED ADDRESSING
- SYSTEM CONTROLLER CAPABILITY
- SERVICE REQUEST
- SERIAL/PARALLEL POLLING
- DEVICE CLEAR/TRIGGER
- DMA FACILITIES
- COMPATIBLE WITH MOST MICROPROCESSORS
- REQUIRES +5VDC ONLY
- 40 PIN CERDIP/PLASTIC PACKAGING
- COMPATIBLE WITH TEXAS INSTRUMENTS TMS9914A



WD9914 BLOCK DIAGRAM

DESCRIPTION

The WD9914 GPIB Controller is a microprocessor controlled device designed to perform the interface function between a microprocessor and the IEEE 488 General Purpose Interface Bus. It automatically handles all Talker, Listener, and Controller operational modes. This relieves the microprocessor from maintaining bus/protocol.

PROPOSED APPLICATIONS

The WD9914 is used in a variety of instruments interconnected by the GPIB and remotely or automatically programmed and controlled. The following is an example:

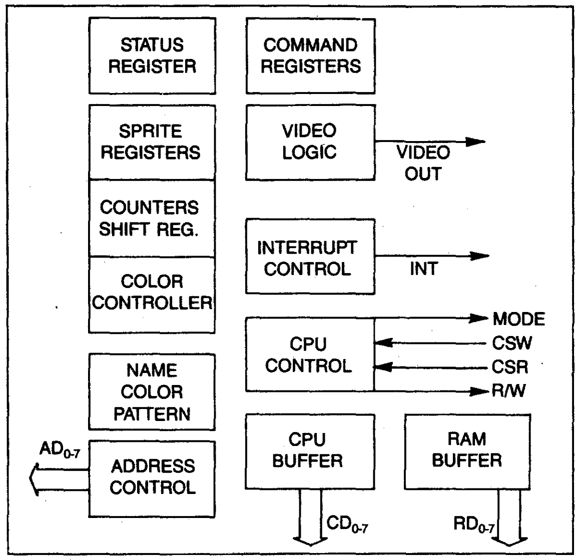
Video Display Processor
WD9918/9928/9929

FEATURES

- 32 SPRITE (OBJECT ANIMATION) PLANES
- 15 UNIQUE COLORS
- GENERAL 8 BIT CPU INTERFACE
- DIRECT INTERFACE TO 4K, I8K OR 16K RAMS
- 256 X 192 TV SCREEN RESOLUTION
- COMPOSITE VIDEO OUTPUT (WD9918)
- COLOR DIFFERENCE OUTPUTS (WD9928/9929)
- EUROPEAN PAL (625 LINE) TV (WD9929)
- REQUIRES +5 VOLT ONLY
- 40 PIN CERDIP/PLASTIC PACKAGES
- COMPATIBLE WITH TEXAS INSTRUMENTS (TMS9918A, 9928A, 9929A)



WD9918 BLOCK DIAGRAM

DESCRIPTION

The Video Display Processor is used to interface a microprocessor and screen refresh memory with a raster scan color CRT display. The device generates all necessary video, control and synchronization signals. Additionally, it controls the storage, retrieval, and refresh of display data in the dynamic screen refresh memory.

PROPOSED APPLICATIONS

The WD9918/28/29 are used in any video system requiring the display of digital data on a home color television or color monitor. This includes color computer terminals, home computers, process monitoring, and drafting aids.

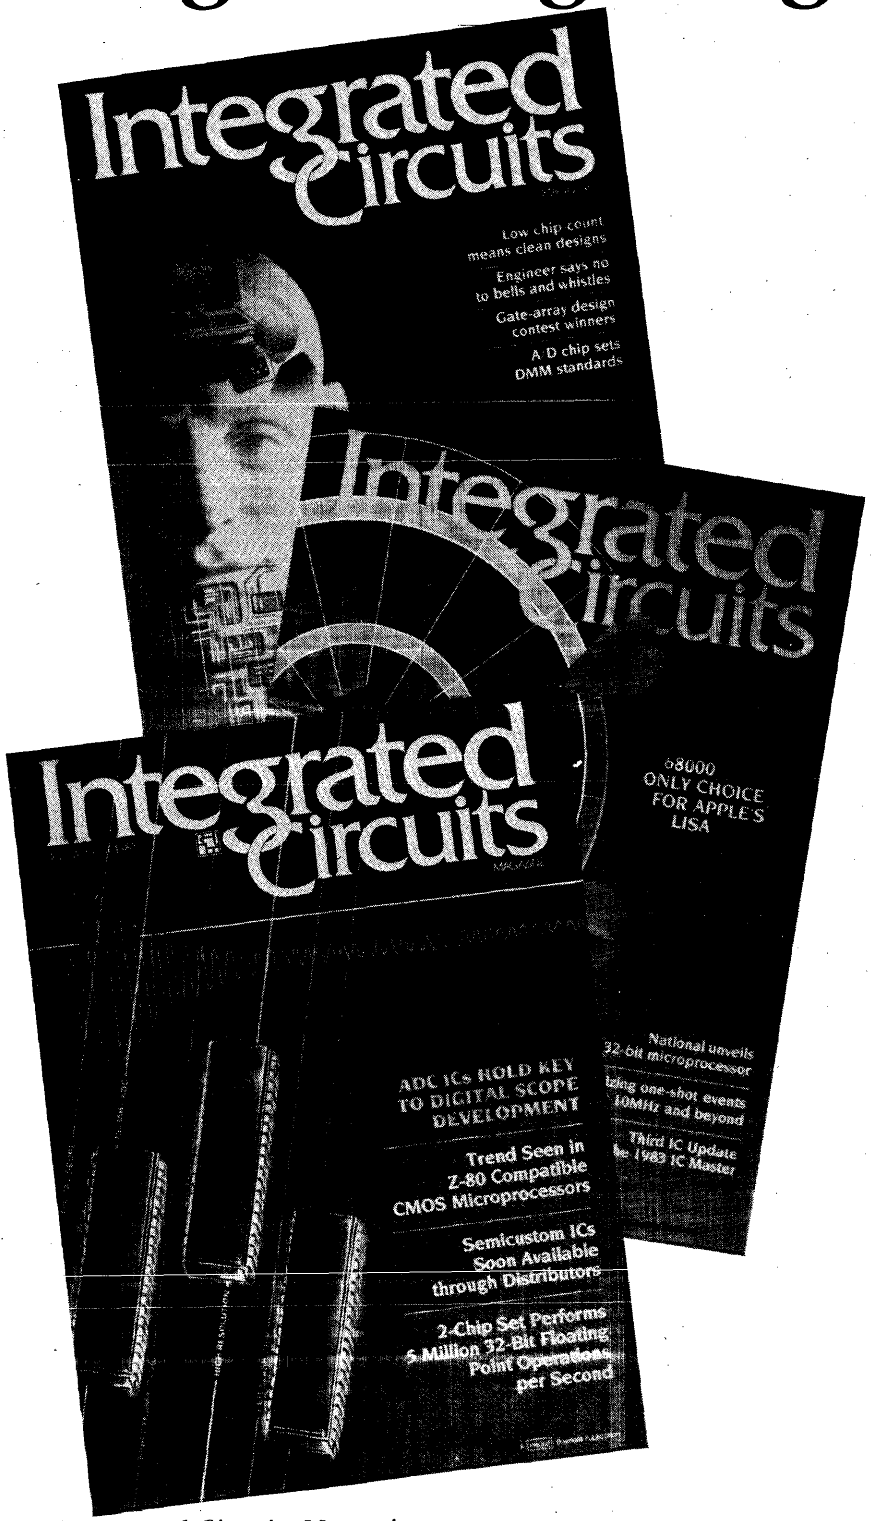
Integrated Circuits Magazine
The magazine for the engineering design strategist*



Integrated Circuits Magazine is the only publication written for senior design engineers and engineering managers who specialize in the specifying and use of ICs and related components in the design of instruments, equipment and systems.

It is unique in that it concentrates on reporting *from the viewpoint of the user.*

Each issue of *Integrated Circuits Magazine* includes staff-written interviews with leading designers at major IC customers, as well as articles written by IC users themselves.

Regular features include: IC User Feedback Reports, Semicustom Design Techniques, IC Design Problems and Solutions. What's New in ICs, and much more.

To receive *Integrated Circuits Magazine* absolutely FREE† simply give us your authorization right now! Just fill out, sign, date and return the subscription card located inside the back cover of Volume I.

Card missing? Additional subscription cards available from publisher upon request.

Integrated Circuits Magazine is designed for *YOU.*

***** *Designers who must keep pace with contemporary engineering design techniques, practices and trends, and how they affect the selection and application of integrated circuits, microcomputers, boards, and systems.*

†Integrated Circuits Magazine is made available on a complimentary basis to those qualified recipients within the United States only.

Canadian and Foreign Subscriptions are available, prepaid by check or money order payable in United States currency, at the following rates: $35.00 per year Canadian/Foreign; $55.00 per year Foreign via Air Mail; $18.00 per year non-qualified Domestic United States.

INTRODUCTION TO LINEAR

The Master Selection Guide provides sufficient information to make initial product selections. All devices that appear in this section, both in the initial selection guide and the data pages, are included in the indexes. These index listings lead to the page and the line on that page where each device appears.

In the Linear section over 1100 operational amplifiers are covered. Since there are so many devices, the operational amplifier entries have been given special consideration. Separate lists are provided for those which have High Speed, High Voltage capability, Wide bandwidth, etc. Under General Purpose, four amplifier types are listed; these are the ones that the high volume manufacturers indicate are the most widely used; however, quad amplifiers should also be considered when appropriate. If you have located an op amp in a specialized category, you can review its characteristics by finding it in the Part Number or Product Indexes and looking it up in the Operational Amplifier Characteristics and in the Data Sections.

Following the special lists, the "Operational Amplifier Characteristics" listings categorize amplifiers by input parameters. They are arranged in order of increasing offset voltage, bias current, offset current and then voltage drift. The other parameters listed do not affect the sequence in which the devices are presented. The column labeled "Comp" indicates the number of external components normally used for compensation for example "0" means no compensation is required.

Consumer circuits such as audio amplifiers, AM, FM, and TV circuits as well as some digital devices (watches, calculators, etc.) are covered by model number in the Consumer Circuit Section. Linear devices and unusual circuits which do not fit elsewhere are listed under the heading "Other Linear Devices."

Detailed Product Information provided by:

The manufacturers listed above have provided detailed information on their latest and most significant products.

LINEAR

Master Selection Guide

EINFÜHRUNG LINEAR-SCHALTUNGEN

Der Master Selection Guide für Linearschaltungen enthält alle Informationen, die Sie für die Erstauswahl Ihres Produkts benötigen. Die Bauteile, die in diesem Abschnitt erscheinen, sowohl im Selection Guide als auch auf den Datenblättern, sind in allen Master Indexes enthalten. Diese Register verweisen auf die Seite und Zeile, auf der das entsprechende Bauelement vorkommt.

Der Linear-Teil enthält über 1100 Operationsverstärker. Da es hier sehr viele Bausteine gibt, haben die Eintragungen über Operationsverstärker besondere Beachtung gefunden. Es gibt getrennte Listen für solche mit hoher Geschwindigkeit, hoher Spannung, großer Bandbreite usw. Unter "Allgemeine Verwendung" (General Purpose) finden sich vier Verstärkertypen. Laut Aussage der großen Hersteller sind dies die Gebräuchlichsten. Jedoch sollten auch Vierfach-Verstärker auf ihre Verwendbarkeit hin untersucht werden. Haben Sie einen Operationsverstärker in einer bestimmten Kategorie gefunden, so schlagen Sie ihn im numerishen Typenverzeichnis oder im Produktverzeichnis nach und überprüfen seine Eigenschaften unter der Rubrik "Operational Amplifier Characteristics" und in den Datenblättern.

Der Abschnitt "Eigenschaften von Operationsverstärkern" (Operational Amplifier Characteristics) bestimmt die Verstärker nach Eingangs-Parametern. Sie sind nach steigender Offsetspannung, Bias-Strom, offsetstrom und Spannungsdrift angeordnet. Die übrigen aufgeführten Parameter haben keinen Einfluß auf die Reihenfolge, in der die Bauteile genannt werden. Die Spalte "Comp" nennt die Anzahl externer Bausteine, die normalerweise für die Kompensation verwendet werden. "O" z.B. bedeutet, daß keine externe Kompensation erforderlich ist.

Consumer-Schaltkreise wie Audio-Verstärker, AM, FM und TV-Schaltungen sowie einige Digital-Bauteile (Uhren, Rechner usw.) erscheinen nach Typennummer im Abschnitt "Consumer Circuit Section." Solche Linear-Bauelemente und Schaltungen, die in keine entsprechende Rubrik passen, werden unter der Uberschrift "Sonstige Linear-Bauelmente" (Other Linear Devices) aufgeführt.

Neu in diesem Jahr sind erweiterte Listen von Sample/Hold Verstärkern und von festen und einstellbaren Spannungsreferenzen (Fixed and Adjustable Voltage References). Zusätzlich zu der Auflistung unter "Other Linear Devices" finden Sie wichtige Leistungsparameter für diese Produkte am Schluß des Linear-Hauptteils.

INTRODUCTION AUX SYSTEMES LINEAIRES

Le Guide Général de Sélection fournit suffisamment de renseignements pour permettre des sélections initiales de produits. Tous les appareils mentionés dans cette Section, à la fois das le Premier Guide de Selection et dans les feuilles de données, sont inclus dans tous les index. Ces index indiquent à quelle page et à quelle ligne il a été fait mention de tel ou tel appareil.

La Section "Linéaire" décrit plus de 1100 amplificateurs opérationnels. Du fait du nombre considérable d'appareils entrant dans cette catégorie, une attention toute spéciale a été apportée lors de leur classification. Des listes énumèrent séparément les appareils à grande vitesse, à capacité de haut voltage, à grande plage de fréquence, etc. Dans la rubrique "Applications Générales" (General Purpose), quatre types d'amplificateurs sont cités. Ce sont, d'après les gros fabricants, ceux qui sont le plus couramment usités. Les amplificateurs "QUAD" sont également dignes d'attention dans certains cas. Si vous recherchez un amplificateur opérationnel dans une categorie bien definie, vous pourrez en obtenir les caractéristiques en consultant les index des Numéros de Pièces ou de Produits, ainsi que la Section "Caractéristiques des Amplificateurs Opérationels" et les feuilles de données.

La Section "Caractéristiques des Amplificateurs Opérationnels", offre une liste d'amplificateurs classes par paramètre d'entrée. Ces derniers font apparaître dans l'ordre : la tension de compensation, l'ajustement intensité/courant, la compensation du courant, et enfin le changement de tension. Les autres paramètres indiqués n'affectent pas l'ordre dans lequel les appareils sont presentés. La colonne intitulee "COMP" indique le nombre de composants externes également utilisés dans un but de compensation, exemple : "0" signifie qu'aucune compensation n'est nécessaire.

Les circuits de grande consommation tels que les amplificateurs radio AM, FM, les amplificateurs télévision, ainsi que les appareils digitaux (montres, calculatrices, etc.) sont regroupés par numero de modèle dans la Section "Circuits de Grande Consommation" (Consumer Circuit Section). Les appareils linéaires et autres circuits de moins grande utilisation qui n'entrent pas dans les autres catégories, sont énumérés dans la Section "Autres Appareils Linéaires" (Other Linear Devices).

Un additif nouveau à l'édition de cette année : des références sur les amplificateurs partiels/continus, et avec voltage fixe ou ajustable. En plus des listes fournies dans la Section "Autres Appareils Linéaires", d'autres paramètres de performance relativement importants pour ces produits, apparaîssent à la fin du Guide Général de Sélection Linéaire.

INTRODUCCIÓN A LINEAL

La Guía Maestra de Selección provee suficiente información para hacer selecciones iniciales del producto. Todas las componentes que aparecen en esta sección, ya sea en la guía de selección inicial o en las páginas de datos, están incluídas en todos los otros índices. Estas listas de índices los refiere a la página y linea de aquella página donde se encuentra cada componente.

En la sección bajo Lineal, aparecen más de 1,100 amplificadores operacionales. Debido a que hay tantas componentes, se les ha dado consideración especial a los amplificadores operacionales. Listas apartes son provistas para equellos con Alta Velocidad, Capacidad de Alto Voltaje, Banda Ancha, etc. Bajo Propósito General, aparecen cuatro tipos de amplificadores, éstos son los que los fabricantes mayores piensan son los más usados; sin embargo, los amplificadores cuadrangulares deben también ser considerados cuando sea necesario. Si usted ha localizado un amp. op. en una categoría especializada, puede usted estudiar sus características encontrándolo en el Indice de Producto o Número de Pieza y buscándolo en la Sección de Datos de las Características de los Amplificadores Operacionales.

Siguiendo las listas especiales, la lista de "Características del Amplificador Operacional" categoriza los amplificadores por parámetros de entrada. Estos están arreglados por orden ascendente de tensión contrapuesta corriente de polarización, corriente contrapuesta, y también deslizamiento de voltaje o tensión. Los otros parametros mencionados no afectan la secuencia en que las componentes aparecen. La columna titulada "Comp" indica el número de componentes externas que normalmente se emplean para compensación; por ejemplo "O" significa que no requiere compensación.

Circuitos del Consumidor como audioamplificadores, AM, FM, y circuitos de TV así como también algunas componentes digitales (relojes, calculadoras, etc.) aparecen por número de modelo en la Sección de Circuitos del Consumidor. Componentes Lineales y circuitos poco comunes que no corresponden en otras secciones aparecen bajo el título "Otras Componentes Lineales."

Listas expandidas para Amplificadores de Muestra/Retención y Referencias de Voltaje Fijas y Ajustables son nuevas para este año. Además de las listas bajo Otras Componentes Lineales, parámetros de redimiento significantes para estos productos aparecen al final de la Guúa Maestra de Selección.

リニアへの案内

マスターセレクションガイドは素子選択にとりかかる充分な資料を揃えています。最初のセレクションガイド並にデータ掲載ページとこのセクションに記載されている製品はどのインデックにも入っていて，そのページ数と行数がすぐ分ります。

ここでは1,100種以上のオペアンプが収録されています。余りに多品種のため，特別の配慮をしました。それはオペアンプを高速，高耐圧，高域巾他と別々に掲載しました。搬用オペアンプには4種のアンプをのせてあります。大量生産している会社が最も巾広く使用されていると云う品種です。がクオドアンプももし適当なものがあれば考慮すべきかも知れません。
あるカテゴリーでオペアンプを見つけられたらその特性をパーツナンバーインデックスかプロダクトインデックスで探し検討し，オペアンプ特性表やデータセクションを良く調べて下さい。

特殊品種リストに続きオペアンプ特性表があり入出パラメーター毎にオペアンプが分類されています。製品はオフセット電圧，バイアス電流，オフセット電流，電圧ドリフト等小さな順に記載されています。"Comp" と表示されている項目の下の数字は0調整をする為に外付部品が何個必要かを示しています。例えば"0"となっていれば0調整不要を意味します。

民生用製品－オーディオアンプ，AM，FM，TV素子，ディジタル素子（時計用，電卓用等）は"コンシューマーサーキットセクション"に掲載されています。他のどのカテゴリーにも入らないリニアや特異な素子は"アザーリニアデバイス"の見出しに載っています。

本年新たに加わったものとしてサンプル／ホールドアンプと固定，調整可能なボルティジリファレンスが広くのっています。
"アザーリニアデバイス"欄にのっている製品中顕著な性能パラメーターはリニアマスターセレクションガイドの最後に掲載されています。

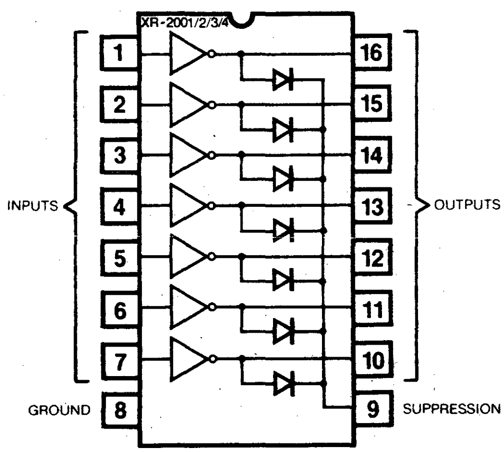
EXAR

High Current Drivers

XR-2001/2002/2003/2004 HIGH-VOLTAGE, HIGH-CURRENT DARLINGTON TRANSISTOR ARRAYS

The XR-2001/2002/2003/2004 are high-voltage, high-current Darlington transistor arrays, consisting of seven silicon npn Darlington pairs on a common monolithic substrate. All units feature open-collector outputs and integral protection diodes for driving inductive loads. Peak inrush currents of up to 600 mA are allowed, making the arrays ideal for driving tungsten filament lamps. The outputs may be paralleled to achieve high-load capability, although each driver has a maximum continuous collector-current rating of 500 mA. The arrays are directly price competitive with discrete transistor alternatives.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Peak Inrush Current Capability of 600 mA
Internal Protection Diodes for Driving Inductive Loads
Excellent Noise Immunity
Direct Compatibility with Most Logic Families
Opposing Pin Configuration Eases Circuit Board Layout

APPLICATIONS

Relay Drive
High-Current Logic Driver

XR-2004CN	Ceramic	0°C to +70°C

XR-2011/2012/2013/2014 HIGH-VOLTAGE, HIGH-CURRENT DARLINGTON TRANSISTOR ARRAYS

The XR-2011/2012/2013/2014 are high-voltage, high-current Darlington transistor arrays, consisting of seven silicon npn Darlington pairs on a common monolithic substrate. All units feature open-collector outputs and integral protection diodes for driving inductive loads. Peak inrush currents of up to 750 mA are allowed, making the arrays ideal for driving tungsten filament lamps. The outputs may be paralleled to achieve high-load capability, although each driver has a maximum continuous collector-current rating of 600 mA. The arrays are price competitive with discrete transistor alternatives.

Exar Integrated Systems

EXAR

Full Custom Development

Exar offers a complete design and production capability for full custom IC development, using Exar's bipolar, I^2L, and CMOS technologies. This provides an excellent complement to Exar's unique semi-custom capability.

Exar's full custom IC development and production capabilities offer complete flexibility to meet changing customer needs or design problems. We can develop a complete custom IC starting from your black box specifications, or reduce your working breadboard prototype to a monolithic chip. Alternately, if you have the facilities and resourses to do the IC design and layout, Exar will provide you with the device characteristics and IC layout rules for the particular process suitable to your design, and review your IC layout for you. Then, Exar can generate the IC tooling and fabricate your IC prototypes for you.

WAFER FOUNDARY SERVICE

Exar's bipolar process technology is compatible with the manufacturing processes available from many of the other IC manufacturers. Thus, if you have developed a set of IC tooling with another manufacturer and would like an alternate (or substitute) supplier for your custom IC product, in most cases the existing IC tooling will be directly compatible with Exar's technology.

Exar's Engineering department has two custom IC design groups dedicated to the development of linear and digital custom LSI. We pride ourselves in our flexibility and quick response to your needs.

CONVERTING SEMI-CUSTOM TO FULL CUSTOM

Exar offers the unique ability to start a program using a combination of semi-custom bipolar and/or I^2L, and CMOS arrays, during the early phases of a customer's product, taking full advantage of the low tooling cost and short development cycle. As a customer's product matures, and its market expands, resulting in higher volume production run rates, Exar can convert the multiple semi-custom chip approach into a single custom IC, achieving a cost reduction, and in many cases a performance improvement. The significant advantage of this type of program is that the risk associated with a custom development is greatly reduced; the IC design approach has been proven, production "bugs" are out of your product, and your production line continues to flow during the full custom chip development. Once the custom chip is completely characterized and found acceptable, the semi-custom IC system in your product can be phased-out while the full custom IC is being phased-in.

Exar is the only company that can offer you the advantages of semi-custom and full custom bipolar design programs, because of our complete in-house semiconductor manufacturing capability.

YOUR FIRST STEP

The following technical data package is required in order for Exar to provide you with a firm quotation for your full custom development program:

1. Circuit block diagram with sub-blocks (as necessary).
2. Circuit schematic or logic diagram.
3. Description of circuit operation, and pertinent application information.
4. Preliminary or objective device specification indicating min/max conditions, and limits for the critical parameters (i.e., input/output voltage and current levels, operating frequency, timing diagrams, input/output impedances, power dissipation, etc.).
5. Production requirements and the desired development timetable.

LINEAR–Operational Amplifiers

General Purpose

Dual Amplifiers. The 1458 (0°C to 70°C) and the 1558 (−55°C to 125°C) offer approximately the same performance as the 741. Compensation is built in.

Device	Source

MC1458	TI

The 101A series consists of the 101A (−55°C to 125°C), the 201A (−25°C to 85°C) and the 301 (0°C to 70°C). These units require an external compensation capacitor which permits the bandwidth to be optimized for particular applications.

TA7506	Toshiba

The performance of the 741 series is similar to the 101. These units include internal compensation to make the device stable and to eliminate the need for an external capacitor.

FET Input. The "741" of the FET input devices has yet to be established. Such a device requires very low cost, several sources, and many users. Commercial devices in the 155 series above meet some of these criteria, however, devices from the series below are generally lower in cost.

FET Input. Bipolar/JFET available in standard (155), wideband (156) and uncompensated (157) versions, premium performance (A and B suffixes), and various temperature ranges (155, 255, 355, etc are available.) Some versions approach the low cost of the units below.

Adjustable, Positive

Arranged in sequence by Output Voltage-High, Output Current, and then Output Voltage-Low.

Suffixes designating package style differences are basically dropped in the Adjustable Voltage Regulator Section. Thus identical part numbers may be referenced more than once under different parameters. Consult manufacturers on availability of different grades.

Advanced Micro Devices

LINEAR
Am6012

Distinctive Characteristics

- All grades 12-bit monotonic over temperature
- Differential nonlinearity to ±.012% (13 bits) max. over temperature
- Trimless design is inherently monotonic
- Fast settling output current: 250nsec
- Full scale current 4mA
- High output impedance and compliance: −5 to +10V
- 100% MIL-STD-883 reliability assurance testing
- Differential current outputs
- Low cost
- High-speed multiplying capability
- Direct interface to TTL, CMOS, ECL, HTL, NMOS
- Performance unchanged over supply range
- Low power consumption: 230mW
- R_{OUT}, C_{OUT} independent of logic code

GENERAL DESCRIPTION

The Am6012 series of 12-bit monolithic multiplying Digital to Analog Converters represent a new level of high speed and accuracy coupled with low cost. The Am6012 is the first 12-bit D/A Converter ever built using standard processing without the requirements of thin film resistors and/or active trimming of individual devices. The Am6012 uses sophisticated new circuit design concepts that give inherent monotonicity without requiring ultra precision internal components.

The Am6012 design guarantees a more uniform step size than is possible with standard binarily weighted DAC's. This ±1/2 LSB differential nonlinearity is desirable in many applications where local linearity is critical. The uniform step size allows finer resolution of levels and in most applications is more useful than conformance to an ideal straight line from zero to full scale.

The Am6012 has high voltage compliance, high impedance dual complementary outputs which increase its versatility and enable differential operation to effectively double the peak to peak output swing. These outputs can be used directly without op amps in many applications. The dual complementary outputs can also be connected in A/D converter applications to present a constant load current and significantly reduce switching transients and increase system throughput. Output full scale current is specified at 4mA, allowing use of smaller load resistors to minimize the output RC delay which usually dominates settling time at the 12-bit level.

The Am6012 series guarantees full 12-bit monotonicity for all grades and differential nonlinearity as tight as ±.012% (13 bits) over the entire temperature range. Device performance is essentially independent of power supply voltage. The devices work over a wide operating range of +5, −12 volts to ±18 volts.

DISTINCTIVE CHARACTERISTICS

- 1μs conversion time
- Trimmed internal voltage reference
- 0.1% nonlinearity
- Ratiometric operation
- Low operating voltages
- Internal matched gain, reference and offset resistors
- Microprocessor compatible
- 3-state outputs
- Pin-programmable unipolar or bipolar two's complement conversion
- Conversion complete available as interrupt or as multiplexed output on data bus
- Available in slim, 24-pin, 0.3″ and standard, 28-pin, 0.6″ packages

FUNCTIONAL DESCRIPTION

The Am6108 and Am6148 are microprocessor-compatible, 8-bit, high-speed, analog-to-digital converters. They include a precision reference, DAC, comparator, SAR, scale resistors, 3-state output buffers and control logic. The Am6108 is available in a standard .600-inch-wide, 28-pin package, and the Am6148 is offered in a space-saving, .300-inch-wide, 24-pin package. The Am6108/Am6148 are capable of completing an 8-bit conversion in under one microsecond and can handle input voltage ranges of 0 to +10V, 0 to +5V, and ±5V without external components. With appropriate external resistors, the user can program the device to operate on other input signal ranges (2 or 3 precision resistors are required). Full 8-bit monotonic performance with no missing codes is guaranteed over temperature. Both devices have 3-state outputs for bus compatibility and a status output.

The Am6108/Am6148 are useful in microprocessor-based systems or can be used in a stand-alone mode. The conversion time is short enough to allow most microprocessors to accept data immediately after requesting a conversion. Applications include Analog I/O subsystems, process control and servo-control.

PRELIMINARY DATA

DISTINCTIVE CHARACTERISTICS

- First totally monolithic, high-speed 12-bit ADC
- 3μs typical conversion time
- Internal precision voltage reference
- No missing codes
- Easy interfacing with 8- and 16-bit microprocessors
- Internal command register for programmable modes of operation
- Offset binary or two's complement output code
- 0 to 10V, or ± 5V input range
- 24-pin package

FUNCTIONAL DESCRIPTION

The Am6112 is the first fully monolithic microprocessor compatible 12-bit high-speed analog-to-digital converter. The Am6112 high-speed A/D contains a precision reference, DAC, comparator, SAR, scale resistors, output three-state buffers and comprehensive control logic, enabling the device to be interfaced with a variety of microprocessors. The Am6112 is capable of completing a 12-bit conversion in typically three microseconds and can handle input voltage ranges of 0 to 10V, and ±5V without external components.

The Am6112 has four modes of microprocessor operation, and a stand-alone mode. These modes are software programmable, except for the stand-alone mode which is pin selectable. Applications include analog I/O subsystems, servo-control and high-speed digital signal processing of analog events.

DEFINITION OF TERMS

Resolution: The number of possible analog input levels an A/D will resolve. Expressed as either the number of output bits, or 1 part in 2^n where n is the number of bits.

Monotonicity (Missing Codes): Monotonicity is a property of the DAC within a successive approximation ADC. Each increment in the digital code to the DAC is accompanied by an analog output that is greater than or equal to that of the proceeding code. Monotonicity of the DAC is a necessary requirement for a successive approximation ADC to have no missing codes.

Differential Nonlinearity: The deviation between the actual code width of an A/D from the ideal code width. The code width is defined as the range of analog input which produces a given digital output code. An ideal value of a code width is equivalent to FSR/2^n, where in is the number of bits.

Linearity: The deviation of each individual code from an ideal straight line transfer curve between zero and full scale, with the straight line measured from the middle of each particular code.

Inherent Quantization Error: Quantization Error is a direct consequence of the resolution of the A/D. All analog voltages within a given range are represented by a single digital output code. There is, therefore, an *inherent* ±1/2 LSB conversion error even for a perfect A/D.

Gain Error: Defined as the difference between the analog input levels required to produce the first and the last digital output code transitions. Gain error is a measure of the deviation between the actual gain from the ideal gain of FS-2 LSB.

Unipolar Offset Error: Difference between the ideal (+1/2 LSB) and the actual analog input level required to produce the first digital code transition (00 . . . . 00 to 00 . . . . 01) over the complete temperature range.

Bipolar Offset Error: Difference between the ideal (1/2 FSR − 1/2 LSB) and the actual analog input level required to produce the major carry output digital code transition (from 01 . . . . 11 to 10 . . . . 00).

Power Supply Sensitivity: A measure of the change in gain and offset of the A/D resulting from a change in supply voltage. Usually expressed in total %FS for a percentage change in supply voltage.

Conversion Time: The measure of how long it takes for the A/D to arrive at the correct digital output code. It is the time between the clock edge that starts a conversion after receiving a start command and the edge of the status line ($\overline{CC}$) which signifies that the conversion is completed.

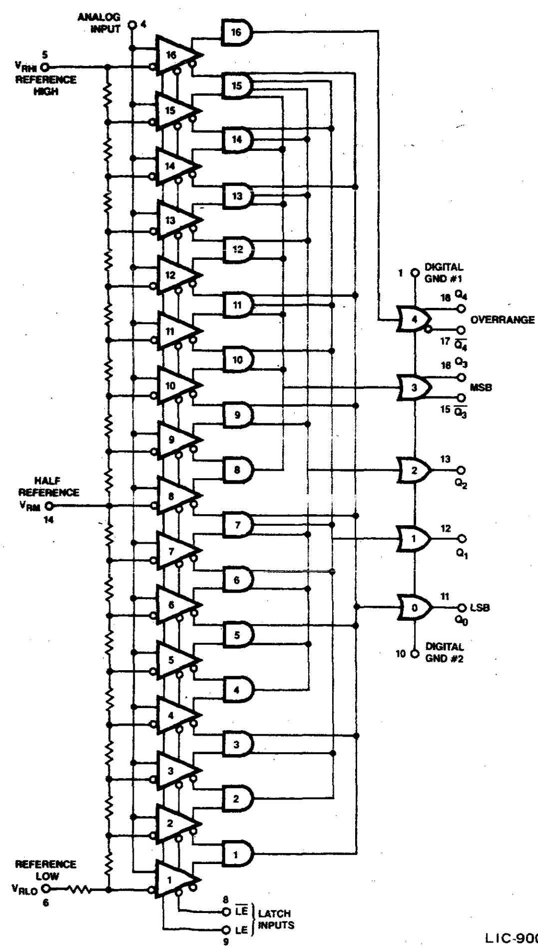
FUNCTIONAL DIAGRAM



LIC-900

FUNCTIONAL DESCRIPTION

The Am6688 4-bit quantizer consists of an array of 16 high-speed ECL sampling comparators, a resistor voltage divider, and an ECL-compatible binary encoder. It will accurately quantize an analog voltage into 15 equally-spaced levels and output a 4-bit binary digital word at sampling rates up to 100 MHz.

Resolution above 4-bits, up to a maximum of 8, may be obtained by stacking quantizers (n bits of resolution requires 2^{n-4} quantizers). An overrange output signal is provided to indicate that the input signal has exceeded the full-scale limit. This overrange output is also the enable gating signal used to encode the higher-order bits of the output in a stacked configuration.

The high speed latch enable inputs are intended to be driven from the complementary outputs of a standard ECL gate or a high-speed comparator such as the Am685. If LE is driven high and $\overline{LE}$ is driven low, the quantizer is in the sample mode and operates like a low-gain, high-bandwidth amplifier. When LE is driven low and LE is driven high, the quantizer will hold its existing digital binary output word.

The outputs are open emitters, requiring external pull-down resistors of at least 200Ω to −2V or 500Ω to −5.2V.

These devices can be used in video data conversion and time-base correction, radar signal processing, nuclear pulse-height analysis, and other systems requiring very high-speed analog-to-digital conversion.

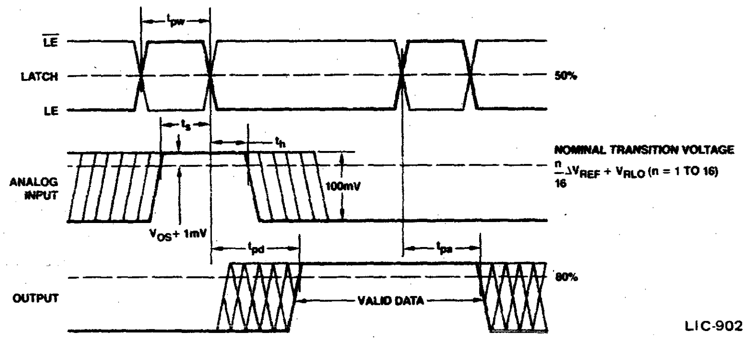
Notes: 1. Unless otherwise specified, $V^+ = +6.0V$, $V^- = -5.2V$, $V_{RHI} = +2.56V$, $V_{RM} = +1.28V$, $V_{RLO} = 0V$, $t_{pw} = 5ns$, and $R_L = 100\Omega$ to −2V at all outputs. The specifications given for V_{OS}, DNL, and t_{pd} apply over the full V_{IN} range and for ±5% supply voltages. The Am6688 is designed to meet the specifications given in the table after thermal equilibrium has been established with a transverse air flow of 500 LFPM or greater.

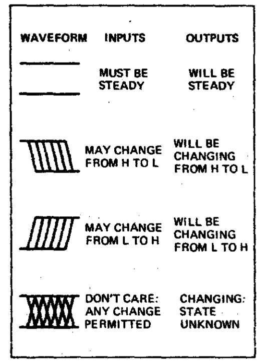
2. Switching characteristics are for a 100mV analog input pulse level-shifted at each transition point to provide an overdrive of 1mV past the maximum specified error voltage.

LINEAR
Am6688

TIMING DIAGRAM



KEY TO TIMING DIAGRAM



During the sampling time, the quantizer acts like a low-gain, very wide-bandwidth linear amplifier. The gain is not high enough to hold the outputs in a stable logic state under all conditions; consequently, the outputs may be undefined during this period. The time that the outputs are unstable begins t_{pa} after the Latch Enable goes HIGH, and terminates t_{pd} after it goes LOW. It is best to minimize this time by using as narrow a sampling pulse as possible, since the possibility of oscillation due to external parasitic feedback is greater the longer the device is in the analog mode.

Am6300

DISTINCTIVE CHARACTERISTICS

- 2.5V ±0.25% temperature compensated reference
- Versatile 100mA output for driving external NPN or PNP power transistors
- Thermal shutdown
- Logic control power up enable
- Programmable delay and rise time for power supply
- ±5% or ±10% over/under voltage detection/protection
- Programmable current limit detection/protection
- Programmable delays for the over/under voltage and current shutdown circuits
- Status outputs for fault conditions and output state

GENERAL DESCRIPTION

The Am6300 Power Control Subsystem consists of a regulator section, an over/under voltage detection section, a current limit section and a reset and control section.

The regulator section contains a complete series pass voltage regulator with thermal shutdown, which uses external resistors to set the output voltage. Both the collector and emitter of the regulator output transistor are available to the user for flexibility in driving external power devices. The regulator also contains a precision, trimmed 2.5 volt reference which is capable of supplying 5mA of current for external purposes in addition to controlling the regulator and generating over and under voltage references.

The over/under voltage section compares the voltage at the sense input of the regulator to the internal reference and determines if the difference exceeds the user programmed limits, ±5% or ±10%. If one of the limits is exceeded for a period longer than the user programmed delay, the regulator shuts down and the voltage alarm output is activated. The regulator is reset by activating the power down inputs or removing power from the device.

The current limit section detects overload current by means of an external sense resistor in series with V_{IN}, GND, or the output of the regulator. The user programs the threshold of this detection circuit with external resistors. The regulator shuts down if a current overload is detected for a period longer than a user programmed delay and the current alarm is activated. The regulator is reset by activating the power down inputs or removing power from the device.

The reset and control section provides to the user, the ability to turn the regulator on and off by logic control. The start up of the regulator is delayed by a user programmed interval after the power up signal is received. After this delay the regulator output ramps up at a rate which is also determined by the user. When the output voltage levels off at the preset value, the over/under voltage and current limit circuits are activated and a power up output is activated which can be used to signal to the user that the supply is operating or enable other circuits.

The Am6300 allows the user a great deal of flexibility in power supply configuration and control. It can be operated locally or remotely in a stand alone configuration or with external power transistors to increase the output current. The Am6300 can be cascaded with other Am6300s for a sequenced supply application.

GENERAL DESCRIPTION

The Am6301 Switching Power Supply Controller contains all the digital and analog functions necessary to control blocking, single-ended, or push-pull switching power supplies. It contains the voltage controlled oscillator, ramp generator, comparator, and reference for basic switched mode power supplies, as well as, a full complement of interface circuits and circuitry to protect both the power supply and its load.

V_{OFF}	Turn-Off Threshold, V_S Falling		8.5	9	10.0	Volts

Notes: 1. All typical values are specified at $V_S = 12V$ and $T_A = 25°C$.

2. The A2 comparator turn-off delay is measured from pin 14 to pin 4 or pin 5. The input signal on pin 14 is a negative-going pulse from 3V to 0.5V. The delay is measured from the 2V level on the input to the 2V level on the output. The output current is set at 4mA. The signal on pin 14 goes negative when the ramp voltage is equal to 2V.

3. For T_A greater than 25°C, derate to limit T_J to a maximum of 150°C. For P_D less than 750mW use typical thermal resistance as follows:

Typ	D-24-1	P-24-1	L-28-1	
θ_{JA}	50	120	100	°C/watt
θ_{JC}	15	60	40	°C/watt

LINEAR

Advanced Micro Devices

Am6301 FUNCTIONAL DESCRIPTION

VOLTAGE-CONTROLLED OSCILLATOR (VCO)

The VCO (voltage-controlled oscillator) generates a sawtooth voltage at C_T. The duration of the falling edge is determined by the selection of C_T. The duration of the rising edge and thus the oscillator frequency is determined by R_T and C_T. Maximum oscillator frequency is 250kHz. The oscillator frequency can be varied for frequency synchronization purposes by varying the voltage at C_{filter}. The falling edge of the VCO generates the synchronization pulse and triggers the ramp generator and other parts of the Am6301.

RAMP GENERATOR – FEED-FORWARD CONTROL

The ramp generator is triggered by the synchronization pulse of the VCO and oscillates at the same frequency. The duration of the falling edge of the ramp generator must be shorter than the fall time of the VCO. The voltage of the rising edge of the ramp generator and a DC voltage at comparator A2 are compared for pulse width control of the output. The slope of the rising edge is adjusted via the current through R_R. This enables an additional superimposed control of the duty cycle dependent on the input voltage of the Switched Mode Power Supplies (SMPS). This capability (feed-forward) allows for compensation of a known interference (e.g. line hum).

PHASE COMPARATOR – SYNCHRONIZATION

If the Am6301 is operated without external synchronization, the synchronization input must be connected to the synchronization output, so that the phase comparator sets the voltage at C_{filter}. The VCO then oscillates at the frequency set by R_T and C_T. Other circuits can be synchronized with the synchronization output. The Am6301 can be synchronized to an external signal of any duty cycle. The synchronization input and output are TTL compatible.

PUSH-PULL FLIP-FLOP

The push-pull flip-flop is toggled by the falling edge of the VCO. This guarantees that only one of the two push-pull outputs can be enabled at any one time.

COMPARATOR A2 – PULSE WIDTH MODULATION

The two noninverting inputs of the comparator are switched in such a manner that the lowest level is always compared with the inverting input. As soon as the voltage of the rising sawtooth at C_R exceeds the lower of the two levels, both outputs are disabled via the pulse turn-off flip-flop.

REGULATING AMPLIFIER A1

A1 is a high-quality regulating amplifier. It can be used in the control loop to transmit the amplified error voltage onto the free noninverting input of the comparator A2. A voltage change is thus transformed into a duty cycle change. The common mode range of A1 covers 0 to +5V. A1's low output impedance allows the use of feedback for the adjustment of the regulator loop-characteristics.

PULSE TURN-OFF FLIP-FLOP

This flip-flop enables the outputs at the beginning of each half period, and upon an error signal from A7 or a turn-off signal from A2 switches the outputs off for the remainder of the half period. Double pulses at the output cannot occur.

COMPARATOR A3

A3 limits the voltage at the $C_{soft\ start}$ pin (and also one input of A2) to a maximum of 5V. For a specified slope of the rising ramp generator edge, the duty cycle can be limited to a maximum value.

COMPARATOR A4

Comparator A4 has its switching threshold set to 1.5V and its output connected to the error flip-flop, so that when the voltage at capacitor $C_{soft\ start}$ is less than 1.5V the flip-flop is set. The error flip-flop only accepts the set pulse if no reset signal is present. Thus, an output turn-on is prevented as long as an error signal is present.

SOFT START

The output duty cycle is a function of the lower of the two voltages at the noninverting inputs of A2. At the time the Am6301 is turned on, the voltage at capacitor $C_{soft\ start}$ is equal to 0V. As long as no error exists, this capacitor is charged with a current of 6μA to the maximum value of 5V. In the case of an error, $C_{soft\ start}$ is discharged with a current of 2μA. The error flip-flop is set when the $C_{soft\ start}$ voltage is below 1.5V and the outputs are enabled if a reset signal is not present at the same time. The minimum ramp generator voltage is 1.8V, therefore, the soft start circuit only controls the duty cycle after the voltage at $C_{soft\ start}$ exceeds 1.8V.

ERROR FLIP-FLOP

Error signals to input $\overline{R}$ of the error flip-flop cause the outputs to be disabled immediately. The system turns on again using the soft start, after the error has been eliminated.

COMPARATOR A5 – OVER VOLTAGE

The input or output voltages of an SMPS can be monitored using A5. In the case of an over voltage, the error flip-flop immediately disables the IC outputs. After the over voltage is reduced, the SMPS turns back on using the soft start. The output of A5 can be fed back to the input. This causes the IC output stage to remain disabled even after elimination of the over voltage, until the supply voltage is briefly turned off, or the over voltage input is briefly connected to ground. To use this SCR-type action, the voltage to be monitored must be coupled resistively ($\geq$5KΩ) to the over voltage comparator.

COMPARATOR A6 – ON/$\overline{\text{OFF}}$ UNDER VOLTAGE

The comparator A6 reacts to an under voltage relative to V_{REF} and switches the IC outputs off. The input voltage of the SMPS can for example, be monitored, turning the outputs off if the input voltage is below a desired level. When the input voltage returns to the desired level, the Am6301 turns back on using the soft start. This input can also be used as a TTL compatible ON/$\overline{\text{OFF}}$ control.

COMPARATOR A7 – DYNAMIC CURRENT LIMITING CIRCUIT

A7 provides for the recognition of over current in the switching transistors. The system is turned on again at the beginning of the half period after the error is eliminated, the soft start is not used however. The A7 common mode range extends from 0 to +4V so that the smallest voltage drops can be recognized. The delay time from the occurrence of an error to the disabling of the outputs is only 250ns.

COMPARATOR A8 – IC UNDER VOLTAGE

Comparator A8 prevents undefined operating conditions of the IC outputs if the IC supply voltage becomes too low. If $V_S \leq 9V$, the output stage is disabled. This condition is maintained until V_S = 0V. Built-in hysteresis prevents permanent switching at the comparator's switching threshold. At a supply voltage of $V_S \geq 9.6V$, the Am6301 turns on using the soft start.

Am6301 FUNCTIONAL DESCRIPTION

VOLTAGE-CONTROLLED OSCILLATOR (VCO)

The VCO (voltage-controlled oscillator) generates a sawtooth voltage at C_T. The duration of the falling edge is determined by the selection of C_T. The duration of the rising edge and thus the oscillator frequency is determined by R_T and C_T. Maximum oscillator frequency is 250kHz. The oscillator frequency can be varied for frequency synchronization purposes by varying the voltage at C_{filter}. The falling edge of the VCO generates the synchronization pulse and triggers the ramp generator and other parts of the Am6301.

RAMP GENERATOR – FEED-FORWARD CONTROL

The ramp generator is triggered by the synchronization pulse of the VCO and oscillates at the same frequency. The duration of the falling edge of the ramp generator must be shorter than the fall time of the VCO. The voltage of the rising edge of the ramp generator and a DC voltage at comparator A2 are compared for pulse width control of the output. The slope of the rising edge is adjusted via the current through R_R. This enables an additional superimposed control of the duty cycle dependent on the input voltage of the Switched Mode Power Supplies (SMPS). This capability (feed-forward) allows for compensation of a known interference (e.g. line hum).

PHASE COMPARATOR – SYNCHRONIZATION

If the Am6301 is operated without external synchronization, the synchronization input must be connected to the synchronization output, so that the phase comparator sets the voltage at C_{filter}. The VCO then oscillates at the frequency set by R_T and C_T. Other circuits can be synchronized with the synchronization output. The Am6301 can be synchronized to an external signal of any duty cycle. The synchronization input and output are TTL compatible.

PUSH-PULL FLIP-FLOP

The push-pull flip-flop is toggled by the falling edge of the VCO. This guarantees that only one of the two push-pull outputs can be enabled at any one time.

COMPARATOR A2 – PULSE WIDTH MODULATION

The two noninverting inputs of the comparator are switched in such a manner that the lowest level is always compared with the inverting input. As soon as the voltage of the rising sawtooth at C_R exceeds the lower of the two levels, both outputs are disabled via the pulse turn-off flip-flop.

REGULATING AMPLIFIER A1

A1 is a high-quality regulating amplifier. It can be used in the control loop to transmit the amplified error voltage onto the free noninverting input of the comparator A2. A voltage change is thus transformed into a duty cycle change. The common mode range of A1 covers 0 to +5V. A1's low output impedance allows the use of feedback for the adjustment of the regulator loop-characteristics.

PULSE TURN-OFF FLIP-FLOP

This flip-flop enables the outputs at the beginning of each half period, and upon an error signal from A7 or a turn-off signal from A2 switches the outputs off for the remainder of the half period. Double pulses at the output cannot occur.

COMPARATOR A3

A3 limits the voltage at the $C_{soft\ start}$ pin (and also one input of A2) to a maximum of 5V. For a specified slope of the rising ramp generator edge, the duty cycle can be limited to a maximum value.

COMPARATOR A4

Comparator A4 has its switching threshold set to 1.5V and its output connected to the error flip-flop, so that when the voltage at capacitor $C_{soft\ start}$ is less than 1.5V the flip-flop is set. The error flip-flop only accepts the set pulse if no reset signal is present. Thus, an output turn-on is prevented as long as an error signal is present.

SOFT START

The output duty cycle is a function of the lower of the two voltages at the noninverting inputs of A2. At the time the Am6301 is turned on, the voltage at capacitor $C_{soft\ start}$ is equal to 0V. As long as no error exists, this capacitor is charged with a current of 6μA to the maximum value of 5V. In the case of an error, $C_{soft\ start}$ is discharged with a current of 2μA. The error flip-flop is set when the $C_{soft\ start}$ voltage is below 1.5V and the outputs are enabled if a reset signal is not present at the same time. The minimum ramp generator voltage is 1.8V, therefore, the soft start circuit only controls the duty cycle after the voltage at $C_{soft\ start}$ exceeds 1.8V.

ERROR FLIP-FLOP

Error signals to input $\overline{R}$ of the error flip-flop cause the outputs to be disabled immediately. The system turns on again using the soft start, after the error has been eliminated.

COMPARATOR A5 – OVER VOLTAGE

The input or output voltages of an SMPS can be monitored using A5. In the case of an over voltage, the error flip-flop immediately disables the IC outputs. After the over voltage is reduced, the SMPS turns back on using the soft start. The output of A5 can be fed back to the input. This causes the IC output stage to remain disabled even after elimination of the over voltage, until the supply voltage is briefly turned off, or the over voltage input is briefly connected to ground. To use this SCR-type action, the voltage to be monitored must be coupled resistively (≥5KΩ) to the over voltage comparator.

COMPARATOR A6 – ON/$\overline{\text{OFF}}$ UNDER VOLTAGE

The comparator A6 reacts to an under voltage relative to V_{REF} and switches the IC outputs off. The input voltage of the SMPS can for example, be monitored, turning the outputs off if the input voltage is below a desired level. When the input voltage returns to the desired level, the Am6301 turns back on using the soft start. This input can also be used as a TTL compatible ON/$\overline{\text{OFF}}$ control.

COMPARATOR A7 – DYNAMIC CURRENT LIMITING CIRCUIT

A7 provides for the recognition of over current in the switching transistors. The system is turned on again at the beginning of the half period after the error is eliminated, the soft start is not used however. The A7 common mode range extends from 0 to +4V so that the smallest voltage drops can be recognized. The delay time from the occurrence of an error to the disabling of the outputs is only 250ns.

COMPARATOR A8 – IC UNDER VOLTAGE

Comparator A8 prevents undefined operating conditions of the IC outputs if the IC supply voltage becomes too low. If V_S ≤9V, the output stage is disabled. This condition is maintained until V_S = 0V. Built-in hysteresis prevents permanent switching at the comparator's switching threshold. At a supply voltage of V_S ≥9.6V, the Am6301 turns on using the soft start.

SYMMETRY

Saturation of the transformer core must be prevented in push-pull converters. The degree of saturation of the transformer can be determined with an external circuit; and, in relation to this, the on times of the outputs can be asymmetrically shortened. If the symmetry correction circuit is not required, the symmetry inputs must be connected to ground. The input levels are TTL compatible.

OUTPUTS, DEADTIME

The two outputs Q_1 and Q_2 are transistors with open collectors. Their saturation voltage is 1V at 25mA. They operate in a push-pull mode and can be connected in parallel to drive single-ended converters with a maximum duty cycle of 96%. The time, during which only one of the two outputs is on, can be varied. The duration of the falling edge at the VCO is the same as the minimum time (dead time) during which both outputs are disabled simultaneously. The dead time, in push-pull SMPS, prevents the power transistors from being on at the same time.

ABI-022

FUNCTIONAL PIN DESCRIPTION

V_{REF} The output of the internal 2.5V reference.

Output Q_1, Q_2 The open collector output transistors capable of sinking 70mA each.

SYMQ_1, Q_2 Transformer unbalance control inputs. With a small amount of external circuitry these inputs can be used to cause asymmetrical output duty cycles. This allows correction for imbalances in the push-pull circuitry.

SYNC OUT The VCO output, used for synchronizing other circuits to the Am6301.

$C_{soft\ start}$ An external capacitor at this pin causes the output duty cycle to increase linearly during power up.

R_T, C_T An external resistor and a capacitor at these pins control the VCO center frequency of the phase locked loop oscillator.

C_{filter} An external filter capacitor for the control voltage of the phase locked loop is connected to this pin.

SYNC IN This pin is connected to one input of the phase comparator in the phase locked loop, the other input is internally connected to the VCO output.

R_R, C_R An external resistor and a capacitor at these pins control the slope of the ramp generator. The feed-forward control works by changing the voltage across R_{ramp} which affects the ramp slope and causes a modulation of the duty cycle.

Comp In The noninverting input of the pulse width modulating comparator.

Amp Out The output of the uncommitted operational amplifier. This amplifier is used as the error amplifier in most systems.

(+) Amp In, (−) Amp In These are the inputs of the uncommitted operational amplifier.

ON/$\overline{\text{OFF}}$ Under Voltage This input disables the outputs when it is connected to a voltage lower than V_{REF}. It can be connected as a remote shutdown or as an under voltage protection.

Over Voltage Input This input disables the outputs whenever it is higher than V_{REF}.

Over Voltage Output The output of the over voltage comparator. This pin can be connected back to the over voltage input for SCR-type protection.

$+I_{DYN}$, $-I_{DYN}$ Sense inputs for the dynamic current limiting circuit.

FSK Modem
WORLD-CHIP™

- Complete FSK MODEM in a 28-pin package (except line interface)
- Meets basic Bell 103/113/108, Bell 202, CCITT V.21, CCITT V.23 specifications (pin-programmable selection)
- No external filtering required
- All digital processing, including digital filters
- ADC/DAC on chip
- Includes essential RS-232/CCITT V.24 handshake signals
- Auto-answer capability
- Local copy/test modes
- 1200 bps full duplex on 4-wire line

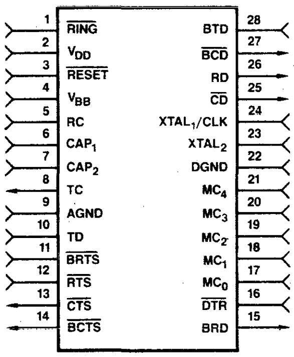

Figure 1. Am7910 Pinout

MMC-036

GENERAL DESCRIPTION

The Am7910 is a single-chip asynchronous Frequency Shift Keying (FSK) voiceband modem. Operating at rates up to 300, 600 or 1200 bits per second, it is compatible with the applicable Bell and CCITT recommended standards for 103/113/108, 202, V.21 and V.23 type modems. Five mode control lines select a desired modem configuration.

Digital signal processsing techniques are employed in the Am7910 to perform all major functions such as modulation, demodulation and filtering. The Am7910 contains on-chip analog-to-digital and digital-to-analog converter circuits to minimize the external components in a system. This device includes the essential RS-232/CCITT V.24 terminal control signals with TTL levels.

Clocking can be generated by attaching a crystal to drive the internal crystal oscillator or by applying an external clock signal.

A data access arrangement (DAA) or acoustic coupler must provide the phone line interface externally.

The Am7910 is fabricated using N-channel MOS technology in a 28-pin package. All the digital input and output signals (except the external clock signal) are TTL compatible. Power supply requirements are ±5 volts.

A COMPLETE FSK MODEM ON ONE WORLD-CHIP™

It's the World's First

The new Am7910 is the first complete, asynchronous Frequency Shift Keying modem ever offered on a single LSI chip. Our Am7910, a crystal, and a few inexpensive, non-critical components are all you need. No external filters, no hybrids, no tuned circuits are needed. Never before has the modem function been so easy to build into your products. See Figure 1.

It's the World's Most Complete

All the features a modem should have are built right in. Filters are already there. Handshake signals already there. Auto-answer is already there. Local loopback is already there. Back channels are already there. No extra components are required to implement these functions. Even line equalization is available if you want it. No modem chip or chip set has ever offered you so many features.

It's a WORLD-CHIP™

No matter where you market your product, the Am7910 is the perfect modem solution. It's designed to meet communications performance standards around the world. Without any additional circuitry, it can be switched to any of 9 Bell or CCITT standards. The flexibility of Digital Signal Processing allows systems built with the Am7910 to be used all over the world without modification to the modem circuit.

DIGITAL SIGNAL PROCESSING FOR HIGH STABILITY, WITHOUT CRITICAL COMPONENTS

The Am7910 Doesn't Drift With Time or Temperature

The Am7910 uses digital signal processing techniques (DSP) to perform all major functions, including modulation, demodulation and filtering. Because of the use of DSP, the performance of each section of the Am7910 is perfectly predictable and inherently stable over time and temperature. The modem performance specifications are designed into the digital signal processing algorithms, and that's where they stay, inside the chip, never changing, guaranteed. There's nothing to adjust, nothing to age or drift. See Figure 2.

No External Filters

Digital Signal Processing completely eliminates the need for external critical-tolerance filters that analog designs require. Since no critical tuned components are required, printed circuit board design with the Am7910 is easier than ever. And DSP does not produce the noise and supply voltage sensitivity that is commonly found in switched capacitor designs. The bottom line is, fewer components, therefore a lower cost system solution.

Advanced Micro Devices

SELECTABLE TO ANY OF 9 DIFFERENT WORLD STANDARDS

The Am7910 is designed to be used in equipment all over the world. The device operates in Bell 103 and 202, and CCITT V.21 and V.23 modem configurations at baud rates from 300 to 1200bps (with back channel). Mode selection is controlled by five simple programming inputs. No crystals need to be changed. No extra resistors, capacitors, or interface circuits. Just switch a few control lines.

MODEM CONFIGURATIONS

STD	BPS	DUPLEX	FEATURES
Bell 103	300	Full	Originate
Bell 103	300	Full	Answer
Bell 202	1200	Half	
Bell 202	1200	Half	Line Equalizer
CCITT V.21	300	Full	Originate
CCITT V.21	300	Full	Answer
CCITT V.23 mode 2	1200	Half	
CCITT V.23 mode 2	1200	Half	Line Equalizer
CCITT V.23 mode 1	600	Half	

MORE BUILT-IN FEATURES MAKE THE Am7910 THE EASIEST MODEM TO USE

Loopback for Simplified Testing

Ten loopback modes exist which permit both analog and digital loopback for each modem configuration. When a loopback mode is selected, the signal processing circuits for both the transmitter and receiver are set to operate on the same channel or frequency band. The analog output (Transmitted Carrier) and the analog input, (Received Carrier) can be externally connected together for local analog loopback. Alternatively, the digital data signals (TD and RD, or BTD and BRD,) can be connected externally, allowing a remote modem to test the local modem with its digital data signals looped back. Thus, the Am7910 reduces maintenance, service time, and cost. The 202 and V.23 loopback modes can also be used for 1200bps full duplex operation over 4-wire lines.

Back Channel Option Included

Low bit-rate back channels are provided by the Am7910 when the Bell 202 or CCITT V.23 modem configurations are selected. The back channel uses the remaining bandwidth of the line to return acknowledgement and control signals to the sender on another channel, while the sender continues to transmit at 1200 baud. Overall transmission speed is improved by not having to turn the line around to send an acknowledgement, nor is it necessary to complete transmission of a data block before receiving an error signal. The 202 back channel allows up to 5 bits per second and the V.23 back channel allows up to 75 bits per second.

Auto-Answer for Remote Installations

Auto-answer capability, important for equipment in remote places, is also built in. Upon receipt of a signal at its Ring Input, the Am7910 generates a silence interval followed by an answer tone of the proper duration at the Transmitted Carrier output. The auto-answer sequence meets Bell and V.25 specifications.

RS-232 and CCITT V.24 Terminal Control Signals Provided On-Chip

Essential terminal control signals such as Data Terminal Ready (DTR), Request to Send (RTS), Clear to Send (CTS) and Carrier Detect (CD), are included in the Am7910. All the specified delays, such as Request-to-Send ON to Clear-to-Send ON are automatically inserted. The control signals are TTL compatible.

SETS THE INTERNATIONAL STANDARD OF PERFORMANCE

The measure of a modem's performance is its ability to extract correct data from a signal received over a line with severe distortion, attenuation, and noise. The graphs below show the Bit Error Rate (BER) of the Am7910 under two sets of conditions. At the left is the data for a Bell 103 configuration over an undistorted line and a line with amplitude and group delay distortion. On the right is the data for a V.23 configuration for an undistorted and a severely distorted line. Compare this performance data with any other modem chip or chip set and you'll see why the Am7910 sets the standard.

THE WORLD-CHIP™ SERIES

Telephone systems around the world are evolving rapidly into something new: a huge digital data communications network. The crossbar switches of yesterday are being replaced by compact electronic switches that route digital bit streams from one subscriber to another. The wires that used to carry human speech alone now also carry streams of digital data via modems. Soon the telephone set itself will be changed from a simple device for talking and listening into a specialized data terminal, capable of doing much more.

As the information carried by our telephone networks has changed, new standards have been added to the old. Standards to digitize voice. Standards for sending digital data over voice-grade lines. Standards for multiplexing many data packets onto a single line. Around the world, two groups of standards are used – one developed by Bell in the U.S., another developed by the CCITT. Until now, the electronic components designed to make this revolution possible have been specialized for one group of standards or the other, and usually for only one standard or variation within that group.

Advanced Micro Devices' World-Chip™ Series is different. We're using a variety of technologies to create circuits that support the telecom revolution all over the world. We're using advanced architectural concepts, especially digital signal processing, to move critical filtering and signal conditioning directly onto the integrated circuit. Digital techniques provide guaranteed high stability and repeatability, and also allow changes to filtering characteristics under user program control. We're using our skills in both linear and digital circuit design to put the conversions between analog signals and digital data on the same IC as the digital processing circuits. And we're using our MOS and Bipolar process technologies to solve each part of the system problem in an optimum way with parts that are designed to work together. By the end of the decade AMD will have led the way to more efficient, effective and inexpensive methods for making the world an even smaller (and faster) place in which to communicate.

AMD has developed a set of components that work in any of the world's telecommunications systems. Each integrated circuit can be programmed to perform its function in conformance with any of the applicable standards. The state-of-the-art features built into our devices are available simultaneously to customers designing equipment for any of the world's telecom markets. And customers who themselves design equipment for more than one market can use a single set of circuits – Advanced Micro Devices' World-Chips™ – to meet all their needs.

Am7990 Family Ethernet Node
System Overview

Advanced Micro Devices is introducing a set of LSI devices that provides the Ethernet system designer, and designers of Ethernet compatible products, a low cost physical and link level interface to the Ethernet Bus.

The Am7990 Ethernet interface family is being designed using a combination of MOS and IMOX™ bipolar technologies. This family consists of the Am7990 Local Area Network Controller for Ethernet (LANCE), and the Am7991 Serial Interface Adapter (SIA). As shown in Figure 1, the Am7990 family provides the complete interface between the device System Bus and the Ethernet Transceiver Cable.

The Am7990 LANCE is a 10M-bit/sec MOS device in a 48-pin package, optimized to perform the link level Ethernet protocol. The CSMA/CD network access, memory management (onboard DMA), error reporting, packet handling, and microprocessor interface functions also reside in the LANCE.

The Am7991 Serial Interface Adaptor provides Manchester encoding and decoding of the serial bit stream and interfaces the TTL output of the LANCE to the differential inputs of the transceiver. It has an on board phase locked loop to recover clock from an incoming signal and can use an external crystal oscillator or TTL inputs to provide clock for transmission.

Coupling the Ethernet Node to the Ethernet Cable requires a transceiver. Commercially available board or module transceivers can be used with the LANCE and SIA. Advanced Micro Devices has a monolithic transceiver in an early phase of development which should lower the cost significantly in this area as well.

BASIC SYSTEM OPERATION

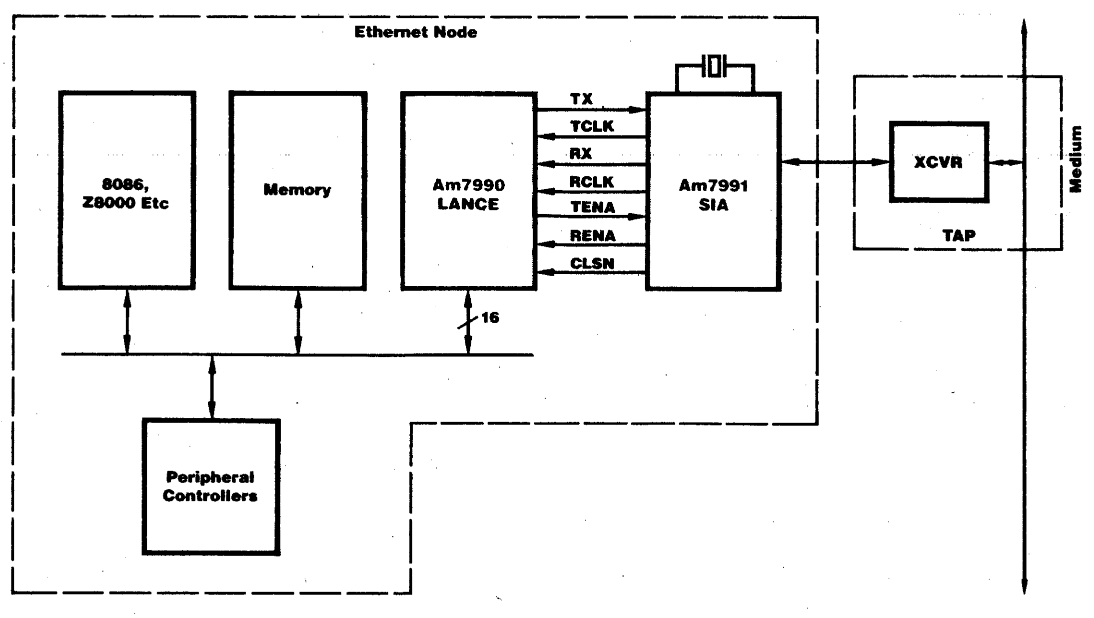
Ethernet is a send and receive half duplex system. The node must function in either transmit or receive mode at any instant in time. Before transmission the node must be sure there is no contention for the bus. The Ethernet CSMA/CD network access algorithm is implemented completely within the LANCE. In addition to listening for a clear coax before transmitting, Ethernet handles collisions in a predetermined way. Should two nodes attempt to transmit at the same time, the signals will collide and the data on the coax will be garbled. The transmitting nodes listen while they transmit and detect the collision. Both continue to transmit for a predetermined length of time to "jam" the network, insuring all nodes have recognized the collision. The transmitting nodes then delay a random amount of time according to the "truncated binary backoff" algorithm implemented in the LANCE, before attempting to transmit again. This minimizes the possibility of collision on retransmission.

TRANSMIT MODE

In the transmit mode, the LANCE initiates a DMA cycle to access data from a transmit buffer. It prefaces the data with a preamble, and sync pattern then calculates and appends a 32-bit CRC.

This packet is transmitted serially to the SIA. The Manchester encoder in the SIA takes the transmitted data from the LANCE and creates the Manchester encoded differential signals TRANSMIT+ and TRANSMIT− to drive the Transceiver cable. These differential signals are coupled through the transceiver cable, transceiver and on to the Ethernet coaxial cable.

Figure 1. Ethernet Node Architecture



LINEAR

Advanced Micro Devices

COMMUNICATIONS
Am7990 Family Ethernet Node

RECEIVE MODE

When carrier is present on the Ethernet coax, the Transceiver will create the differential signals RECEIVE+ and RECEIVE−. These inputs to the SIA are decoded by the Manchester decoder. A phase locked loop synchronizes to the Ethernet Preamble, allowing the decoder to recover clock and data from the encoded signals. These two signals are supplied to the LANCE as the TTL signals RECEIVE DATA and RECEIVE CLOCK. In addition, the SIA creates the signal CARRIER PRESENT while it is receiving data from the cable, indicating to the LANCE that receive data and clock are available. When these signals reach the LANCE, the CRC is calculated and compared to the CRC checksum at the end of the packet. If the calculated CRC doesn't agree with the packet CRC an error bit is set and an interrupt generated to the microprocessor.

ADDRESSING

There are three addressing modes. The first is physical addressing which requires a comparison of the 48-bit destination address in the packet with the node address programmed into the LANCE during initialization. The second mode is multi-cast addressing. This mode can be useful when sending packets to all of one type of a device simultaneously on the network, or for a broadcast situation where all nodes on the network receive the packet. In the final "promiscuous" mode of operation, a node will accept all packets on the coax regardless of their destination address.

ERROR REPORTING

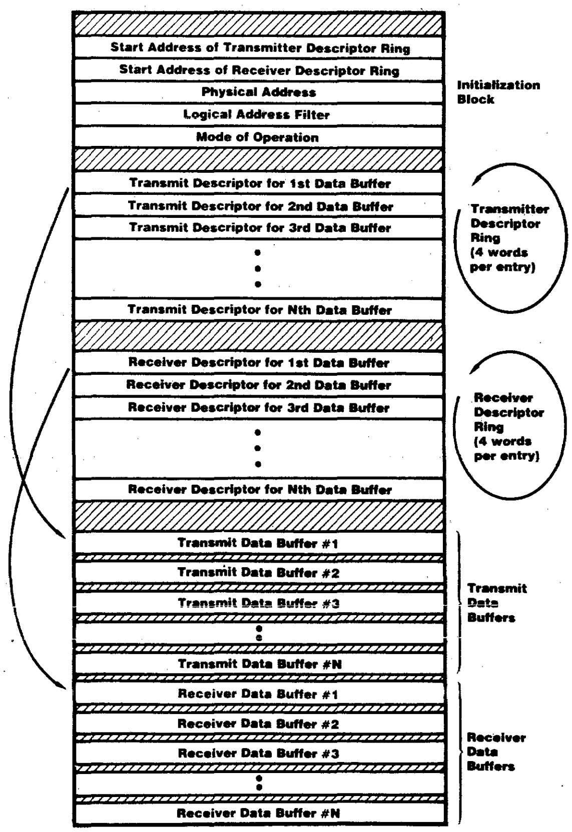
Extensive error reporting is provided by the LANCE through microprocessor interrupt and error bits in a status register. The following are the significant error conditions:

- CRC error on receive
- Babbling error
- Missed packet
- Memory error

BUFFER MANAGEMENT

A key feature of the LANCE and it's on board DMA channel is the flexibility and speed of communication between the LANCE and the host microprocessor through common memory locations. The basic organization of the buffer management consists of circular task queues called descriptor rings for transmit and receive operations. Up to 128 tasks may be queued on a descriptor ring awaiting execution by the LANCE. (Figure 2)

Figure 2. LANCE/Processor Memory Interface



MMC-105

Advanced Micro Devices

MICROPROCESSOR INTERFACE

The parallel interface of the LANCE has been designed to be "friendly" or easy to interface to a variety of popular 16-bit microprocessors. These microprocessors include the 68000, Z8000, 8086, and LSI-II devices.

The LANCE has a 24-bit wide linear address space when it is in the Bus Master Mode allowing it to DMA directly into the entire address space of the above microprocessors. The LANCE interfaces with both multiplexed and demultiplexed data busses (Figure 3) and features control signals for address/data bus transceivers.

GENERAL DESCRIPTION

The Am7990 Local Area Network Controller for Ethernet (LANCE) is a 48-pin VLSI device designed to greatly simplify interfacing a microcomputer or minicomputer to an Ethernet Local Area Network. This chip, in conjunction with the Am7991 Serial Interface Adapter (SIA) and closely coupled local memory and microprocessor, is intended to provide the user with a complete interface module for an Ethernet network. The Am7990 is designed using a scaled N-Channel MOS technology and is compatible with a variety of microprocessors. On-board DMA, advanced buffer management and extensive error reporting and diagnostics facilitate design and improve system performance.

PIN DEFINITIONS

DAL_{00} – DAL_{15} — **Data/Address Lines (Input/Output 3-State).** The time multiplexed Address/Data bus. During the address portion of a memory transfer, $DAL_{00}-DAL_{15}$ contains the lower 16 bits of the memory address. The upper 8 bits of address are contained in $A_{16}-A_{23}$.

During the data portion of a memory transfer, $DAL_{00}-DAL_{15}$ contains the read or write data, depending on the type of transfer.

The LANCE drives these lines as a Bus Master and as a Bus Slave.

$A_{16}-A_{23}$ — **High Order Address Bus (Output 3-State).** The additional address bits necessary to extend the DAL lines to access a 24-bit address. These lines are driven as a Bus Master only.

READ — **(Input/Output 3-State).** Indicates the type of operation to be performed in the current bus cycle. This signal is an output when the LANCE is a Bus Master.

High – Data is taken off the DAL by the chip
Low – Data is placed on the DAL by the chip

The signal is an input when the LANCE is a Bus Slave

High – Data is placed on the DAL by the chip
Low – Data is taken off the DAL by the chip

$\overline{BM_0}$/BYTE $\overline{BM_1}$/$\overline{BUSAKO}$ — I/O pins 15 and 16 are programmable through bit (00) of CSR_3.

If CSR_3 (00) BCON = 0
I/O PIN 15 = $\overline{BM_0}$ (Output 3-state)
I/O PIN 16 = $\overline{BM_1}$ (Output 3-state)

$\overline{BM_0}$, $\overline{BM_1}$ (Byte Mask). This indicates the byte(s) on the DAL are to be read or written during this bus transaction. The LANCE drives these lines only as a Bus Master. It ignores the Byte Mask lines when it is a Bus Slave, and assumes word transfers.

Byte selection using Byte Mask is done as described by the following table.

$\overline{BM_1}$	$\overline{BM_0}$	
LOW	LOW	Whole Word
LOW	HIGH	Upper Byte
HIGH	LOW	Lower Byte
HIGH	HIGH	None

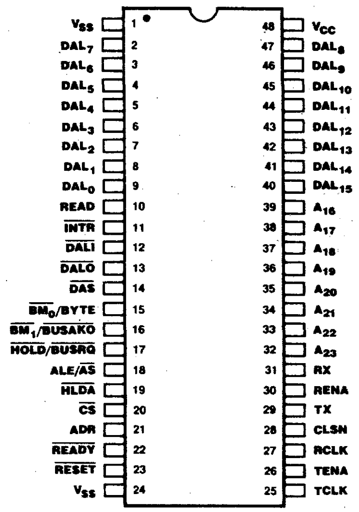
If CSR_3 (00) BCON = 1
I/O PIN 15 = BYTE (Output 3-state)
I/O PIN 16 = $\overline{BUSAKO}$ (Output)

Byte selection may also be done using the BYTE line and DAL_{00} line, latched during the address portion of the bus cycle. The LANCE drives BYTE only as a Bus Master and ignores it when a Bus Slave selection is done (similar to $\overline{BM_0}$, $\overline{BM_1}$).

Byte selection is done as outlined in the following table.

BYTE	DAL_{00}	
LOW	LOW	Whole Word
LOW	HIGH	Illegal Condition
HIGH	LOW	Lower Byte
HIGH	HIGH	Upper Byte

LANCE PIN DESCRIPTION
D-48-1



Note: Pin 1 is marked for orientation.

$\overline{BUSAKO}$ is a bus request daisy chain output. If the chip is not requesting the bus and it receives $\overline{HLDA}$, $\overline{BUSAKO}$ will be driven low. If the LANCE is requesting the bus when it receives $\overline{HLDA}$, $\overline{BUSAKO}$ will remain high.

Byte Swapping

In an effort to be compatible with the variety of 16-bit microprocessors available to the designer, the LANCE may be programmed to swap the position of the upper and lower order bytes on data involved in transfers with the internal FIFO.

Byte swapping is done when BSWP = 1. The most significant byte of the word in this case will appear on DAL lines 7-0 and the least significant byte on DAL lines 15-8.

When BYTE = H (indicating a byte transfer) the table indicates on which part of the 16 bit data bus the actual data will appear.

Whenever byte swap is activated, the only data that is swapped is data traveling to and from the FIFO.

Signal Line \ Mode Bits	BSWP = 0 and BCON = 1	BSWP = 1 and BCON = 1
BYTE = L and DAL_{00} = L	Word	Word
BYTE = L and DAL_{00} = H	Illegal	Illegal
BYTE = H and DAL_{00} = H	Upper Byte	Lower Byte
BYTE = H and DAL_{00} = L	Lower Byte	Upper Byte

$\overline{CS}$ — **Chip Select (Input).** Indicates, when asserted, that the LANCE is the slave device of the data transfer. $\overline{CS}$ must be valid throughout the data portion of the bus cycle.

Advanced Micro Devices

COMMUNICATIONS
Am7990 Family Ethernet Node

ADR — **Register Address Port Select (Input).** When LANCE is slave, ADR indicates which of the two register ports is selected. ADR LOW selects register data port, ADR HIGH selects register address port. ADR must be valid throughout the data portion of the bus cycle and is only used by the LANCE when CS is low.

ALE/$\overline{\text{AS}}$ — **Address Latch Enable (Output 3-State).** Used to demultiplex the DAL lines and define the address portion of the bus cycle. This I/O pin is programmable through bit (01) of CSR$_3$.

As ALE, (CSR$_3$ (01), ACON = 0) the signal transitions from a HIGH to a LOW during the address portion of the transfer and remains low during the data portion. ALE can be used by a Slave device to control a latch on the bus address lines. When ALE is high the latch is open and when ALE goes low the latch is closed.

As $\overline{\text{AS}}$ (CSR$_3$ (01), ACON = 1), the signal pulses LOW during the address portion of the bus transaction. The low to high transition of AS can be used by a slave device to strobe the address into a register.

The LANCE drives the ALE/$\overline{\text{AS}}$ line only as a Bus Master.

$\overline{\text{DAS}}$ — **Data Strobe (Input/Output 3-State).** Defines the data portion of the bus transaction. $\overline{\text{DAS}}$ is high during the address portion of a bus transaction and low during the data portion. The low to high transition can be used by a Slave device to strobe bus data into a register. $\overline{\text{DAS}}$ is driven only as a Bus Master.

$\overline{\text{DALO}}$ — **Data/Address Line Out (Output 3-State).** An external bus transceiver control line. $\overline{\text{DALO}}$ is asserted when the LANCE drives the DAL lines. $\overline{\text{DALO}}$ will be low only during the address portion if the transfer is a READ. It will be low for the entire transfer if the transfer is a WRITE. $\overline{\text{DALO}}$ is driven only when LANCE is a Bus Master.

$\overline{\text{DALI}}$ — **Data/Address Line In (Output 3-State).** An external bus transceiver control line. $\overline{\text{DALI}}$ is asserted when the LANCE reads from the DAL lines. It will be low during the data portion of a READ transfer and remain high for the entire transfer if it is a WRITE. $\overline{\text{DALI}}$ is driven only when LANCE is a Bus Master.

$\overline{\text{HOLD}}$/$\overline{\text{BUSRQ}}$ — **Bus Hold Request (Output Open Drain).** Asserted by the LANCE when if requires access to memory. $\overline{\text{HOLD}}$ is held LOW for the entire ensuing bus transaction. The function of this pin is programmed through bit (00) of CSR$_3$. Bit (00) of CSR$_3$ is cleared when $\overline{\text{RESET}}$ is asserted.

When CSR$_3$ (00) BCON = 0
I/O pin 17 = $\overline{\text{HOLD}}$ (Output Open Drain)

When CSR$_3$ (00) BCON = 1
I/O pin 17 = $\overline{\text{BUSRQ}}$ (Output Open Drain)

$\overline{\text{BUSRQ}}$ will be asserted only if I/O pin 17 is high prior to assertion.

$\overline{\text{HLDA}}$ — **Bus Hold Acknowledge (Input).** A response to $\overline{\text{HOLD}}$. When $\overline{\text{HLDA}}$ is low in response to the chip's assertion of $\overline{\text{HOLD}}$, the chip is the Bus Master. $\overline{\text{HLDA}}$ deasserts upon the deassertion of $\overline{\text{HOLD}}$.

$\overline{\text{INTR}}$ — **Interrupt (Output Open Drain).** An attention signal that indicates, when active, that one or more of the following CSR$_0$ status flags is set: BABL, MERR, MISS, RINT, TINT or IDON. $\overline{\text{INTR}}$ is enabled by bit 06 of CSR$_0$ (INEA = 1).

RX — **Receive (Input).** Receive Input Bit Stream.

TX — **Transmit (Output).** Transmit Output Bit Stream.

TENA — **Transmit Enable (Output).** Transmit Output Bit Stream enable. A level-asserted with the Transmit Output Bit Stream, TX, to enable the external transmit logic.

RCLK — **Receive Clock (Input).** A 10MHz square wave synchronized to the Receive data and only active while receiving an Input Bit Stream.

CLSN — **Collision (Input).** A logical input that indicates that a collision is occurring on the channel.

RENA — **Receive Enable (Input).** A logical input that indicates the presence of carrier on the channel.

TCLK — **Transmit Clock (Input).** 10MHz clock.

$\overline{\text{READY}}$ — **(Input/Output Open Drain).** When the LANCE is a Bus Master, $\overline{\text{READY}}$ is an asynchronous acknowledgement from the bus memory that it will accept data in a WRITE cycle or that it has put data on the DAL lines in a READ cycle.

As a Bus Slave, the LANCE asserts $\overline{\text{READY}}$ when it has put data on the DAL lines during a READ cycle or is about to take data off the DAL lines during a write cycle. $\overline{\text{READY}}$ is a response to $\overline{\text{DAS}}$ and will return HIGH after $\overline{\text{DAS}}$ has gone HIGH. $\overline{\text{READY}}$ is an input when the LANCE is a Bus Master and an output when the LANCE is a Bus Slave.

$\overline{\text{RESET}}$ — **(Input).** Bus Reset Signal. Causes the LANCE to cease operation and enter an idle state.

V_{CC} — Power supply pin +5 volts ± 5%.

V_{SS} — Ground. Pins 1 and 24 should be connected together externally, as close to the chip as possible.

FUNCTIONAL DESCRIPTION

The parallel interface of the Local Area Network Controller for Ethernet (LANCE) has been designed to be "friendly" or easy to interface to a variety of popular 16-bit microprocessors. These microprocessors include the following: Z8000, 8086, 68000 and LSI-11. The LANCE has a 24-bit wide linear address space when it is in the Bus Master Mode allowing it to DMA directly into the entire address space of the above microprocessors. A programmable mode of operation allows byte addressing in one of two ways: A Byte/Word control signal compatible with the 8086 and Z8000, or an Upper Data Strobe and Lower Data Strobe signal compatible with microprocessors such as the 68000. A programmable polarity on the Address Strobe signal eliminates the need for external logic. The LANCE interfaces with both multiplexed and demultiplexed data busses and features control signals for address/data bus transceivers.

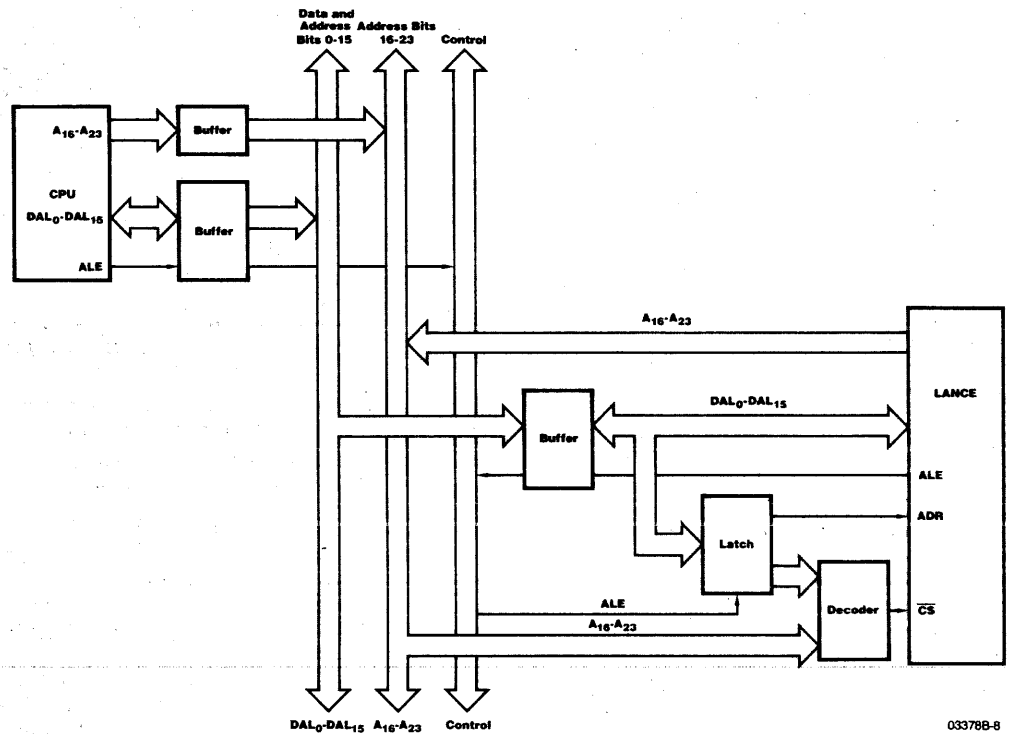
During initialization, the CPU loads the starting address of the initialization block into two internal control registers. The LANCE has four internal control and status registers ($CSR_{0,1,2,3}$) which are used for various functions such as the loading of the initialization block address, different programming modes and status conditions. The host processor communicates with the LANCE during the initialization phase, for demand transmission and periodically to read the status bits following interrupts. All other transfers to and from the memory are handled as DMA under microword control.

Interrupts to the microprocessor are generated by the LANCE: 1) upon completion of its initialization routine, 2) the reception of a packet, 3) the transmission of a packet, 4) transmitter timeout error, 5) a missed packet and 6) memory error.

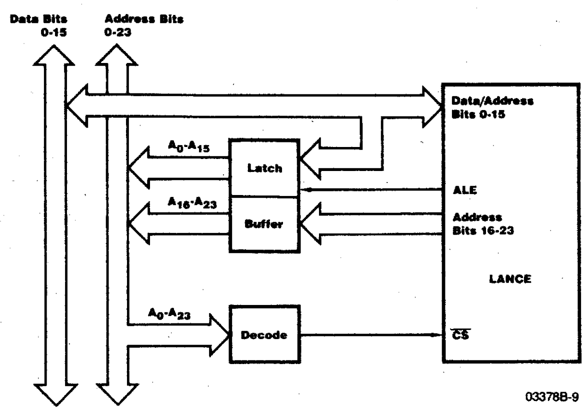
The cause of the interrupt is ascertained by reading CSR_0. Bit (06) of CSR_0, (INEA) enables or disables interrupts to the microprocessor. In systems where polling is used in place of

Figure 1. LANCE/CPU Interfacing

a) Multiplexed Bus



b) Demultiplexed Bus



interrupts, bit (07) of CSR_0 (INTR) indicates an interrupt condition.

The basic operation of the LANCE consists of two distinct modes: transmit and receive. In the transmit mode the LANCE chip directly accesses data in a transmit buffer in memory. It prefaces the data with a preamble, sync pattern, and calculates and appends a 32-bit CRC. This packet is then ready for transmission to the Am7991 SIA.

In the receive mode, packets are sent via the SIA to the LANCE. The packet is loaded into buffer memory. A CRC is calculated and compared with the CRC appended to the data packet. If the calculated CRC checksum doesn't agree with the packet CRC, an error bit is set.

ADDRESSING

Packets can be received using 3 different destination addressing schemes: physical, logical and promiscuous.

The first type is a full comparison of the 48-bit destination address in the packet with the node address that was programmed into the LANCE during an initialization cycle. There are two types of logical address, one is group type mask where the 48-bit address in the packet is put through a hash filter in order to map the 48-bit physical addresses into 1 of 63 logical groups. This mode can be useful if sending packets to all of a particular type of device simultaneously (i.e., send a packet to all file servers or all printer servers). The second logical address is a multicast address where all nodes on the network receive the packet. The last receive mode of operation is the so-called "promiscuous mode" in which a node will accept all packets on the coax regardless of their destination address.

COLLISION DETECTION AND IMPLEMENTATION

The Ethernet CSMA/CD network access algorithm is implemented completely within the LANCE. In addition to listening for a clear coax before transmitting, Ethernet handles collisions in a predetermined way. Should two transmitters attempt to seize the coax at the same time they will collide and the data on the coax will be garbled. The transmitting nodes listen while they transmit; detect the collision, then continue to transmit for a predetermined length of time to "jam" the network and ensure that all nodes have recognized the collision. The transmitting nodes then delay a random amount of time according to the Ethernet "truncated binary backoff" algorithm in order that the colliding nodes don't try to repeatedly access the network at the same time. Up to 16 attempts to access the network are made by the LANCE before reporting back an error due to excessive collisions.

ERROR REPORTING AND DIAGNOSTICS

Extensive error reporting is provided by the LANCE. Errors conditions reported relate either to the network as a whole or to data packets. Network-related errors are recorded as flags in the CSRs and are examined by the CPU following interrupt. Packet related errors are written into descriptor entries corresponding to the packet.

System errors include:

- Babbling Transmitter
  - Transmitter attempting to transmit more than 1518 data bytes.
- Collision
  - Collision detection circuitry nonfunctional
- Missed packet
  - Insufficient buffer space
- Memory timeout
  - Memory response failure

Packet related errors:

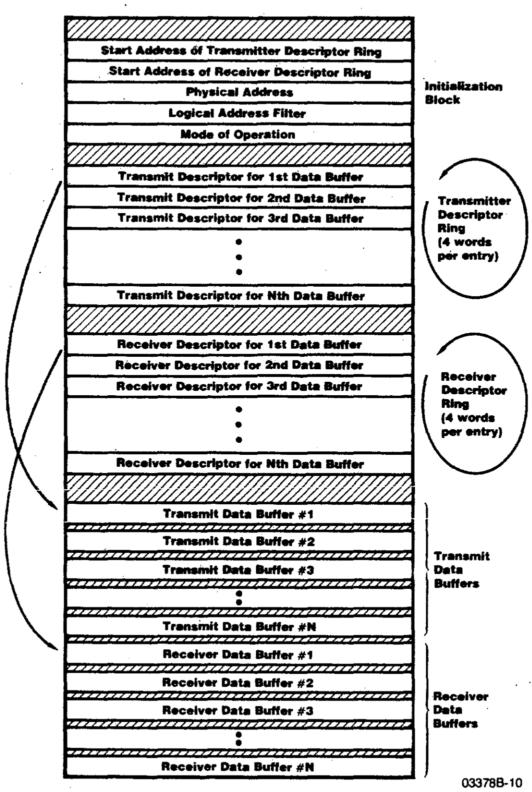
- CRC
  - Invalid data
- Framing
  - Packet did not end on a byte boundary
- Overflow/Underflow
  - Indicates abnormal latency in servicing a DMA request
- Buffer
  - Insufficient buffer space available

The LANCE performs several diagnostic routines which enhance the reliability and integrity of the system. These include a CRC logic check and two loop back modes (internal/external). Errors may be introduced into the system to check error detection logic. A Time Domain Reflectometer is incorporated into the LANCE to aid system designers locate faults in the Ethernet cable. Shorts and opens manifest themselves in reflections which are sensed by the TDR.

BUFFER MANAGEMENT

A key feature of the LANCE and its on-board DMA channel is the flexibility and speed of communication between the LANCE and the host microprocessor through common memory locations. The basic organization of the buffer management is a circular queue of tasks in memory called descriptor rings as shown in Figure 2. There are separate descriptor rings to describe transmit and receive operations. Up to 128 tasks may be queued up on a descriptor ring awaiting execution by the LANCE. Each entry in a descriptor ring holds a pointer to a data memory buffer and an

Figure 2. LANCE/Processor Memory Interface



entry for the length of the data buffer. Data buffers can be chained or cascaded in order to handle a long packet in multiple data buffer areas. The LANCE searches the descriptor rings in a "look ahead manner" to determine the next empty buffer in order to chain buffers together or to handle back to back packets. As each buffer is filled, an "own" bit is reset allowing the host processor to process the data in the buffer.

LANCE INTERFACE

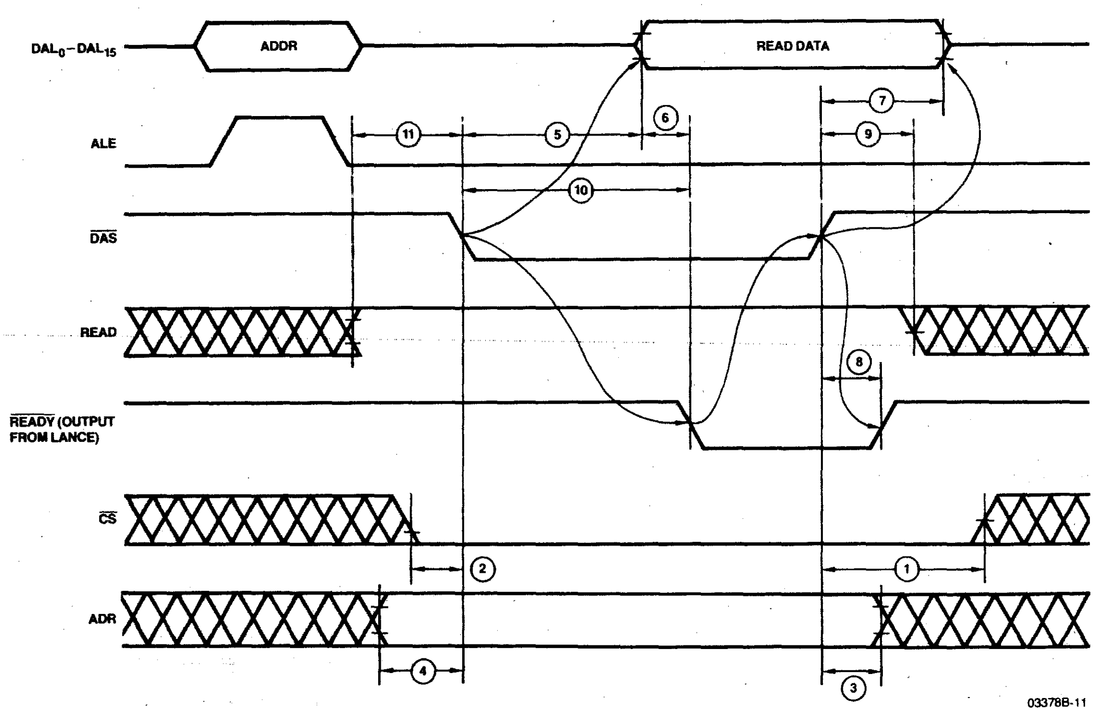
CSR bits such as ACON, BCON and BSWP are used for programming the pin functions used for different interfacing schemes. For example, ACON is used to program the polarity of the Address Strobe signal (ALE/$\overline{AS}$).

BCON is used for programming the pins for handling either the BYTE/$\overline{WORD}$ method for addressing word organized, byte addressable memories where the BYTE signal is decoded along with the least significant address bit to determine upper or lower byte, or an explicit scheme in which two signals labeled as BYTE MASK ($\overline{BM_0}$ and $\overline{BM_1}$) indicate which byte is addressed. When the BYTE scheme is chosen the $\overline{BM_1}$ pin can be used for performing the function $\overline{BUSAKO}$.

BCON is also used to program pins for different DMA modes. In a daisy chain DMA scheme, 3 signals ($\overline{BUSRQ}$, $\overline{HLDA}$, $\overline{BUSAKO}$), are used. In systems using a DMA controller for arbitration, only $\overline{HOLD}$ and $\overline{HLDA}$ are used.

All data transfers from the LANCE in the Bus Master mode are timed by ALE, $\overline{DAS}$ and $\overline{READY}$. The automatic adjustment of the LANCE cycle by the $\overline{READY}$ signal allows synchronization with variable cycle time memory due either to memory refresh or to dual port access. Bus cycles are a minimum of 600ns in length and can be increased in 100ns increments.

BUS SLAVE WRITE TIMING



Note: 1. There are two types of delays which depend on which internal register is accessed.
Typ 1 refers to access of CSR_0, CSR_1 and RAP.
Typ 2 refers to access of CSR_1 and CSR_2.

COMMUNICATIONS
Am7990 Family Ethernet Node

READ SEQUENCE

The read cycle is begun by valid addresses being placed on $DAL_{00}-DAL_{15}$ and $A_{16}-A_{23}$. The BYTE MASK signals are placed valid to indicate a word, upper byte or lower byte memory reference and READ indicates the type of cycle. ALE or $\overline{AS}$ are pulsed and the trailing edge of either can be used to latch addresses. $DAL_{00}-DAL_{15}$ go into a 3-state mode and $\overline{DAS}$ falls low to signal the beginning of the memory access. The memory responds by placing $\overline{READY}$ low to indicate that the DAL lines have valid data. The LANCE then latches memory data on the rising edge of $\overline{DAS}$ which in turn ends the memory cycle and $\overline{READY}$ returns high.

The bus transceiver controls, $\overline{DALI}$ and $\overline{DALO}$, are used to control the bus transceivers. $\overline{DALI}$ signals to strobe data toward the LANCE and $\overline{DALO}$ signals to strobe data or addresses away from the LANCE. During a read cycle $\overline{DALO}$ goes inactive before $\overline{DALI}$ becomes active to avoid "spiking" of the bus transceivers.

WRITE SEQUENCE

The write cycle is very similar except that the $DAL_{00}-DAL_{15}$ lines change from containing addresses to data after ALE or $\overline{AS}$ go inactive $\overline{DAS}$ goes active after data is valid on the bus. Data to memory is held valid after $\overline{DAS}$ goes inactive.

COMMUNICATIONS
Am7990 Family Ethernet Node

DISTINCTIVE CHARACTERISTICS

- Compatible with Ethernet/IEEE 802.3 specifications
- Crystal controlled Manchester Encoder
- Manchester Decoder acquires clock and data within six bit times with an accuracy of ±3ns
- Guaranteed carrier detection and collision detection threshold limits
  - Carrier/collision detected for greater than −300mV
  - No carrier/collision for less than −175mV
- Input signal conditioning rejects transient noise
  - Transients <10ns for collision detector inputs
  - Transients <16ns for carrier detector inputs
- Receiver decodes Manchester data with up to ±20ns clock jitter (at 10MHz)
- TTL comaptible host interface
- Transmit accuracy ±0.01% (without adjustments)

GENERAL DESCRIPTION

The Am7991 Serial Interface Adapter (SIA) is a Manchester Encoder/Decoder compatible with both Ethernet and IEEE-802.3 specifications. In an Ethernet/IEEE-802.3 application the Am7991 interfaces the Am7990 Local Area Network Controller for Ethernet (LANCE) to the Ethernet transceiver cable, acquires clock and data within 6 bit-times and decodes Manchester data with up to ±20ns phase jitter at 10MHz. SIA provides both guaranteed signal threshold limits and transient noise suppression circuitry in both data and collision paths to minimize false start conditions.

DTMF TONE GENERATOR

Features

- ☐ Low Output Tone Distortion: 7%
- ☐ Wide Operating Supply Voltage Range: 2.5 to 10 Volts
- ☐ Oscillator Bias Resistor On-Chip
- ☐ Can be Powered Directly from Telephone Line or from Small Batteries
- ☐ Interfaces Directly to a Standard Telephone Push-Button or Calculator Type X-Y Keyboard
- ☐ Four Options Available on Pin 15 and Pin 16:
  - Bipolar Output
    - E: Mode Select
    - F: Chip Disable
  - Darlington Output
    - G: Mode Select
    - H: Chip Disable

General Description

The S2559E, F, G and H are improved members of the S2559 Tone Generator Family. The new devices feature extended operating voltage range, lower tone distortion, and an on-chip oscillator bias resistor. The S2559E and F are pin and functionally compatible with the S2559C and D, respectively.

The S2559 G and H are identical to the E and F, except that there is a Darlington amplifier configuration on the tone out pin, rather than a single bipolar transistor as shown in the block diagram. In many applications this eliminates the need for a transistor in the telephone circuit. Tone distortion in the telephone is also likely to be lower.

DTMF TONE GENERATOR

Features

- ☐ Wide Operating Voltage Range: 2.5 to 10 Volts
- ☐ Optimized for Constant Operating Supply Voltages, Typically 3.5V
- ☐ Tone Amplitude Stability is Within ±1.5dB of Nominal Over Operating Temperature Range
- ☐ Low Power CMOS Circuitry Allows Device Power to to be Derived Directly From the Telephone Lines or From Small Batteries
- ☐ Uses TV Crystal Standard (3.58MHz) to Derive All Frequencies Thus Providing Very High Accuracy and Stability
- ☐ Specifically Designed for Electronic Telephone Applications
- ☐ Interfaces Directly to a Standard Telephone Push-Button Keyboard With Common Terminal
- ☐ Low Total Harmonic Distortion
- ☐ Single Tone as Well as Dual Tone Capability
- ☐ Direct Replacement for Mostek MK5089 Tone Generator

General Description

The S25089 DTMF Generator is specifically designed to implement a dual tone telephone dialing system in applications requiring fixed supply operation and high stability tone output level, making it well suited for electronic telephone applications. The device can interface directly to a standard pushbutton telephone keyboard with common terminal connected to V_{SS} and operates directly from the telephone lines. All necessary dual-tone frequencies are derived from the widely used TV crystal standard providing very high accuracy and stability. The required sinusoidal waveform for the individual tones is digitally synthesized on the chip. The waveform so generated has very low total harmonic distortion. A voltage reference is generated on the chip which is very stable over the operating temperature range and regulates the signal levels of the dual tones to meet the recommended telephone industry specifications.

S2560A

PULSE DIALER

Features

- ☐ Low Voltage CMOS Process for Direct Operation from Telephone Lines
- ☐ Inexpensive R-C Oscillator Design Provides Better than ± 5% Accuracy Over Temperature and Unit to Unit Variations
- ☐ Dialing Rate Can be Varied by Changing the Dial Rate Oscillator Frequency
- ☐ Dial Rate Select Input Allows Changing of the Dialing Rate by a 2:1 Factor Without Changing Oscillator Components
- ☐ Two Selections of Mark/Space Ratios (33⅓/66⅔ or 40/60)
- ☐ Twenty Digit Memory for Input Buffering and for Redial with Access Pause Capability
- ☐ Mute and Dial Pulse Drivers on Chip
- ☐ Accepts DPCT Keypad with Common Arranged in a 2 of 7 Format; Also Capable of Interface to SPST Switch Matrix

General Description

The S2560A Pulse Dialer is a CMOS integrated circuit that converts pushbutton inputs to a series of pulses suitable for telephone dialing. It is intended as a replacement for the mechanical telephone dial and can operate directly from the telephone lines with minimum interface. Storage is provided for 20 digits, therefore, the last dialed number is available for redial until a new number is entered. IDP is scaled to the dialing rate such as to produce smaller IDP at higher dialing rates. Additionally, the IDP can be changed by a 2:1 factor at a given dialing rate by means of the IDP select input.

SINGLE CHIP REPERTORY DIALER

Features

- ☐ Complete Pin Compatibility With S2560A and S2560G Pulse Dialer Allowing Easy Upgrading of Existing Designs.
- ☐ Ten 18-Digit Number Memories Plus Last Number Redial (22 Digit) Memory On Chip.
- ☐ Low Voltage CMOS Process for Direct Operation From Telephone Lines.
- ☐ Inexpensive R-C Oscillator Design With Accuracy Better Than ±5% Over Temperature and Unit-Unit Variations.
- ☐ Independent Select Inputs for Variation of Dialing Rates (10pps/20pps), Mark/Space Ratio (33⅓-66⅔/40-60), Interdigit Pause (400ms/800ms).
- ☐ Can Interface With Inexpensive XY Matrix or Standard 2 of 7 Keyboard With Common. Also Capable of Logic Interface (Active High).
- ☐ Mute and Pulse Drivers On Chip.
- ☐ Call Disconnect by Pushing * and # Keys Simultaneously.

S2561/S2561A/S2561C

TONE RINGER

Features

- ☐ CMOS Process for Low Power Operation
- ☐ Operates Directly from Telephone Lines with Simple Interface
- ☐ Also Capable of Logic Interface for Non-Telephone Applications
- ☐ Provides a Tone Signal that Shifts Between Two Predetermined Frequencies at Approximately 16Hz to Closely Simulate the Effects of the Telephone Bell
- ☐ Push-Pull Output Stage Allows Direct Drive, Eliminating Capacitive Coupling and Provides Increased Power Output
- ☐ 50mW Output Drive Capability at 10V Operating Voltage
- ☐ Auto Mode Allows Amplitude Sequencing such that the Tone Amplitude Increases in Each of the First Three Rings and Thereafter Continues at the Maximum Level
- ☐ Single Frequency Tone Capability

General Description

The S2561 Tone Ringer is a CMOS integrated circuit that is intended as a replacement for the mechanical telephone bell. It can be powered directly from the telephone lines with minimum interface and can drive a speaker to produce sound effects closely simulating the telephone bell.

S3522

BELL 212A/CCITT V.22 COMPATIBLE MODEM FILTER WITH EQUALIZER

Features

- ☐ Bell 212A/V.22 Compatible
- ☐ Usable for Bell 103/113 Applications
- ☐ High and Low Band Filters with Compromise Group Delay Equalizers
- ☐ Originate/Answer Operating Modes
- ☐ Buffered Clock Output
- ☐ Excellent Rejection of CCITT Guard Tones
- ☐ Low Power CMOS 50mW Typ.
- ☐ ±5 Volt Operation
- ☐ Low Cost 16-Pin Package

General Description

The AMI S3522 Modem Filter is a 16-pin monolithic CMOS integrated circuit designed to implement both the filtering and equalizing functions required in Bell 212A and CCITT V.22 Modems. The S3522 includes both the transmit signal shaping filter and the receive signal separation filter and features on-chip originate/answer mode selection logic. In addition, half-channel compromise amplitude and group delay equalization is included, giving full compromise equalization through the transmit and receive filter pair. The S3522 features excellent rejection of the CCITT Guard Tones at 550Hz: Low-Band (56dB), High-Band (61dB) and 1800Hz: Low-Band (48dB), High-Band (28dB).

SINGLE FREQUENCY TUNEABLE BANDPASS/NOTCH FILTER/TONE GENERATOR

Features

- ☐ Center Frequency of Filters Match and Track Frequency of Generated Tone
- ☐ Tone Frequency Adjustable Over a 100Hz to 5kHz Range
- ☐ Unfiltered Input, Input with Notched Tone, Input Tone and Tone Generator Outputs
- ☐ Operation from a Crystal or External CMOS/TTL Clock
- ☐ Operation at 2600Hz from a Low Cost 3.58MHz TV Color Burst Crystal or 256kHz Ext. Clock
- ☐ Buffered Output Drives 600Ω Loads
- ☐ Single or Split Supply Operation
- ☐ Low Power CMOS Technology

General Description

The S3526 is a low power CMOS Circuit which may be used in a variety of single frequency (SF) communication applications such as SF-Tone Receivers, Tone Remote Control in Mobile systems, Loopback Diagnostics in Modems, control of Echo Cancellers, dialing and privacy functions in Common Carrier Radio Telephone, etc. The main functional blocks of the S3526 include a low distortion tone (sinewave) generator whose frequency may be programmed using a crystal (i.e. 2600Hz using a low cost TV color burst crystal) or external clock time base; a bandpass filter used to extract tone information from the input signal; a band reject filter which is used to "Notch" out tone information from the input signal; and a buffer amplifier with selectable input (unfiltered input signal, or input signal with tone notched) capable of driving a 600Ω load.

S3528

PROGRAMMABLE LOW PASS FILTER

Features

- ☐ Seventh Order Ellipitical Ladder Filter with Cosine Prefiltering Stage
- ☐ Cutoff Frequency (f_C) Range of 10Hz to 20kHz, 40Hz to 20kHz Via 3.58MHz TV Crystal
- ☐ Passband Ripple: <0.1dB
- ☐ Stopband Attenuation: >51dB for $f>1.3f_C$
- ☐ Cutoff Frequency Selectable in 64 Steps Via Six Bit Control Word
- ☐ Steps May Be Custom Programmed from a Set of 2,048 Discrete Points Via Internal ROM
- ☐ Cutoff Frequency Continuously Variable Via External Clock (Crystal, Resonator, or TTL/CMOS Clock)
- ☐ Uncommitted Input and Output Op Amps for Anti-Aliasing and Smoothing Functions
- ☐ Low Power CMOS Technology

General Description

The S3528 is a programmable low pass filter which may be used in a wide variety of filtering applications commonly found in speech analysis, telecommunications, test equipment and instrumentation, etc. The 3528's CMOS design using switched capacitor design techniques allows easy programming of the filter's cutoff frequency (f_C), discretely, in 64 steps via a six bit control word or continuously by varying the external time base. The useful range of operation of the filter passband extends from 10Hz to 20kHz. When operating from a low cost TV crystal (3.58MHz) a range of 40Hz to 20kHz may be realized. For special applications the S3528 may be customized via the internal ROM to accomodate a specific set of cutoff frequencies from a choice of 2,048 possiblities.

S3506/S3507/S3507A

CMOS SINGLE CHIP μ-LAW/A-LAW SYNCHRONOUS COMBO CODECS WITH FILTERS

Features

- ☐ Independent Transmit and Receive Sections With 75dB Isolation
- ☐ Low Power CMOS 80mW (Operating) 8mW (Standby)
- ☐ Stable Voltage Reference On-Chip
- ☐ Meets or Exceeds AT&T D3, and CCITT G.711, G.712 and G.733 Specifications
- ☐ Input Analog Filter Eliminates Need for External Anti-Aliasing Prefilter
- ☐ Input/Output Op Amps for Programming Gain
- ☐ Output Op Amp Provides ±3.1V into a 600Ω Load or Can Be Switched Off for Reduced Power (70mW)
- ☐ Special Idle Channel Noise Reduction Circuitry for Crosstalk Suppression
- ☐ Encoder has Dual-Speed Auto-Zero Loop for Fast Acquisition on Power-Up
- ☐ Low Absolute Group Delay = 450μsec. @ 1kHz

General Description

The S3506 and S3507 are monolithic silicon gate CMOS Companding Encoder/Decoder chips designed to implement the per channel voice frequency Codecs used in PCM systems. The chips contain the band-limiting filters and the analog↔digital conversion circuits that conform to the desired transfer characteristic. The S3506 provides the European A-Law companding and the S3507 provides the North American μ-Law companding characteristic.

SIGNAL PROCESSING PERIPHERAL

Features

- Single-Chip Programmable Digital Signal Processor
- May Be Customized (ROM Programmed) With Customer Generated Routines
- Self-Emulation Capability
- Standard Preprogrammed Processors Available
- Fetch/Multiply/Add/Store Cycle
- 512 Word × 18 Bit Instruction Memory
- Unique Three Port Data Memory 256 × 16 RAM/128 × 16 ROM
- 12 × 12 Pipelined Multiplier With 16 Bit Product
- 16 Bit Accumulator With Overflow Detect/Protect
- Double Buffered Asynchronous Serial I/O Port
- μP-Compatible I/O Port i.e. 6800 (A Version), 8080 (B Version), etc.

General Description

The S28211 is a single-chip microcomputer which has been optimized to execute digital signal processing algorithms commonly used in applications such as telecommunications speech processing, industrial process control instrumentation, etc. It may be used as a stand alone unit, or may be operated as a peripheral in a microprocessor based system. The latter configuration allows arrays of S28211s to be used together for increased processing throughput. The S28211's multibus, pipelined architecture and powerful multi-operation instructions make it possible to write very compact algorithms. This allows the available memory to be used efficiently and increases the execution speed of a given algorithm. The S28211 may be

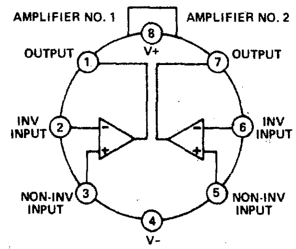
AD547 SINGLE VERSION



AD647 DUAL VERSION

PRODUCT DESCRIPTION

The AD547 and AD647 are monolithic, FET input operational amplifiers combining the very low input bias current advantages of a BIFET op amp with offset and drift performance previously available only in high quality bipolar amplifiers.

The exclusive Analog Devices laser wafer trim process trims both the input offset voltage and offset voltage drift to levels far lower than any competing BIFET amplifier (1mV, 5μV/°C–J versions, 0.25mV, 1μV/°C–L versions).

In addition, the offset voltage is laser trimmed to less than 0.25mV and matched to 0.25mV for the AD647L, 0.5mV and matched to 0.25mV for the AD647K.

The AD547 offers the lowest guaranteed input bias currents of any BIFET amplifier with 50pA max for the J grade and 25pA max for the L grade. The AD647 offers matched bias currents that are significantly lower than currently available monolithic dual FET input operational amplifiers: 35pA max, matched to 15pA for the AD647K and L; 75pA max, matched to 25pA for the AD647J and S.

PRODUCT HIGHLIGHTS

1. Advanced laser wafer trimming techniques reduce offset voltage drift to 1μV/°C max and reduce offset voltage to only 0.25mV max on the AD547L.
2. Analog Devices BIFET processing provides 25pA max (10pA typical) bias currents specified after 5 minutes of warm-up.
3. Low voltage noise, high open loop gain and outstanding offset performance make the series true precision BIFET amplifiers.
4. The AD647 dual has tight matching specifications to ensure high performance, eliminating the need to match individual devices.
5. Laser-wafer-trimming reduces offset voltage to as low as 0.25mV max and matched side to side to 0.25mV (AD647L), thus eliminating the need for external nulling.
6. The standard dual amplifier pin out allows the AD647 to replace lower performance duals without redesign.

OUTLINE DIMENSIONS

Dimensions shown in inches and (mm).

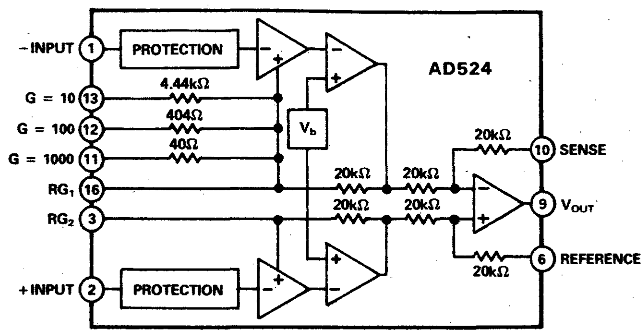
Input Protection, Power On – Power Off
No External Components Required
Internally Compensated

AD524 FUNCTIONAL BLOCK DIAGRAM



PRODUCT DESCRIPTION

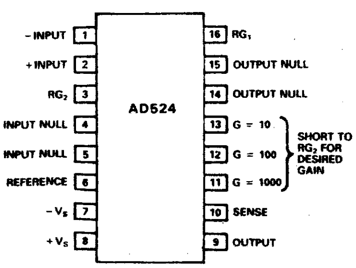
The AD524 is a precision monolithic instrumentation amplifier designed for data acquisition applications requiring high accuracy under worst-case operating conditions. An outstanding combination of high linearity, high common mode rejection, low offset voltage drift, and low noise makes the AD524 suitable for use in many data acquisition systems.

The AD524 has an output offset voltage drift of less than 25μV/°C, input offset voltage drift of less than 0.5μV/°C, CMR above 90dB at unity gain (120dB at G = 1000) and maximum nonlinearity of 0.003% at G = 1. In addition to the outstanding dc specifications the AD524 also has a 25MHz gain bandwidth product (G = 100). To make it suitable for high speed data acquisition systems the AD524 has an output slew rate of 5V/μs and settles in 15μs to 0.01% for gains of 1 to 100.

As a complete amplifier the AD524 does not require any external components for fixed gains of 1, 10, 100 and 1,000. For other gain settings between 1 and 1000 only a single resistor is required. The AD524 input is fully protected for both power on and power off fault conditions.

The AD524 IC instrumentation amplifier is available in four different versions of accuracy and operating temperature range. The economical "A" grade, the low drift "B" grade and lower drift, higher linearity "C" grade are specified from –25°C to +85°C. The "S" grade guarantees performance to specification over the extended temperature range –55°C to +125°C.

PIN CONFIGURATION



PRODUCT HIGHLIGHTS

1. The AD524 has guaranteed low offset voltage, offset voltage drift and low noise for precision high gain applications.
2. The AD524 is functionally complete with pin programmable gains of 1, 10, 100 and 1000, and single resistor programmable for any gain.
3. Input and output offset nulling terminals are provided for very high precision applications and to minimize offset voltage changes in gain ranging applications.
4. The AD524 is input protected for both power on and power off fault conditions.
5. The AD524 offers superior dynamic performance with a gain bandwidth product of 25MHz, full power response of 75kHz and a settling time of 15μs to 0.01% of a 10V step (G = 100).

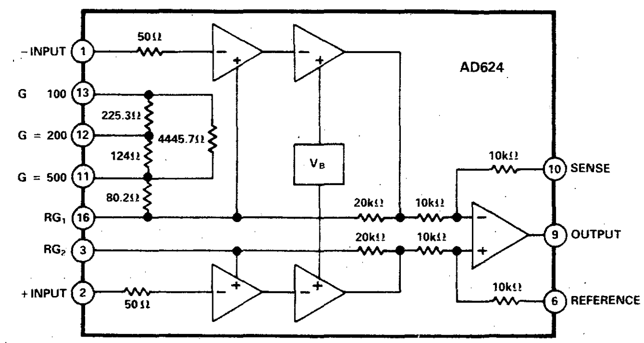
AD624 FUNCTIONAL BLOCK DIAGRAM



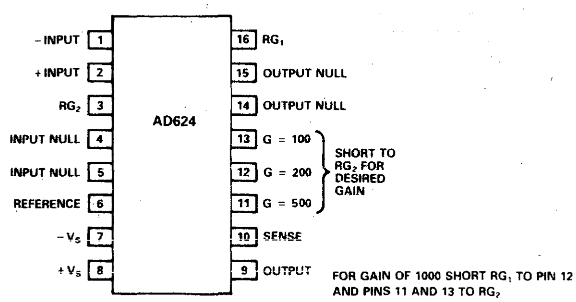
PRODUCT DESCRIPTION

The AD624 is a high precision ultra low noise instrumentation amplifier designed primarily for use with low level transducers, including load cells, strain gauges and pressure transducers. An outstanding combination of low noise, high gain accuracy, low gain temperature coefficient and high linearity make the AD624 ideal for use in high resolution data acquisition systems.

The AD624C has an input offset voltage drift of less than 0.25μV/°C, output offset voltage drift of less than 10μV/°C, CMR above 90dB at unity gain (130dB at G = 500) and a maximum nonlinearity of 0.001% at G = 1. In addition to these outstanding dc specifications the AD624 exhibits superior ac performance as well. A 25MHz gain bandwidth product, 5V/μs slew rate and 15μs settling time permit the use of the AD624 in high speed data acquisition applications.

The AD624 does not need any external components for pre-trimmed gains of 1, 100, 200, 500 and 1000. Additional gains such as 250 and 330 can be programmed within a few percent accuracy with external jumpers. A single external resistor can also be used to set the 624's gain to any value in the range of 1 to 1000.

PIN CONFIGURATION



PRODUCT HIGHLIGHTS

1. The AD624 offers outstanding noise performance. Input noise is typically less than $4nV/\sqrt{Hz}$ at 1kHz.
2. The AD624 is a functionally complete instrumentation amplifier. Pin programmable gains of 1, 100, 200, 500 and 1000 are provided on the chip. Other gains are achieved through the use of a single external resistor.
3. The offset voltage, offset voltage drift, gain accuracy and gain temperature coefficients are guaranteed for all pre-trimmed gains.
4. The AD624 provides totally independent input and output offset nulling terminals for high precision applications. This minimizes the effect of offset voltage in gain ranging applications.
5. A sense terminal is provided to enable the user to minimize the errors induced through long leads. A reference terminal is also provided to permit level shifting at the output.

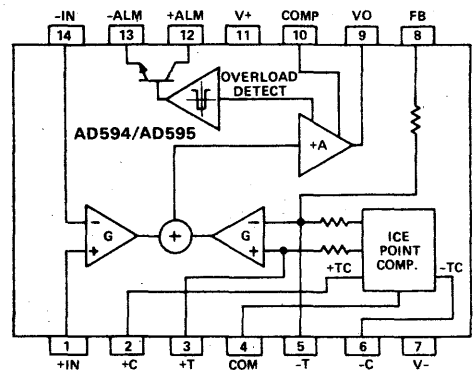
Monolithic Thermocouple Amplifier with Cold Junction Compensation

AD594*/AD595*

FEATURES
Pretrimmed for Type J (AD594) or Type K (AD595) Thermocouples
Can Be Used with Type T Thermocouple Inputs
Low Impedance Voltage Output: 10mV/°C
Built-In Ice Point Compensation
Wide Power Supply Range: +5V to ±15V
Low Power: <1mW typical
Thermocouple Failure Alarm
Laser Wafer Trimmed to 1°C Calibration Accuracy
Set-Point Mode Operation
Self-Contained Celsius Thermometer Operation
High Impedance Differential Input

AD594/AD595 FUNCTIONAL BLOCK DIAGRAM



PRODUCT DESCRIPTION

The AD594/AD595 is a complete instrumentation amplifier and thermocouple cold junction compensator on a monolithic chip. It combines an ice point reference with a precalibrated amplifier to produce a high level (10mV/°C) output directly from a thermocouple signal. Pin-strapping options allow it to be used as a linear amplifier-compensator or as a switched output set-point controller using either fixed or remote set-point control. It can be used to amplify its compensation voltage directly, thereby converting it to a stand-alone Celsius transducer with a low-impedance voltage output.

The AD594/AD595 includes a Thermocouple Failure Alarm that indicates if one or both thermocouple leads become open. The alarm output has a flexible format which includes TTL drive capability.

The AD594/AD595 can be powered from a single ended supply (including +5V) and by including a negative supply, temperatures below 0°C can be measured. To minimize self-heating, an unloaded AD594/AD595 will typically operate with a total supply current of 160μA, but is also capable of delivering in excess of ±5mA to a load.

The AD594 is precalibrated by laser wafer trimming to match the characteristic of type J (iron-constantan) thermocouples and the AD595 is laser trimmed for type K (chromel-alumel) inputs. The temperature transducer voltages and gain control resistors are available at the package pins so that the circuit can be recalibrated for other thermocouple types by the addition of two or three resistors. These terminals also allow more precise calibration for both thermocouple and thermometer applications.

The AD594/AD595 is available in two performance grades. The C and the A versions have calibration accuracies of ±1°C and ±3°C, respectively. Both are designed to be used from 0 to +50°C, and are available in a 14-pin, hermetically sealed, side-brazed ceramic DIP.

*Protected by U.S. Patent No. 4,029,974.

PRODUCT HIGHLIGHTS

1. The AD594/AD595 provides cold junction compensation, amplification, and an output buffer in a single IC package.
2. Compensation, zero, and scale factor are all precalibrated by laser wafer trimming (LWT) of each IC chip.
3. Flexible pin-out provides for operation as a set-point controller or a stand-alone temperature transducer calibrated in degrees Celsius.
4. Operation at remote application sites is facilitated by low quiescent current and a wide supply voltage range of +5V to dual supplies spanning 30V.
5. Differential input rejects common-mode noise voltage on the thermocouple leads.

ANALOG DEVICES

Ultra-Fast Comparators

AD9685/AD9687

FEATURES
2.2ns Propagation Delay – AD9685BD/BH
2.7ns Propagation Delay – AD9687BD
0.5ns Latch Set-Up Time
Pin-Compatible to Am685/687 but FASTER
+5V, −5.2V Supply Voltages

APPLICATIONS
Ultra-High-Speed A/D Converters
Ultra-High-Speed Line Receivers
Peak Detectors
Threshold Detectors

GENERAL DESCRIPTION

The AD9685BD/BH and AD9687BD are ultra-fast comparators manufactured with a high performance bipolar process which makes it possible to obtain incredibly short propagation delays and latch set-up times.

The AD9685BD/BH is a single comparator which is pin-compatible with the Am685, but has speed capabilities that far outstrip the earlier unit. The AD9687BD is pin-for-pin compatible with the Am687 and, like its predecessor, is a dual comparator; its speed capabilities are far superior to the Am687.

Both Analog Devices units have differential inputs and complementary outputs fully compatible with ECL logic levels. Their output current levels are capable of driving 50Ω terminated transmission lines, and their high resolution make them ideally suited for a variety of analog-to-digital signal processing applications.

AD9685BD/BH Single Comparator

A latch function allows the AD9685BD/BH to be operated in a sample-hold mode. When the Latch Enable (LE) is ECL HIGH, the comparator functions normally. When the Latch Enable is driven LOW, its outputs are locked in the logic state dictated by the input conditions at the time of the latch input transition. If the latch function is not used, the Latch Enable input should be connected to ground.

In addition to its speed advantages over the earlier Am685, the AD9685BD/BH also dissipates less power because it operates on a positive 5 volt supply instead of the 6 volts required by the AMD device.

AD9687BD Dual Comparator

The latch function of the AD9687BD provides an ability to operate the unit in either a track-hold or sample-hold mode. The latch function inputs are separated on the two comparators and are designed to be driven from the complementary outputs of a standard ECL logic gate. When LE is High and $\overline{LE}$ is LOW, the normal comparator function is in operation. When LE is forced LOW and $\overline{LE}$ is driven HIGH, the outputs of the comparator being exercised are locked in their existing logical states, as determined by the input conditions present at the time of arrival of the latch signal. If the latch function is not used on either one of the two comparators in the AD9687BD, the appropriate Latch Enable input should be connected to ground; the companion $\overline{\text{Latch Enable}}$ input can be left open.

The AD9687BD is basically two AD9685BD/BH units in a single package and operates in a similar fashion to a pair of the single comparators.

COMPARATORS

The AD9685BD/BH and AD9687BD are ultra-fast comparators which make it possible to obtain incredibly short propagation delays and latch setup times. The AD9685BD/BH is a single comparator, with the BD and BH suffixes indicating a DIP or TO-100 configuration; the AD9687BD is a dual comparator in a DIP.

The Analog Devices units are pin-for-pin compatible with the Am685 and Am687 comparators, but are far superior in speed to their forerunners. The ADI devices are an alternate source, not a second source, for the earlier units because of their greater speed capabilities but can be used as a higher-performance replacement for most applications.

SPECIFICATIONS (typical @ +25°C unless otherwise noted)

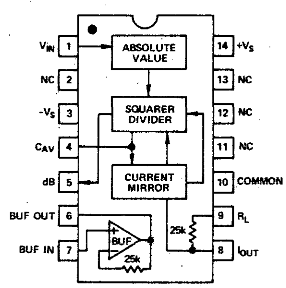
ANALOG DEVICES

Low Level True rms-to-dc Converter

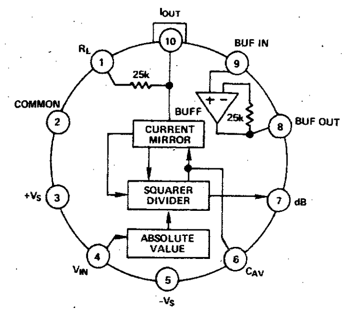
AD636

FEATURES
- True rms-to-dc Conversion
- 200mV Full Scale
- Laser-Trimmed to High Accuracy
  - 0.5% max Error (AD636K)
  - 1.0% max Error (AD636J)
- Wide Response Capability:
  - Computes rms of ac and dc Signals
  - 1MHz -3dB Bandwidth: V_{rms}>100mV
  - Signal Crest Factor of 6 for 0.5% Error
- dB Output with 50dB Range
- Low Power: 800μA Quiescent Current
- Single or Dual Supply Operation
- Monolithic Integrated Circuit
- Low Cost

AD636 FUNCTIONAL BLOCK DIAGRAMS



TO-116
TOP VIEW



TO-100
TOP VIEW

PRODUCT DESCRIPTION

The AD636 is a low power monolithic IC which performs true rms-to-dc conversion on low level signals. It offers performance which is comparable or superior to that of hybrid and modular converters costing much more. Similar in operation to the AD536A, the AD636 is specified for a signal range of 0 to 200 millivolts rms. Crest factors up to 6 can be accommodated with less than 0.5% additional error, allowing accurate measurement of complex input waveforms.

The low power supply current requirement of the AD636, typically 800μA, allows it to be used in battery-powered portable instruments. A wide range of power supplies can be used, from ±2.5V to ±12V or a single +5V to +24V supply. The input and output terminals are fully protected; the input signal can exceed the power supply with no damage to the device (allowing the presence of input signals in the absence of supply voltage) and the output buffer amplifier is short-circuit protected.

The AD636 includes an auxiliary dB output. This signal is derived from an internal circuit point which represents the logarithm of the rms output. The 0dB reference level is set by an externally supplied current and can be selected by the user to correspond to any input level from 0dBm (774.6mV) to -20dBm (77.46mV). Frequency response ranges from 1.2MHz at a 0dBm level to over 10kHz at -50dBm.

The AD636 is designed for ease of use. The device is factory-trimmed at the wafer level for input and output offset, positive and negative waveform symmetry (dc reversal), and full scale accuracy. Thus no external trims are required to achieve full rated accuracy.

The AD636 is available in two accuracy grades; the AD636J has a total error of ±0.5mV ±1.0% of reading, and the AD636K is accurate within ±0.2mV ±0.5% of reading. Both versions are specified for the 0 to 70°C temperature range, and are offered in either a hermetically sealed 14-pin DIP or a 10 pin TO-100 metal can.

Integrated Circuit True rms-to-dc Converter

AD637

FEATURES

High Accuracy
- **0.02% Max Nonlinearity, 0 to 2V rms Input**
- **0.10% Max Error to Crest Factor of 3**

Wide Bandwidth
- **8MHz at 2V rms Input**
- **600kHz at 100mV rms**

Computes:
- **True rms**
- **Square**
- **Mean Square**
- **Absolute Value**

dB Output (−60dB Range)

Chip Select-Power Down Feature Allows:
- **Analog "3-State" Operation**
- **Quiesent Current Reduction from 2.2mA to 350µA**

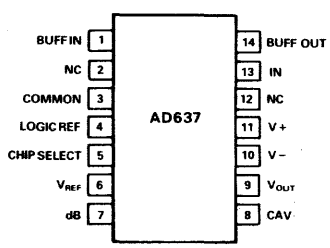
PRODUCT DESCRIPTION

The AD637 is a complete high accuracy monolithic rms to dc converter that computes the true rms value of any complex waveform. It offers performance that is unprecedented in integrated circuit rms to dc converters and comparable to discrete and modular techniques in accuracy, bandwidth and dynamic range. A crest factor compensation scheme in the AD637 permits measurements of signals with crest factors of up to 10 with less than 1% additional error. The circuit's wide bandwidth permits the measurement of signal up to 600kHz with inputs of 200mV rms and up to 8MHz when the input levels are above 2V rms.

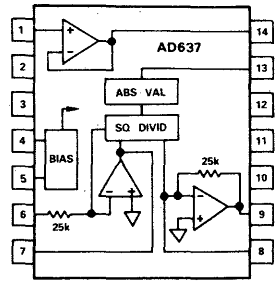
As with previous monolithic rms converters from Analog Devices, the AD637 has an auxiliary dB output available to the user. The logarithm of the rms output signal is brought out to a separate pin allowing direct dB measurement with a useful range of 60dB. An externally programmed reference current allows the user to select the 0dB reference voltage to correspond to any level between 0.1V and 2.0V rms.

A chip select connection on the AD637 permits the user to decrease the supply current from 2.2mA to 350µA during periods when the rms function is not in use. This feature facilitates the addition of precision rms measurement to remote or hand-held applications where minimum power consumption is critical. In addition when the AD637 is powered down the output goes to a high impedance state. This allows several AD637s to be tied together to form a wide-band true rms multiplexer.

PIN CONFIGURATION



AD637 FUNCTIONAL BLOCK DIAGRAM



The input circuitry of the AD637 is protected from overload voltages that are in excess of the supply levels. The inputs will not be damaged by input signals if the supply voltages are lost.

The AD637 is available in two accuracy grades (J, K) for commercial (0 to +70°C) temperature range applications and one (S) rated over the −55°C to +125°C military temperature range. All versions are available in ceramic 14-lead DIP packages.

PRODUCT HIGHLIGHTS

1. The AD637 computes the true root-mean-square, mean square, or absolute value of any complex ac (or ac plus dc) input waveform and gives an equivalent dc output voltage. The true rms value of a waveform is more useful than an average rectified signal since it relates directly to the power of the signal. The rms value of a statistical signal is also related to the standard deviation of the signal.
2. The AD637 is laser wafer trimmed to achieve rated performance without external trimming. The only external component required is a capacitor which sets the averaging time period. The value of this capacitor also determines low frequency accuracy, ripple level and settling time.
3. The chip select feature of the AD637 permits the user to power down the device down during periods of nonuse, thereby, decreasing battery drain in remote or hand-held applications.
4. The on-chip buffer amplifier can be used as either an input buffer or in an active filter configuration. The filter can be used to reduce the amount of ac ripple, thereby, increasing the accuracy of the measurement.

14-PIN CERAMIC DIP

ANALOG DEVICES

Balanced Modulator-Demodulator

AD630

FEATURES
Recovers Signal from +100dB Noise
2MHz Channel Bandwidth
45V/μs Slew Rate
−120dB Crosstalk @ 1kHz
Pin Programmable Closed Loop Gains of ±1 and ±2
0.05% Closed Loop Gain Accuracy and Match
100μV Channel Offset Voltage (AD630BD)
350kHz Full Power Bandwidth

PRODUCT DESCRIPTION

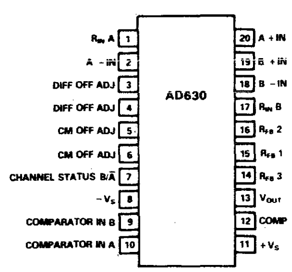
The AD630 is a high precision balanced modulator which combines a flexible commutating architecture with the accuracy and temperature stability afforded by laser wafer trimmed thin film resistors. Its signal processing applications include balanced modulation and demodulation, synchronous detection, phase detection, quadrature detection, phase sensitive detection, lock-in amplification and square wave multiplication. A network of on-board applications resistors provides precision closed loop gains of ±1 and ±2 with 0.05% accuracy (AD630B). These resistors may also be used to accurately configure multiplexer gains of +1, +2, +3 or +4. Alternatively, external feedback may be employed allowing the designer to implement his own high gain or complex switched feedback topologies.

The AD630 may be thought of as a precision op amp with two independent differential input stages and a precision comparator which is used to select the active front end. The rapid response time of this comparator coupled with the high slew rate and fast settling of the linear amplifiers minimize switching distortion. In addition, the AD630 has extremely low crosstalk between channels of −100dB @ 10kHz.

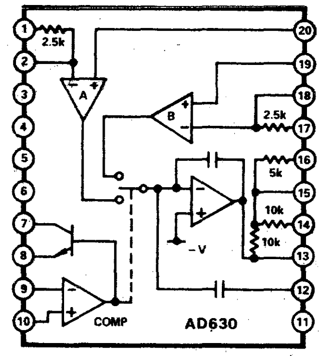
The AD630 is intended for use in precision signal processing and instrumentation applications requiring wide dynamic range. When used as a synchronous demodulator in a lock-in amplifier configuration, it can recover a small signal from 100dB of interfering noise (see lock-in amplifier application). Although optimized for operation up to 1kHz, the circuit is useful at frequencies up to several hundred kilohertz.

Other features of the AD630 include pin programmable frequency compensation, optional input bias current compensation resistors, common mode and differential offset voltage adjustment, and a channel status output which indicates which of the two differential inputs is active.

PIN CONFIGURATION



AD630 FUNCTIONAL BLOCK DIAGRAM



PRODUCT HIGHLIGHTS

1. The configuration of the AD630 makes it ideal for signal processing applications such as: balanced modulation and demodulation, lock-in amplification, phase detection, and square wave multiplication.
2. The application flexibility of the AD630 makes it the best choice for many applications requiring precisely fixed gain, switched gain, multiplexing, integrating-switching functions, and high-speed precision amplification.
3. The 100dB dynamic range of the AD630 exceeds that of any hybrid or IC balanced modulator/demodulator and is comparable to that of costly signal processing instruments.
4. The op-amp format of the AD630 ensures easy implementation of high gain or complex switched feedback functions. The application resistors facilitate the implementation of most common applications with no additional parts.
5. The AD630 can be used as a two channel multiplexer with gains of +1, +2, +3 or +4. The channel separation of 100dB @ 10kHz approaches the limit which is achievable with an empty IC package.
6. The AD630 has pin-strappable frequency compensation (no external capacitor required) for stable operation at unity gain without sacrificing dynamic performance at higher gains.
7. Laser trimming of comparator and amplifying channel offsets eliminates the need for external nulling in most cases.

Two Quadrant Multiplication/Division
Two Independent Signal Channels
Signal Bandwidth of 60MHz (I_{OUT})
Linear Control-Bandwidth of 5MHz
Fully-Calibrated, Monolithic Circuit

APPLICATIONS
Precise AGC and VCA Systems
Voltage-Controlled Filters
Video-Signal Processing
High-Speed Analog Division
Automatic Signal-Leveling
Square-Law Gain/Loss Control

PRODUCT DESCRIPTION
The AD539 is a low-distortion analog multiplier having two identical signal channels (Y1 and Y2), with a common X-input providing linear control of gain. Excellent ac characteristics up to video frequencies and a 3dB bandwidth of over 60MHz are provided. Although intended primarily for applications where speed is important the circuit exhibits good static accuracy in "computational" applications. Scaling is accurately determined by a band-gap voltage reference and all critical parameters are laser-trimmed during manufacture.

The full bandwidth can be realized over most of the gain range using the AD539 with simple resistive loads of up to 100Ω. Output voltage is restricted to a few hundred millivolts under these conditions. Using external op amps in conjunction with the on-chip scaling resistors, accurate multiplication and large output voltages can be achieved, but with a reduction in bandwidth typically to 25MHz.

The two channels provide flexibility. In single-channel applications they may be used in parallel, to double the output current, or in series, to achieve a square-law gain function with a control range of over 100dB, or differentially, to reduce distortion. Alternatively, they may be used independently, as in audio stereo applications, with low crosstalk between channels. Voltage-controlled filters and oscillators using the "state-variable" approach are easily designed, taking advantage of the dual channels and common control. The AD539 can also be configured as a divider with signal bandwidths up to 15MHz.

Power consumption is only 135mW using the recommended ±5V supplies. The AD539 is available in three versions: the "J" and "K" grades are specified for 0 to +70°C operation and "S" grade is guaranteed over the extended range of −55°C to +125°C. All versions are packaged in 16-pin DIPs.

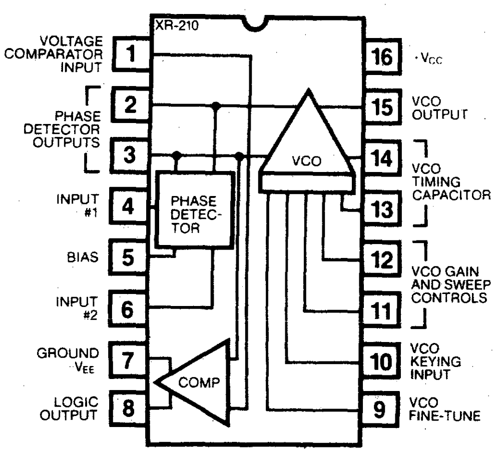
Phase-Locked Loops

XR-210 FSK MODULATOR/ DEMODULATOR

The XR-210 is a highly versatile monolithic phase-locked loop system especially designed for data communications. It is particularly well suited for FSK modulation/demodulation (MODEM) applications, frequency synthesis, tracking filters and tone decoding. The XR-210 operates over a power supply range of 5V to 26V, and over a frequency band of 0.5 Hz to 20 MHz. The circuit can accomodate analog signals between 300 μV and 3V, and can interface with conventional DTL, TTL, and ECL logic families.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Digital Programming Capability	
RS-232C Compatible Demodulator Output	
ON-OFF Keying & Sweep Capability	
Wide Tracking Range	± 1% to ± 50%
Good Temperature Stability	200 ppm/°C
High Current Logic Output	50 mA
Independent "Mark" and "Space" Frequency Adjustment	
VCO Duty Cycle Control	

APPLICATIONS

Data Synchronization	Signal Conditioning
FSK Generation	Tone Decoding
Frequency Synthesis	FSK Demodulation
Tracking Filter	FM Detection
FM and Sweep Generation	Wideband Discrimination

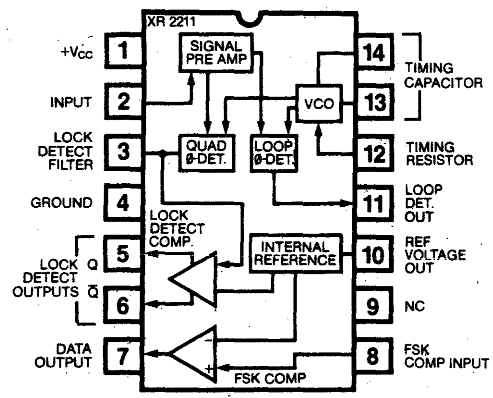
ORDERING INFORMATION

Part Number	Package	Operating Temperature
XR-210M	Ceramic	-55°C to +125°C
XR-210CN	Ceramic	0°C to +70°C

XR-2211 FSK DEMODULATOR/ TONE DECODER

The XR-2211 is a monolithic phase-locked loop system especially designed for data communications, and particularly well-suited for FSK modem applications. It has a supply voltage range of 4.5V to 20V and a wide frequency range of 0.01 Hz to 300 kHz. The circuit accomodates analog signals between 2 mV and 3V, and interfaces with conventional DTL, TTL, and ECL logic families. The XR-2211 consists of a basic PLL for tracking an input signal within the passband, a quadrature phase detector for carrier detection, and an FSK voltage comparator for FSK demodulation. Independent external components set the center frequency, bandwidth, and output delay.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Wide Frequency Range	0.01 Hz to 300 kHz
Wide Supply Voltage Range	4.5V to 20V
DTL/TTL/ECL Logic Compatibility	
Wide Dynamic Range	2 mV to 3V rms
Adjustable Tracking Range	± 1% to ± 80%
Excellent Temperature Stability	20 ppm/°C, Typical
FSK Demodulation with Carrier-Detection	

APPLICATIONS

FSK Demodulation	FM Detection
Data Synchronization	Carrier Detection
Tone Decoding	

ORDERING INFORMATION

Part Number	Package	Operating Temperature
XR-2211M	Ceramic	-55°C to +125°C
XR-2211N	Ceramic	-40°C to +85°C

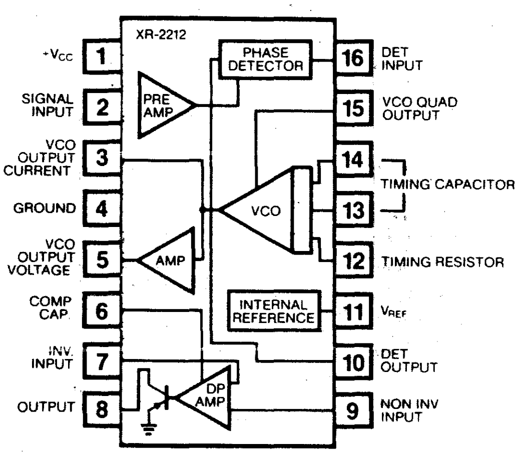
XR-2211CN	Ceramic	0°C to +70°C
XR-2211CP	Plastic	0°C to +70°C

Phase-Locked Loops

XR-2212 PRECISION PHASE-LOCKED LOOP

The XR-2212 is an ultra-stable monolithic phase-locked loop (PLL) system especially designed for data communication and control system applications. It is ideally suited for frequency synthesis, FM detection, and tracking filter applications. The circuit consists of a PLL system made up of an input preamplifier, a phase detector, a stable voltage-controlled oscillator (VCO), and a high-gain differential amplifier. The center frequency, bandwidth, and tracking range of the PLL are controlled independently by the choice of external components.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Quadrature VCO Outputs	
Wide Frequency Range	0.01 Hz to 300 kHz
Wide Supply Voltage Range	4.5V to 20V
Adjustable Tracking Range	± 1% to ± 80%
Excellent Temperature Stability	20 ppm/°C, Typical

APPLICATIONS

Frequency Synthesis	FSK Demodulation
Data Synchronization	Tracking Filters
FM Detection	Clock Extraction
Signal Conditioning

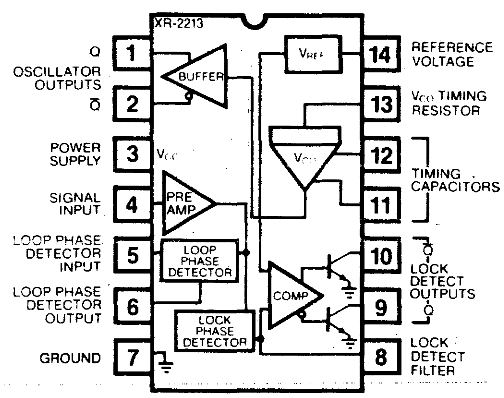
XR-2213 PRECISION PHASE-LOCKED LOOP/TONE DECODER

The XR-2213 is a high-stability phase-locked loop system designed for control systems and tone detection applications. The circuit features a high-stability V_{CO}, an input preamplifier and a high-gain voltage comparator, in addition to loop and quadrature-phase detectors.

The XR-2213 has an operating frequency range of 0.01 Hz to 300 kHz. The input preamplifier allows an input signal range of 2 mV to 3 volts rms, while the V_{CO} and comparator supply TTL-compatible output signals. The V_{CO} and voltage comparator provide both Q and $\overline{Q}$ outputs for greater flexibility and reduced external parts count. All of the loop parameters are independently adjustable by the choice of external components.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Wide Frequency Range	0.01 Hz to 300 kHz
Wide Supply Voltage Range	4.5V to 15V
Uncommitted V_{CO} Q and $\overline{Q}$ Outputs	
Wide Dynamic Input Voltage Range	2 mV to 3V rms
Excellent V_{CO} Stability	20 ppm/°C, Typical

APPLICATIONS

Tone Detection	FM Detection
Frequency Synthesis	Tracking Filters

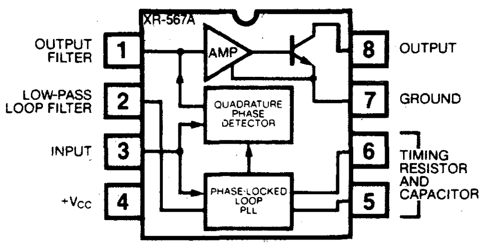
Tone Decoders

XR-567/567A MONOLITHIC TONE DECODER

The XR-567 is a monolithic phase-locked loop system designed for general purpose tone and frequency decoding. It offers a wide frequency band of 0.01 Hz to 500 kHz, and has a logic compatible output capable of sinking up to 100 mA of load current. Four independent external components determine the bandwidth, center frequency, and output delay. The XR-567A offers improved frequency accurancy and drift characteristics over the standard 567. The improved design enhances overall circuit performance, while reducing initial circuit adjustments.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Direct Replacement for SE/NE567	
Adjustable Bandwidth	0% to 14%
Logic Compatible Output with Current Sinking Capability	100 mA
Adjustable Center Frequency	0.01 Hz to 500 kHz
Inherent Immunity to False Signals	
High Rejection of Out-of-Band Signals and Noise	
Adjustable Range Frequency by External Resistor	over 20:1 range

APPLICATIONS

Touch-Tone® Decoding
Sequential Tone Decoding
Communications Paging
Ultrasonic Remote Control and Monitoring
Carrier-Tone Transceiver
Wireless Intercom
Precision Oscillator

ORDERING INFORMATION

Part Number	Package	Operating Temperature
XR-567M/AM	Ceramic	-55°C to +125°C

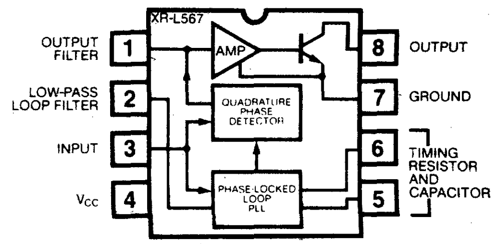
XR-567CP/ACP	Plastic	0°C to +70°C

XR-L567 MONOLITHIC TONE DECODER

The XR-L567 is a micropower phase-locked loop (PLL) circuit designed for general purpose tone and frequency decoding. It is a direct replacement for the popular 567-type tone decoder ICs, designed for applications requiring very low power dissipation. The XR-L567 offers approximately 1/10th the power dissipation of the conventional 567-type tone decoder, without sacrificing its key features, such as oscillator stability, frequency selectivity and detection threshold. At 5-volt operation, typical quiescent power dissipation is less than 4 mW.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Very Low Power Dissipation	< 4 mW at 5V
Adjustable Bandwidth	0% to 14%
Logic Compatible Output with 10 mA Current Sinking Capability	
Highly Stable Center Frequency	
Adjustable Center Frequency	0.01 Hz to 50 kHz
Inherent Immunity to False Signals	
High Rejection of Out-of-Band Signals and Noise	
Adjustable Frequency Range by External Resistor	over 20:1 range

APPLICATIONS

Battery Operated Tone Detection
Touch-Tone® Decoding
Communications Paging
Ultrasonic Remote Control
Telemetry Decoding

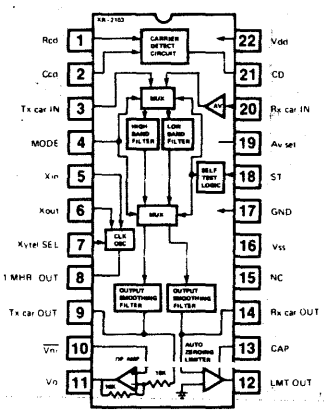
Filters

XR-2103 FSK MODEM FILTER

The XR-2103 is a Monolithic Switched-Capacitor Filter designed to perform the complete filtering function necessary for a Bell 103 Compatible Modem. The XR-2103 is specifically intended for use with the XR-14412 Modulator/Demodulator to form a complete stand alone two-chip Modem. In addition to complete high and low bandpass filters, the XR-2103 contains internal mode switching, auto-zeroing limiter and dedicated duplexer op amp. An on-board carrier detect circuit is also included to complete the over-all system. Designed for crystal-controlled operation, the XR-2103 may operate from a 4.0 MHz crystal or 1 MHz input from the XR-14412. A self-test circuit is included to complement that of the XR-14412.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Single 5 Volt Operation
4.0 MHz/1 MHz Clock Input
Complete On-board Output
Active Filters
Low Supply Current
Internal Answer/Originate Mode Switching
Programmable Input Receive Gain

APPLICATIONS

Bell 103 Transmit/Receive Filtering
Complement to XR-14412 or other
Modulator/Demodulators

ORDERING INFORMATION

Part Number	Package	Operating Temperature

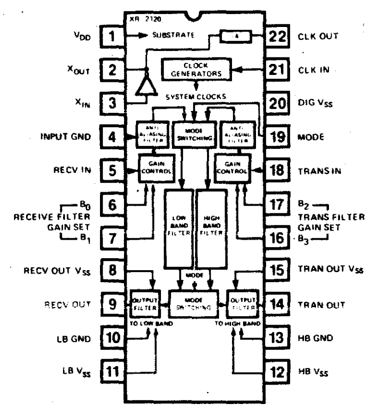
XR-2103CN	Ceramic	0°C to 70°C

XR-2120 PSK MODEM FILTER

The XR-2120 is a self-contained bandpass filter set designed for realization of Bell 212A compatible 1200 bits/sec PSK MODEMS. The XR-2120 utilizes CMOS technology and switched capacitor circuit techniques to minimize external components to a single crystal or frequency source. Contained in the device are two complete bandpass filters centered around the Bell standard 1200 Hz and 2400 Hz send and receive frequencies. These filters also provide compromise line equalization. Additional features included are digitally programmable transmit and receive gains as well as input anti-aliasing and complete output smoothing filters. Separate V_{SS} pins for transmit, receive, and digital sections are provided to minimize crosstalk.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

On-board Crystal Oscillator With Buffered Output
Internal Anti-aliasing Filters
Complete On-board Output Active Filters
Digitally Programmable Transmit and Receive Gains
MODE Input Internally Switches Filters
for Answer/Originate
Single or Split Supply Operation
Center Frequencies Movable with Input Clock
High-Impedance Inputs (100 kΩ min)
Low Supply Current
1% Center Frequency Accuracy
Separate CLK IN and CLK OUT Pins

APPLICATIONS

Bell 212A Transmit/Receive Filtering
Answer Back Signal Filtering

ORDERING INFORMATION

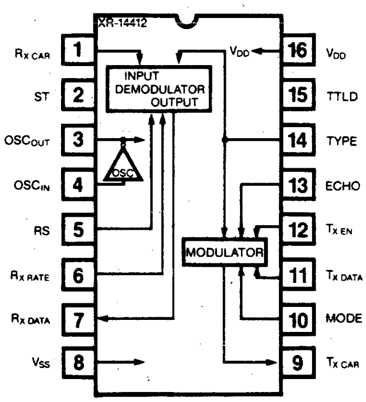
XR-2120CN	Ceramic	0°C to +70°C
XR-2120CP	Plastic	0°C to +70°C

Modem Circuits

XR-14412 FSK MODEM SYSTEM

The XR-14412 contains all the necessary circuitry to construct a complete FSK modulator/demodulator (MODEM) system. Included is circuitry for pin-programmable frequency bands, either U.S. or foreign (CCITT) standards for low-speed MODEMS. The XR-14412 provides TTL-compatible inputs and outputs. Included in the XR-14412 are features for self-testing and an echo suppression tone generator. The XR-14412 utilizes complementary MOS technology for low-power operation.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Simplex, Half-Duplex, and Full Duplex Operation
Crystal Controlled
Answer or Originate Modes
Single Supply Operation
Self-test Mode
Selectable Data Rates 300 or 600 bps
TTL, or CMOS-Compatible Inputs and Outputs
Echo Suppressor Disable Tone Generator
U.S. or Foreign (CCITT) Compatible

APPLICATIONS

Stand-Alone MODEMS
Remote Terminals
Acoustical Couplers
Built-in MODEMS

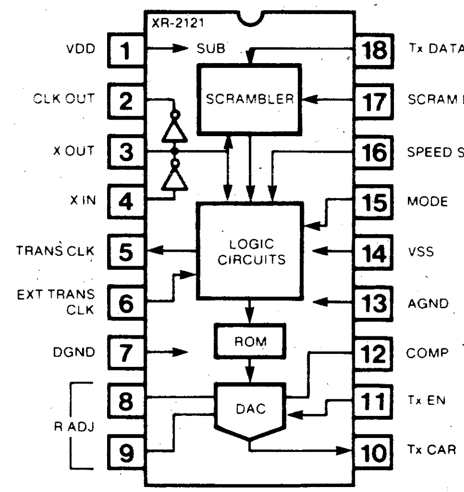
XR-2121 BELL 212A MODULATOR

The XR-2121 is designed to provide the complete modulator function for the Bell Standard 212A PSK Modem. It can be used with the XR-2120 PSK Filter, XR-2122 Demodulator, and XR-2125 Sync/Async Converter to provide a four chip solution for realizing this 1200/300 bps Modem System.

The XR-2121 Modulator provides either a 1200 bps PSK or 0 to 300 bps FSK output. Crystal controlled operation offers extremely accurate and stable 1200/2400 Hz carriers for the PSK and 1170/2125 Hz carriers for the FSK. An enable/disable pin is provided for blanking the modulator output. A transmit clock of 1200 Hz is also provided for synchronization of the terminal and other facilities. The XR-2121 is designed to operate from dual 5-volt power supplies and utilizes CMOS technology for low power consumption.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Bell Standard 212A Compatible
6-Bit Synthesized Sine Wave Output
Internal Scrambler
Enable/Disable Input
1200 Hz Transmit Clock Output
Crystal Controlled with Buffered Clock Output
External Clock Input
CMOS/TTL Compatible Inputs

APPLICATIONS

Stand-Alone Modems
Remote Terminals
Built-In Modems

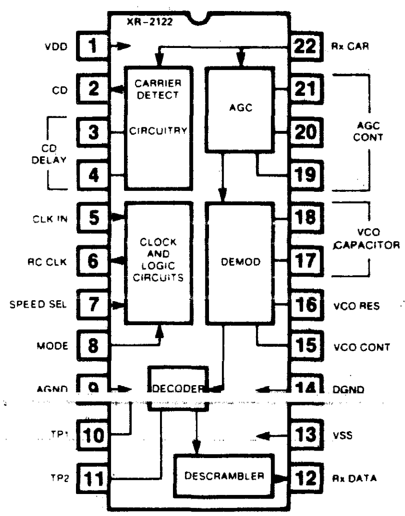
Modem Circuits

XR-2122 BELL 212A DEMODULATOR

The XR-2122 is designed to provide the complete demodulator function for the Bell Standard 212A PSK Modem. It can be used with the XR-2120 PSK Filter, XR-2121 Modulator, and XR-2125 Sync/Async Converter to provide a four chip solution for realizing this 1200/300 bps Modem System.

The XR-2122 Demodulator provides the complete demodulation function for either 1200 bps PSK or 0 to 300 bps FSK incoming carriers. An internal descrambler, automatic gain control circuit, and carrier detect circuit are also provided. The XR-2122 is designed to operate from dual 5-volt power supplies and utilizes CMOS technology for low power consumption.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Bell Standard 212A Compatible
Automatic Speed Selection in Answer Mode
36 dB (-9 to -45 dBm) Dynamic Input Range
On-Board Descrambler
Carrier Detect Output
Crystal Controlled Operation
CMOS/TTL Compatible Inputs and Outputs

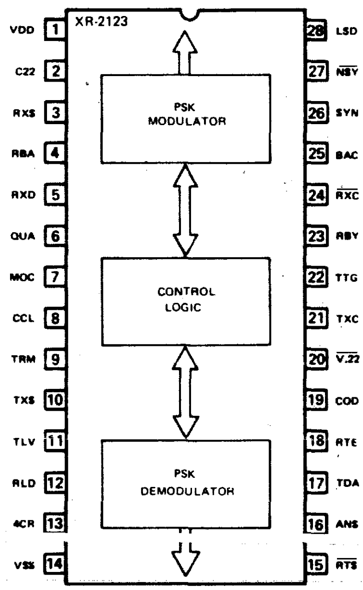
XR-2123 PSK MODULATOR/DEMODULATOR

The XR-2123 provides the phase-shift keying (PSK) Modulator and Demodulator Functions for implementing a Full-Duplex 1200 bps or Half-Duplex 2400 bps Modem System. Using fully digital circuit techniques allows the XR-2123 to be externally programmed for operation for Bell Standards 201B and C or 212A (1200 bps only), and CCITT V.22 or V.26. Internal logic and timing functions minimize external parts while crystal controlled operation provides stable and accurate operation.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

CMOS Technology
Single +5 Volt Operation
Low Power Consumption (Typ 10mw)
1200 bps Full-Duplex
2400 bps Half-Duplex
Programmable for US or European Standards (CCITT)
Dibit PSK (DPSK) Operation
Crystal Controlled
Synthesized Sine Wave Modulator Output
Adjustable Modulator Output
Input Protection

APPLICATIONS

Bell Standard 201 or 212A Modems
CCITT Standard V.22 or V.26 Modems

Modem Circuits

XR-2125 SYNC/ASYNC CONVERTER

The XR-2125 is designed to provide the interface between asynchronous digital equipment and the synchronous operation of the modulator and demodulator functions in a Bell Standard 212A PSK Modem. It can be used with the XR-2120 PSK Filter, XR-2121 Modulator, and XR-2122 Demodulator to provide a four chip solution for realizing this 1200/300 bps Modem System.

The XR-2125 maintains proper timing of data by inserting or removing stop bits when interfacing with asynchronous digital equipment. Enable/Disable pins are provided to allow straight-through operation when interfacing with synchronous equipment. Operation with character lengths of either 9 or 10 bits may be selected also. The XR-2125 is designed to operate from a single 5-volt supply and utilizes CMOS technology for low power consumption.

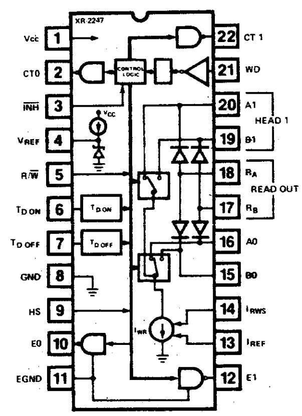
XR-2247 FLOPPY DISK WRITE AMPLIFIER

The XR-2247 is a write amplifier designed to provide the complete interface between write data signals and tunnel-erase magnetic heads. Although primarily intended for floppy disk drive systems, the XR-2247 can also be used in other magnetic media systems such as tape drives. Complete internal active transistor switching is provided to minimize external parts for dual head systems. Write and erase currents are each externally programmable with a single resistor. Also included is circuitry for inner track write current compensation. To prevent false write current outputs on power-on, an inhibit input has been provided. Turn-on and turn-off times for the tunnel-erase systems are each externally programmable.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Fully Programmable Write and Erase Currents
Fully Programmable Tunnel Delay
for Turn-on/Turn-off
Internal Switching Diodes (active transistors)
for Dual Head Drives
Single Supply Operation
Inner Track Write Current Compensation
Inhibit Input
TTL Compatible Inputs
Low External Parts Count

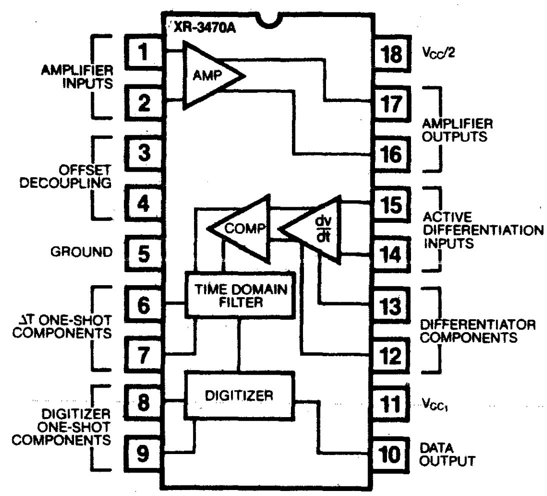
XR-3470A FLOPPY DISK READ AMPLIFIER

The XR-3470A is a read amplifier system designed primarily for use in a floppy disk system. It is designed to perform the complete readback function, by accepting the readback signal from a magnetic head and converting it into digital output pulses. To perform this function, the XR-3470A contains a high frequency amplifier, an active differentiator, a zero-crossing detector, and a time domain filter.

The XR-3470A is suited for systems with data transfer rates up to 3 megabaud. High input sensitivity allows operation with signal levels as low as 1.4 mV pp, which gives it the flexability to be used for single or double density floppy disk systems.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Complete Floppy Disk Read Amplifier	
Low Input Voltage Detection	1.4 mV pp
Low Peak Shift	2.0% Maximum
Low Amplifier Gain Variation	100 V/V Min
	130 V/V Max
High Amplifier Frequency Response	10 MHz, Min

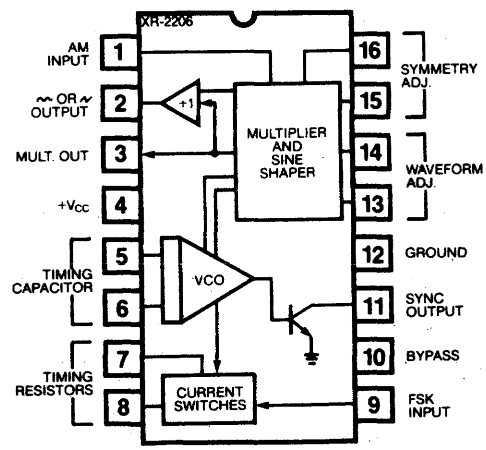
Function Generators

XR-2206 MONOLITHIC FUNCTION GENERATOR

The XR-2206 is a monolithic function generator integrated circuit capable of producing high quality sine, square, triangle, ramp, and pulse waveforms of high-stability and accuracy. The output waveforms can be both amplitude and frequency modulated by an external voltage. Frequency of operation can be selected externally over a range of 0.01 Hz to more than 1 MHz.

The circuit is ideally suited for communications, instrumentation, and function generator applications requiring sinusoidal tone, AM, FM, or FSK generation.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Low-Sine Wave Distortion	.5%, Typical
Excellent Stability	20 ppm/°C, Typical
Wide Sweep Range	2000:1, Typical
Linear Amplitude Modulation	
Adjustable Duty Cycle	1% to 99%

APPLICATIONS

Waveform Generation	V/F Conversion
Sweep Generation	FSK Generation
AM/FM Generation	Phase-Locked Loops

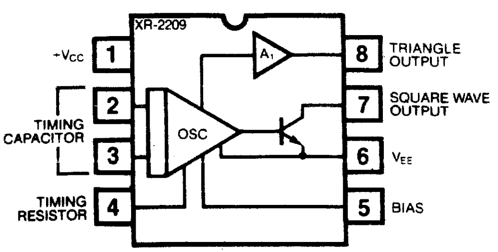
Function Generators

XR-2209 PRECISION OSCILLATOR

The XR-2209 is a monolithic variable frequency oscillator circuit featuring excellent temperature stability and a wide linear sweep range. The circuit provides simultaneous triangle and square wave outputs over a frequency range of 0.01 Hz to 1 MHz. The frequency is set by an external RC product. The device is ideally suited for frequency modulation, voltage-to-frequency or current-to-frequency conversion, sweep or tone generation, as well as for phase-locked loop applications when used in conjunction with a phase comparator such as the XR-2208.

The circuit is comprised of three functional blocks: A variable frequency oscillator and two buffer amplifiers. The XR-2209 has a typical drift specification of 20 ppm/°C. The frequency can be linearly swept over a 1000:1 range, by an external control signal.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Excellent Temperature Stability	20 ppm/°C
Linear Frequency Sweep	
Wide Sweep Range	1000:1, Minimum
Wide Supply Voltage Range	±4V to ±13V
Low Supply Sensitivity	0.15%/V
Wide Frequency Range	0.01 Hz to 1 MHz
Simultaneous Triangle and Square Wave Outputs	

APPLICATIONS

V/F Conversion	Waveform Generation
C/F Conversion	Stable Phase-Locked Loop
FM and Sweep Generation

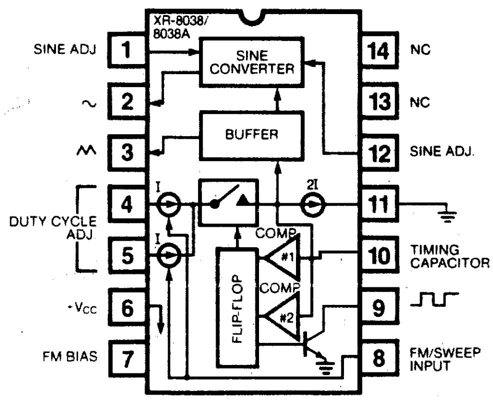
XR-8038/8038A PRECISION WAVEFORM GENERATOR

The XR-8038/8038A is a precision waveform generator IC capable of producing sine, square, triangular, sawtooth, and pulse waveforms with a minimum of external components and adjustments. Its operating frequency can be selected over nine decades of frequency, from 0.001 Hz to 1 MHz, by the choice of external RC components. The frequency of oscillation is highly stable over a wide temperature and supply voltage range. The frequency modulation and sweeping can be accomplished with an external control voltage, without affecting the quality of the output waveforms. The frequency can be programmed digitally through the use of either resistors or capacitors.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Direct Replacement for Intersil 8038	
Low Frequency Drift	50 ppm/°C
Simultaneous Sine, Triangle and Square Wave Outputs	
Low Distortion	THD 1%
High FM and Triangle Linearity	
Wide Frequency Range	0.001 Hz to 1 MHz
Minimum External Component Count	
Variable Duty Cycle	2% to 98%

APPLICATIONS

Precision Waveform Generation	Sweep Generation
Test Instrumentation Design	Precision PLL Design
Phase-Locked Clock Generation	Tone Generation

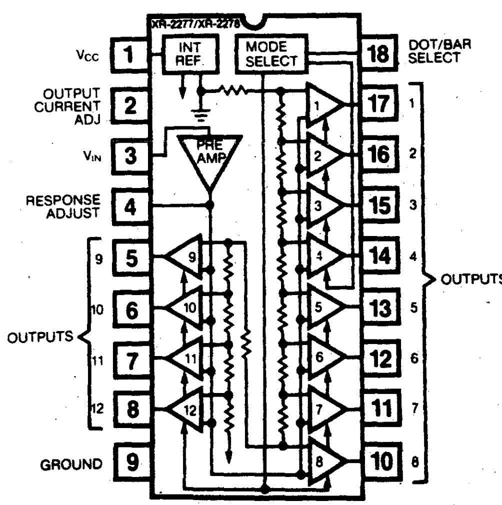
Display Drivers

XR-2277/XR-2278 DOT AND BAR-GRAPH DISPLAY GENERATORS

The XR-2277 and XR-2278 are 12-point level detector circuits designed for interfacing directly with LED moving dot or bar-graph displays. Each circuit is comprised of an input buffer amplifier, a set of 12 comparators which are biased from an internal voltage reference, and a resistor string. Each comparator provides a high-impedance current source output; each of the output currents is very closely matched and can be adjusted, simultaneously, with a single external setting resistor.

The XR-2277 has 12 discrete output levels, over a range of -30 dB to +6 dB, referenced to an externally set zero dB reference level. The XR-2278 has similar electrical characteristics, except for a dynamic range of -20 dB to +8 dB.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Direct LED Interface	Adjustable Zero dB Reference
Constant-Current Outputs	Adjustable Output Currents
External Mode-Select for Dot/Bar-Graph Format	High Input Impedance

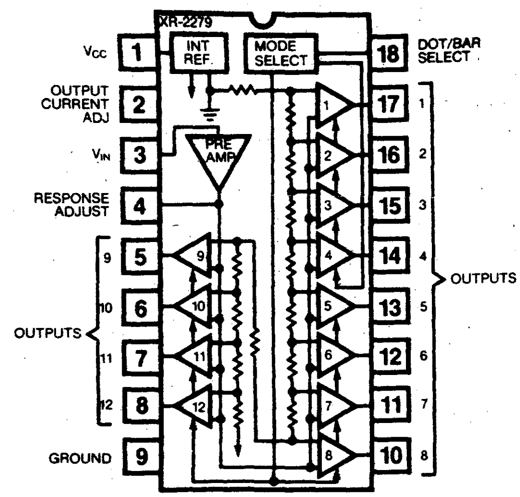
XR-2278CP	Plastic	0°C to +70°C

XR-2279 DOT AND BAR-GRAPH DISPLAY GENERATOR

The XR-2279 is a 12-point logarithmic level-detector circuit comprised of an input buffer amplifier and a set of 12 voltage comparators. The circuit produces 12 discrete output levels, spaced in three dB intervals, over a dynamic range of -27 dB to +6 dB, referenced to an externally adjusted zero dB level. It is designed for interfacing directly with LED moving dot or bar-graph displays. Each of the comparator outputs provides a high-impedance constant-current drive which is well-matched and can be adjusted by an external resistor setting. The circuit output is either a moving dot or a continuous bar-graph format, based on control voltage applied to the mode-select pin.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Direct LED Interface
Constant 3 dB per Step Logarithmic Scale
External Mode-Select for Dot/Bar-Graph Formats
Adjustable Output Current Levels
Adjustable Zero dB Reference

APPLICATIONS

Bar-Graph Generator	Logarithmic Level Indicator
Moving Dot Display Generator	Sequential Level Indicator

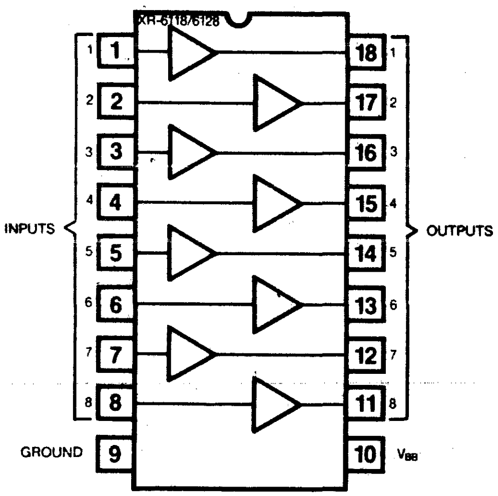
Display Drivers

XR-6118/6128 FLUORESCENT DISPLAY DRIVER

The XR-6118 and XR-6128 are high-voltage display driver arrays which are designed to interface between low-level digital logic and vacuum fluorescent displays. Each circuit consists of eight independent signal channels comprised of Darlington output stages and common-emitter inputs. All channels on the chip share common power supply and ground connections. Both device types are capable of driving digits and/or segments of fluorescent displays, and all of the eight outputs can be activated simultaneously. The XR-6118 is compatible with TTL and 5V CMOS logic while the XR-6128 interfaces with 6V to 15V PMOS or CMOS. The XR-6118 amd XR-6128 are designed to operate with a supply voltage of 80V, and the XR-6118-2 with a supply voltage of 60V.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Direct Replacement for Sprague 6118A/6128A
Digit or Segment Drivers
Low Power and Input Current
Internal Output Pulldown Resistors
High Output Breakdown Voltage 77V, Minimum

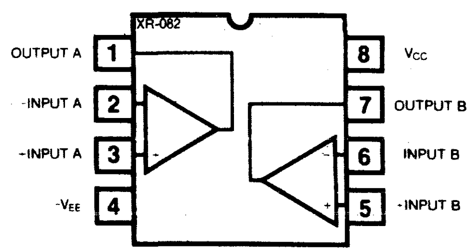
Operational Amplifiers

XR-082/083 DUAL BIPOLAR JFET OPERATIONAL AMPLIFIER

The XR-082/083 family of junction FET input dual operational amplifiers are designed to offer higher performance than conventional bipolar op amps. Each amplifier features high slew rate, low input bias and offset currents, and low offset voltage drift with temperature. These operational amplifier circuits are fabricated using ion implantation technology to combine well-matched junction FET's and high-performance bipolar transistors on the same monolithic chip.

The XR-082 family of dual bipolar JFET op amps are packaged in an 8-Pin dual-in-line package. The XR-083 family of op amps offers an independent offset adjustment for each of the individual op amps on the same chip, and are available in a 14-Pin dual-in-line package.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Direct Replacement for TL082/083 (See Chart)
Low Power Consumption
Wide Common-Mode and Differential Voltage Ranges
Low Input Bias and Offset Currents
Output Short Circuit Protection
High-Input Impedance . . . . FET Input Stage
Internal Frequency Compensation
Latch-Up-Free Operation
High Slew Rate 13V/µs, Typical

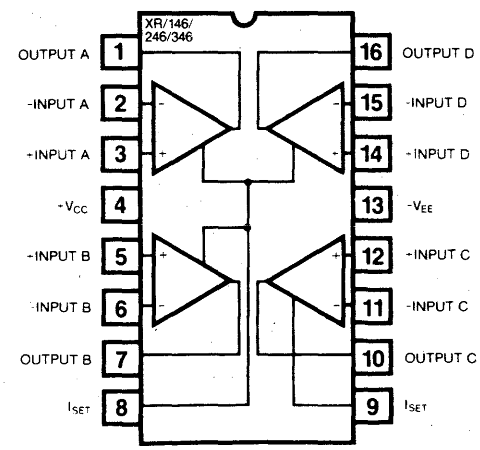
XR-146/246/346 PROGRAMMABLE QUAD OPERATIONAL AMPLIFIER

The XR-146 family of quad operational amplifiers contain four independent high-gain, low-power, programmable op amps on a monolithic chip. The use of external bias setting resistors permit the user to program the gain bandwidth product, supply current, input bias current, input offset current, input noise, and slew rate.

The basic XR-146 family of circuits offers partitioned programming of the internal op amps. One setting resistor is used to set the bias levels in the three op amps, and a second bias setting is used for the remaining op amp. Its modified version, XR-346-2, provides a separate bias setting resistor for each of the two op amp pairs.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Direct Replacement for LM146/246/346
Direct Replacement for LM346-2
Programmable Electrical Characteristics

Low Supply Current	350 μA per Amplifier
Large dc Voltage Gain	120 dB
Low Noise Voltage	25 nV/$\sqrt{Hz}$

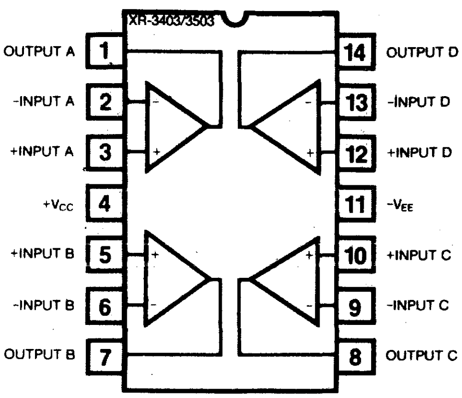
Operational Amplifiers

XR-3403/3503 QUAD OPERATIONAL AMPLIFIER

The XR-3403 is an array of four independent operational amplifiers, each with true differential inputs. The device has electrical characteristics similar to the popular 741. However, the XR-3403 has several distinct advantages over standard operational amplifier types in single supply applications. The XR-3403 can operate at supply voltages as low as 3.0 volts, or as high as 36 volts. Quiescent currents remain about one-fifth of those associated with the 741 (on a per amplifier basis). The common-mode input range includes the negative supply, thereby eliminating the necessity for external biasing components in many applications. The output voltage swing extends to the negative supply.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Direct Pin for Pin Replacement for MC3403/3503, LM324 & RC4137	
Suitable for Single Supply Operation	
Short Circuit Protected Outputs	
Class AB Output Stage	No Crossover Distortion
Single Supply Operation	3.0V to 36V
Split Supply Operation	± 1.5V to ± 18V
Low Input Bias Currents	500 nA Maximum
Internally Compensated	

APPLICATIONS

Circuits Requiring Ground Sensing at Inputs
Low Supply Voltage Systems

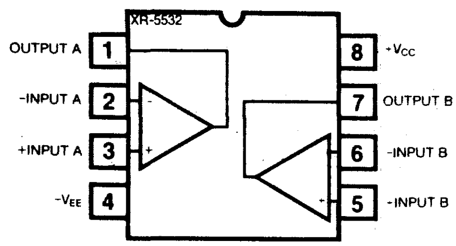
XR-5532/5532A DUAL LOW-NOISE OPERATIONAL AMPLIFIER

The XR-5532 ultralow noise dual operational amplifier is especially designed for high quality audio and instrumentation applications. Compared to standard 741- or 301A-type op amps, these operational amplifiers offer an order of magnitude improvement in both noise performance and small signal bandwidth. Higher output drive capability and internal compensation are added features. The XR-5532A is specially screened for a guaranteed ultralow noise specification. This ultralow noise specification makes the XR-5532A ideally suited for audio preamplifier and other low level applications.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Pin for Pin Replacement MC1458, RC4558, TL072 TL082 & LF 353	
Direct Replacement for NE5532/NE5532A	
Ultralow Input Noise	4 nV/ Hz, Typical
Wide Small Signal Bandwidth	10 MHz, Typical
High Output Drive Capability	10V rms into 600Ω
Wide Supply Range	± 3V to ± 20V

XR-5534/5534A LOW-NOISE OPERATIONAL AMPLIFIER

The XR-5534 is a high performance, ultralow noise operational amplifier. Compared to the standard 741- or 301A-type op amps, it offers an order of magnitude improvement in noise performance, and small signal bandwidth, as well as significantly better output drive capability. The XR-5534 is ideally suited for applications in high quality and professional audio equipment, instrumentation, control circuits, and telephone channel amplifiers. The op amp is internally compensated for a gain of three or greater. The frequency response can be optimized with an external compensation capacitor for applications requiring unity-gain, low-overshoot response, or capacitive load driving. The XR-5534A is specially screened for a guaranteed ultralow noise specification.

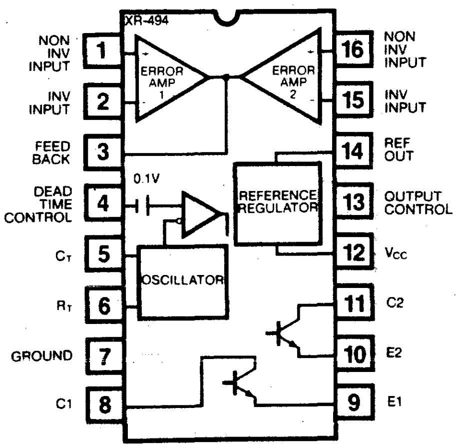
Voltage Regulators

XR-494 PULSE-WIDTH MODULATING REGULATOR

All functions required to construct a pulse-width modulating regulator are incorporated on a single monolithic chip in the XR-494. The device is primarily designed for power supply control and contains an on-chip 5-volt regulator, two error amplifiers, an adjustable oscillator, a dead-time control comparator, a pulse-steering flip-flop, and output control circuits. Either common emitter or emitter follower output capability is provided by the uncommitted output transistors.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Complete PWM Power Control Circuitry
Uncommitted Outputs for 200 mA Sink or Source
Output Control Selects Single-ended
or Push-pull Operation
Internal Circuitry Prohibits Double Pulse at Either Output
Variable Dead-time Provides Control Over Total Range
Internal Regulator Provides a Stable 5V Reference Supply
Circuit Architecture Provides Easy Synchronization

APPLICATIONS

Pulse-Width Modulated Power Control Systems
Switching Regulators
Motor Speed Control
Power Inverters

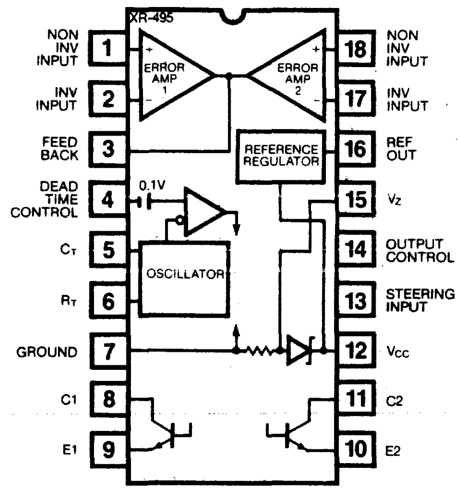
XR-495 PULSE-WIDTH MODULATING REGULATOR

All functions required to construct a pulse-width modulating regulator are incorporated on a single monolithic chip. The device is primarily designed for power supply control and contains an on-chip 5-volt regulator, two error amplifiers, an adjustable oscillator, a dead-time control comparator, a pulse-steering flip-flop, and output control circuits. Either common emitter or emitter follower output capability is provided by the uncommitted output transistors.
The XR-495 also contains an on-chip 39-volt Zener diode for high-voltage applications, where V_{CC} is greater than 40 volts, and an output steering control that overrides the internal control of the pulse-steering flip-flop.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Complete PWM Power Control Circuitry
Uncommitted Outputs for 200 mA Sink or Source
Output Control Selects Single-ended
or Push-pull Operation
Internal Circuitry Prohibits Double-Pulse at Either Output
Variable Dead-time Provides Control Over Total Range

APPLICATIONS

Pulse-Width Modulated Power Control Systems
Switching Regulators

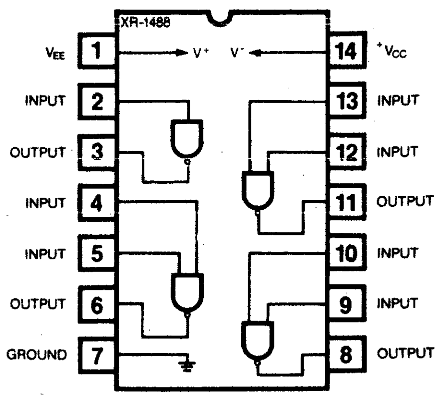
Line Interface Circuits

XR-1488 QUAD LINE DRIVER

The XR-1488 is a monolithic quad line driver designed to interface data terminal equipment with data communications equipment, in conformance with the specifications of EIA Standard No. RS232C. This extremely versatile integrated circuit can be used to perform a wide range of applications. The circuit features output current limiting circuitry, and independent positive and negative power supply driving elements. Compatibility with all DTL and TTL logic families enhances the versatility of the circuit.

The XR-1488 quad line driver along with its companion circuit, the XR-1489A quad line receiver, provides a complete interface system between DTL and TTL logic levels, and the RS232C defined voltage and impedance levels.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Current Limited Output
Independent Positive Power Supply Driving Elements
Independent Negative Power Supply Driving Elements
Compatible with DTL and TTL Logic Families
Data Terminal/Data Communication Interface
Conforms to EIA Standard No. RS232C

APPLICATIONS

RS232 C Interface

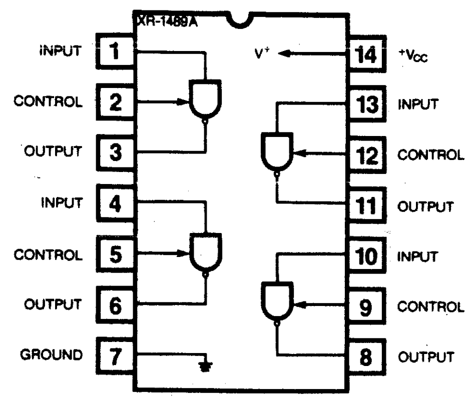
XR-1488P	Plastic	0°C to +70°C

XR-1489A QUAD LINE RECEIVER

The XR-1489A is a monolithic quad line receiver especially designed for data bus interface. Each of the line receiver sections has adjustable hysteresis characteristics for improved noise rejection. The input and output levels of the circuit are designed to provide direct interface between RS232C data bus standards and the DTL or TTL type logic levels.

The XR-1489A quad line receiver along with its companion circuit, the XR-1488 quad line driver, provides a complete interface between DTL and TTL logic levels, and the RS232C defined voltage and impedance levels.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Direct Replacement for MC1489A
Current Limited Output
Compatible with DTL and TTL Logic
Meets EIA Standard RS232C

APPLICATIONS

Data Bus Interface
Microprocessor Interface
Remote Terminal Interface
RS232 Interface

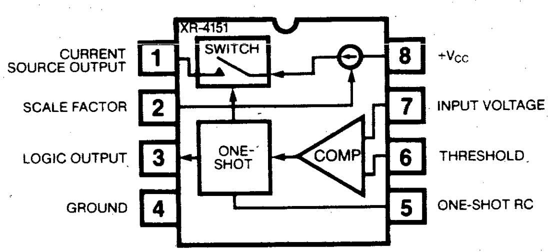
Special Functions

XR-4151 VOLTAGE-TO-FREQUENCY CONVERTER

The XR-4151 is a device designed to provide a simple, low cost, method for converting a dc voltage into a proportional pulse repetition frequency. It is also capable of converting an input frequency into a proportional output voltage. The XR-4151 is useful in a wide range of applications, including A/D and D/A conversion and data transmission.

FUNCTIONAL BLOCK DIAGRAM



FEATURES

Single Supply Operation	+ 8V to + 22V
Pulse Output Compatible with all Logic Forms	
Programmable Scale Factor	
Linearity (Precision Mode)	± 0.05%, Typical
Temperature Stability	± 100 ppm/°C, Typical
High-Noise Rejection	
Inherent Monotonicity	
Easily Transmittable Output	
Simple Full Scale Trim	
Single-ended Input	
Frequency-to-Voltage Conversion	
Direct Replacement for RC/RV/RM4151	

APPLICATIONS

Voltage-to-Frequency Conversion
A/D and D/A Conversion
Data Transmission
Frequency-to-Voltage Conversion
Transducer Interface
System Isolation

Semi-Custom Development

SEMI-CUSTOM BIPOLAR PROGRAM

The Exar bipolar semi-custom design program offers a variety of semi-custom chips to fulfill various application performance requirements and complexities.

These semi-custom chips offer a unique method of manufacturing an almost unlimited variety of custom linear and digital integrated circuits, with greatly reduced cost and development time. Exar makes this possible by stocking wafers that are completely fabricated except for the final process step of device interconnection, which metalizes the selected components together in the required circuit configurations.

BIPOLAR SEMI-CUSTOM CHIPS

Chip Type	Chip Size in Mils	Breakdown Voltage	NPN	PNP	JFET's
A100	73 x 83	20V	60	18	
B100	85 x 85	20V	69	12	
C100A	56 x 62	20V	23	8	
D100	80 x 80	36V	50	16*	
E100	80 x 81	20V	48	15	
F100	91 x 110	20V	97	32*

*** Dual collector PNP transistors**
**** Contact Custom Product Application Engineering for more details.**

Exar offers a design kit which contains simple instructions and guidelines for designing the metal mask as well as the actual breadboard components (consisting of npn and pnp arrays and integrated resistors), which are representative of the devices available on the semi-custom chips. This provides the design engineer with the ability to closely evaluate his design's performance prior to integrating it on a monolithic chip.

SEMI-CUSTOM I^2L PROGRAM

With the introduction of the I^2L Gate Array chips, Exar has extended its semi-custom design program to the Integrated Injection Logic (I^2L) technology. This unique method of custom LSI development technique now makes it possible to manufacture an almost unlimited variety of digital or analog/digital circuits using I^2L technology, with greatly reduced development cost and time.

I^2L Semi-Custom Chips

Characteristics	CHIP SIZE XR-200	XR-300	XR-400	XR-500
Chip Size (mils)	98 x 119	104 x 146	119 x 156	122 x 185
I^2L Gates	192	288	256	520
Max. Operating Voltage	7V	7V	7V	7V
Bipolar I/O Interfaces	24	28	18	40
Bonding Pads	30	34	40	42

The XR-300 and XR-500 gate arrays are intended primarily for digital LSI designs. The XR-400 gate array features the advantage of combining analog and digital functions on the same IC chip. These I^2L gate array chips are customized by three custom mask patterns, which are simultaneously generated from a pencil layout, using Exar's unique computerized mask generation technique. In this manner, the chip layout is greatly simplified and gate utilization efficiency is increased.

Exar also offers an I^2L design kit which is intended to familiarize the designer with the basic features of I^2L technology, provides helpful design guidelines in reducing his design concept to breadboard and, finally, the IC layout stage.

SEMI-CUSTOM CMOS PROGRAMS

Metal Gate CMOS

Exar now offers two families of CMOS Gate Arrays. The first family consists of four chips featuring from 112 to 544 uncommitted logic gates, fabricated with 7.5μ metal gate technology.

CMOS Master-Chips

Chip Type	CMOS Gates	I/O Cells	Bonding Pads
XR-CMA	112	29	32
XR-CMB	162	34	38
XR-CMC	216	40	44
XR-CMD	544	46	53

A CMOS design kit is also available to familiarize the designer with the basic features of CMOS technology and to assist in the breadboarding layout of the IC chip.

Silicon Gate CMOS

The newest family of semi-custom Master-Chips to be added to Exar's product line is a series of four silicon gate arrays (4μ channel length drawn approximately 3μ actual) and range in size from 500 gates to 1600 gates. These devices feature dual layer metal and an extensive library of standard cells. Please contact Exar Custom Product Applications Engineering for more information.

ECONOMICS OF SEMI-CUSTOM

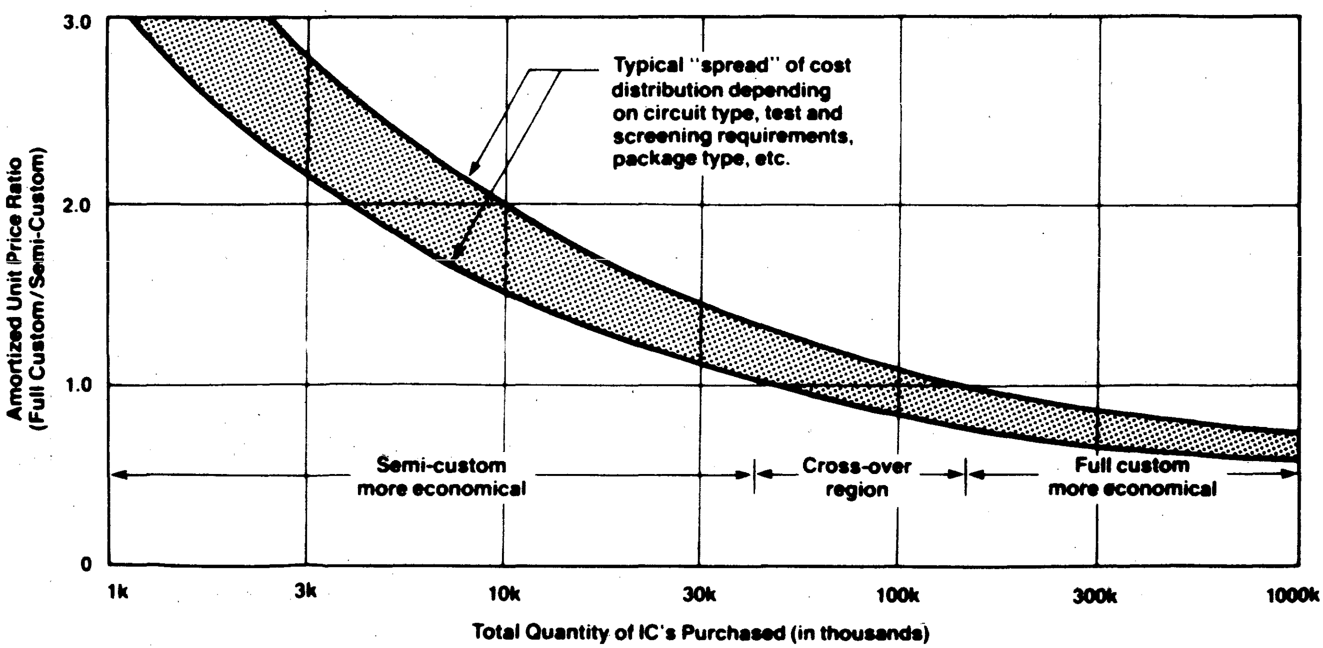
As the Amortized Unit Price Ratio graph in the figure below indicates, for production runs of 50,000 units or less, development costs are a significant influence, and a semi-custom program is clearly the best option. Over 150,000 pieces, production costs become the most important factor, and you are better off with a full custom chip.

Converting Semi-Custom To Full Custom

When production levels get closer to 150,000 units, converting from semi-custom to full custom is most cost effective. The conversion is simple and you get the lower production cost advantages of full custom without giving up the development benefits of semi-custom. In addition, the semi-custom prototypes often serve as a monolithic breadboard to optimize and debug the final design. The actual conversion is a relayout, rather than a redesign. The unused undedicated components are eliminated, and the circuit is laid out on a smaller chip.

Cost Savings Of Two-Step Conversion

Semi-custom design requires only 10-20% of the full custom development costs. Conversion from semi-custom to full custom costs about 50% of the total cost of full custom development. Therefore, the total development costs of the two-step conversion are only 60-70% of a complete full custom program.



Processing sparks improvement of semicustom linear chips

A number of modern semiconductor processing techniques previously not used for semicustom linear ICs were implemented in the XR-W100 and XR-V100 Master Chips.

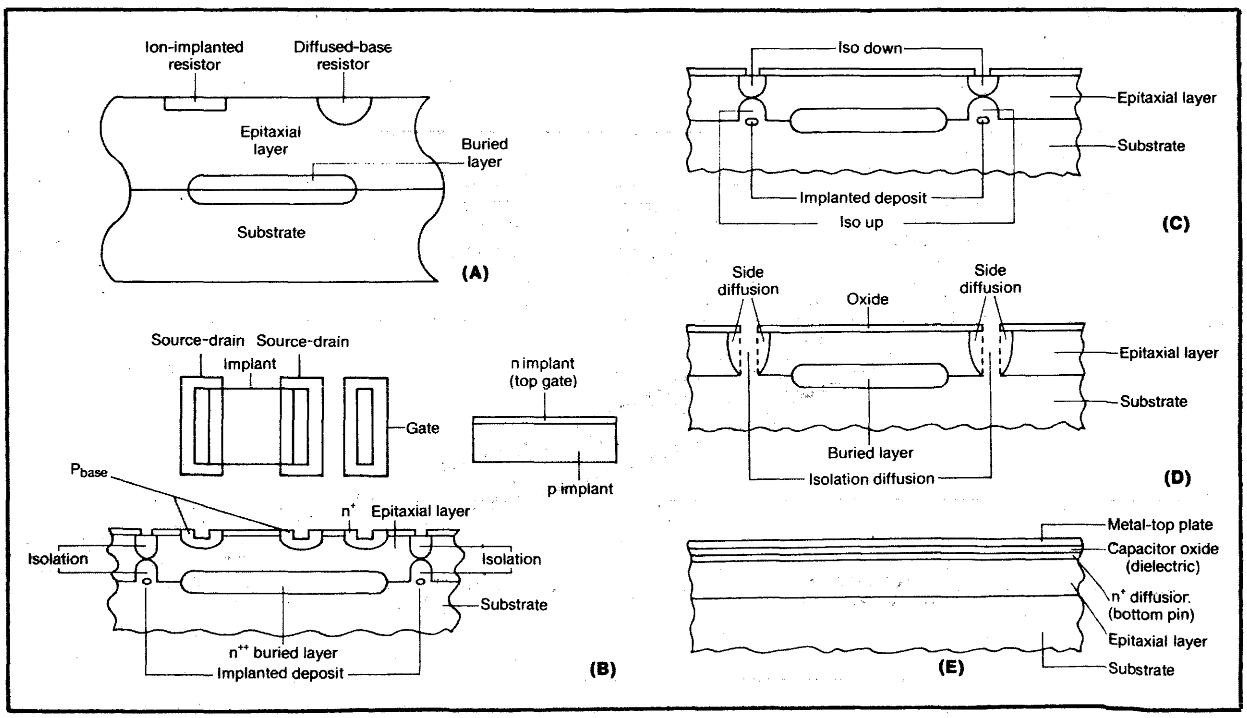
Ion implantation. Ion implantation ballistically introduces dopant ions into the surface of a semiconductor material. Because a machine similar to a linear accelerator shoots the dopant into the surface, their penetration and concentration can be precisely controlled by varying the particle-beam dosage and energy. This technology produces having very high sheet resistivity; thus high-value resistors can fit into much smaller areas on the chip than previously. In addition, ion-implanted resistors have about 300% better absolute-value tolerance and matching than their diffused coun terparts, which depend on the diffusion of dopants into the semiconductor surface (Fig. A).

With ion implantation, p-channel JFETs can be built on the same semiconductor surface as standard bipolar components. JFETs are basically implanted resistors with a second n-implant on top of the channel region that serves as a gate (Fig. B). They are useful in high-input-impedance amplifiers, automatic gaincontrol circuits, current sources, analog switches, multiplexers, and similar applications.

Double isolation. Double isolation, also called "iso-up," employs a rich ion-implanted p-type deposit in the substrate prior to growing the epitaxial layer. With conventional top-bottom diffusion, the bottom deposit diffuses downward. If everything is aligned correctly, the two deposits meet in the middle (Fig. C), leading not only to substantial reductions in lateral diffusions, but also to a smaller die.

Contrasting with that iso-up process is the traditional single isolation, which depends on a rich p-type diffusion penetrating through the epitaxial layer and into the substrate, thereby isolating regions of the epitaxial layer (Fig. D). This method does have its disadvantages, though. For one, it requires a long, high-temperature diffusion cycle. More critical to the user, however are the wider spacing needed between the isolation and subsequent diffusions to permit the significant lateral diffusion of the isolation. That extra spacing accumulates across the die, consuming a large amount of silicon. With the cost of manufacturing the die related largely to its area, the wasted space is reflected in a higher selling price to the user.

Oxide capacitance. By adding a special oxidation step to the processing, oxide capacitors are easily placed on a semicustom IC (Fig. E). These com-



Reprinted from **ELECTRONIC DESIGN — December 9, 1982**

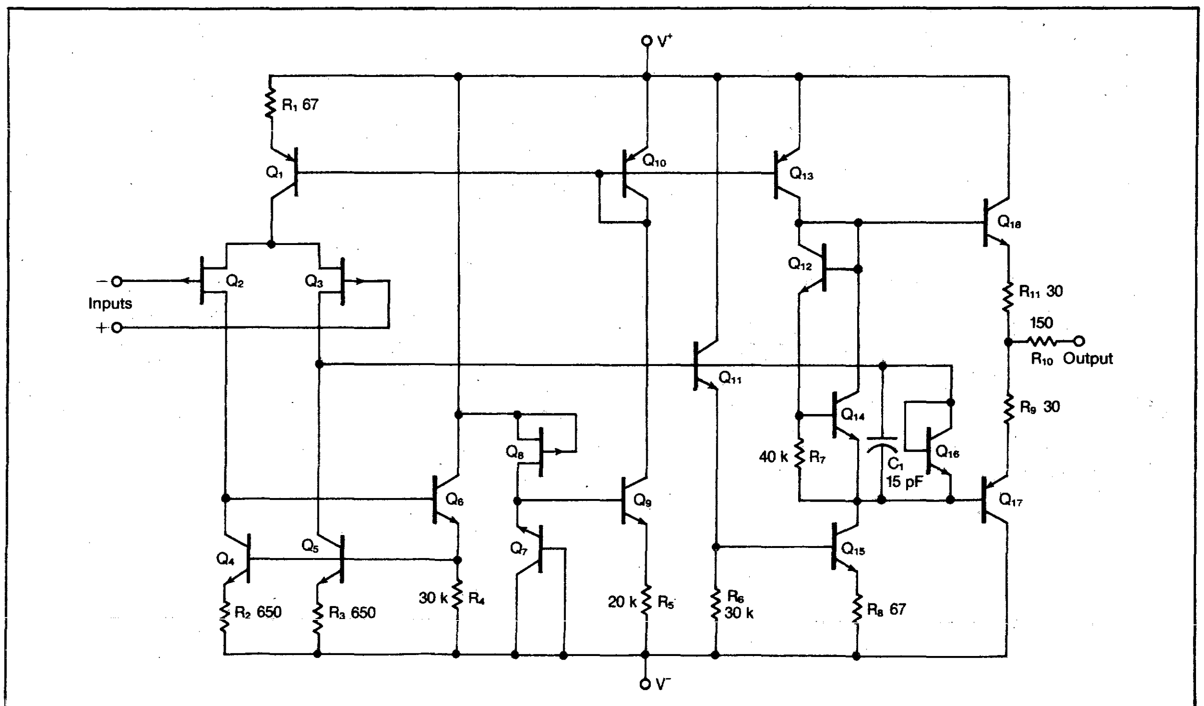
ponents are identical in constuction to those that internally compensate standard op amps; but unlike junction capacitors, they are not voltage-dependent.

36-V process. In the past, high-density semicustom linear ICs were offered only with 20-V processing. Users needing 24V or the standard ±15-V op-amp supply were forced to externally regulate down to a voltage compatible with the chip or to place all high-voltage components off chip. Both cases severely limited higher levels of system integration. With the new 36-V process, these limitations become a thing of the past.

Nitride passivation. Applied over the standard purposes: it helps to eliminate ionic contamination from the chip surface, and it seals the active chip area from moisture. Both functions are aimed at reducing failure rates and improving the chip's overall reliability. Furthermore, with nitride passivation, a user can employ a plastic package in applications that might otherwise require a more expensive, hermetically sealed ceramic housing.

IC components. Though many characteristics of integrated components are similar to those of their discrete counterparts, there are important differences. Discrete components are individually produced and connected into circuits as required. Each component is manufactured by the most suitable process, thus optimizing performance. In the microscopic setting of integrated circuitry, such luxuries do not exist. Because the components are produced simultaneously, compromises must be made on performance. Despite these limitations, integrated components have unique advantages that allow them to overcome most design problems.

Master Chip System typical building block cell



A typical building-block cell in the Master Chip system, this JFET operational amplifier is similar to one of Exar's standard discrete op amps. This type of high-performance device relieves designers of the difficult task of creating their own amplifiers to satisfy each new application.

HA-1608

+10V Adjustable Voltage Reference

FEATURES

- MONOLITHIC CONSTRUCTION
- INITIAL ACCURACY +10V ± 0.010V
- OUTPUT VOLTAGE ERROR, TOTAL ±1/4 LSB
- LOW NOISE $20\mu V_{p-p}$
- WIDE INPUT RANGE 12V TO 30V
- LOW POWER DISSIPATION 30mW
- OUTPUT SHORT CIRCUIT PROTECTION
- ADJUSTABLE OUTPUT

APPLICATIONS

- AN ECONOMICAL EXTERNAL REFERENCE FOR: HI-5608; DAC 08; AD1408; AD559
- VOLTAGE REGULATOR REFERENCE
- PORTABLE BATTERY OPERATED EQUIPMENT
- NEGATIVE 10V REFERENCE

DESCRIPTION

HA-1608 is a monolithic +10V adjustable voltage reference featuring accuracy and temperature stability specifications detailed exclusively for 8 bit data conversion systems. A stable +10V output is provided by a reference zener and buffer amplifier coupled with laser trimmed feedback and zener bias resistors. Long term stability is ensured through integration of all reference components into a monolithic design. Flexibility of HA-1608 is provided through an external trim control which allows the user to adjust the output voltage for binary or BCD applications without affecting overall performance.

These devices provide a total output voltage error of ± 1/4 LSB for 8 bit D/A or A/D converters. Low standby power (0.3mW) makes HA-1608 a natural selection for portable battery operated equipment, comparator references, and reference stacking circuits. These devices can also be used on -10V references.

HA-1608 is packaged in 8 pin metal cans (TO-99) and the pinout is arranged for convenient replacement of other less accurate regulators in applications demanding minimal change with temperature and time. HA-1608-2 is specified for -55°C to +125°C operation while the HA-1608-5 operates from 0°C to +75°C.

HA-2400/2404/2405

PRAM Four Channel Programmable Amplifier

FEATURES

- PROGRAMMABILITY
- HIGH SLEW RATE 30V/μs
- WIDE GAIN BANDWIDTH 40MHz
- HIGH GAIN 150,000
- LOW OFFSET CURRENT 5nA
- HIGH INPUT IMPEDANCE 30MΩ
- SINGLE CAPACITOR COMPENSATION
- DTL/TTL COMPATIBLE INPUTS

APPLICATIONS

- THOUSANDS OF NEW APPLICATIONS; PROGRAM
  - SIGNAL SELECTION/MULTIPLEXING
  - OP AMP GAIN
  - OSCILLATOR FREQUENCY
  - FILTER CHARACTERISTICS
  - ADD-SUBTRACT FUNCTIONS
  - INTEGRATOR CHARACTERISTICS
  - COMPARATOR LEVELS

DESCRIPTION

HA-2400/2404/2405 comprise a series of four-channel programmable amplifiers providing a level of versatility unsurpassed by any other monolithic operational amplifier. Versatility is achieved by employing four input amplifier channels, any one (or none) of which may be electronically selected and connected to a single output stage through DTL/TTL compatible address inputs. The device formed by the output and the selected pair of inputs is an op amp which delivers excellent slew rate, gain bandwidth and power bandwidth performance. Other advantageous features for these dielectrically isolated amplifiers include high voltage gain and input impedance coupled with low input offset voltage and offset current. External compensation is not required on this device at closed loop gains greater than 10.

Each channel of the HA-2400/2404/2405 can be controlled and operated with suitable feedback networks in any of the standard op amp configurations. This specialization makes these amplifiers excellent components for multiplexing, signal selection, and mathematical function designs. With 30V/μs slew rate, 40MHz gain bandwidth, and 30M ohms input impedance these devices are ideal building blocks for signal generators, active filters, and data acquisition designs. Programmability coupled with 2mV typical offset voltage and 5nA offset current makes these amplifiers outstanding components for signal conditioning circuits.

HA-2400/2404/2405 are available in a 16 pin dual-in-line package. HA-2400 is specified from -55°C to +125°C. HA-2404 is specified over the -25°C to +85°C range, while HA-2405 operates from 0°C to +75°C.

HARRIS

HA-2500/02/05

Precision High Slew Rate Operational Amplifiers

FEATURES

- HIGH SLEW RATE 30V/μS
- FAST SETTLING 330ns
- WIDE POWER BANDWIDTH 500kHz
- HIGH GAIN BANDWIDTH 12MHz
- HIGH INPUT IMPEDANCE 50 MΩ
- LOW OFFSET CURRENT 10nA
- INTERNALLY COMPENSATED

APPLICATIONS

- DATA ACQUISTION SYSTEMS
- R.F. AMPLIFIERS
- VIDEO AMPLIFIERS
- SIGNAL GENERATORS
- PULSE AMPLIFICATION

DESCRIPTION

HA-2500/2502/2505 comprise a series of monolithic operational amplifiers whose designs are optimized to deliver excellent slew rate, bandwidth, and settling time specifications. The outstanding dynamic features of this internally compensated device are complemented with low offset voltage and offset current.

These dielectrically isolated amplifiers are ideally suited for applications such as data acquisition, R.F., video, and pulse conditioning circuits. Slew rate of ±25V/μs and 330ns (0.1%) settling time make these devices excellent components in fast, accurate data acquisition and pulse amplification designs. 12 MHz bandwidth and 500kHz power bandwidth make these devices well suited to R.F. and video applications. With 2mV typical offset voltage plus offset trim capability and 10nA offset current, HA-2500/2502/2505 are particularly useful components in signal conditioning designs.

The gain and offset voltage figures of the HA-2500 series are optimized by internal component value changes while the similar design of the HA-2510 series is maximized for slew rate.

HA-2500/2502/2505 are available in metal can (TO-99) packages. HA-2500 and HA-2502 are specified over the -55°C to +125°C range. HA-2505 is specified from 0°C to +75°C.

HA-2510/2512/2515

High Slew Rate Operational Amplifiers

FEATURES

- HIGH SLEW RATE 60V/μs
- FAST SETTLING 250ns
- WIDE POWER BANDWIDTH 1,000kHz
- HIGH GAIN BANDWIDTH 12MHz
- HIGH INPUT IMPEDANCE 100MΩ
- LOW OFFSET CURRENT 10nA
- INTERNALLY COMPENSATED

APPLICATIONS

- DATA ACQUISITION SYSTEMS
- R.F. AMPLIFIERS
- VIDEO AMPLIFIERS
- SIGNAL GENERATORS
- PULSE AMPLIFICATION

DESCRIPTION

The HA-2510/2512/2515 are a series of high performance operational amplifiers which set the standards for maximum slew rate, highest accuracy and widest bandwidth for internally compensated monolithic devices. In addition to excellent dynamic characteristics, these dielectrically isolated amplifiers also offer low offset current and high input impedance.

The ±60V/ μs slew rate and 250ns (0.1%) settling time of these amplifiers is ideally suited for high speed D/A, A/D, and pulse amplification designs. HA-2510/2512/2515's superior 12MHz gain bandwidth and 1000kHz power bandwidth is extremely useful in R.F. and video applications. For accurate signal conditioning these amplifiers also provide 10nA offset current, coupled with 100MΩ input impedance, and offset trim capability.

The HA-2510/2512 are available in metal can (TO-99) and 14-pin flat packages. HA-2510 and HA-2512 are specified from -55°C to +125°C. HA-2515 is specified over the 0°C to +75°C range, and is available in the TO-99 package.

HA-2520/22/25

Uncompensated High Slew Rate Operational Amplifiers

FEATURES

- HIGH SLEW RATE 120V/μs
- FAST SETTLING 200ns
- WIDE POWER BANDWIDTH 2,000kHz
- HIGH GAIN BANDWIDTH 20MHz
- HIGH INPUT IMPEDANCE 100MΩ
- LOW OFFSET CURRENT 10nA

APPLICATIONS

- DATA ACQUISITION SYSTEMS
- R.F. AMPLIFIERS
- VIDEO AMPLIFIERS
- SIGNAL GENERATORS
- PULSE AMPLIFICATION

DESCRIPTION

HA-2520/2522/2525 comprise a series of monolithic operational amplifiers delivering an unsurpassed combination of specifications for slew rate, bandwidth and settling time. These dielectrically isolated amplifiers are controlled at closed loop gains greater than 3 without external compensation. In additon, these high performance components also provide low offset current and high input impedance.

120V/μs slew rate and 200ns (0.1%) settling time of these amplifiers make them ideal components for pulse amplification and data acquisition designs. These devices are valuable components for R.F. and video circuitry requiring up to 20MHz gain bandwidth and 2MHz power bandwidth. For accurate signal conditioning designs the HA-2520/2522/2525's superior dynamic specifications are complimented by 10nA offset current, 100MΩ input impedance and offset trim capability.

The HA-2520/2522 are available in metal can (TO-99) and 14-pin flat packages. HA-2520 and HA-2522 are specified over -55°C to +125°C range. HA-2525 is specified from 0°C to +75°C, and is available in the TO-99 package.

HARRIS

HA-2539

Very High Slew Rate Wideband Operational Amplifiers

FEATURES

- VERY HIGH SLEW RATE 600V/μs
- OPEN LOOP GAIN 30kV/V
- WIDE GAIN-BANDWIDTH 600MHz
- POWER BANDWIDTH 9.5MHz
- LOW OFFSET VOLTAGE 3mV
- INPUT VOLTAGE NOISE 15nV/$\sqrt{Hz}$
- OUTPUT VOLTAGE SWING $\pm$10V

APPLICATIONS

- PULSE AND VIDEO AMPLIFIERS
- WIDEBAND AMPLIFIERS
- HIGH SPEED SAMPLE-HOLD CIRCUITS
- RF OSCILLATORS

GENERAL DESCRIPTION

The Harris HA-2539 represents the ultimate in high slew rate wideband, monolithic, operational amplifiers. It has been designed and constructed with the Harris high frequency BIPDIP (Bipolar dielectric isolation process), and features dynamic parameters never before available from a truly differential device.

With a 600V/ μs slew rate and a 600MHz gain-bandwidth-product, the HA-2539 is ideally suited for use in video and RF amplifier designs. Full $\pm$ 10V output swing coupled with outstanding A.C. parameters and complemented by high open loop gain makes these devices useful in high speed data acquisition systems.

The HA-2539 is available in the 14 pin CERDIP. The HA-2539-2 denotes -55°C to +125°C operation while the HA-2539-5 operates over the 0°C to +75°C range.

HARRIS

HA-2540

Wideband, Fast Settling Operational Amplifiers

Preliminary

FEATURES

- VERY HIGH SLEW RATE 400V/μs
- FAST SETTLING TIME 250ns
- WIDE GAIN-BANDWIDTH 400MHz
- POWER BANDWIDTH 6MHz
- LOW OFFSET VOLTAGE 5mV
- INPUT VOLTAGE NOISE 15nV/$\sqrt{Hz}$
- OUTPUT VOLTAGE SWING $\pm$10V
- MONOLITHIC BIPOLAR CONSTRUCTION

APPLICATIONS

- PULSE AND VIDEO AMPLIFIERS
- WIDEBAND AMPLIFIERS
- HIGH SPEED SAMPLE-HOLD CIRCUITS
- FAST, PRECISE D/A CONVERTERS

GENERAL DESCRIPTION

The Harris HA-2540 is a wideband, very high slew rate, monolithic operational amplifier featuring superior speed and bandwidth characteristics. Bipolar construction coupled with dielectric isolation allows this truly differential device to deliver outstanding performance. Additionally, the HA-2540 has a drive capability of $\pm$10V into a 1K ohm load. Other desirable characteristics include low input voltage noise, low offset voltage, and fast settling time.

A 400V/μs slew rate ensures high performance in video and pulse amplification circuits, while the 400MHz gain-bandwidth-product is ideally suited for wideband signal amplification. A settling time of 250ns also makes the HA-2540 an excellent selection for high speed Data Acquisition Systems.

The HA-2540-2 is specified over the -55°C to +125°C range while the HA-2540-5 is specified from 0°C to +75°C.

HARRIS HA-2600/2602/2605

WideBand, High Impedance Operational Amplifiers

FEATURES

- WIDE BANDWIDTH 12MHz
- HIGH INPUT IMPEDANCE 500MΩ
- LOW INPUT BIAS CURRENT 1nA
- LOW INPUT OFFSET CURRENT 1nA
- LOW INPUT OFFSET VOLTAGE 0.5mV
- HIGH GAIN 150K V/V
- HIGH SLEW RATE 7V/μs
- OUTPUT SHORT CIRCUIT PROTECTION

APPLICATIONS

- VIDEO AMPLIFIER
- PULSE AMPLIFIER
- AUDIO AMPLIFIERS AND FILTERS
- HIGH-Q ACTIVE FILTERS
- HIGH-SPEED COMPARATORS
- LOW DISTORTION OSCILLATORS

DESCRIPTION

HA-2600/2602/2605 are internally compensated bipolar operational amplifiers that feature very high input impedance (500 MΩ, HA-2600) coupled with wideband AC performance. The high resistance of the input stage is complemented by low offset voltage (0.5mV, HA-2600) and low bias and offset current (1nA, HA-2600) to facilitate accurate signal processing. Input offset can be reduced further by means of an external nulling potentiometer. 12MHz unity gain-bandwidth product, 7V/μs slew rate and 150,000V/V open-loop gain enables HA-2600/2602/2605 to perform high-gain amplification of fast, wideband signals. These dynamic characterisitics, coupled with fast settling times, make these amplifiers ideally suited to pulse amplification designs as well as high frequency (e.g. video) applications. The frequency response of the amplifier can be tailored to exact design requirements by means of an external bandwidth control capacitor.

In addition to its application in pulse and video amplifier designs, HA-2600/2602/2605 is particularly suited to other high performance designs such as high-gain low distortion audio amplifiers, high-Q and wideband active filters and high-speed comparators.

HA-2600 and HA-2602 are guaranteed over -55°C to +125°C. HA-2605 is specified from 0°C to +75°C. All devices are available in TO-99 cans, and HA-2600/2602 are available in 10 lead flat packages.

HARRIS HA-2620/2622/2625

Very WideBand, Uncompensated Operational Amplifiers

FEATURES

- GAIN BANDWIDTH PRODUCT(A_V = 5) 100MHz
- HIGH INPUT IMPEDANCE 500MΩ
- LOW INPUT BIAS CURRENT 1nA
- LOW INPUT OFFSET CURRENT 1nA
- LOW INPUT OFFSET VOLTAGE 0.5mV
- HIGH GAIN 150K V/V
- HIGH SLEW RATE 35V/μs
- OUTPUT SHORT CIRCUIT PROTECTION

APPLICATIONS

- VIDEO AND R.F. AMPLIFIERS
- PULSE AMPLIFIER
- AUDIO AMPLIFIERS AND FILTERS
- HIGH-Q ACTIVE FILTERS
- HIGH-SPEED COMPARATORS
- LOW DISTORTION OSCILLATORS

DESCRIPTION

HA-2620/2622/2625 are bipolar operational amplifiers that feature very high input impedance (500MΩ, HA-2620) coupled with wideband AC performance. The high resistance of the input stage is complemented by low offset voltage (0.5mV, HA-2620) and low bias and offset current (1nA, HA-2620) to facilitate accurate signal processing. Input offset can be reduced further by means of an external nulling potentiometer. 100MHz gain-bandwidth product (HA-2620/2622/2625 are stable for closed loop gains greater than 5), 35V/ μs slew rate and 150,000V/V open-loop gain enables HA-2620/2622/2625 to perform high-gain amplification of very fast, wideband signals. These dynamic characterisitcs, coupled with fast settling times, make these amplifiers ideally suited to pulse amplification designs as well as high frequency (e.g. video) applications. The frequency response of the amplifier can be tailored to exact design requirements by means of an external bandwidth control capacitor.

In addition to its application in pulse and video amplifier designs HA-2620/2622/2625 is particularly suited to other high performance designs such as high-gain low distortion audio amplifiers, high-Q and wideband active filters and high-speed comparators.

HA-2620 and HA-2622 are guaranteed over -55°C to +125°C. HA-2625 is specified from 0°C to +75°C. All devices are available in TO-99 cans, and 14 lead D.I.P. packages.

HARRIS

HA-2630/2635

High Performance Current Booster

FEATURES

• OUTPUT CURRENT	±400mA
• SLEW RATE	500V/μs
• BANDWIDTH	8MHz
• FULL POWER BANDWIDTH	8MHz
• INPUT RESISTANCE	$2.0 \times 10^6\Omega$
• OUTPUT RESISTANCE	2.0Ω
• POWER SUPPLY RANGE	±5V to ±20V
• PACKAGE IS ELECTRICALLY ISOLATED	

APPLICATIONS

- COAXIAL CABLE DRIVERS
- AUDIO OUTPUT AMPLIFIERS
- SERVO MOTOR DRIVERS
- POWER SUPPLIES (BIPOLAR)
- PRECISION DATA RECORDING

DESCRIPTION

HA-2630 and HA-2635 are monolithic, unity voltage gain current amplifiers delivering extremely high slew rate, wide bandwidth, and full power bandwidth even under heavy output loading conditions. This dielectrically isolated current booster also offers high input impedance and low output resistance. These devices are intended to be used in series with an operational amplifier and inside the feedback loop whenever additional output current is required. Output current levels are programmable by selecting two optional external resistors.

These current amplifiers offer an exceptional 500V/μs slew rate and 8MHz bandwidth which allows them to be used with many high performance op amps in precision data recording and high speed coaxial cable driver designs. 2.0M ohm input resistance and 2 ohm output resistance coupled with ±400mA output current make HA-2630 and HA-2635 ideal components in high fidelity audio output amplifier designs.

HA-2630 and HA-2635 are available in an electrically isolated TO-8 type can for ease of mounting with or without a heat sink. HA-2630 is specified over the -55°C to +125°C range. HA-2635 is specified from 0°C to +75°C.

HA-2640/2645

High Voltage Operational Amplifier

FEATURES

- OUTPUT VOLTAGE SWING ±35V
- SUPPLY VOLTAGE ±10V TO ±40V
- OFFSET CURRENT 5nA
- BANDWIDTH 4MHz
- SLEW RATE 5V/μs
- COMMON MODE INPUT VOLTAGE SWING ±35V
- OUTPUT OVERLOAD PROTECTION

APPLICATIONS

- INDUSTRIAL CONTROL SYSTEMS
- POWER SUPPLIES
- HIGH VOLTAGE REGULATORS
- RESOLVER EXCITATION
- SIGNAL CONDITIONING

DESCRIPTION

HA-2640 and HA-2645 are monolithic operational amplifiers which are designed to deliver unprecedented dynamic specifications for a high voltage internally compensated device. These dielectrically isolated devices offer very low values for offset voltage and offset current coupled with large output voltage swing and common mode input voltage.

For maximum reliability, these amplifiers offer unconditional output overload protection through current limiting and a chip temperature sensing circuit. This sensing device turns the amplifier "off", when the chip reaches a certain temperature level.

These amplifers deliver ±35V common mode input voltage swing, ±35V output voltage swing, and up to ±40V supply range for use in such designs as regulators, power supplies, and industrial control systems. 4MHz gain bandwidth and 5V/μs slew rate make these devices excellent components for high performance signal conditioning applications. Outstanding input and output voltage swings coupled with a low 5nA offset current make these amplifiers excellent components for resolver excitation designs.

HA-2640 and HA-2645 are available in metal can (TO-99) packages and can be used as high performance pin-to-pin replacements for many general purpose op amps. HA-2640 is specified from -55°C to +125°C and HA-2645 is specified over the 0°C to +75°C range.

HA-2650/2655

Dual High Performance Operational Amplifier

LINEAR

Harris Semiconductor

FEATURES

- SLEW RATE 5V/μs
- BANDWIDTH 8MHz
- BIAS CURRENT 35nA
- AV. OFFSET VOLTAGE DRIFT 8μV/^{o}C
- POWER CONSUMPTION 75mW
- SUPPLY VOLTAGE RANGE ±2V TO ±20V

APPLICATIONS

- VIDEO AMPLIFIERS
- HIGH IMPEDANCE, WIDEBAND BUFFERS
- INTEGRATORS
- AUDIO AMPLIFIERS
- ACTIVE FILTERS

DESCRIPTION

HA-2650/2655 contains two internally compensated operational amplifiers offering high slew rate and high frequency performance combined with exceptional DC characteristics. 5V/μ sec slew rate and 8MHz bandwidth make these amplifiers suitable for processing fast, wideband signals extending into the video frequency spectrum. Signal processing accuracy is enhanced by front-end performance that includes 1.5mV offset voltage, 8μ V/^{o}C offset voltage drift and low offset and bias current (1nA and 35nA respectively). Offset voltage can be trimmed to zero on the devices offered in dual-in-line packages. Signal conditioning is further enhanced by 500MΩ input impedance.

Applications for HA-2650/2655 include video circuit designs such as high impedance buffers, integrators, tone generators and filters. These amplifiers are also ideal components for active filtering of audio and voice signals.

HA-2650/2655 are offered in 14 pin D.I.P. and metal TO-99 packages and are also available in dice form. HA-2650 is specified from -55^{o}C to +125^{o}C. HA-2655 operates from 0^{o}C to +75^{o}C.

HARRIS

HA-2720/25

Wide Range Programmable Operational Amplifier

FEATURES

- WIDE PROGRAMMING RANGE

SLEW RATE	0.06 TO 6V/μs
BANDWIDTH	5kHz TO 10MHz
BIAS CURRENT	0.4 TO 50nA
SUPPLY CURRENT	1μA TO 1.5mA

- WIDE POWER SUPPLY RANGE ±1.2 TO ±18V
- CONSTANT AC PERFORMANCE OVER SUPPLY RANGE

APPLICATIONS

- ACTIVE FILTERS
- CURRENT CONTROLLED OSCILLATORS
- VARIABLE ACTIVE FILTERS
- MODULATORS
- BATTERY-POWERED EQUIPMENT

DESCRIPTION

HA-2720/2725 programmable amplifiers are internally compensated monolithic devices offering a wide range of performance, that can be controlled by adjusting the circuits' "set" current (I_{SET}). By means of adjusting an external resistor or current source, power dissipation, slew rate, bandwidth, output current and input noise can be programmed to desired levels. This versatile adjustment capability enables HA-2720/2725 to provide optimum design solutions by delivering the required level of performance with minimum possible power dissipation. HA-2720 and HA-2725 can, therefore, be utilized as the standard amplifier for a variety of designs simply by adjusting their programming current.

A major advantage of HA-2720/2725 is that operating characteristics remain virtually constant over a wide supply range (±1.2V to ±15V), allowing the amplifiers to offer maximum performance in almost any system including battery-operated equipment. A primary application for HA-2720/2725 is in active filters for a wide variety of signals that differ in frequency and amplitude. Also, by modulating the "set" current, HA-2720/2725 can be used for designs such as current controlled oscillators modulators, sample and hold circuits and variable active filters.

HA-2720 is guaranteed over -55°C to +125°C. HA-2725 is specified from 0°C to +75°C. Both parts are available in TO-99 cans or dice form.

HA-2730/35

Wide Range Dual Programmable Operational Amplifier

FEATURES

- WIDE PROGRAMMING RANGE

SET CURRENT	0.1 TO 100μA
SLEW RATE	0.06 TO 6V/μs
BANDWIDTH	5kHz TO 10MHz
BIAS CURRENT	0.4 TO 50nA
SUPPLY CURRENT	1μA TO 1.5mA

- WIDE POWER SUPPLY RANGE ±1.2 TO ±18V
- CONSTANT AC PERFORMANCE OVER SUPPLY RANGE

APPLICATIONS

- ACTIVE FILTERS
- CURRENT CONTROLLED OSCILLATORS
- VARIABLE ACTIVE FILTERS
- MODULATORS
- BATTERY-POWERED EQUIPMENT

DESCRIPTION

HA-2730/2735 Dual Programmable Amplifiers are internally compensated monolithic devices offering a wide range of performance, that can be controlled by adjusting the circuits' "set" current (I_{SET}). By means of adjusting an external resistor or current source, power dissipation, slew rate, bandwidth, output current and input noise can be programmed to desired levels. Each amplifier on the chip can be adjusted independently. This versatile adjustment capability enables HA-2730/2735 to provide optimum design solutions by delivering the required level of performance with minimum possible power dissipation. HA-2730/2735 can, therefore, be utilized as the standard amplifier for a variety of designs simply by adjusting their programming current.

A major advantage of HA-2730/2735 is that operating characteristics remain virtually constant over a wide supply range (±1.2V to ±15V), allowing the amplifiers to offer maximum performance in almost any system including battery-operated equipement. A primary application for HA-2730/2735 is in active filters for a wide variety of signals that differ in frequency and amplitude. Also, by modulating the "set" current, HA-2730/2735 can be used for designs such as current controlled oscillators, modulators, sample and hold circuits and variable active filters.

HA-2730 is guaranteed over -55°C to +125°C. HA-2735 is specified from 0°C to +75°C. Both parts are available in 14 lead D.I.P. package or dice form.

HARRIS

HA-2740

Quad Programmable Operational Amplifier

FEATURES

- WIDE PROGRAMMING RANGE
  - ▶ SLEW RATE 0.8V/μs
  - ▶ BANDWIDTH 1MHz
  - ▶ BIAS CURRENT 8nA
  - ▶ SUPPLY CURRENT 250μA
- WIDE POWER SUPPLY RANGE
- CONSTANT AC PERFORMANCE OVER SUPPLY RANGE

DESCRIPTION

The Harris HA-2740 programmable amplifier is an internally compensated monolithic device offering a wide range of performance, that can be controlled by adjusting the circuit "set" current (I_{SET}). By means of adjusting an external resistor or current source, power dissipation, slew rate, bandwidth, output current and input noise can be programmed to desired levels. This versatile adjustment capability enables the HA-2740 to provide optimum design solutions by delivering the required level of performance with minimum possible power dissipation. The HA-2740 can, therefore, be utilized as the standard amplifier for a variety of designs simply by adjusting programming current.

A major advantage of the HA-2740 is that operating characteristics remain virtually constant over a wide supply range (±1.2V to ±18V), allowing the amplifier to offer maximum performance in almost any system including battery-operated equipment. A primary application for the HA-2740 is in active filters for a wide variety of signals that differ in frequency and amplitude. Also, by modulating the "set" current, the HA-2740 can be used for designs such as current controlled oscillators, modulators, sample and hold circuits and variable active filters.

The HA-2740-2 is guaranteed over -55°C to +125°C. The HA-2740-5 is specified from 0°C to +75°C. Both parts are available in a 16 pin dual-in-line package.

APPLICATIONS

- ACTIVE FILTERS
- CURRENT CONTROLLED OSCILLATORS
- VARIABLE ACTIVE FILTERS
- MODULATORS
- BATTERY-POWERED EQUIPMENT

HARRIS

HA-4156

High Performance Quad Operational Amplifier

FEATURES

- SLEW RATE 1.6 V/μs (TYP.)
- BANDWIDTH 3.5 MHz (TYP.)
- INPUT VOLTAGE NOISE (f = 1KHz) 9 NV/$\sqrt{Hz}$ (TYP.)
- INPUT OFFSET VOLTAGE 0.5 mV (TYP.)
- INPUT BIAS CURRENT 60 nA (TYP.)
- SUPPLY RANGE ±2V to ±20V
- NO CROSSOVER DISTORTION
- STANDARD QUAD PIN-OUT

DESCRIPTION

The HA-4156 contains four general purpose operational amplifiers on a monolithic chip. The performance of each amplifier is equal to or better than the 741 type amplifier in all respects. Its superior bandwidth, slew rate and noise characteristics make it an excellent choice for active filter or audio amplifier applications.

The HA-4156-5 is guaranteed over 0°C to +75°C.

HARRIS

HA-4600/02/05

High Performance Quad Operational Amplifier

FEATURES

- LOW OFFSET VOLTAGE 0.3mV
- HIGH SLEW RATE ±4V/μs
- WIDE BANDWIDTH 8MHz
- LOW DRIFT 2μV/°C
- FAST SETTLING (0.01%, 10V STEP) 4.2μs
- LOW POWER CONSUMPTION 35mW/AMP
- SUPPLY RANGE ±5V TO ±20V

APPLICATIONS

- HIGH Q, WIDE BAND FILTERS
- INSTRUMENTATION AMPLIFIERS
- AUDIO AMPLIFIERS
- DATA ACQUISITION SYSTEMS
- INTEGRATORS
- ABSOLUTE VALUE CIRCUITS
- TONE DETECTORS

DESCRIPTION

The HA-4600 series are high performance dielectrically isolated monolithic quad operational amplifiers with superior specifications not previously available in a quad amplifier. These amplifiers offer excellent dynamic performance coupled with low values for offset voltage and drift, input noise voltage and power consumption.

A wide range of applications can be achieved by using the features made available by the HA-4600 series. With wide bandwidth (8MHz), low power (35mW/amp), and internal compensation, these devices are ideally suited for precision active filter designs. For audio applications these amplifiers offer low noise (8nV/$\sqrt{Hz}$) and excellent full power bandwidth (60kHz). The HA-4602/4605 is particularly useful in designs requiring low offset voltage (0.3mV) and drift (2μV/°C), such as instrumentation and signal conditioning circuits. The high slew rate (4V/μs) and fast settling time (4.2μs to 0.01%, 10V step) makes these amplifiers useful compoinents in fast, accurate data acquisition systems.

The HA-4600 series are available in 14 pin CERDIP packages which are interchangeable with most other quad op amps. HA-4600/4602-2 is specified from -55°C to +125°C and HA-4600/4605-5 is specified over 0°C to +75°C range.

HA-4620/22/25

Wideband, High Performance Quad Operational Amplifier

FEATURES

- Wide Gain Bandwidth Product 70MHz
- High Slew Rate ±20V/μs
- Low Offset Voltage 0.3mV
- Fast Settling (0.01%, 10V Step) 2.5μs
- Total Harmonic Distortion <.01% to 30kHz
- Low Drift 2μV/°C
- Low Power Consumption 35mW/Amp
- Supply Range ±5V to ±20V

APPLICATIONS

- High Q Wide Band Filters
- Pulse Amplifiers
- Audio Amplifiers
- Data Acquisition Systems
- Absolute Value Circuits
- Video and R.F. Amplifiers

DESCRIPTION

The HA-4620 series are wide band quad operational amplifiers featuring high slew rate, wide bandwidth and fast settling time specifications complemented by low input offset voltage, low drift and input noise voltage.

These dielectrically isolated devices are optimized to offer excellent features suitable for applications where a gain of 10 or greater is to be used. The 35mW/amp and a 70MHz gain-bandwidth-product make these monolithic amplifiers valuable components for many active filter circuits. HA-4620 series offers 0.3mW offset voltages and 2μV/°C offset voltage drift for very accurate signal conditioning designs. In high performance audio applications, these amplifiers deliver 260kHz full power bandwidth and $8nV\sqrt{Hz}$ noise voltage. For fast accurate data acquisition systems HA-4620 series offer 20Vμs slew rate and settling time of 2.5μsecs to 0.1% 10V step.

HA-4620 series are available in 14 pin CERDIP packages and are interchangeable with most other quad op amps. HA-4625 is also available in chip form. HA-4620/4622-2 is specified from -55°C to +125°C and HA-4620/4625-5 is specified over 0°C to +75°C range.

HARRIS

HA-4741

Quad Operational Amplifier

LINEAR

Harris Semiconductor

FEATURES

- SLEW RATE 1.6V/μs (TYP.)
- BANDWIDTH 3.5MHz (TYP.)
- INPUT VOLTAGE NOISE 9nV√Hz (TYP.)
- INPUT OFFSET VOLTAGE 0.5mV (TYP.)
- INPUT BIAS CURRENT 60nA (TYP.)
- SUPPLY RANGE ±2V TO ±20V
- NO CROSSOVER DISTORTION
- STANDARD QUAD PIN-OUT

APPLICATIONS

- UNIVERSAL ACTIVE FILTERS
- D3 COMMUNICATIONS FILTERS
- AUDIO AMPLIFIERS
- BATTERY-POWERED EQUIPMENT

DESCRIPTION

The HA-4741, which contains four amplifiers on a monolithic chip, provides a new measure of performance for general purpose operational amplifiers. Each amplifier in the HA-4741 has operating specifications that equal or exceed those of the 741-type amplifier in all categories of performance.

HA-4741 is well suited to applications requiring accurate signal processing by virtue of its low values of input offset voltage (0.5mV), input bias current (60nA) and input voltage noise (9nV/ √Hz at 1kHz). 3.5MHz bandwidth, coupled with high open-loop gain, allow the HA-4741 to be used in designs requiring amplification of wide band signals, such as audio amplifiers. Audio application is further enhanced by the HA-4741's negligible output crossover distortion. These excellent dynamic characteristics also make the HA-4741 ideal for a wide range of active filter designs. Performance integrity of multi-channel designs is assured by a high level of amplifier-to-amplifier isolation (108dB at 1kHz).

A wide range of supply voltages (±2V to ±20V) can be used to power the HA-4741, making it compatible with almost any system including battery-powered equipment.

The HA-4741 has guaranteed operation over -55°C to +125°C and can be furnished to meet MIL-STD-883 (HA-4741-8). The HA-4741-5 is guaranteed over 0°C to +75°C and is available in ceramic and plastic dual-in-line packages and in dice form.

HARRIS

HA-5062 Series

Low Power JFET Input Dual Operational Amplifiers

Preliminary

FEATURES

- HIGH INPUT IMPEDANCE $10^{12}\Omega$
- LOW INPUT BIAS CURRENT 200pA
- LOW INPUT OFFSET CURRENT 100pA
- VERY LOW POWER CONSUMPTION
  TYPICAL SUPPLY CURRENT 200μA
- INTERNAL FREQUENCY COMPENSATION
- HIGH SLEW RATE 4V/μs
- PIN COMPATIBLE WITH LM1458
- DIRECT REPLACEMENT FOR TL062

APPLICATIONS

- ACTIVE FILTERS
- INSTRUMENTATION AMPLIFIERS
- AUDIO AMPLIFIERS
- BATTERY OPERATED EQUIPMENT
- SIGNAL CONDITIONING

DESCRIPTION

The HARRIS HA-5062 operational amplifiers are a series of dual monolithic JFET-input amplifiers featuring low input bias and offset currents, high input impedence and very low power operation. In addition to being a direct replacement for the TL062 series, the HA-5062 series offers improved performance with a minimum open loop gain 20K V/V and a slew rate of 4v/μs.

This improved performance is a result of the HARRIS FET/Bipolar technology and makes the HA-5062 series of amplifiers ideally suited for applications in industrial control, communication, and battery powered instrumentation equipment.

The HA-5062-2 is characterized for operation over the full military temperature range of -55°C to +125°C. The HA-5062A-5, HA-5062B-5 and HA-5062-5 are all characterized over the commercial temperature range of 0°C to +75°C.

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
2. For supply voltages less than ±15V, the absolute maximum input voltage is equal to the supply voltage.
3. $R_S = 50\Omega$.
4. $R_L \geq 10K\Omega$, $V0 = \pm 10V$.
5. $\Delta V_{IN} = \pm 10V$.
6. $R_L = 10K\Omega$.
7. $R_L = 10K$; Full power bandwidth guaranteed based on slew rate measurement using $FPBW = \frac{\text{SLEW RATE}}{2 \pi V_{PEAK}}$.
8. $V_{IN} = 50mV$, $C_L = 50pF$, $R_L = 10K\Omega$.
9. $V_{IN} = 10V$, $C_L = 50pF$, $R_L = 10K\Omega$.
10. Settling time is measured to 0.1% of final value for a 10 volt output step and $A_V = -1$.
11. No load, No signal.
12. $V_{SUPP} = \pm 5V.D.C.$ to ± 15 V.D.C.

HARRIS

HA-5064 Series

Low Power, JFET Input Quad Operational Amplifiers

JULY 1982

Preliminary

FEATURES

- LOW INPUT BIAS CURRENT 100pA
- LOW POWER DISSIPATION 24mW/Pkg.
- FAST SLEWING 4V/μs
- LOW VIO DRIFT 10μV/^{o}C
- HIGH INPUT IMPEDANCE $10^{12}\Omega$
- GOOD CHANNEL SEPARATION 120dB
- POWER SUPPLY RANGE ±5V TO ±20V

APPLICATIONS

WHERE DENSITY AND POWER REQUIREMENTS ARE DEMANDING:

- ACTIVE FILTERS
- SIGNAL CONDITIONING
- SIGNAL GENERATION
- INSTRUMENTATION AMPLIFIERS

DESCRIPTION

The HARRIS HA-5064 series JFET input monolithic, quad operational amplifiers feature very low power requirements coupled with excellent AC and DC characteristics. Maximum power dissipation of 24 mW/package is achieved by using complementary design, process, and layout techniques.

A 4V/μs slew rate coupled with 1MHz gain-bandwidth makes these devices most suitable for active filter and signal conditioning designs. The HA-5064 series is ideally suited for those applications demanding low power and high density without compromising other performance characteristics. High input impedance and low drift also makes the HA-5064 series useful as instrumentation amplifiers.

The HA-5064 is packaged in a 14-pin DIP and is pin compatible with most other quad operational amplifiers. The HA-5064-2 is specified for -55^{o}C to +125^{o}C operation while the HA-5064 A-5/HA-5064B-5/HA-5064-5 are specified over the 0^{o}C to +75^{o}C range.

HARRIS

HA-5082 Series

JFET Input Dual Operational Amplifiers

Preliminary

FEATURES

- HIGH INPUT IMPEDANCE $10^{12}\Omega$
- LOW INPUT BIAS CURRENT 200pA
- LOW INPUT OFFSET CURRENT 100pA
- LOW POWER CONSUMPTION TYPICAL SUPPLY CURRENT 3.5mA
- HIGH SLEW RATE 15V/μs
- PIN COMPATIBLE WITH LM1458
- DIRECT REPLACEMENT FOR TL082

APPLICATIONS

- ACTIVE FILTERS
- INSTRUMENTATION AMPLIFIERS
- AUDIO AMPLIFIERS
- SIGNAL CONDITIONING

DESCRIPTION

The HARRIS HA-5082 operational amplifiers are a series of dual monolithic JFET-input amplifiers featuring low input bias and offset currents, high input impedance and, high slew rate. In addition to being a direct replacement for the TL082 series, the HA-5082 series offers improved performance with an input offset voltage of 2mV, a slew rate of 15V/μs, and bandwidths of 4MHz.

This improved performance is a result of the HARRIS FET/Bipolar technology and makes the HA-5082 series of amplifiers ideally suited for applications in industrial control, communication, and computer peripheral equipment.

The HA-5082-2 is characterized for operation over the full military temperature range of -55°C to +125°C. The HA-5082A-5, HA-5082B-5 and HA-5082-5 are all characterized over the commercial temperature range of 0°C to +75°C.

HARRIS

HA-5084 Series

JFET Input Quad Operational Amplifiers

Preliminary

FEATURES

- LOW INPUT BIAS CURRENT 200pA
- HIGH SLEW RATE 15V/μs
- WIDE BANDWIDTH 4MHz
- LOW DRIFT 10μV/°C
- HIGH INPUT IMPEDANCE $10^{12}\Omega$
- LOW SUPPLY CURRENT 7.2mA
- SUPPLY RANGE ±5V TO ±20V

APPLICATIONS

- HIGH Q, WIDEBAND FILTERS
- INTEGRATORS
- TONE DETECTORS
- SAMPLE/HOLD CIRCUITS
- DATA ACQUISITION SYSTEMS
- ABSOLUTE VALUE CIRCUITS

DESCRIPTION

The Harris HA-5084 is a JFET input, monolithic, quad operational amplifier featuring low input bias and offset currents, high input impedance, and high slew rate. Manufactured using FET/Bipolar technology coupled with advanced layout considerations, these devices also feature excellent channel separation and offset voltage drift specifications.

High slew rate (15V/ μs) coupled with excellent input bias (30pA) and offset current (3pA) make the HA-5084 ideally suited for high speed analog designs such as integrators, fast D/A converters, and sample-and-hold circuits.

The HA-5084 is available in ceramic and plastic 14 pin DIP's and is pin compatible with the LM324, LM348, and MC3403 quad operational amplifier pinout.

The HA-5084-2 is specified from -55°C to +125°C while the HA-5084-5 operates from 0°C to +75°C.

HARRIS

HA-5100/5105

Wideband, JFET Input Operational Amplifier

FEATURES

- LOW INPUT OFFSET VOLTAGE 0.5mV
- LOW OFFSET DRIFT . . . . $5\mu V/^oC$
- LOW INPUT BIAS CURRENT 50pA
- LARGE VOLTAGE GAIN . . . . 150K V/V
- WIDE BANDWIDTH 18MHz
- HIGH SLEW RATE . . . . $8V/\mu sec$
- FAST LARGE SIGNAL SETTLING TIME: $1.7\mu sec$

APPLICATIONS

- PRECISION, HIGH SPEED, DATA ACQUISITION SYSTEMS
- PRECISION SIGNAL GENERATION
- PULSE AMPLIFICATION

GENERAL DESCRIPTION

The HA-5100/5105 are monolithic wideband operational amplifiers manufactured with FET/Bipolar technologies and dielectric isolation. Precision laser trimming of the input stage complements the amplifier high frequency capabilities with excellent input characteristics.

The HA-5100/5105 offer a number of important advantages over similar FET input op amps from other manufacturers. In addition to superior bandwidth and settling characteristics the Harris devices have quite constant slew rate, bandwidth, and settling characteristics over the operating range. This provides the user predictable performance in applications where settling time, full power bandwidth, closed loop bandwidth, or phase shift is critical. The slewing waveform is symmetrical to provide reduced distortion. Note also that Harris specifies all parameters at ambient (rather than junction) temperature to provide the designer meaningful data to predict actual operating performance.

Complementing HA-5100/5105's predictable and excellent dynamic characteristics are very low input offset voltage, very low input bias current, and extremely high input impedance. This ideal combination of features make these amplifiers most suitable for precision, high speed, data acquisition system designs and for a wide variety of signal conditioning applications.*

* -2 denotes a range of -55^oC to $+125^oC$ and -5 denotes a 0^oC to $+75^oC$ range.

HARRIS

HA-5110/5115

Wideband, JFET Input, Uncompensated, Operational Amplifier

FEATURES

- WIDE GAIN BANDWIDTH 60MHz
- HIGH SLEW RATE 50V/μs
- SETTLING TIME 850ns
- POWER BANDWIDTH 800KHz
- OFFSET VOLTAGE 0.5mV
- BIAS CURRENT 50pA

APPLICATIONS

- VIDEO AND RF AMPLIFIERS
- DATA ACQUISITION
- PULSE AMPLIFIERS
- PRECISION SIGNAL GENERATION

DESCRIPTION

HA-5110/5115 are wideband, uncompensated, operational amplifiers manufactured with FET/Bipolar technologies and dielectric isolation. These monolithic amplifiers feature superior high frequency capabilities further enhanced by precision laser trimming of the input stage to provide excellent input characteristics. These devices are controlled at closed loop gains greater than 10 without compensation.

With excellent dynamic and input characteristics, HA-5110/5115 are well suited for many wideband, pulse, and video applications. These amplifiers are ideal components for video and RF circuitry requiring up to 60MHz gain-bandwidth-product and 800KHz power bandwidth. 50V/μs slew rate and 850ns settling time make these devices useful in pulse amplification and data acquisition designs. HA-5110/5115's 0.5mV offset voltage, 10pA offset current, and extremely high impedance coupled with excellent AC parameters make these amplifiers ideal selections for accurate signal conditioning designs. For applications requiring less critical input characteristics, HA-5115 is available in untrimmed form.

HA-5110/5115 are available in metal can (TO-99) packages. Suffix -2 denotes a range to -55°C to +125°C and -5 denotes a 0°C to +75°C range.

HARRIS

HA-5130/5135

Precision Operational Amplifier

FEATURES

- LOW OFFSET VOLTAGE 25μV
- LOW OFFSET VOLTAGE DRIFT 0.4μV/°C
- LOW NOISE 9nV/$\sqrt{Hz}$
- OPEN LOOP GAIN 10^7
- BANDWIDTH (UNITY GAIN) 2.5MHz
- ALL BIPOLAR CONSTRUCTION

APPLICATIONS

- HIGH GAIN INSTRUMENTATION
- PRECISION DATA ACQUISITION
- PRECISION INTEGRATORS
- BIOMEDICAL AMPLIFIERS
- PRECISION THRESHOLD DETECTORS

DESCRIPTION

HA-5130/5135 are precision operational amplifiers manufactured using a combination of key technological advancements to provide outstanding input characteristics.

A Super Beta input stage is combined with laser trimming, dielectric isolation, and matching techniques to produce 25μV (Max.) input offset voltage and 0.4 μV/°C input offset voltage average drift. Other features enhanced by this process include 9nV (Typ.) Input Noise Voltage, 1nA Input Bias Current, and 140dB Open Loop Gain.

These features coupled with 120dB CMRR and PSRR make HA-5130/5135 an ideal device for precision DC instrumentation amplifiers. Excellent input characteristics in conjunction with 2.5MHz bandwidth and 0.8V/μs slew rate, makes this amplifier extremely useful for precision integrator and biomedical amplifier designs. These amplifiers are also well suited for precision data acquisition and for accurate threshold detector applications.

HA-5130/35 is packaged in an 8 pin (TO-99) can and an 8 lead Cerdip and is pin compatible with many existing op amp configurations.

HA-5130/5135-2 is specified for -55°C to +125°C operation while HA-5130/5135-5 operate from 0°C to +75°C.

NOTES:

1. Absolute maximum ratings are limiting values, applied individually beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
2. Derate at 6.8mW/°C for operation at ambient temp.'s above +75°C.
3. Not tested. 90% of units meet or exceed these specifications.
4. V_{OUT} = ± 10V; R_L = 2k. Gain dB = 20 $\log_{10}$ Average
   ∴ 120dB = 1000V/mV
   140dB = 10,000V/mV
5. V_{CM} = ± 10V DC
6. R_L = 600Ω
7. R_L = 2k; Full power bandwidth guaranteed based on slew rate measurement using $FPBW = \frac{SLEW\ RATE}{2\pi V_{PEAK}}$
8. V_{OUT} = 10V
9. Output resistance measured under open loop conditions (f = 100Hz)
10. Refer to test circuits section of the data sheet.
11. Settling time is measured to 0.1% of final value for a 10V output step and A_V = -1.
12. V_{SUPP} = ± 5V DC to ± 20V DC.

HARRIS

HA-5141/42/44

ADVANCE

Ultra-Low Power Operational Amplifier

FEATURES

- LOW SUPPLY CURRENT 60μA
- WIDE OPERATING VOLTAGE RANGE 2V to 30V
- SINGLE SUPPLY OPERATION
- HIGH SLEW RATE 1.5V/μs
- HIGH GAIN 100K V/V
- AVAILABLE IN SINGLES, DUALS AND QUADS

APPLICATIONS

- PORTABLE INSTRUMENTS
- METER AMPLIFIERS
- TELEPHONE HEADSETS
- MICROPHONE AMPLIFIERS
- INSTRUMENTATION

DESCRIPTION

The HA-5141/42/44 ultra-low power operational amplifiers provide AC and DC performance characteristics similar to or better than most general purpose amplifiers while only drawing 1/30 of the supply current of most general purpose amplifiers. These amplifiers are well suited to applications which require low power dissipation and good electrical characteristics.

The HA-5141/42/44 provides accurate signal processing by virtue of its low input offset voltage (0.5mV), low input bias current (50nA), high open loop gain (100KV/V) and low noise, for low power operational amplifiers (20nV/$\sqrt{Hz}$). These characteristics coupled with 1.5V/μs slew rate and 400KHz bandwidth make the HA-5141/42/44 ideal for use in low power instrumentation, audio amplifier and active filter designs. The wide range of supply voltages (2V to 30V) also allow these amplifiers to be very useful in low voltage battery powered equipment.

These amplifiers are available in singles (HA-5141, can or minidip), duals (HA-5142, can or minidip) or quads (HA-5144, 14 pin dip) with industry standard pinouts which allow the HA-5141/42/44's to be interchangeable with most other operational amplifiers.

HARRIS

HA-5160/5162

Wideband, JFET Input, High Slew Rate, Uncompensated, Operational Amplifier

FEATURES

- WIDE GAIN BANDWIDTH 100MHz
- HIGH SLEW RATE 120V/μs
- SETTLING TIME (0.2%) 280ns
- POWER BANDWIDTH 1000kHz
- OFFSET VOLTAGE 1.0mV
- BIAS CURRENT 20pA

APPLICATIONS

- VIDEO AND RF AMPLIFIERS
- DATA ACQUISITION
- PULSE AMPLIFIERS
- PRECISION SIGNAL GENERATION

DESCRIPTION

The HA-5160/5162 is a wideband, uncompensated, operational amplifier manufactured with FET/Bipolar technologies and dielectric isolation. This monolithic amplifier features superior high frequency capabilities further enhanced by precision laser trimming of the input stage to provide excelent input characteristics. This device has excellent phase margin at a closed loop gain of 10 without external compensation.

The HA-5160/5162 offers a number of important advantages over similar FET input op amps from other manufacturers. In addition to superior bandwidth and settling characteristics, the HARRIS devices have nearly constant slew rate, bandwidth, and settling characteristics over the operating temperature range. This provides the user predictable performance in applications where settling time, full power bandwidth, closed loop bandwidth, or phase shift is critical. Note also that HARRIS specified all parameters at ambient (rather than junction) temperature to provide the designer meaningful data to predict actual operating performance.

Complementing the HA-5160/5162's predictable and excellent dynamic characteristics are very low input offset voltage, very low input bias current, and extremely high input impedance. This ideal combination of features make these amplifiers most suitable for precision, high speed, data acquisition system designs and for a wide variety of signal conditioning applications.* The HA-5160 provides excellent performance for applications which require both precision and high speed performance. The HA-5162 meets or exceeds the performance specifications of National's hybrid op amp, the LH0062.

* -2 denotes a range of -55°C to +125°C and -5 denotes a 0°C to +75°C range.

HARRIS

HA-5170

Precision JFET Input Operational Amplifier

FEATURES

- LOW OFFSET VOLTAGE 100μV
- LOW OFFSET VOLTAGE DRIFT 2μV/°C
- LOW NOISE 10nV/$\sqrt{Hz}$
- HIGH OPEN LOOP GAIN 600K V/V
- WIDE BANDWIDTH 5MHz

APPLICATIONS

- HIGH GAIN INSTRUMENTATION AMPLIFIERS
- PRECISION DATA ACQUISITION
- PRECISION INTEGRATORS
- PRECISION THRESHOLD DETECTORS

DESCRIPTION

The Harris HA-5170 is a precision, JFET input, operational amplifier which features low noise, low offset voltage and low offset voltage drift. Constructed using FET/Bipolar technology, the Harris Dielectric Isolation (DI) process, and laser trimming this amplifier offers low input bias and offset currents. This operational amplifier design also completely eliminates the troublesome errors due to warm-up drift.

Complementing these excellent input characteristics are dynamic performance characteristics never before available from precision operational amplifiers. An 8V/μ s slew rate and 5MHz bandwidth allow the designer to extend precision instrumentation applications in both speed and bandwidth. These characteristics make the HA-5170 well suited for precision integrator amplifier designs.

The superior input characteristics also make the HA-5170 ideally suited for transducer signal amplifiers, precision voltage followers and precision data acquisition systems.

Packaged in an 8-pin (TO-99) can or an 8 lead Minidip, the HA-5170 is pin compatible with most existing op amp configurations.

HARRIS

HA-5180/5180A

Low Bias Current, Low Power JFET Input Operational Amplifier

APRIL 1982 **Preliminary**

FEATURES

- ULTRA LOW BIAS CURRENT 250fA
- LOW POWER SUPPLY CURRENT 0.8mA
- LOW OFFSET VOLTAGE 0.5mV (max.)
- BANDWIDTH 2 MHz
- SLEW RATE 7V/μs

APPLICATIONS

- ELECTROMETER AMPLIFIER DESIGNS
- PHOTO CURRENT DETECTORS
- PRECISION LONG-TERM INTEGRATORS
- LOW DRIFT SAMPLE & HOLD CIRCUITS
- VERY HIGH IMPEDANCE BUFFERS
- HIGH IMPEDANCE BIOLOGICAL MICRO PROBES

DESCRIPTION

The HARRIS HA-5180/5180A is an ultra low input bias current, JFET input, monolithic operational amplifier which also features low power, low offset voltage and excellent AC characteristics. Employing FET/Bipolar construction coupled with dielectric isolation this operational amplifier offers the lowest input bias currents (250fA typ.) available in any monolithic operational amplifier. The HA-5180/5180A has another unique feature in which the offset bias current may be nulled by externally adjusting the offset voltage. For applications which require precision performance the HA-5180A offers an input offset voltage of 0.5 mV (max) while the HA-5180 offers 3 mV (max.)

The HA-5180/5180A also offers excellent AC performance not previously available in similar hybrid or monolithic op amp designs. The 2 MHz bandwidth and 7V/μs slew rate of the HA-5180/5180A extends the bandwidth and speed for applications such as very low drift sample and hold amplifiers and photo-current detectors. Other applications include use in electrometer designs, pH/Ion sensitive electrodes, low current oxygen sensors, long term precision integrators and very high impedance buffer measurement designs.

The HA-5180/5180A is packaged in an 8-pin (TO-99) can and an 8-lead cerdip and is pin compatible with most existing op amp configurations. The case of the TO-99 package is internally connected to pin 8 so that it may be connected to the same potential as the input. This feature helps minimize stray leakage to the case, helps shield the amplifier from external noise and reduces common mode input capacitance.

NOTES:

1. Absolute maximum ratings are limiting values, applied individually beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
2. Deraie at 6.9 mW/°C for operation at ambient temperatures above +75°C.
3. This parameter is guaranteed by design and is not 100% tested.
4. $V_{OUT} = \pm 10V$; $R_L = 2k$. Gain dB = 20 $\log_{10}$Av.
5. $V_{CM} = \pm 10V$ D.C.
6. R_l = 2k
7. R_L = 2k; Full power bandwidth guaranteed based on slew rate measurement using $FPBW = \frac{SLEW\ RATE}{2\pi V_{PEAK}}$
8. $V_{OUT} = \pm 10V$.
9. Output resistance measured under open loop conditions (f = 100Hz)
10. Settling time is measured to 0.1% of final value for a 10V output step and $A_V = -1$.
11. V_{SUPP} = + 5V D.C. to ±20V D.C.

HARRIS

HA-5190/5195

Wideband, Fast Settling Operational Amplifier

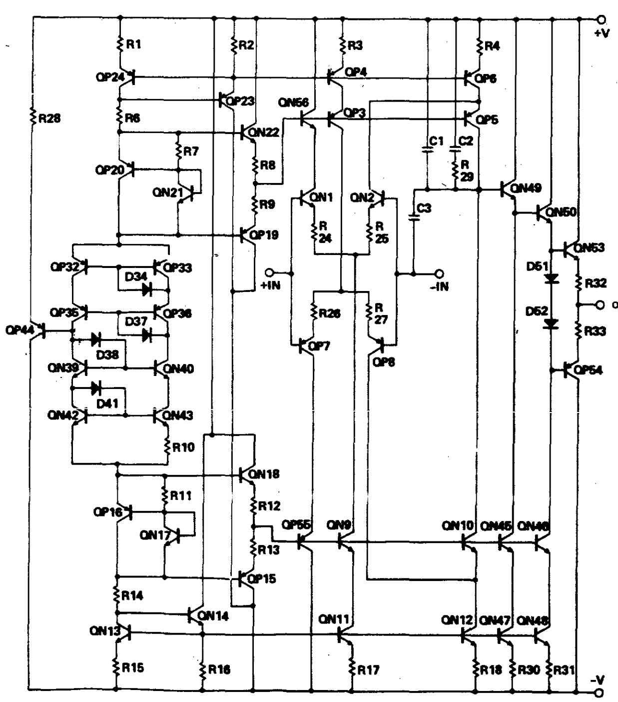
FEATURES

- FAST SETTLING TIME 70ns
- VERY HIGH SLEW RATE 200V/μs
- WIDE GAIN-BANDWIDTH 150MHz
- POWER BANDWIDTH 6.5MHz
- LOW OFFSET VOLTAGE 5mV
- INPUT VOLTAGE NOISE 15nV/$\sqrt{Hz}$
- MONOLITHIC BIPOLAR CONSTRUCTION

APPLICATIONS

- FAST, PRECISE D/A CONVERTERS
- HIGH SPEED SAMPLE-HOLD CIRCUITS
- PULSE AND VIDEO AMPLIFIERS
- WIDEBAND AMPLIFIERS
- REPLACE COSTLY HYBRIDS

SCHEMATIC



GENERAL DESCRIPTION

HA-5190/5195 are monolithic operational amplifiers featuring an ultimate combination of speed, precision, and bandwidth. Employing monolithic bipolar construction coupled with dielectric isolation, these devices are capable of delivering an unparalleled 200V/μs slew rate with a settling time of 70ns (0.1%, 5V output step). These truly differential amplifiers are designed to operate at gains $\geq$5 without the need for external compensation. Other outstanding HA-5190/5195 features are 150MHz gain-bandwidth-product and 6.5MHz full power bandwidth. In addition to these dynamic characteristics, these amplifiers also have excellent input characteristics such as 5mV offset voltage and 15nV input voltage noise (at 1kHz).

With 200V/μs slew rate and 70ns settling time, these devices make ideal output amplifiers for accurate, high speed D/A converters or the main components in high speed sample/hold circuits. 150MHz gain-bandwidth-product, 6.5MHz power bandwidth, and 5mV offset voltage make HA-5190/5195 ideally suited for a variety of pulse and wideband video amplifier applications.

At temperatures above +75°C, a heat sink is required for HA-5190. (See note 2). HA-5190 is specified over the -55°C to +125°C range while HA-5195 is specified from 0°C to +75°C.

HA-4900/02/05

Precision Quad Comparator

FEATURES

- FAST RESPONSE TIME 130ns
- LOW OFFSET VOLTAGE 2.0mV
- LOW OFFSET CURRENT 10nA
- SINGLE OR DUAL-VOLTAGE SUPPLY OPERATION
- SELECTABLE OUTPUT LOGIC LEVELS
- ACTIVE PULL-UP/PULL-DOWN OUTPUT CIRCUIT - NO EXTERNAL RESISTORS REQUIRED

APPLICATIONS

- THRESHOLD DETECTOR
- ZERO-CROSSING DETECTOR
- WINDOW DETECTOR
- ANALOG INTERFACES FOR MICROPROCESSORS
- HIGH STABILITY OSCILLATORS
- LOGIC SYSTEM INTERFACES

DESCRIPTION

The HA-4900 series are monolithic, quad, precision comparators offering fast response time, low offset voltage, low offset current, and virtually no channel-to-channel crosstalk for applications requiring accurate, high speed, signal level detection. These comparators can sense signals at ground level while being operated from either a single +5 volt supply (digital systems) or from dual supplies (analog networks) up to ±15 volts. The HA-4900 series contains a unique current driven output stage which can be connected to logic system supplies ($V_{Logic}+$ and $V_{Logic}-$) to make the output levels directly compatible (no external components needed) with any standard logic or special system logic levels. In combination analog/digital systems, the design employed in the HA-4900 series input and output stages prevents troublesome ground coupling of signals between analog and digital portions of the system.

These comparators' combination of features makes them ideal components for signal detection and processing in data acquisition systems, test equipment, and microprocessor/analog signal interface networks.

All devices are available in 16 pin dual-in-line ceramic packages. The HA-4900/4902-2 operates from -55°C to +125°C and the HA-4905-5 operates over a 0°C to +75°C temperature range.

HARRIS

HA-5102/04/12/14

Low Noise High Performance Operational Amplifiers

Preliminary

FEATURES

- LOW NOISE — 4.3 nV/√Hz
- WIDE BANDWIDTH — 8MHz (COMP.), 60MHz (UNCOMP.)
- HIGH SLEW RATE — 3V/μs (COMP.), 20V/μs (UNCOMP.)
- LOW OFFSET VOLTAGE — 2mV
- SINGLE SUPPLY OPERATION
- AVAILABLE IN DUALS OR QUADS

APPLICATIONS

- HIGH Q, ACTIVE FILTERS
- AUDIO AMPLIFIERS
- INSTRUMENTATION AMPLIFIERS
- INTEGRATORS
- SIGNAL GENERATORS

DESCRIPTION

Low noise and high performance are key words describing HA-5102/04/12/14. These general purpose amplifiers offer an array of dynamic specifications ranging from 3V/μs slew rate and 8MHz bandwidth (5102/04) to 20V/μs slew rate and 60MHz gain-bandwidth-product (HA-5112/14). Complementing these outstanding parameters is a very low noise specification of 4.3 nV/√Hz at 1KHz.

Fabricated using the Harris standard high frequency process, these operational amplifiers also offer excellent input specifications such as 2.0mV offset voltage and 30nA offset current. Complementing these specifications are 108dB open loop gain and 108dB channel separation. Consuming a very modest amount of power (90mW/package for duals and 150mW/package for quads), HA-5102/04/12/14 also provide the flexibility of operating from a single +5V supply.

This impressive combination of features make this series of amplifiers ideally suited for designs ranging from audio amplifiers and active filters to the most demanding signal conditioning and instrumentation circuits.

These operational amplifiers are available in dual or quad form with industry standard pinouts allowing for immediate interchangeability with most other dual and quad operational amplifiers.

HARRIS

HA-5033

Preliminary

Video Buffer

FEATURES

- DIFFERENTIAL PHASE ERROR .1°
- DIFFERENTIAL GAIN ERROR .1%
- HIGH SLEW RATE 1000V/μs
- WIDE POWER BANDWIDTH DC TO 80MHz
- FAST RISE TIME 3ns
- WIDE POWER SUPPLY RANGE ±5 to ±16V

APPLICATIONS

- VIDEO BUFFER
- HIGH FREQUENCY BUFFER
- OP AMP ISOLATION BUFFER
- HIGH SPEED LINE DRIVER
- IMPEDANCE MATCHING

DESCRIPTION

The HA-5033 is a high performance voltage follower designed for use in high frequency applications requiring a high speed wideband buffer. Specifically designed for driving coaxial cable and featuring a bandwidth of 250MHz and outstanding differential gain and phase characteristics, the HA-5033 is an excellent device for the line driver and buffer applications common to video circuit design. In addition, the HA-5033 offers a minimum slew rate of 1000V/μs.

This device is fabricated using the HARRIS dielectric isolation process. Reduced parasitic capacitance and leakage currents along with improved high frequency PNP transistor performance are among the benefits derived from the superior electrical isolation of the D.I. process.

Available in a 12 pin (TO-8) metal can or an 8 pin epoxy mini-dip, the HA-5033-2 is specified over the military temperature range of -55°C to +125°C. The HA-5033-5 is characterized over the commerical temperature range of 0°C to +75°C.

HA-23080

Operational Transconductance Amplifier

Preliminary

FEATURES

- LOW OFFSET VOLTAGE 0.3mV
- HIGH SLEW RATE 50V/μs
- ADJUSTABLE/GATEABLE GAIN
- LOW OFFSET CURRENT 120nA
- ADJUSTABLE POWER CONSUMPTION

APPLICATIONS

- USE AS BUILDING BLOCKS FOR:
- MULTIPLEXERS
- SAMPLE AND HOLD CIRCUITS
- COMPARATORS
- VOLTAGE FOLLOWERS

DESCRIPTION

HA-23080 is an operational transconductance amplifier offering an unique blend of DC and AC electrical characteristics coupled with a bias input control for additional versatility. Fabricated using Harris Semiconductor's standard dielectric isolation process, these gateable-gain blocks provide input characteristics such as 0.3mV offset voltage, 120nA offset current and 150μV/V offset voltage sensitivity. Combined with these input characteristics are outstanding dynamic specifications including 50V/μs slew rate and 2MHz bandwidth.

Using these features plus the flexibility afforded by the amplifier bias input, HA-23080 may be easily employed as the main component in multiplexer, comparator, multiplier, and sample/hold designs. This OTA is also useful as a fast voltage follower.

Using the popular operational amplifier pinout, HA-23080 comes available in 8 pin (TO-99) cans and 8 pin cerdips. Its specified temperature range is 0°C to +75°C for -5 and -55°C to +125°C for -2.

NOTES:

1. Absolute maximum ratings are limiting values applied individually beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
2. I_{ABC} (Amplifier Bias Current) The current supplied to the amplifier bias terminal (Pin 5) to establish its operating point.
3. f = 1MHz
4. $R_L = \infty$
5. $R_L = 0$
6. $V_S = \pm 8.5V$, $I_{ABC} = 500nA$, Bandwidth = 1kHz, $R_{SOURCE} = 100k\Omega$, Test Time = 30 sec.

LINEAR

Harris Semiconductor

HARRIS

HC-5502

SLIC-LC Subscriber Line Interface Circuit

FEATURES

- MONOLITHIC INTEGRATED DEVICE
- UNIQUE DI HIGH VOLTAGE PROCESS
- COMPATIBLE WITH WORLDWIDE PABX PERFORMANCE REQUIREMENTS
- CONTROLLED SUPPLY OF BATTERY FEED CURRENT FOR SHORT LOOPS
- INTERNAL RING RELAY DRIVER
- LOW POWER CONSUMPTION DURING STANDBY
- SWITCH HOOK, GROUND KEY AND RING TRIP DETECTION FUNCTIONS
- SELECTIVE DENIAL OF POWER TO SUBSCRIBER LOOPS

APPLICATIONS

- SOLID STATE LINE INTERFACE CIRCUIT FOR ANALOG AND DIGITAL PBX SYSTEMS

DESCRIPTION

The HARRIS SLIC-LC incorporates many of the BORSHT functions on a single IC chip. This includes DC battery feed, a ring relay driver, supervisory and hybrid functions. Using the unique HARRIS dielectric isolation process, the SLIC-LC can operate directly with a wide range of station battery voltagees.

The SLIC-LC also provides selective denial of power. If the PABX system becomes overloaded during an emergency, the SLIC-LC will provide system protection by denying power to selected subscriber loops.

The HARRIS SLIC-LC is ideally suited in the design of new digital PABX systems, by eliminating bulky, expensive hybrid transformers.

SLIC-LC is available in either a 24 pin dual-in-line plastic or ceramic package.

HC-5512/5512A

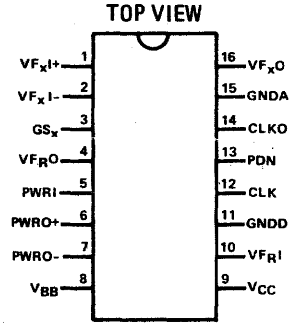
PCM Monolithic Filter

FEATURES

- EXCEEDS ALL D3/D4 AND CCITT SPECIFICATIONS
- +5V, -5V POWER SUPPLIES
- LOW POWER CONSUMPTION:
  45mW (600Ω 0dBm LOAD)
  30mW (POWER AMPS DISABLED)
- POWER DOWN MODE: 0.5mW
- 20dB GAIN ADJUST RANGE
- NO EXTERNAL ANTI-ALIASING COMPONENTS
- SIN x/x CORRECTION IN RECEIVE FILTER
- 50/60Hz REJECTION IN TRANSMIT FILTER
- TTL AND CMOS COMPATIBLE LOGIC
- ALL INPUT PROTECTED AGAINST STATIC DISCHARGE DUE TO HANDLING

PINOUT

DUAL-IN-LINE PACKAGE
TOP VIEW



DESCRIPTION

The HC-5512/HC-5512A filter is a monolithic circuit containing both transmit and receive filters specifically designed for PCM CODEC filtering applications in 8kHz sampled systems.

The filter is manufactured using double-poly silicon gate CMOS technology. Switched capacitor integrators are used to simulate classical LC ladder filters which exhibit low component sensitivity.

TRANSMIT FILTER STAGE

The transmit filter is a fifth order elliptic low pass filter in series with a fourth order Chebyshev high pass filter. It provides a flat response in the passband and rejection of signals below 200Hz and above 3.4kHz.

RECEIVE FILTER STAGE

The receive filter is a fifth order elliptic low pass filter designed to reconstruct the voice signal from the decoded/demultiplexed signal which, as a result of the sampling process, is a stair-step signal having the inherent sin x/x frequency response. The receive filter approximates the function required to compensate for the degraded frequency response and restore the flat passband response.

HARRIS

HC-55564

All-Digital Continuously Variable Slope Delta Modulator (CVSD)

Preliminary

FEATURES

- REQUIRES FEW EXTERNAL PARTS
- LOW POWER DRAIN: 6mW FROM SINGLE 4.5V-7V SUPPLY
- TIME CONSTANTS DETERMINED BY CLOCK FREQUENCY; NO CALIBRATION OR DRIFT PROBLEMS; AUTOMATIC OFFSET ADJUSTMENT
- HALF DUPLEX OPERATION UNDER DIGITAL CONTROL
- FILTER RESET UNDER DIGITAL CONTROL
- AUTOMATIC OVERLOAD RECOVERY
- AUTOMATIC "QUIET" PATTERN GENERATION
- AGC CONTROL SIGNAL AVAILABLE

APPLICATIONS

- VOICE TRANSMISSION OVER DATA CHANNELS
- VOICE ENCRYPTION/SCRAMBLING
- VOICE I/O FOR DIGITAL SYSTEMS AND SPEECH SYNTHESIS
- AUDIO MANIPULATIONS: DELAY LINES, TIME COMPRESSION, ECHO GENERATION/SUPPRESSION, SPECIAL EFFECTS, ETC.

DESCRIPTION

The HC-55564 is a half duplex modulator/demodulator CMOS integrated circuit used to convert voice signals into serial NRZ digital data, and to reconvert that data into voice. The conversion is by delta modulation, using the continuously variable slope (CVSD) method of companding.

While the signals are compatible with other CVSD circuits, the internal design is unique. The analog loop filters have been replaced by digital filters, using very low power, and requiring no external timing components. This approach allows inclusion of many desirable features which would be difficult to implement using other approaches.

The HC-55564 is usable from 9K bits/sec to above 64K bits/sec. The unit is available in a 14 pin ceramic or plastic DIP package in commercial and military temperature ranges including MIL-STD 883-B processing.

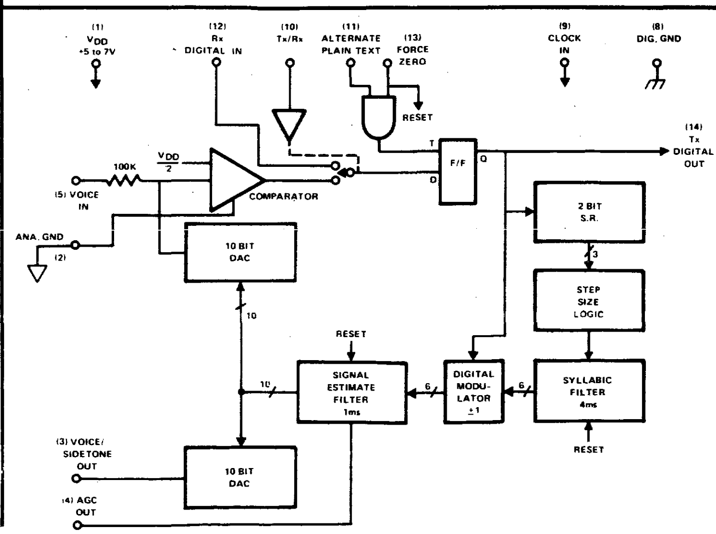
FUNCTIONAL DIAGRAM



HARRIS

HC-55536

All-Digital Continuously Variable Slope Delta Demodulator (CVSD)

FEATURES

- REQUIRES FEWER EXTERNAL PARTS
- LOW POWER DRAIN: 6mW FROM SINGLE 5V-7V SUPPLY
- TIME CONSTANTS DETERMINED BY CLOCK FREQUENCY; NO CALIBRATION OR DRIFT PROBLEMS; AUTOMATIC OFFSET ADJUSTMENT
- FILTER RESET BY DIGITAL CONTROL
- AUTOMATIC OVERLOAD RECOVERY
- AUTOMATIC "QUIET" PATTERN GENERATION

APPLICATIONS

- SPEECH SYNTHESIS
- AUDIO MANIPULATIONS; DELAY LINES, ECHO GENERATION/SUPPRESSION, SPECIAL EFFECTS, ETC.

DESCRIPTION

The HC-55536 is a CMOS integrated circuit used to convert serial NRZ digital data to an analog (voice) signal. Conversion is by delta demodulation, using the continuously variable slope (CVSD) method.

While signals are compatible with other CVSD circuits, the internal design is unique. The analog loop filters have been replaced by digital filters which use very low power and require no external timing components. This digital approach allows inclusion of many desirable features, which otherwise would be difficult to implement. Internal time constants are optimized for a 16K bit/sec data rate. However, the device is usable from 9K bits/sec to above 64K bits/sec.

The package is a 14 pin DIP, available in plastic (0°C to +70°C) or ceramic (-40°C to +85°C). Chips are available, probe tested at +25°C.

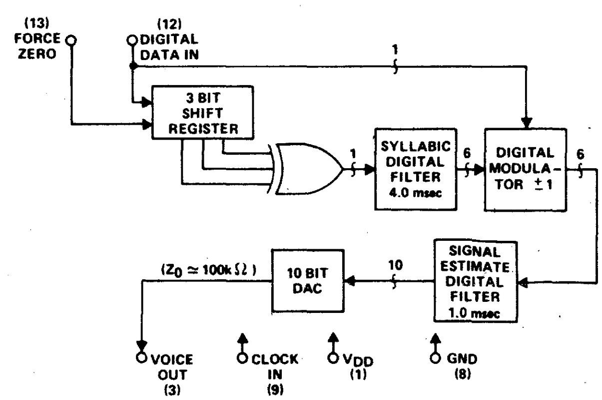
FUNCTIONAL DIAGRAM



HARRIS

HV-1000/1000A

Induction Motor Energy Saver

FEATURES

- OPERATES DIRECTLY OFF 120V/240V AC LINE – NO POWER SUPPLY REQUIRED
- 50Hz OR 60Hz OPERATION
- PRODUCES POWER SAVINGS FROM 10% TO 50% FOR MOTORS WITH LIGHT OR VARIABLE LOADS
- SCR OUTPUT STAGE TRIGGERS TRIAC DIRECTLY
- LOAD ANTICIPATOR SENSES SHOCK LOADS AND RESPONDS INSTANTLY WITH FULL POWER
- WITHSTANDS LINE SURGES TO 3500V
- CAUSES MOTOR TO RUN QUIETER, COOLER
- CAN BE MOUNTED INSIDE MOTOR
- NEEDS ONLY 3 RESISTORS, 3 CAPACITORS AND A TRIAC TO ASSEMBLE COMPLETE CONTROLLER

DESCRIPTION

The HV-1000 and HV-1000A are energy saving induction motor control circuits designed to reduce the power consumed by single phase induction motors. HV-1000 is for 120V AC use and HV-1000A for 240V AC use.

The controller circuit senses the load on the motor and then controls a TRIAC to apply reduced voltage to lightly loaded motors, full voltage to heavily loaded motors.

The HV-1000/1000A are available in a 16 lead plastic DIP. Ideal for mounting inside induction motors, they can also be mounted in a heat sunk circuit box for external, after market application.

APPLICATIONS

- MACHINE TOOLS
- INDUSTRIAL SEWING MACHINES
- HEAT PUMPS
- PRESSES
- CONVEYORS
- DISC PACK DRIVES
  - ► ANY APPLICATION WHERE FOR SOME OF THE TIME THE MOTOR IS DRIVING LESS THAN ITS RATED LOAD

Precision Voltage References

Type	Description	
ICL8069	Low Voltage Reference	The ICL8069 is a 1.2V temperature compensated voltage reference. It uses the band-gap principle to achieve excellent stability and low noise at reverse currents down to 50μA.
ICL8075-9	Ultra Precision Temperature Stabilized Voltage References	The ICL8075-9 is a family of precision laser-trimmed voltage references that incorporate a substrate heater to produce extremely low overall voltage temperature coefficients. The series of devices is produced so that exact voltages are available for the most popular A/D and D/A converters. This avoids the necessity to perform adjustments in most cases, and reduces the problems with trim range and temperature coefficient loss in all others.

CMOS Power Supply Circuits

Type	Description	
ICL7660	Voltage Converter	The ICL7660 performs the complete supply voltage conversion from positive to negative for an input range of +1.5V to +10.0V, resulting in complementary output voltages of −1.5V to −10.0V.
ICL7663 ICL7664	Positive Regulator Negative Regulator	The ICL7663 (positive) and ICL7664 (negative) series regulators are low-power, high-efficiency devices which accept inputs from 1.6V to 16V and provide adjustable outputs over the same range at currents up to 40mA. Operating current is typically less than 40μA, regardless of load.
ICL7665	Programmable Micropower Voltage Detector	The ICL7665 contains two individually programmable voltage detectors on a single chip. Requiring only ~3μA for operation, the device is intended for battery-operated systems and instruments which require high or low voltage warnings, settable trip points, or fault monitoring and correction.

INTERSIL

ICH8500/A
Ultra Low Bias Current Operational Amplifier

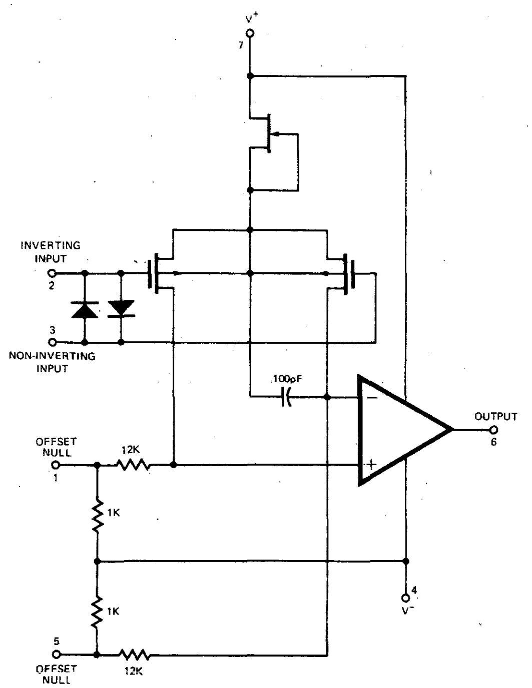
FEATURES

- Input diode protection
- Input bias current less than 0.01 pA at all operating temperatures
- No frequency compensation required
- Offset voltage null capability
- Short circuit protection
- Low power consumption

APPLICATIONS

- Femto Ammeter
- Electrometers
- Long time integrators
- Flame detectors
- pH meter
- Proximity detector
- Sample and Hold Circuits

SCHEMATIC DIAGRAM



GENERAL DESCRIPTION

The ICM8500 and ICH8500A are hybrid circuits designed for ultra low input bias current operational amplifier applications. They are ideally suited for analog and electrometer applications where high input resistance and low input current are of prime importance.

Functionally, they are pin for pin identical to the popular 741 monolithic amplifier. These amplifiers are unconditionally stable and the input offset voltage can be adjusted to zero with an external 20k potentiometer. The input bias current for the inverting and non-inverting inputs is 0.1 pA maximum for the ICH8500, and 0.01 pA maximum for the ICH8500A and are constant over the operating temperature range of -25°C to +85°C.

Pin 8 is connected to the case. This permits the designer to operate the case at any desired potential, the key to achieving the ultra low input currents associated with these two amplifiers. Forcing the case to the same potential as the inputs eliminates current flow between the case and the input pins, and leakage currents that may have otherwise existed between any of the other pins and the inputs are intercepted by the case.

INTERSIL

ICH8510/8520/8530 Power Amplifier/ Motor & Actuator Driver

KEY FEATURES:

- Delivers up to 2.7 amps @ 24-28V DC (30V supplies)
- Protected against inductive kick back with internal power limiting
- Programmable current limiting (short circuit protection)
- Package is electrically isolated (allowing easy heat sinking)
- DC gain > 100dB
- 20mA typical standy quiescent current
- Popular 8 pin TO-3 package
- Internal frequency compensation
- Can drive up to 0.1 horsepower motors.

DESCRIPTION:

The ICH8510/8520/8530 is a family of hybrid power amplifiers that have been specifically designed to drive linear and rotary actuators, electronic valves, push-pull solenoids, and DC & AC motors.

There are three models available for up to +30V power supply operation: 2.7 amps @ 24 volt output levels, 2 amps @ 24V and 1 amp @ 24V. All amplifiers are protected against shorts to ground by the addition of 2 external protection resistors. For a device operating at lower voltages, see the ICH8515.

The design uses a conventional 741 operational amplifier, a special monolithic driver chip (BL8063), NPN & PNP power transistors, and internal frequency compensating capacitors. The chips are mounted on a beryllium oxide substrate for optimum heat transfer to the metal package; this substrate provides electrical isolation between amplifiers and metal package.

The I.C. power driver chip has built-in regulators to drive the 741 @ typically ±13V supply voltages.

ICL761X/ 762X/763X/764X Low Power CMOS™ Operational Amplifiers

FEATURES

- Wide operating voltage range ±1.0V to ±8V
- High input impedance — $10^{12}\Omega$
- Programmable power consumption — as low as 20μW
- Input current lower than BIFETs — typ 1pA
- Available as singles, duals, triples, and quads
- Output voltage swing ranges to within millivolts of V- to V+
- Low power replacement for many standard op amps
- Compensated and uncompensated versions

APPLICATIONS

- Portable instruments
- Telephone headsets
- Hearing aid/microphone amplifiers
- Meter amplifiers
- Medical instruments
- High impedance buffers

A number of special options are available. They include:

- Single, dual, triple, and quad configurations
- Internally compensated and uncompensated versions
- Inputs protected to ±200V (ICL7613/15)
- Input common mode voltage range greater than supply rails (ICL7612)

NOTES:
1. HIGH VALUE THIN FILM RESISTORS ARE PRESENT ONLY ON ICL7613 AND 7615. FOR ALL OTHER DEVICES, THEY ARE REPLACED BY DIRECT CONNECTIONS.
2. OFFSET NULLING PINS ARE NOT AVAILABLE ON TRIPLE (ICL763X) AND QUAD (ICL764X) VERSIONS.
3. I_Q AND COMP TERMINALS ARE METAL MASK OPTIONS OF THE SAME BONDING PAD; ONLY ONE OF THESE FUNCTIONS IS AVAILABLE IN A GIVEN DEVICE.
4. FOR INTERNALLY COMPENSATED VERSIONS ONLY. THIS CAPACITOR IS ABSENT FOR ALL OTHER DEVICES.

ICL761X/762X/763X/764X

GENERAL DESCRIPTION

The ICL761X/762X/763X/764X series is a family of monolithic CMOS op amps. These amplifiers provide the designer with high performance operation at low supply voltages and selectable quiescent currents, and are an ideal design tool when ultra low input current and low power drain are essential.

The basic amplifier will operate at supply voltages ranging from ±1.0V to ±8V, and may be operated from a single Lithium cell.

A unique quiescent current programming pin allows setting of standby current to 1 mA, 100 μA, or 10 μA, with no external components. This results in power drain as low as 20 μW. Output swings range to within a few millivolts of the supply voltages.

Of particular significance is the extremely low (1 pA) input current, input noise current of .01 pA/ $\sqrt{Hz}$, and $10^{12}\Omega$ input impedance. These features optimize performance in very high source impedance applications.

The inputs are internally protected and require no special handling procedures. Outputs are fully protected against shorts to ground or to either supply.

AC performance is excellent, with a slew rate of 1.6V/μs, and unity gain bandwidth of 1 MHz at I_Q= 1 mA.

Because of the low power dissipation, operating temperatures and drift are quite low. Applications utilizing these features may include stable instruments, extended life designs, or high density packages.

GENERAL INFORMATION

STATIC PROTECTION

All devices are static protected by the use of input diodes. However, strong static fields should be avoided, as it is possible for the strong fields to cause degraded diode junction characteristics, which may result in increased input leakage currents.

LATCHUP AVOIDANCE

Junction-isolated CMOS circuits employ configurations which produce a parasitic 4-layer (p-n-p-n) structure. The 4-layer structure has characteristics similar to an SCR, and under certain circumstances may be triggered into a low impedance state resulting in excessive supply current. To avoid this condition, no voltage greater than 0.3V beyond the supply rails may be applied to any pin. (An exception to this rule concerns the inputs of the ICL7613 and ICL7615, which are protected to ±200V.) In general, the op amp supplies must be established simultaneously with, or before any input signals are applied. If this is not possible, the drive circuits must limit input current flow to 2 mA to prevent latchup.

CHOOSING THE PROPER I_Q

Each device in the ICL76XX family has a similar I_Q set-up scheme, which allows the amplifier to be set to nominal quiescent currents of 10 μA, 100 μA or 1 mA. These current settings change only very slightly over the entire supply voltage range. The ICL7611/12/13 and ICL7631/32 have an external I_Q control terminal, permitting user selection of each amplifiers' quiescent current. (The ICL7614/15, 7621/22, and 7641/42 have fixed I_Q settings — refer to selector guide for details.) To set the I_Q of programmable versions, connect the I_Q terminal as follows:

I_Q = 10μA — I_Q pin to V+

I_Q = 100μA — I_Q pin to ground. If this is not possible, any voltage from V+ -0.8 to V^- +0.8 can be used.

I_Q = 1mA — I_Q pin to V^-

NOTE: The negative output current available is a function of the quiescent current setting. For maximum p-p ouput voltage swings into low impedance loads, I_Q of 1 mA should be selected.

OUTPUT STAGE AND LOAD DRIVING CONSIDERATIONS

Each amplifiers' quiescent current flows primarily in the output stage. This is approximately 70% of the I_Q settings. This allows output swings to almost the supply rails for output loads of 1M, 100K, and 10K, using the output stage in a highly linear class A mode. In this mode, crossover distortion is avoided and the voltage gain is maximized. However, the output stage can also be operated in Class AB, which can supply higher output currents. (See graphs under Typical Operating Characteristics). During the transition from Class A to Class B operation, the output transfer characteristic is non-linear and the voltage gain decreases.

A special feature of the output stage is that it approximates a transconductance amplifier, and its gain is directly proportional to load impedance. Approximately the same open loop gains are obtained at each of the I_Q settings if corresponding loads of 10K, 100K, and 1M are used.

INPUT OFFSET NULLING

For those models provided with OFFSET NULLING pins, nulling may be achieved by connecting a 25K pot between the OFFSET terminals with the wiper connected to V^+. At quiescent currents of 1 mA and 100 μA, the nulling range provided is adequate for all V_{OS} selections; however with $I_Q = 10\ \mu A$, nulling may not be possible with higher values of V_{OS}.

FREQUENCY COMPENSATION

The ICL7611/12/13, 7621/22, 7631, 7641/42 are internally compensated, and are stable for closed loop gains as low as unity for capacitive loads up to 100pF

The ICL7614 and 15 are externally compensated by connecting a capacitor between the COMP and OUT pins. A 39pF capacitor is required for unity gain compensation; for greater than unity gain applications, increased bandwidth and slew rate can be obtained by reducing the value of the compensating capacitor.

Since the g_m of the first stage is proportional to $\sqrt{I_Q}$, greatest compensation is required when $I_Q = 1$mA. The ICL7632 is not compensated internally, nor can it be compensated externally. The device is stable when used as follows:

I_Q of 1 mA for gains ≥ 20
I_Q of 100 μA for gains ≥ 10
I_Q of 10 μA for gains ≥ 5

HIGH VOLTAGE INPUT PROTECTION

The ICL7613 and 7615 include on-chip thin film resisitors and clamping diodes which allow voltages of up to ±200 to be applied to either input for an indefinite time without device failure. These devices will be useful where high common mode voltages, differential mode voltages, or high transients may be experienced. Such conditions may be found when interfacing separate systems with separate supplies. Unity gain stability is somewhat degraded with capacitive loads because of the high value of input resistors.

EXTENDED COMMON MODE INPUT RANGE

The ICL7612 incorporates additional processing which allows the input CMVR to exceed each power supply rail by 0.1 volt for applications where $V_{SUPP} \geq \pm 1.5$V. For those applications where $V_{SUPP} \leq \pm 1.5$V, the input CMVR is limited in the positive direction, but may exceed the negative supply rail by 0.1 volt in the negative direction (eg. for $V_{SUPP} = \pm 1.0$V, the input CMVR would be + 0.6 volts to -1.1 volts).

OPERATION AT $V_{SUPP} = \pm 1.0$ VOLTS

Operation at $V_{SUPP} = \pm 1.0$V is guaranteed at $I_Q = 10\mu A$ only. This applies to these devices with selectable I_Q, and those devices are set internally to $I_Q = 10\mu A$ (i.e., ICL7611 , 7612, 7613, 7631, 7632, 7642).

Output swings to within a few millivolts of the supply rails are achievable for $R_L \geq 1$ MegΩ. Guaranteed input CMVR is ±0.6V minimum and typically +0.9V to -0.7 at $V_{SUPP} = \pm 1.0$V. For applications where greater common mode range is desirable, refer to description of ICL7612 above.

The user is cautioned that, due to extremely high input impedances, care must be exercised in layout, construction, board cleanliness, and supply filtering to avoid hum and noise pickup.

Notes:

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Long term offset voltage stability will be degraded if large input differential voltages are applied for long periods of time.
3. The outputs may be shorted to ground or to either supply, for $V_{SUPP} \leq 10$V. Care must be taken to insure that the dissipation rating is not exceeded.

ELECTRICAL CHARACTERISTICS $V_{SUPP} = \pm 5.0V$, $T_A = 25°C$, unless otherwise specified

ICL7650
Chopper Stabilized Operational Amplifier

INTERSIL

FEATURES

- **Extremely low input offset voltage – 1μV over temperature range**
- **Low long-term and temperature drifts of input offset voltage**
- **Low DC input bias current – 10pA**
- **Extremely high gain, CMRR and PSRR – min 120dB**
- **High slew rate – 2.5V/μs**
- **Wide bandwidth – 2MHz**
- **Internally compensated for unity-gain operation**
- **Very low intermodulation effects (open loop phase shift <10° @ chopper frequency)**
- **Clamp circuit to avoid overload recovery problems and allow comparator use**
- **Extremely low chopping spikes at input and output**

GENERAL DESCRIPTION

The ICL7650 chopper-stabilized amplifier is a high-performance device which offers exceptionally low offset voltage and input-bias parameters, combined with excellent bandwidth and speed characteristics. Intersil's unique CMOS approach to chopper-stabilized amplifier design yields a versatile precision component which can replace more expensive hybrid or modular parts, while at the same time out-performing them and other monolithic devices.

The chopper amplifier achieves its low offset by comparing the inverting and non-inverting input voltages in a nulling amplifier, nulled by alternate clock phases. Two external capacitors are required to store the correcting potentials on the two amplifier nulling inputs; these are the only external components necessary.

The clock oscillator and all the other control circuitry is entirely self-contained, however the 14-pin version includes a provision for the use of an external clock, if required for a particular application. In addition, the ICL7650 is internally compensated for unity-gain operation.

ORDERING INFORMATION

PART	TEMP RANGE	PACKAGE
ICL 7650 CPA	0° - 70°C	8-Pin Plastic
ICL 7650 CPD	0° - 70°C	14-Pin Plastic
ICL 7650 CTV	0° - 70°C	8-Pin TO-99
ICL 7650 IJA	– 20°C - 85°C	8-Pin Cerdip
ICL 7650 IJD	– 20°C - 85°C	14-Pin Cerdip
ICL 7650 ITV	– 20°C - 85°C	8-Pin TO-99
ICL 7650 MJD	– 55°C - 125°C	14-Pin Cerdip
ICL 7650 MTV	– 55°C - 125°C	8-Pin TO-99
ICL 7650 CPA-1	0° - 70°C	8-Pin Plastic
ICL 7650 CTV-1	0° - 70°C	8-Pin TO-99
ICL 7650 IJD-1	– 20°C - 85°C	8-Pin Cerdip
ICL 7650 ITV-1	– 20°C - 85°C	8-Pin TO-99
ICL 7650 MTV-1	– 55°C - 125°C	8-Pin TO-99

NOTE: By using the ICL 7650-1 versions and connecting C_{RETN}, better noise performance can be attained.

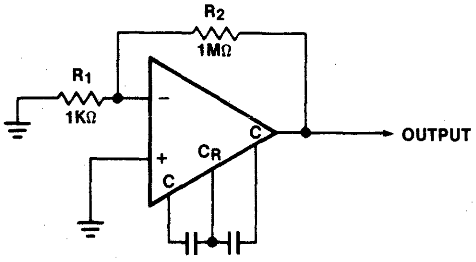
TEST CIRCUIT



DETAILED DESCRIPTION

AMPLIFIER

The block diagram shows the major elements of the ICL7650. There are two amplifiers, the main amplifier, and the nulling amplifier; both have offset-null capability. The main amplifier is connected full-time from the input to the output, while the nulling amplifier, under the control of the chopping frequency oscillator and clock circuit, alternately nulls itself and the main amplifier. The nulling connections, which are MOSFET back gates, are inherently high impedance, and two external capacitors provide the required storage of the nulling potentials and the necessary nulling-loop time constants. The nulling arrangement operates over the full common-mode and power-supply ranges, and is also independent of the output level, thus giving exceptionally high CMRR, PSRR, and A_{VOL}.

Careful balancing of the input switches, and the inherent balance of the input circuit, minimizes chopper frequency charge injection at the input terminals, and also the feedforward-type injection into the compensation capacitor, which is the main cause of output spikes in this type of circuit.

INTERMODULATION

Previous chopper-stabilized amplifiers have suffered from intermodulation effects between the chopper frequency and input signals. These arise because the finite AC gain of the amplifier necessitates a small AC signal at the input. This is seen by the zeroing circuit as an error signal, which is chopped and fed back, thus injecting sum and difference frequencies and causing disturbances to the gain and phase vs. frequency characteristics near the chopping frequency. These effects are sustantially reduced in the ICL7650 by feeding the nulling circuit with a dynamic current, corresponding to the compensation capacitor current, in such a way as to cancel that portion of the input signal due to finite AC gain. Since that is the major error contribution to the ICL7650, the intermodulation and gain/phase disturbances are held to very low values, and can generally be ignored.

CAPACITOR CONNECTION

The null-storage capacitors should be connected to the C_{EXTA} and C_{EXTB} pins, with a common connection to the C_{RETN} pin (in the case of 14-pin devices) or the V^- pin (in the case of the 8-pin devices). This connection should be made directly by either a separate wire or PC trace to avoid injecting load current IR drops into the capacitive circuitry. The outside foil, where available, should be connected to C_{RETN} (or V^-).

OUTPUT CLAMP

The OUTPUT CLAMP pin allows reduction of the overload recovery time inherent with chopper-stabilized amplifiers. When tied to the inverting input pin, or summing junction, a current path between this point and the OUTPUT pin occurs just before the device output saturates. Thus uncontrolled input differential inputs are avoided, together with the consequent charge build-up on the correction-storage capacitors. The output swing is slightly reduced.

CLOCK

The ICL7650 has an internal oscillator giving a chopping frequency of 200 Hz, available at the CLOCK OUT pin on the 14-pin devices. Provision has also been made for the use of an external clock in these parts. The INT/$\overline{EXT}$ pin has an internal pull-up and may be left open for normal operation, but to utilize an external clock this pin must be tied to V^- to disable the internal clock. The external clock signal may then be applied to the EXT. CLOCK IN pin. At low frequencies, the duty cycle of the external clock is not critical, since an internal divide-by-two provides the desired 50% switching duty cycle. However, since the capacitors are charged only when EXT CLK IN is HIGH, a 50-80% positive duty cycle is favored for frequencies above 500Hz to ensure that any transients have time to settle before the capacitors are turned OFF. The external clock should swing between V^+ and GROUND for power supplies up to ±6V, and between V^+ and V^+ −6V for higher supply voltages. Note that a signal of about 400Hz will be present at the EXT CLK IN pin with INT/$\overline{EXT}$ high or open. This is the internal clock signal before the divider.

In those applications where a strobe signal is available, an alternate approach to avoid capacitor misbalancing during overload can be used. If a strobe signal is connected to EXT CLK IN so that it is low during the time that the overload signal is applied to the amplifier, neither capacitor will be charged. Since the leakage at the capacitor pins is quite low at room temperature, the typical amplifier will drift less than 10μV/sec, and relatively long measurements can be made with little change in offset.

BRIEF APPLICATION NOTES

COMPONENT SELECTION

The two required capacitors, C_{EXTA} and C_{EXTB}, have optimum values depending on the clock or chopping frequency. For the preset internal clock, the correct value is 0.1μF, and to maintain the same relationship between the chopping frequency and the nulling time constant this value should be scaled approximately in proportion if an external clock is used. A high-quality film-type capacitor such as mylar is preferred, although a ceramic or other lower-grade capacitor may prove suitable in many applications. For quickest settling on initial turn-on, low dielectric absorbtion capacitors (such as poly propylene) should be used. With ceramic capacitors, several seconds may be required to settle to 1μV.

STATIC PROTECTION

All device pins are static-protected by the use of input diodes. However, strong static fields and discharges should be avoided, as they can cause degraded diode junction characteristics, which may result in increased input-leakage currents.

LATCH-UP AVOIDANCE

Junction-isolated CMOS circuits inherently include a parasitic 4-layer (p-n-p-n) structure which has characteristics similar to an SCR. Under certain circumstances this junction may be triggered into a low-impedance state, resulting in excessive supply current. To avoid this condition, no voltage greater than 0.3V beyond the supply rails should be applied to any pin. In general, the amplifier supplies must be established either at the same time or before any input signals are applied. If this is not possible, the drive circuits must limit input current flow to under 1mA to avoid latchup, even under fault conditions.

OUTPUT STAGE/LOAD DRIVING

The output circuit is a high-impedance stage (approximately 18kΩ), and therefore, with loads less than this the chopper amplifier behaves in some ways like a transconductance amplifier whose open-loop gain is proportional to load resistance. For example, the open-loop gain will be 17dB lower with a 1kΩ load than with a 10kΩ load. If the amplifier is used strictly for DC, this lower gain is of little consequence, since the DC gain is typically greater than 120dB even with a 1KΩ load. However, for wideband applications, the best frequency response will be achieved with a load resistor of 10K or higher. This will result in a smooth 6dB/octave response from 0.1Hz to 2MHz, with phase shifts of less than 10° in the transition region where the main amplifier takes over from the null amplifier.

THERMO-ELECTRIC EFFECTS

The ultimate limitations to ultra-high precision DC amplifiers are the thermo-electric or Peltier effects arising in thermocouple junctions of dissimilar metals, alloys, silicon, etc. Unless all junctions are at the same temperature, thermoelectric voltages typically around 0.1μV/°C, but up to tens of μV/°C for some materials, will be generated. In order to realize the extremely low offset voltages that the chopper amplifier can provide, it is essential to take special precautions to avoid temperature gradients. All components should be enclosed to eliminate air movement, especially that caused by power-dissipating elements in the system. Low thermoelectric-coefficient connections should be used where possible and power supply voltages and power dissipation should be kept to a minimum. High-impedance loads are preferable, and good separation from surrounding heat-dissipating elements is advisable.

GUARDING

Extra care must be taken in the assembly of printed circuit boards to take full advantage of the low input currents of the ICL7650. Boards must be thoroughly cleaned with TCE or alcohol and blown dry with compressed air. After cleaning, the boards should be coated with epoxy or silicone rubber to prevent contamination.

Even with properly cleaned and coated boards, leakage currents may cause trouble, particularly since the input pins are adjacent to pins that are at supply potentials. This leakage can be significantly reduced by using guarding to lower the voltage difference between the inputs and adjacent metal runs. Input guarding of the 8-lead TO-99 package is accomplished by using a 10-lead pin circle, with the leads of the device formed so that the holes adjacent to the inputs are empty when it is inserted in the board. The guard, which is a conductive ring surrounding the inputs, is connected to a low impedance point that is at approximately the same voltage as the inputs. Leakage currents from high-voltage pins are then absorbed by the guard.

The pin configuration of the 14-pin dual in-line package is designed to facilitate guarding, since the pins adjacent to the inputs are not used (this is different from the standard 741 and 101A pin configuration, but corresponds to that of the LM108).

INVERTING AMPLIFIER FOLLOWER NON-INVERTING AMPLIFIER

PIN COMPATIBILITY

The basic pinout of the 8-pin device corresponds, where possible, to that of the industry-standard 8-pin devices, the LM741, LM101, etc. The null-storing external capacitors are connected to pins 1 and 8, usually used for offset null or compensation capacitors, or simply not connected. The output-clamp pin (5) is similarly used. In the case of the OP-05 and OP-07 devices, the replacement of the offset-null pot, connected between pins 1 and 8 and V+, by two capacitors from those pins to V−, will provide easy compatibility. As for the LM108, replacement the compensation capacitor between pins 1 and 8 by the two capacitors to V− is all that is necessary. The same operation, with the removal of any connection to pin 5, will suffice for the LM101, μA748, and similar parts.

The 14-pin device pinout corresponds most closely to that of the LM108 device, owing to the provision of "NC" pins for guarding between the input and all other pins. Since this device does not use any of the extra pins, and has no provision for offset-nulling, but requires a compensation capacitor, some changes will be required in layout to convert to the ICL7650.

TYPICAL APPLICATIONS

Clearly the applications of the ICL7650 will mirror those of other op. amps. Thus, anywhere that the performance of a circuit can be significantly improved by a reduction of input-offset voltage and bias current, the ICL7650 is the logical choice. Basic non-inverting and inverting amplifier circuits are shown in Figs. 2 and 3. Both circuits can use the output clamping circuit to enhance the overload recovery performance. The only limitations on the replacement of other op. amps by the ICL7650 are the supply voltage (± 8V max.) and the output drive capability (10kΩ load for full swing). Even these limitations can be overcome using a simple booster circuit, as shown in Fig. 4, to enable the full output capabilities of the LM741 (or any other standard device) to be combined with the input capabilities of the ICL7650. The pair form a composite device, so loop gain stability, when the feedback network is added, should be watched carefully.

Fig. 5 shows the use of the clamp circuit to advantage in a zero-offset comparator. The usual problems in using a chopper stabilized amplifier in this application are avoided, since the clamp circuit forces the inverting input to follow the input signal. The threshold input must tolerate the output clamp current ≈ V_{IN}/R without disturbing other portions of the system.

Normal logarithmic amplifiers are limited in dynamic range in the voltage-input mode by their input-offset voltage. The built-in temperature compensation and convenience features of the ICL8048 can be extended to a voltage-input dynamic range of close to 6 decades by using the ICL7650 to offset-null the ICL8048, as shown in Fig. 6. The same concept can also be used with such devices as the HA2500 or HA2600 families of op amps. to add very low offset voltage capability to their very high slew rates and bandwidths. Note that these circuits will also have their DC gains, CMRR, and PSRR enhanced.

Mixing the ICL7650 with circuits operating at ±15V supplies requires the provision of a lower voltage. Although this can be met fairly easily, a highly efficient voltage divider can be built using the ICL7660 voltage converter circuit 'backwards'. A suitable connection is shown in Fig. 7.

INTERSIL

ICL7652

Chopper-Stabilized Operational Amplifier

FEATURES

- **Extremely low input offset voltage—1μV over temperature range**
- **Ultra low long-term and temperature drifts of input offset voltage (100nV/√month, 10nV/°C)**
- **Low DC input bias current—15pA**
- **Extremely high gain, CMRR and PSRR—min 110dB**
- **Low input noise voltage—0.2μVp-p (DC—1Hz)**
- **Internally compensated for unity-gain operation**
- **Very low intermodulation effects (open-loop phase shift < 2° @ chopper frequency)**
- **Clamp circuit to avoid overload recovery problems and allow comparator use**
- **Extremely low chopping spikes at input and output**

GENERAL DESCRIPTION

The ICL7652 chopper-stabilized amplifier offers exceptionally low input offset voltage and is extremely stable with respect to time and temperature. It is similar to INTERSIL's ICL7650 but offers improved noise performance and a wider common-mode input voltage range. The bandwidth and slew rate are reduced slightly.

INTERSIL's unique CMOS chopper-stabilized amplifier circuitry is user-transparent, virtually eliminating the traditional chopper amplifier problems of intermodulation effects, chopping spikes, and overrange lock-up.

The chopper amplifier achieves its low offset by comparing the inverting and non-inverting input voltages in a nulling amplifier, nulled by alternate clock phases. Two external capacitors are required to store the correcting potentials on the two amplifier nulling inputs; these are the only external components necessary.

The clock oscillator and all the other control circuitry is entirely self-contained, however the 14-pin version includes a provision for the use of an external clock, if required for a particular application. In addition, the ICL7652 is internally compensated for unity-gain operation.

GENERAL DESCRIPTION

The Intersil ICL7660 is a monolithic MAXCMOS™ power supply circuit which offers unique performance advantages over previously available devices. The ICL7660 performs the complete supply voltage conversion from positive to negative for an input range of +1.5V to +10.0V, resulting in complementary output voltages of −1.5 to −10.0V with the addition of only 2 non-critical external capacitors needed for the charge pump and charge reservoir functions. Note that an additional diode is required for V_{SUPPLY} >6.5V.

Contained on chip are a series DC power supply regulator, RC oscillator, voltage level translator, four output power MOS switches, and a unique logic element which senses the most negative voltage in the device and ensures that the output N-channel switches are not forward biased. This assures latch-up free operation.

The oscillator, when unloaded, oscillates at a nominal frequency of 10kHz for an input supply voltage of 5.0 volts. This frequency can be lowered by the addition of an external capacitor to the "OSC" terminal, or the oscillator may be overdriven by an external clock.

The "LV" terminal may be tied to GROUND to bypass the internal series regulator and improve low voltage (LV) operation. At medium to high voltages (+3.5 to +10.0 volts), the LV pin is left floating to prevent device latchup.

Typical applications for the ICL7660 will be data acquisition and microprocessor based systems where there is a +5 volt supply available for the digital functions and an additional −5 volt supply is required for the analog functions. The ICL7660 is also ideally suited for providing low current, −5V body bias supply for dynamic RAMs.

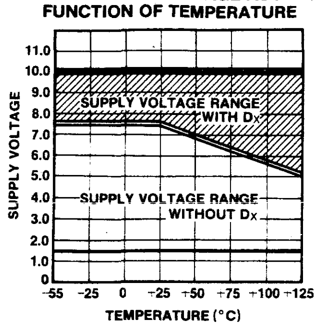
			100		kΩ	V = 5 Volts

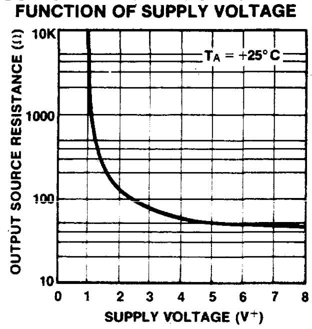
Notes: 1. Connecting any input terminal to voltages greater than V+ or less than GROUND may cause destructive latchup. It is recommended that no inputs from sources operating from external supplies be applied prior to "power up" of the ICL7660.
2. Derate linearly above 50°C by 5.5mW/°C.
3. ICL7660M only.

TYPICAL PERFORMANCE CHARACTERISTICS (Circuit of Figure 1)

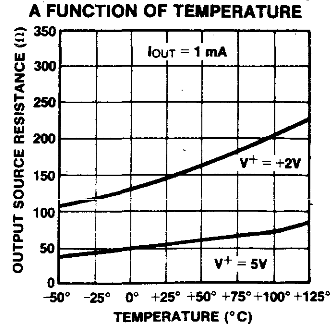
OPERATING VOLTAGE AS A FUNCTION OF TEMPERATURE



OUTPUT SOURCE RESISTANCE AS A FUNCTION OF SUPPLY VOLTAGE



OUTPUT SOURCE RESISTANCE AS A FUNCTION OF TEMPERATURE



TYPICAL APPLICATIONS

1. Simple Negative Voltage Converter

The majority of applications will undoubtedly utilize the ICL7660 for generation of negative supply voltages. Figure 4 shows typical connections to provide a negative supply where a positive supply is available. A similar scheme may be employed for supply voltages anywhere in the operating range of +1.5V to +10.0 volts, keeping in mind that pin 6 (LV) is tied to the supply negative (GND) only for supply voltages below 3.5 volts, and that diode D_X must be included for proper operation at higher voltages and/or elevated temperatures.

The output characteristics of the circuit in Figure 4 are those of a nearly ideal voltage source in series with 70 ohms. Thus for a load current of −10mA and a supply voltage of +5 volts, the output voltage will be −4.3 volts. The dynamic output impedance due to the capacitor impedances is approximately $1/\omega C$ where

$$C = C_1 = C_2$$

$$\text{giving} \quad \frac{1}{\omega C} = \frac{1}{2\pi f_{OSC} \times 10^{-5}} = 3 \text{ ohms}$$

for $C = 10\mu F$ and $f_{OSC} = 5kHz$ (1/2 of oscillator frequency)

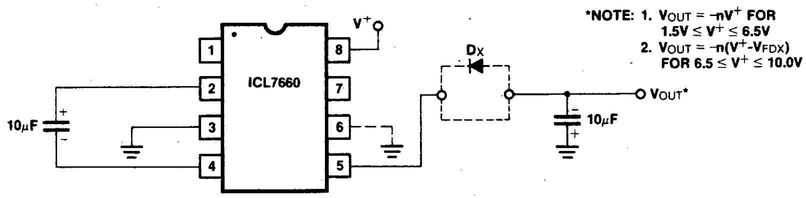


Figure 4: Simple Negative Converter

2. Paralleling Devices

Any number of ICL7660 voltage convertors may be paralleled to reduce output resistance. The reservoir capacitor, C_2, serves all devices while each device requires its own pump capacitor, C_1. The resultant output resistance would be approximately

$$R_{OUT} = \frac{R_{OUT} \text{ (of ICL7660)}}{n \text{ (number of devices)}}$$

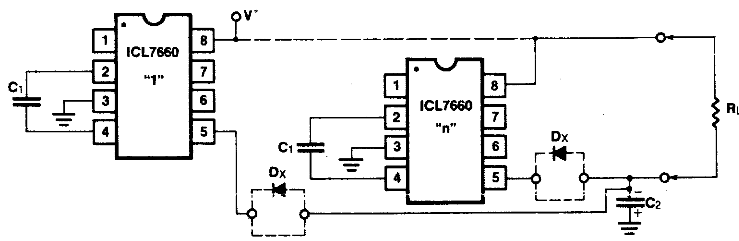

Figure 5: Paralleling Devices

3. Cascading Devices

The ICL7660 may be cascaded as shown to produce larger negative multiplication of the initial supply voltage, however, due to the finite efficiency of each device, the practical limit is 10 devices for light loads. The output voltage is defined by:

$$V_{OUT} = -n\,(V_{IN}),$$

where n is an integer representing the number of devices cascaded. The resulting output resistance would be approximately the weighted sum of the individual ICL7660 R_{OUT} values.

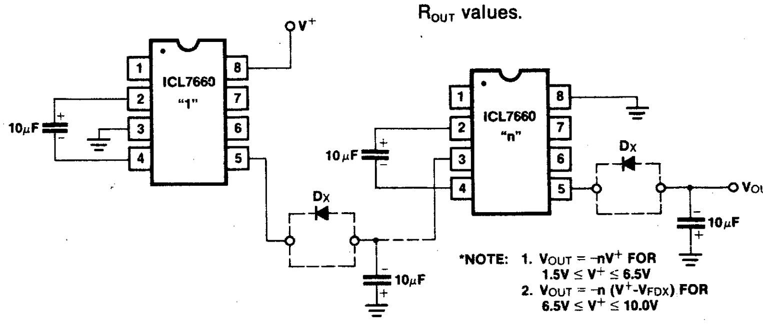

Figure 6: Cascading Devices for Increased Output Voltage

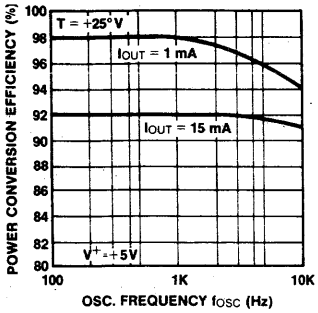
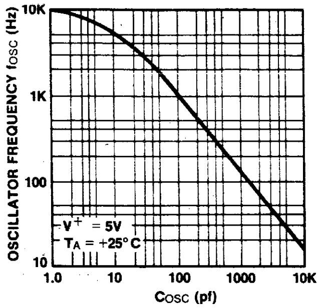
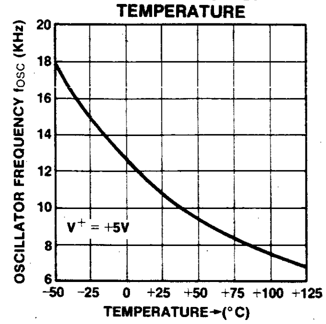
POWER CONVERSION EFFICIENCY AS A FUNCTION OF OSC. FREQUENCY



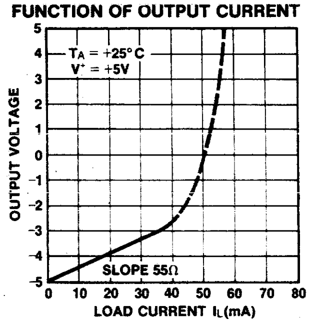
FREQUENCY OF OSCILLATION AS A FUNCTION OF EXTERNAL OSC. CAPACITANCE



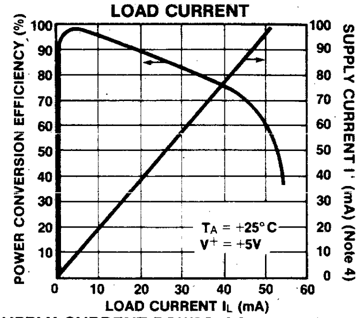
UNLOADED OSCILLATOR FREQUENCY AS A FUNCTION OF TEMPERATURE



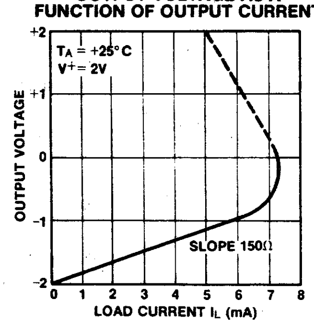
OUTPUT VOLTAGE AS A FUNCTION OF OUTPUT CURRENT



SUPPLY CURRENT & POWER CONVERSION EFFICIENCY AS A FUNCTION OF LOAD CURRENT



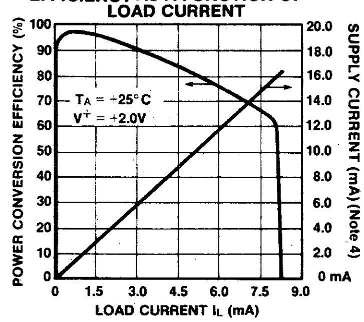
OUTPUT VOLTAGE AS A FUNCTION OF OUTPUT CURRENT

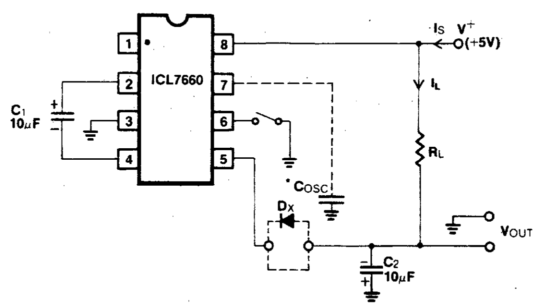


NOTE 4.

Note that the curves on the right include in the supply current that current fed directly into the load (R_L) from V^+ (see Figure 1). Thus, approximately half the supply current goes directly to the positive side of the load, and the other half, through the ICL7660, to the negative side of the load. Ideally, $V_{OUT} \simeq 2 V_{IN}$, $I_S \simeq 2 I_L$, so $V_{IN} \cdot I_S \simeq V_{OUT} \cdot I_L$.

SUPPLY CURRENT POWER CONVERSION EFFICIENCY AS A FUNCTION OF LOAD CURRENT





NOTES: 1. For large value of C_{OSC} (>1000pF) the values of C_1 and C_2 should be increased to 100μF.
2. D_X is required for supply voltages greater than 6.5V @ $-55° \leq T_A \leq +70°C$; refer to performance curves for additional information.

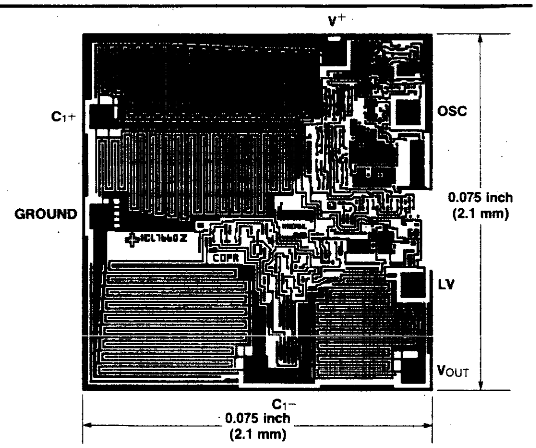

Figure 2: Chip Topography

LINEAR

Intersil

CIRCUIT DESCRIPTION

The ICL7660 contains all the necessary circuitry to complete a voltage doubler, with the exception of 2 external capacitors which may be inexpensive 10μF polarized electrolytic capacitors. The mode of operation of the device may be best understood by considering Figure 3, which shows an idealized voltage doubler. Capacitor C_1 is charged to a voltage, V^+, for the half cycle when switches S_1 and S_3 are closed. (Note: Switches S_2 and S_4 are open during this half cycle.) During the second half cycle of operation, switches S_2 and S_4 are closed, with S_1 and S_3 open, thereby shifting capacitor C_1 negatively by V^+ volts. Charge is then transferred from C_1 to C_2 such that the voltage on C_2 is exactly V^+, assuming ideal switches and no load on C_2. The ICL7660 approaches this ideal situation more closely than existing non-mechanical circuits.

In the ICL7660, the 4 switches in Figure 3 are MOS power switches; S_1 is a P-channel device and S_2, S_3 & S_4 are N-channel devices. The main difficulty with this approach is that in integrating the switches, the substrates of S_3 & S_4 must always remain reverse biased with respect to their sources, but not so much as to degrade their "ON" resistances. In addition, at circuit startup, and under output short circuit conditions ($V_{OUT} = V^+$), the output voltage must be sensed and the substrate bias adjusted accordingly. Failure to accomplish this would result in high power losses and probable device latchup.

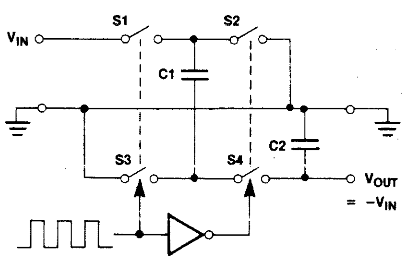

Figure 3. Idealized Voltage Doubler

This problem is eliminated in the ICL7660 by a logic network which senses the output voltage (V_{OUT}) together with the level translators and switches the substrates or S_3 & S_4 to the correct level to maintain necessary reverse bias.

The voltage regulator portion of the ICL7660 is an integral part of the anti-latchup circuitry, however it's inherent voltage drop can degrade operation at low voltages. Therefore, to improve low voltage operation the "LV" pin should be connected to GROUND, disabling the regulator. For supply voltages greater than 3.5 volts the LV terminal must be left open to insure latchup proof operation, and prevent device damage.

THEORETICAL POWER EFFICIENCY CONSIDERATIONS

In theory a voltage multiplier can approach 100% efficiency if certain conditions are met:

A The drive circuitry consumes minimal power

B The output switches have extremely low ON resistance and virtually no offset.

C The impedances of the pump and reservoir capacitors are negligible at the pump frequency.

The ICL7660 approaches these conditions for negative voltage multiplication if large values of C_1 and C_2 are used. **ENERGY IS LOST ONLY IN THE TRANSFER OF CHARGE BETWEEN CAPACITORS IF A CHANGE IN VOLTAGE OCCURS.** The energy lost is defined by:

$$E = 1/2\, C_1\, (V_1{}^2 - V_2{}^2)$$

where V_1 and V_2 are the voltages on C_1 during the pump and transfer cycles. If the impedances of C_1 and C_2 are relatively high at the pump frequency (refer to Fig. 3) compared to the value of R_L, there will be a substantial difference in the voltages V_1 and V_2. Therefore it is not only desirable to make C_2 as large as possible to eliminate output voltage ripple, but also to employ a correspondingly large value for C_1 in order to achieve maximum efficiency of operation.

DO'S AND DONTS

1 Do not exceed maximum supply voltages.
2 Do not connect LV terminal to GROUND for supply voltages greater than 3.5 volts.
3 Do not short circuit the output to V^+ supply for supply voltages above 5.5 volts for extended periods, however, transient conditions including startup are okay.
4 When using polarized capacitors, the + terminal of C_1 must be connected to pin 2 of the ICL7660 and the + terminal of C_2 must be connected to GROUND.
5 Add diode D_X as shown in Fig. 1 for hi-voltage, elevated temperature applications.

CONSIDERATIONS FOR HI VOLTAGE & ELEVATED TEMPERATURE

The ICL7660 will operate efficiently over its specified temperature range with only 2 external passive components (storage & pump capacitors), provided the operating supply voltage does not exceed 6.5 volts at +70°C and 5.0 volts at +125°C. Exceeding these maximums at the temperatures indicated may result in destructive latch-up of the ICL7660. (Ref: Graph "Operating Voltage Vs. Temperature")

Operation at supply voltages of up to 10.0 volts over the full temperature range without danger of latch-up can be achieved by adding a general purpose diode in series with the ICL7660 output, as shown by "D_X" in the circuit diagrams. The effect of this diode on overall circuit performance is the reduction of output voltage by one diode drop (approximately 0.6 volts).

4. Changing the ICL7660 Oscillator Frequency

It may be desirable in some applications, due to noise or other considerations, to increase the oscillator frequency. This is achieved by overdriving the oscillator from an external clock, as shown in Figure 7. In order to prevent possible device latchup, a 1kΩ resistor must be used in series with the clock output. In the situation where the designer has generated the external clock frequency using TTL logic, the addition of a 10kΩ pullup resistor to V^- supply is required. Note that the pump frequency with external clocking, as with internal clocking, will be 1/2 of the clock frequency. Output transitions occur on the positive-going edge of the clock.

It is also possible to increase the conversion efficiency of the ICL7660 at low load levels by lowering the oscillator frequency. This reduces the switching losses, and is achieved by connecting an additional capacitor, C_{OSC}, as shown in Figure 8. However, lowering the oscillator frequency will cause an undesirable increase in the impedance of the pump (C_1) and reservoir (C_2) capacitors; this is overcome by increasing the values of C_1 and C_2 by the same factor that the frequency has been reduced. For example, the addition of a 100pF capacitor between pin 7 (Osc) and V^+ will lower the oscillator frequency to 1kHz from its nominal frequency of 10kHz (a multiple of 10), and thereby necessitate a corresponding increase in the value of C_1 and C_2 (from 10μF to 100μF).

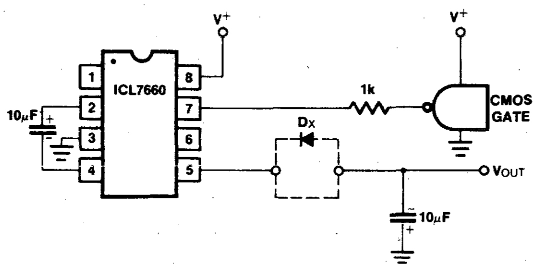

Figure 7: External Clocking

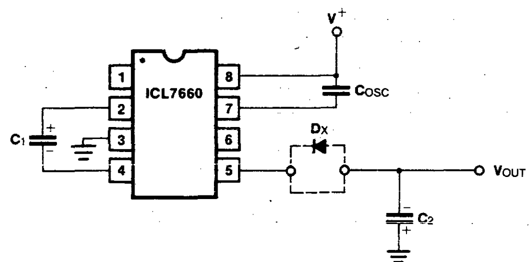

Figure 8: Lowering Oscillator Frequency

5. Positive Voltage Multiplication

The ICL7660 may be employed to achieve positive voltage multiplication using the circuit shown in Figure 9. In this application, the pump inverter switches of the ICL7660 are used to charge C_1 to a voltage level of $V^+ - V_F$ (where V^+ is the supply voltage and V_F is the forward voltage drop of diode D_1). On the transfer cycle, the voltage on C_1 plus the supply voltage (V^+) is applied through diode D_2 to capacitor C_2. The voltage thus created on C_2 becomes $(2V^+) - (2V_F)$ or twice the supply voltage minus the combined forward voltage drops of diodes D_1 and D_2.

The source impedance of the output (V_{OUT}) will depend on the output current, but for $V^+ = 5$ volts and an output current of 10mA it will be approximately 60 ohms.

6. Combined Negative Voltage Conversion and Positive Supply Multiplication

Figure 10 combines the functions shown in Figures 4 and 9 to provide negative voltage conversion and positive voltage multiplication simultaneously. This approach would be, for example, suitable for generating +9 volts and −5 volts from an existing +5 volt supply. In this instance capacitors C_1 and C_3 perform the pump and reservoir functions respectively for the generation of the negative voltage, while capacitors C_2 and C_4 are pump and reservoir respectively for the multiplied positive voltage. There is a penalty in this configuration which combines both functions, however, in that the source impedances of the generated supplies will be somewhat higher due to the finite impedance of the common charge pump driver at pin 2 of the device.

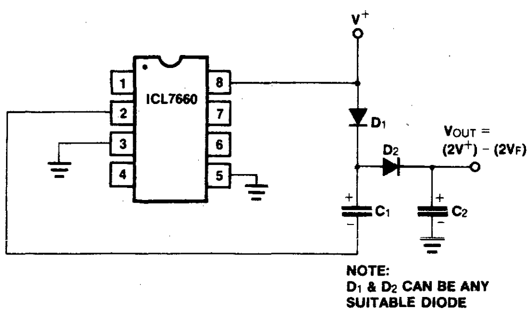

Figure 9: Positive Voltage Multiplier

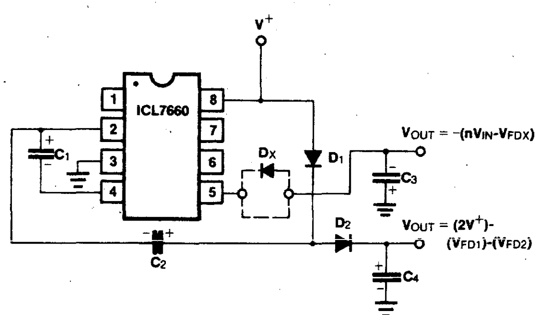

Figure 10: Combined Negative Converter and Positive Multiplier

7. Voltage Splitting

The bidirectional characteristics can also be used to split a higher supply in half, as shown in Figure 11. The combined load will be evenly shared between the two sides. Once again, a high value resistor to the LV pin ensures start-up. Because the switches share the load in parallel, the output impedance is much lower than in the standard circuits, and higher currents can be drawn from the device. By using this circuit, and then the circuit of Figure 6, +15V can be converted (via +7.5, and −7.5) to a nominal −15V, though with rather high series resistance (~250Ω).

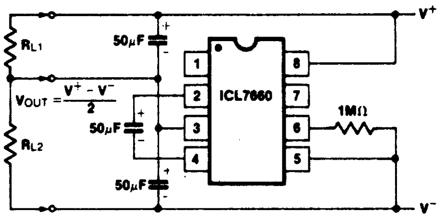

Figure 11: Splitting a Supply in Half.

ICL7660's output does not respond instantaneously to a change in input, but only after the switching delay. The circuit shown supplies enough delay to accommodate the 7660, while maintaining adequate feedback. An increase in pump and storage capacitors is desirable, and the values shown provides an output impedance of less than 5Ω to a load of 10mA.

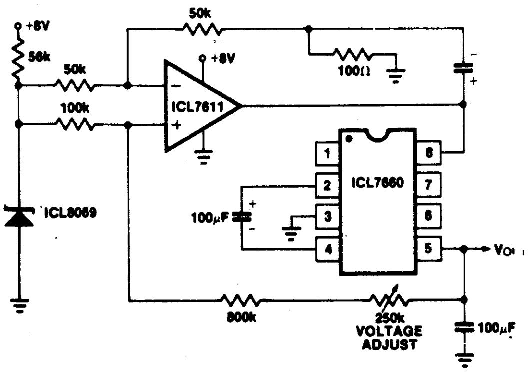

Figure 12: Regulating the Output Voltage

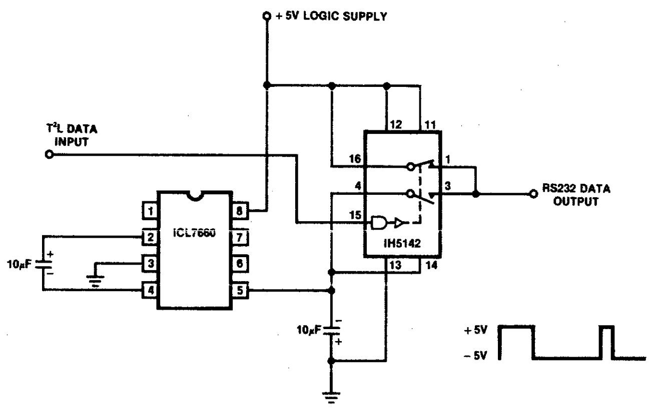

Figure 13: RS232 Levels from a Single 5V Supply

8. Regulated Negative Voltage Supply

In some cases, the output impedance of the ICL7660 can be a problem, particularly if the load current varies substantially. The circuit of Figure 12 can be used to overcome this by controlling the input voltage, via an ICL7611 low-power CMOS op amp, in such a way as to maintain a nearly constant output voltage. Direct feedback is inadvisable, since the

OTHER APPLICATIONS

Further information on the operation and use of the ICL7660 may be found in A051 "Principals and Applications of the ICL7660 CMOS Voltage Converter" by Peter Bradshaw and Dave Bingham.

ICL7663/7664

CMOS Programmable Micropower Voltage Regulators

FEATURES

- **Ideal for battery-operated systems: less than 4µA typical current drain**
- **Will handle input voltages from 1.6V to 16V**
- **Very low input-output differential voltage**
- **1.3V bandgap voltage reference**
- **Up to 40mA output current**
- **Output shutdown via current-limit sensing or external logic signal**
- **Output voltages programmable from 1.3V to 16V**
- **Output voltages with programmable negative temperature coefficients (ICL7663 only)**

GENERAL DESCRIPTION

The ICL7663 (positive) and ICL7664 (negative) series regulators are low-power, high-efficiency devices which accept inputs from 1.6V to 16V and provide adjustable outputs over the same range at currents up to 40mA. Operating current is typically less than 4µA, regardless of load.

Output current sensing and remote shutdown are available on both devices, thereby providing protection for the regulators and the circuits they power. A unique feature, on the ICL7663 only, is a negative temperature coefficient output. This can be used, for example, to efficiently tailor the voltage applied to a multiplexed LCD through the driver (e.g., ICM7231/2/3/4) so as to extend the display operating temperature range many times.

The ICL7663 and ICL7664 are available in either an 8-pin plastic minidip package or a TO-99 can.

Note 2: For ICL7664, exchange V_{OUT1} and V_{OUT2}. S_2 action differs, as follows:

Device	S_2 Closed	S_2 Open
ICL7663	V_{OUT1}	V_{OUT2}
ICL7664	$V_{OUT1} + V_{OUT2}$	V_{OUT1}

Note 3: $V_{OUT} = \frac{R_2 + R_1}{R_1} V_{SET}$
Note 4: I_Q quiescent current is measured at GND pin by meter M
Note 5: S_3 when ON, permits normal operation, when OFF, shuts down both V_{OUT1} and V_{OUT2}

Test Circuit for ICL7663/64 (Polarities shown are for ICL7663. Reverse for ICL7664)

DETAILED DESCRIPTION

The ICL7663 and ICL7664 are CMOS integrated circuits which contain all the functions of a voltage regulator plus protection circuitry on a single monolithic chip. Referring to the block diagrams (Figures 1 and 2), each contains a bandgap-type voltage reference of 1.3 Volts; this voltage, therefore, is the lowest output voltage the regulators can control (−1.3V for the ICL7664). Error amplifier A drives either a P-channel (ICL7663) or an N-channel (ICL7664) pass transistor which is sufficient for low (under about 5mA) currents; this transistor is augmented by a duplicate in the ICL7664, which permits higher current outputs. In the ICL7663, the high current output is formed by an NPN transistor connected as a follower. This configuration gives more gain and lower output impedance.

Logic-controlled shutdown is implemented via an MOS transistor of the appropriate polarity. Current-sensing is achieved with comparator C, which functions with the V_{OUT2} line on each chip. Finally, the positive regulator (ICL7663 only) has an output (V_{TC}) from a buffer amplifier (B), which can be used to generate programmable-temperature-coefficient output voltages.

The amplifiers, reference and comparator circuitry all operate at bias levels well below 1μA to achieve the extremely low quiescent current. This does limit the dynamic response of the circuits, however, and transients are best dealt with outside the regulator loop.

BASIC OPERATION

The ICL7663 and ICL7664 are designed to regulate battery voltages in the 5V to 15V region at maximum load currents of about 5mA to 30mA. Although intended as low power devices, power dissipation limits must be observed. For example, the power dissipation in the case of a 15V supply regulated down to 5V with a load current of 30mA clearly exceeds the power dissipation rating of the minidip: (15-5) (30) (10^{-3}) = 300mW. The test circuit illustrates proper use of the devices. Although the following discussion refers to the ICL7663, it applies as well to the parallel features of the ICL7664 as long as the appropriate polarities are reversed. Individual features and precautions will be discussed where appropriate.

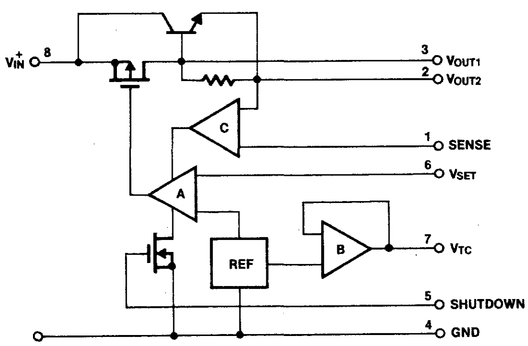

Figure 1. Block Diagram of the ICL7663

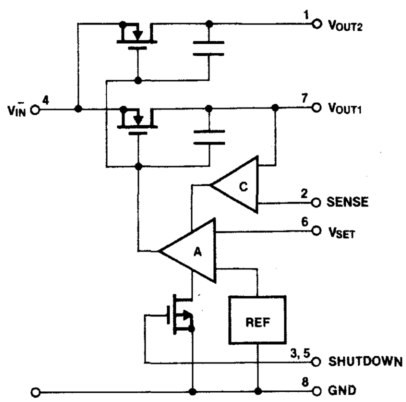

Figure 2. Block Diagram of the ICL7664

CMOS devices generally require two precautions: every input pin must go somewhere, and maximum values of applied voltages and current limits must be rigorously observed. Neglecting these precautions may lead to, at the least, incorrect or non-operation, and at worst, destructive device failure. To avoid the problem of latchup, do not apply inputs to any pins before supply voltage is applied.

Input Voltages—These regulators accept working inputs of about 1.4V to 16V. When power is applied, the rate-of-rise of the input may be hundreds of volts per microsecond. This is potentially harmful to the regulators, where internal operating currents are in the nanoampere range. The 0.047μF capacitor on the device side of the switch will limit inputs to a safe level around 2V/μs. Use of this capacitor is suggested in all applications. In severe rate-of-rise cases, it may be advisable to use an RC network on the SHutDowN pin to delay output turn-on. Battery charging surges, transients, and assorted noise signals should be kept from the regulators by RC filtering, zener protection, or even fusing.

Output Voltages—The resistor divider R_2/R_1 is used to scale the reference voltage, V_{SET}, to the desired output using the formula $V_{OUT} = (1 + R_2/R_1)\, V_{SET}$. In the ICL7664, V_{IN}^- and V_{SET} are negative, so V_{OUT} will be also. Suitable arrangements of these resistors, using a potentiometer, enables exact values for V_{OUT} to be obtained. Because of the low leakage current of the V_{SET} terminal, these resistors can be tens of megohms for minimum additional quiescent drain current. However, *some* load current is required for proper operation, so for extremely low-drain applications it is necessary to draw at least 1μA. This can include the current for R_2 and R_1.

Output voltages up to nearly the V_{IN} supply may be obtained at low load currents, while the low limit is the reference voltage. The minimum input-output differential in each regulator is obtained using the V_{OUT1} terminal.

Output Currents—For the ICL7663, low output currents of less than 5mA are obtained with the least input-output differential from the V_{OUT1} terminal (connect V_{OUT2} to V_{OUT1}). Either output may be used on the ICL7664, with the unused output connected to V_{IN}^-. Where higher currents are needed, use V_{OUT2} on the ICL7663 (V_{OUT1} should be left open in this case) and parallel V_{OUT1} and V_{OUT2} on the ICL7664.

High output currents can be obtained only as far as package dissipation allows. It is strongly recommended that output current-limit sensing be used in such cases.

Current-Limit Sensing—The on-chip comparator (C in the block diagrams) permits shutdown of the regulator output in the event of excessive current drain. As the test circuits show, a current-limiting resistor, R_{CL}, is placed in series with V_{OUT2}, and the SENSE terminal is connected to the load side of R_{CL}. When the current through R_{CL} is high enough to produce a voltage drop equal to V_{CL} (0.7V for ICL7663, 0.35V for ICL7664) the voltage feedback is bypassed and the regulator output will be limited to this current. Therefore, when the maximum load current (I_{LOAD}) is determined, simply divide V_{CL} by I_{LOAD} to obtain the value for R_{CL}.

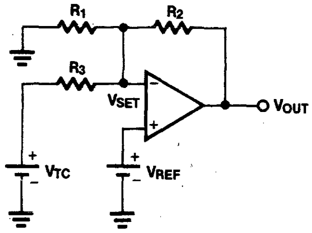
Logic-Controllable Shutdown—When equipment is not needed continuously (e.g., in remote data-acquisition systems), it is desirable to eliminate its drain on the system until it *is* required. This usually means switches, with their unreliable contacts. Instead, the ICL7663 and ICL7664 can be shut down by a logic signal, leaving only I_Q (under 4μA) as a drain on the power source. Since this pin must not be left open, it should be tied to ground if not needed. A voltage of less than 0.3V for the ICL7663, and greater than −0.3V for the ICL7664 will keep the regulator ON, and a voltage level of more than 1.4V but less than V_{IN}^+ for the ICL7663, and less than −1.4V but not less than V_{IN}^- for the ICL7664 control will turn the outputs OFF. If there is a possibility that the control signal could exceed the regulator input (V_{IN}^+ or V_{IN}^-), the current from this signal should be limited to 100μA maximum by a high-value (1MΩ) series resistor. This situation may occur when the logic signal originates from a separately-powered system from that of the regulator.

Additional Circuit Precautions—These regulators have poor rejection of voltage fluctuations from AC sources above 10Hz or so. To prevent the output from responding (where this might be a problem), a reservoir capacitor across the load is advised. The value of this capacitor is chosen so that the regulated output voltage reaches 90% of its final value in 20ms. From

$$I = C\frac{\Delta V}{\Delta t},\; C = I_{OUT}\frac{(20 \times 10^{-3})}{0.9V_{OUT}} = 0.022\frac{I_{OUT}}{V_{OUT}}.$$

In addition, where such a capacitor is used, a current-limiting resistor is also suggested (see **"Current-Limit Sensing"**).

Producing Output Voltages With Negative Temperature Coefficients—The ICL7663 has an additional output (not present on the ICL7664) which is 0.9V relative to GND and has a tempco of +2.5mV/°C. By applying this voltage to the inverting input of amplifier A (i.e., the V_{SET} pin), output voltages having negative TC may be produced. The TC of the output voltage is controlled by the R_2/R_3 ratio (see Figure 3 and its design equations).



EQ. 1: $V_{OUT} = V_{SET}\left(1 + \frac{R_2}{R_1}\right) + \frac{R_2}{R_3}(V_{SET} - V_{TC})$

EQ. 2: $TC\,V_{OUT} = -\frac{R_2}{R_3}(TC\,V_{TC})$ in mV/°C

WHERE: $V_{SET} = 1.3V$
$V_{TC} = 0.9V$
$TCV_{TC} = +2.5mV/°C$

Figure 3. Generating Negative Temperature Coefficients

APPLICATIONS (Continued)

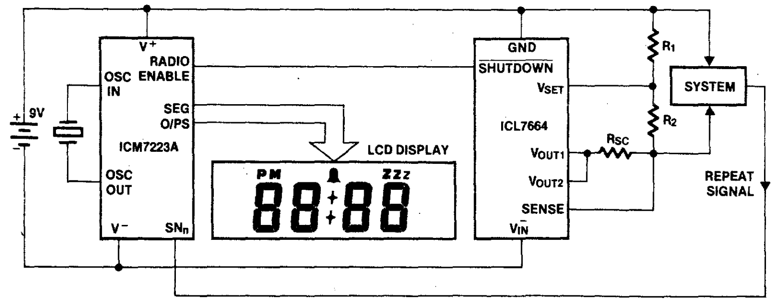


Figure 8. Once a Day System. This circuit will turn on a regulated supply to a system for one minute every day, via the SHUTDOWN pin on the ICL7664, and under control of the ICM7223A Alarm Clock circuit. If the system decides it needs another one minute activation, pulling the REPEAT line to V+ (GND) during one activation will trigger a subsequent activation after a **snooze** interval set by the choice of SN pins (2 mins shown). Alternatively, activation of the **Sleep** timer, without pause, can be achieved. See ICM7223A data sheet for details.

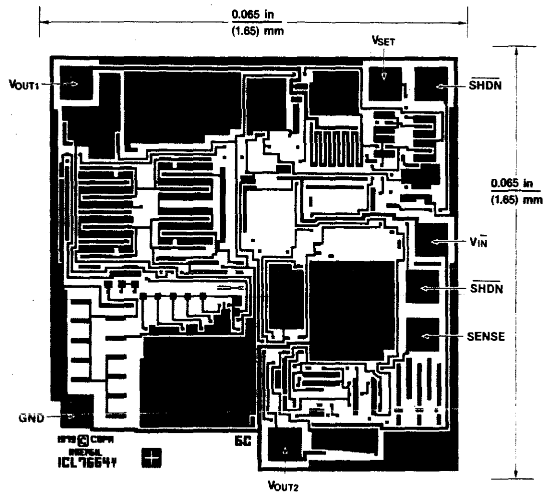
ICL7663



ICL7664

LINEAR

Intersil

ICL7665

Micropower Under-/ Over-Voltage Detector

FEATURES

- Exceptionally low supply current ($<3\mu A$ typ)
- Individually programmable upper and lower trip voltages and hysteresis levels
- Accurate on-chip bandgap reference, used by both detectors
- Up to 20mA output current sinking ability
- Wide supply voltage range

GENERAL DESCRIPTION

The ICL7665 contains two individually programmable voltage detectors on a single chip. Requiring only $\sim 3\mu A$ for operation, the device is intended for battery-operated systems and instruments which require high or low voltage warnings, settable trip points, or fault monitoring and correction. Typical applications are battery-backup computer memories, battery-operated medical devices, radiation dosimeters, pocket pagers, portable calibrators and test instruments, and charging systems.

Note 1: Derate above +25°C ambient temperature at 4mW/°C.

Note 2: Due to the SCR structure inherent in the CMOS process used to fabricate these devices, connecting any terminal to voltages greater than (V^+ +0.3V) or less than (GND − 0.3V) may cause destructive device latchup. For this reason, it is recommended that no inputs from external sources not operating from the same power supply be applied to the device before its supply is established, and that in multiple supply systems, the supply to the ICL7665 be turned on first. If this is not possible, currents into inputs and/or outputs must be limited to ±0.5mA and voltages must not exceed those defined above.

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

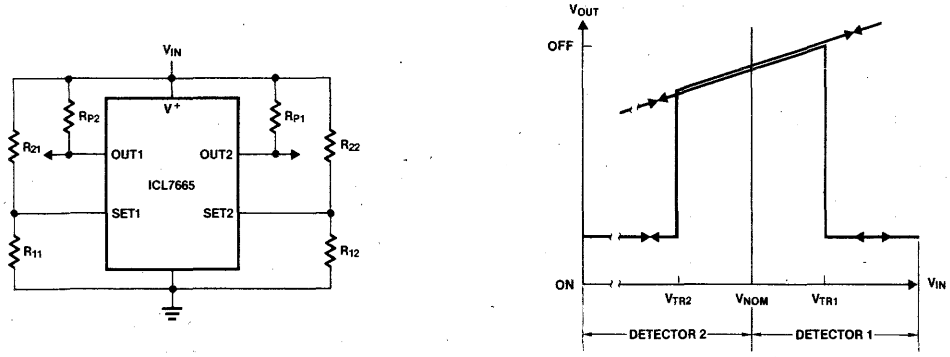
APPLICATIONS



(a) Circuit Configuration (b) Transfer Characteristics

Figure 1. Simple Threshold Detector

Figure 1 shows the simplest connection of the ICL7665 for threshold detection. From the graph (b), it can be seen that at low input voltages OUT1 is OFF, or high, while OUT2 is ON, or low. As the input rises (e.g. at power-on) toward V_{NOM} (usually the eventual operating voltage), OUT2 goes high on reaching V_{TR2}. If the voltage rises above V_{NOM} as much as V_{TR1}, OUT1 goes low. The equations giving V_{SET1} and V_{SET2} are, from Figure 1(a):

$$V_{SET1} = V_{IN} \frac{R_{11}}{(R_{11} + R_{21})} \qquad V_{SET2} = V_{IN} \frac{R_{12}}{(R_{12} + R_{22})}$$

Since the voltage to trip each comparator is nominally 1.3V, the value of V_{IN} for each trip point can be found from

$$V_{TR1} = V_{SET1} \frac{(R_{11} + R_{21})}{R_{11}} = 1.3 \frac{(R_{11} + R_{21})}{R_{11}} \text{ for detector 1 and}$$

$$V_{TR2} = V_{SET2} \frac{(R_{12} + R_{22})}{R_{12}} = 1.3 \frac{(R_{12} + R_{22})}{R_{12}} \text{ for detector 2.}$$

Either detector may be used alone, as well as both together, in any of the circuits shown here.

When V_{IN} is very close to one of the trip voltages, normal variations and noise may cause it to wander back and forth across this level, leading to erratic output ON and OFF conditions. The addition of hysteresis, making the trip points slightly different for rising and falling inputs, will avoid this condition.

Figure 2(a) shows how to set up such hysteresis, while Figure 2(b) shows how the hysteresis around each trip point produces switching action at different points depending on whether V_{IN} is rising or falling (the arrows indicate direction of change). The HYST outputs are basically switches which short out R_{31} or R_{32} when V_{IN} is above the respective trip point. Thus if the input voltage rises from a low value, the trip point will be controlled by R_{1n}, R_{2n} and R_{3n}, until the trip point is reached. As this value is passed, the detector changes state, R_{3n} is shorted out, and the trip point becomes controlled by only R_{1n} and R_{2n}, a lower value. The input will then have to fall to this new point to restore the initial comparator state, but as soon as this occurs, the trip point will be raised again.

An alternative circuit for obtaining hysteresis is shown in Figure 3. In this configuration, the HYST pins put the extra resistor in parallel with the upper setting resistor. The values of the resistors differ, but the action is essentially the same. The governing equations are given in Table 1. These ignore the effects of the resistance of the HYST outputs, but these can normally be neglected if the resistor values are above about 100kΩ.

INTERSIL

ICL8021—ICL8023 Low Power Operational Amplifiers

FEATURES

- ΔVos = 3 mV max (adjustable to zero).
- ±1V to ±18V Power Supply Operation.
- Power Consumption – 20 μW @ ± 1V.
- Input Bias Current – 30 nA max.
- Internal Compensation.
- Pin-For-Pin Compatible With 741.
- Short Circuit Protected.

ABSOLUTE MAXIMUM RATINGS

Supply Voltage	±18V
Differential Input Voltage (Note 1)	±15V
Common Mode Input Voltage (Note 1)	±15V
Output Short Circuit Duration	Indefinite
Power Dissipation (Note 2)	300 mW
Operating Temperature Range	
8021M	−55°C to +125°C
8021C	0°C to +70°C
Storage Temperature Range	−65°C to +150°C
Lead Temperature (Soldering, 10 sec)	+300°C

NOTE 1: For supply voltages less than ±15V, the absolute maximum input voltage is equal to the supply voltage.

NOTE 2: Rating applies for case temperatures to +125°C; derate linearly at 5.6 mW/°C for ambient temperatures above +95°C.

GENERAL DESCRIPTION

The Intersil 8021 integrated circuit is a low power operational amplifier specifically designed for applications requiring very low standby power consumption over a wide range of supply voltages. The electrical characteristics of the 8021 can be tailored to a particular application by adjusting an external resistor, R_{SET}, which controls the quiescent current. This is advantageous because I_Q can be made independent of the supply voltages: it can be set to an extremely low value where power is critical, or to a larger value for high slew rate or wideband applications.

Other features of the 8021 include low input current that remains constant with temperature, low noise, high input impedance, internal compensation and pin-for-pin compatibility with the 741.

The Intersil 8022 (8023) consists of two (three) low power operational amplifiers in a single 14-pin DIP. Each amplifier is identical to an 8021 low power op amp, and has separate connections for adjusting its electrical characteristics by means of an external resistor, R_{SET}, which controls the quiescent current of that amplifier.

Intersil

ICL8038 Precision Waveform Generator/Voltage Controlled Oscillator

FEATURES

- Low frequency drift with temperature - 50ppm/°C
- Simultaneous sine, square, and triangle wave outputs
- Low distortion - 1% (sine wave output)
- High linearity - 0.1% (triangle wave output)
- Wide operating frequency range - 0.001Hz to 0.3MHz
- Variable duty cycle - 2% to 98%
- High level outputs - TTL to 28V
- Easy to use - just a handful of external components required

GENERAL DESCRIPTION

The ICL8038 Waveform Generator is a monolithic integrated circuit capable of producing high accuracy sine, square, triangular, sawtooth and pulse waveforms with a minimum of external components. The frequency (or repetition rate) can be selected externally from .001Hz to more than 300kHz using either resistors or capacitors, and frequency modulation and sweeping can be accomplished with an external voltage. The ICL8038 is fabricated with advanced monolithic technology, using Schottky-barrier diodes and thin film resistors, and the output is stable over a wide range of temperature and supply variations. These devices may be interfaced with phase locked loop circuitry to reduce temperature drift to less than 50ppm/°C.

NOTE 5: Fig. 2, pins 7 and 8 connected, V_{SUPP} = ±10V. See Fig. 6c for T.C. vs V_{SUPP}.

APPLICATIONS

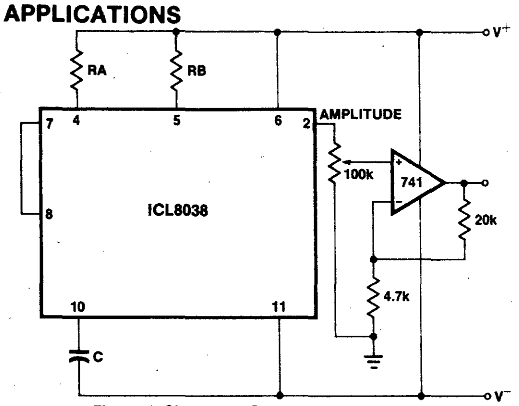

Figure 4: Sine Wave Output Buffer Amplifiers.

The sine wave output has a relatively high output impedance (1kΩ Typ). The circuit of Figure 4 provides buffering, gain and amplitude adjustment. A simple op amp follower could also be used.

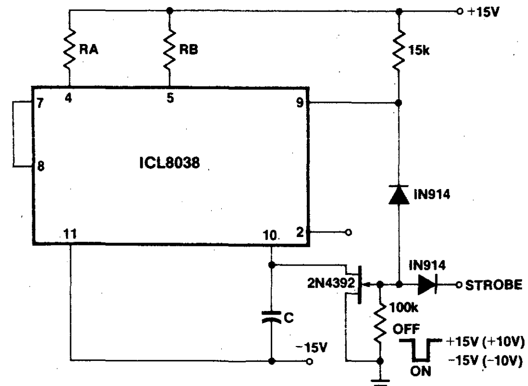

Figure 5: Strobe-Tone Burst Generator.

With a dual supply voltage the external capacitor on Pin 10 can be shorted to ground to halt the 8038 oscillation. Figure 5 shows a FET switch, diode ANDed with an input strobe signal to allow the output to always start on the same slope.

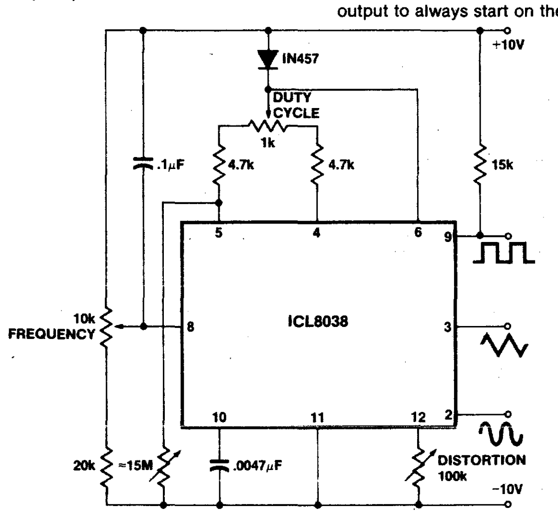

Figure 6: Variable Audio Oscillator, 20Hz to 20kHz.

To obtain a 1000:1 Sweep Range on the 8038 the voltage across external resistors R_A and R_B must decrease to nearly zero. This requires that the highest voltage on control Pin 8 exceed the voltage at the top of R_A and R_B by a few hundred millivolts.

The Circuit of Figure 6 achieves this by using a diode to lower the effective supply voltage on the 8038. The large resistor on pin 5 helps reduce duty cycle variations with sweep.

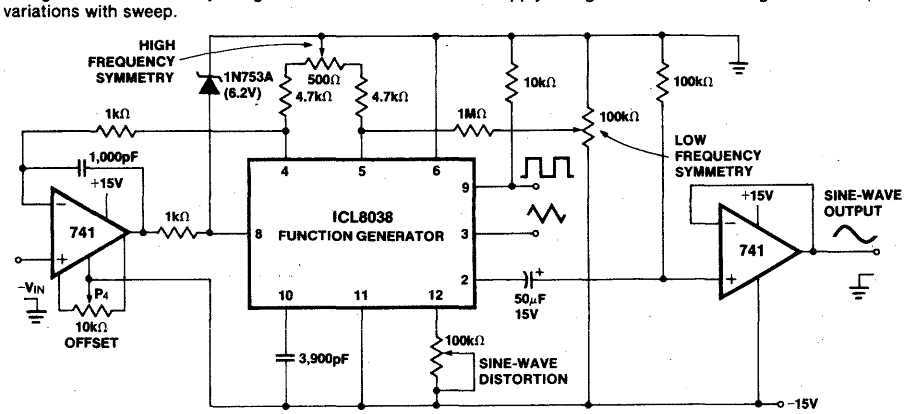

Figure 7: Linear Voltage Controlled Oscillator

The linearity of input sweep voltage versus output frequency can be significantly improved by using an op amp as shown in Figure 7.

LINEAR

Intersil

ICL8069 Series
Low Voltage Reference

FEATURES
- **Temperature Coefficient guaranteed to 10 ppm/°C max.**
- **Low Bias Current . . . 50μA min**
- **Low Dynamic Impedance**
- **Low Reverse Voltage**
- **Low Cost**

GENERAL DESCRIPTION
The ICL8069 is a 1.2V temperature compensated voltage reference. It uses the band-gap principle to achieve excellent stability and low noise at reverse currents down to 50μA. Applications include analog-to-digital converters, digital-to-analog converters, threshold detectors, and voltage regulators. Its low power consumption makes it especially suitable for battery operated equipment.

TYPICAL CONNECTION DIAGRAMS

Intersil

ICL8211, ICL8212
Programmable Voltage Reference

FEATURES
- High accuracy voltage sensing and generation: internal reference 1.15 volts typical
- Low sensitivity to supply voltage and temperature variations
- Wide supply voltage range: Typ. 1.8 to 30 volts
- Essentially constant supply current over full supply voltage range
- Easy to set hysteresis voltage range
- Defined output current limit - ICL8211
  High output current capability - ICL8212

GENERAL DESCRIPTION
The Intersil ICL8211/12 are micropower bipolar monolithic integrated circuits intended primarily for precise voltage detection and generation. These circuits consist of an accurate voltage reference, a comparator and a pair of output buffer/drivers.

Specifically, the ICL8211 provides a 7mA current limited output sink when the voltage applied to the 'THRESHOLD' terminal is less than 1.15 volts (the internal reference). The ICL8212 requires a voltage in excess of 1.15 volts to switch its output on (no current limit). Both devices have a low current output (HYSTERESIS) which is switched on for input voltages in excess of 1.15V. The HYSTERESIS output may be used to provide positive and noise free output switching using a simple feedback network.

Applications include:
1. Low voltage sensor/indicator
2. High voltage sensor/indicator
3. Non volatile out-of-voltage range sensor/indicator
4. Programmable voltage reference or zener diode
5. Series or shunt power supply regulator
6. Fixed value constant current source

NOTE 3: The maximum output current of the ICL8211 is limited by design to 15ma under any operating conditions. The output voltage may be sustained at any voltage up to +30 as long as the maximum power dissipation of the device is not exceeded.
NOTE 4: The maximum output current of the ICL8212 is not defined, and systems using the ICL8212 must therefore ensure that the output current does not exceed 30ma and that the maximum power dissipation of the device is not exceeded.

ICM7206 CMOS Touch Tone™ Encoder

FEATURES

- **Low cost system with minimum component count**
- **Fully integrated oscillator uses 3.58 MHz color TV crystal**
- **High current bipolar output driver**
- **Low output harmonic distortion**
- **Wide operating supply voltage range: 3 to 6 volts**
- **Uses inexpensive single contact per key calculator type keyboard (ICM7206/C/D)**
- **Extremely low power ≤ 5.5mW with a 5.5V supply**
- **Single and dual tone capabilities**
- **Multiple key lockout**
- **Disable output: provides output switch function whenever a key is pressed**
- **Custom options available**

GENERAL DESCRIPTION

The Intersil ICM7206/A/B/C/D are 2-of-8 sine wave tone encoders for use in telephone dialing systems. Each circuit contains a high frequency oscillator, two separate programmable dividers, a D/A converter, and a high level output driver.

The reference frequency is generated from a fully integrated oscillator requiring only a 3.58 MHz color TV crystal. This frequency is divided by 8 and is then gated into two divide by N counters (possible division ratios 1 through 128) which provide the correct division ratios for the upper and lower band of frequencies. The outputs from these two divide by N counters are further divided by 8 to provide the time sequencing for a 4 voltage level synthesis of each sinewave. Both sinewaves are added and buffered to a high current output driver, with provisions made for up to two external capacitors for low pass filtering, if desired. Typically, the total output harmonic distortion is 20% with no L.P. filtering and it may be reduced to typically less than 5% with filtering. The output drive level of the tone pairs will be approximately −3dBV into a 900 ohm termination. The skew between the high and low groups is typically 2.5 dB without low pass filtering.

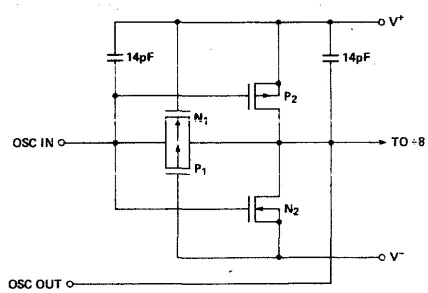
The 7206 uses either a 3 x 4 or 4 x 4 single contact keyboard; the oscillator will run whenever the power is applied, and the DISABLE output consists of a p-channel open drain FET whose source is connected to V^+.

The 7206A can also use a 3 x 4 or 4 x 4 keyboard, but requires a double contact type with the common line tied to V^+. The oscillator will be on whenever power is applied; the DISABLE output consists of a p-channel open drain FET; its' source is connected to V^+.

The 7206B requires a 4 x 4 double contact keyboard with the common line tied to V^-. The oscillator will be on only during the time that a ROW is enabled, and the DISABLE output consists of an n-channel open drain FET with its' source tied to V^-.

The 7206C uses either a 3 x 4 or 4 x 4 single contact keyboard; the oscillator will be on only during the time that a key is depressed. The DISABLE output consists of an n-channel open drain FET with its source tied to V^-.

The 7206D uses a single contact 3 x 4 or 4 x 4 keyboard. The oscillator will be on only during the time that a key is depressed. DISABLE output consists of a p-channel open drain FET with its source tied to V^+.



ICM7206 Oscillator

PIN CONFIGURATION (OUTLINE DRAWING PE)

ABSOLUTE MAXIMUM RATINGS (Note 1)

Supply Voltage (Note 2) 6.0V
Supply Current V^- (terminal 8) 25mA
Supply Current V^+ (terminal 16) 40mA
Disable Output Volt. (term. 7) .. Not more pos. than V^+ nor more neg. than -6V with respect to V^+
Output Volt. (term. 15). Not more pos. than +5V with respect to V^+, nor more neg. than -1.0 with respect to V^-
Output Current (terminal 15) 25mA
Power Dissipation 300mW
Operating Temperature Range .... -40°C to +85°C
Storage Temperature Range .... -55°C to +125°C

NOTE 1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

NOTE 2. The ICM7206 family has a zener diode connected between V^+ and V^- having a breakdown voltage between 6.2 and 7.0 volts. If the currents into terminals 8 and 16 are limited to 25 and 40mA maximum respectively, the supply voltage may be increased above 6 volts to zener voltage. With no such current limiting, the supply voltage must not exceed 6 volts.

TYPICAL OPERATING CHARACTERISTICS

TEST CONDITIONS: $V^+ = 5.5V$, Test Circuit, $T_A = 25°C$ unless otherwise specified.

Oscillator Startup Time ICM7206B, C, D	t_{start}	$V^+ = 3V$ (Note 5)			7	ms

NOTE 3: Operation above 6 volts must employ supply current limiting. Refer to 'ABSOLUTE MAXIMUM RATINGS' and the Application Notes for further information.

NOTE 4: The ICM7206 family uses dynamic high frequency circuitry in the initial 2^3 divider resulting in low power dissipation and excellent performance over a restricted frequency range. Thus, for reliable operation with a 6 volt supply an oscillator frequency of not less than 2MHz must be used.

NOTE 5: After row input is enabled.

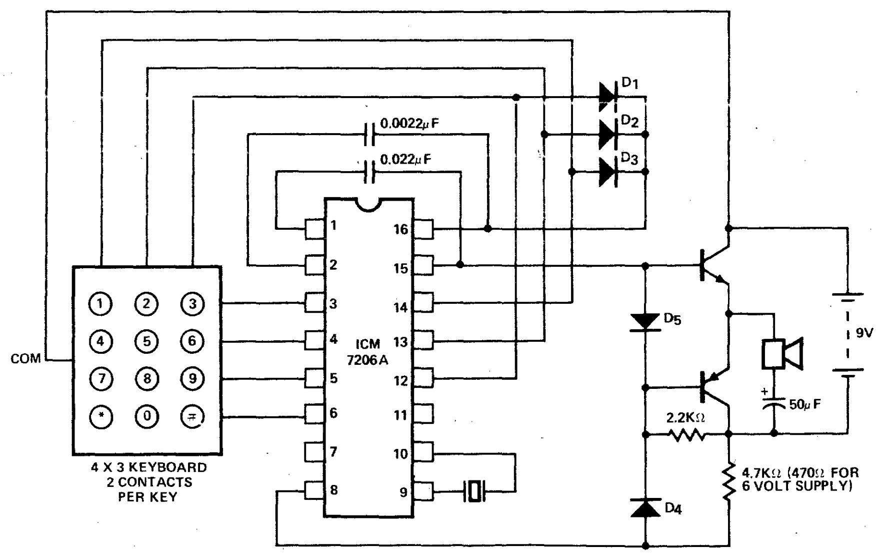

FIGURE 6: Portable Tone Generator

ICM7555/7556
CMOS
General Purpose Timers

FEATURES

- **Exact equivalent in most cases for SE/NE555/556 or the 355.**
- **Low Supply Current — 80μA Typ. (ICM7555) 160μA Typ. (ICM7556)**
- **Extremely low trigger, threshold and reset currents - 20pA Typical**
- **High speed operation - 500 kHz guaranteed**
- **Wide operation supply voltage range guaranteed 2 to 18 volts**
- **Normal Reset function - No crowbarring of supply during output transition.**
- **Can be used with higher impedance timing elements than regular 555/6 for longer RC time constants.**
- **Timing from microseconds through hours**
- **Operates in both astable and monostable modes**
- **Adjustable duty cycle**
- **High output source/sink driver can drive TTL/CMOS**
- **Typical temperature stability of 0.005% per °C at 25°C**
- **Outputs have very low offsets, HI and LO**

GENERAL DESCRIPTION

The ICM7555/6 are CMOS RC timers providing significantly improved performance over the standard SE/NE555/6 and 355 timers, while at the same time being direct replacements for those devices in most applications. Improved parameters include low supply current, wide operating supply voltage range, low THRESHOLD, $\overline{\text{TRIGGER}}$ and $\overline{\text{RESET}}$ currents, no crowbarring of the supply current during output transitions, higher frequency performance and no requirement to decouple CONTROL VOLTAGE for stable operation.

Specifically, the ICM7555/6 are stable controllers capable of producing accurate time delays or frequencies. The ICM7556 is a dual ICM7555, with the two timers operating independently of each other, sharing only V^+ and GND. In the one shot mode, the pulse width of each circuit is precisely controlled by one external resistor and capacitor. For astable operation as an oscillator, the free running frequency and the duty cycle are both accurately controlled by two external resistors and one capacitor. Unlike the regular bipolar 555/6 devices, the CONTROL VOLTAGE terminal need not be decoupled with a capacitor. The circuits are triggered and reset on falling (negative) waveforms, and the output inverter can source or sink currents large enough to drive TTL loads, or provide minimal offsets to drive CMOS loads.

APPLICATIONS

- Precision Timing
- Pulse Generation
- Sequential Timing
- Time Delay Generation
- Pulse Width Modulation
- Pulse Position Modulation
- Missing Pulse Detector

APPLICATION NOTES

GENERAL

The ICM7555/6 devices are, in most instances, direct replacements for the NE/SE 555/6 devices. However, it is possible to effect economies in the external component count using the ICM7555/6. Because the bipolar 555/6 devices produce large crowbar currents in the output driver, it is necessary to decouple the power supply lines with a good capacitor close to the device. The 7555/6 devices produce no such transients. See Figure 2.

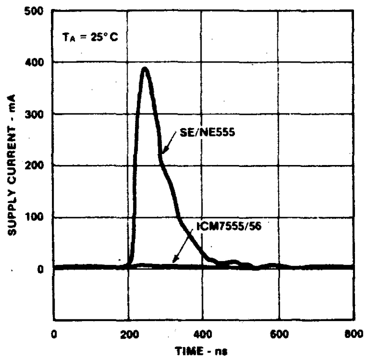

Figure 2. Supply Current Transient Compared with a Standard Bipolar 555 During an Output Transition

The ICM7555/6 produces supply current spikes of only 2-3 mA instead of 300-400 mA and supply decoupling is normally not necessary. Secondly, in most instances, the CONTROL VOLTAGE decoupling capacitors are not required since the input impedance of the CMOS comparators on chip are very high. Thus, for many applications 2 capacitors can be saved using an ICM7555, and 3 capacitors with an ICM7556.

POWER SUPPLY CONSIDERATIONS

Although the supply current consumed by the ICM7555/6 devices is very low, the total system supply can be high unless the timing components are high impedance. Therefore, use high values for R and low values for C in Figures 3 and 4.

OUTPUT DRIVE CAPABILITY

The output driver consists of a CMOS inverter capable of driving most logic families including CMOS and TTL. As such, if driving CMOS, the output swing at all supply voltages will equal the supply voltage. At a supply voltage of 4.5 volts or more the ICM7555/6 will drive at least 2 standard TTL loads.

ASTABLE OPERATION

The circuit can be connected to trigger itself and free run as a multivibrator, see Figure 3. The output swings from rail to rail, and is a true 50% duty cycle square wave. (Trip points and output swings are symmetrical). Less than a 1% frequency variation is observed, over a voltage range of +5 to +15V.

$$f = \frac{1}{1.4\,RC}$$

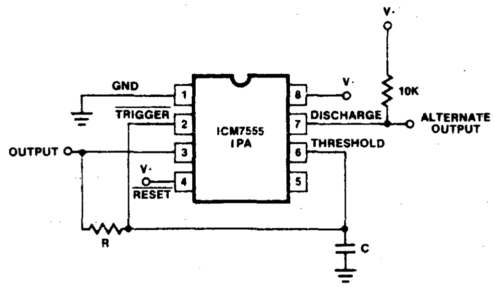

Figure 3: Astable Operation

MONOSTABLE OPERATION

In this mode of operation, the timer functions as a one-shot. Initially the external capacitor (C) is held discharged by a transistor inside the timer. Upon application of a negative $\overline{\text{TRIGGER}}$ pulse to pin 2, the internal flip flop is set which releases the short circuit across the external capacitor and drives the OUTPUT high. The voltage across the capacitor now increases exponentially with a time constant $t = R_AC$. When the voltage across the capacitor equals 2/3 V^+, the comparator resets the flip flop, which in turn discharges the capacitor rapidly and also drives the OUTPUT to its low state. $\overline{\text{TRIGGER}}$ must return to a high state before the OUTPUT can return to a low state.

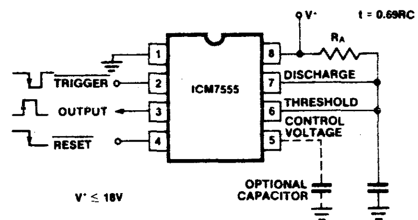

Figure 4: Monostable Operation

CONTROL VOLTAGE

The CONTROL VOLTAGE terminal permits the two trip voltages for the THRESHOLD and $\overline{\text{TRIGGER}}$ internal comparators to be controlled. This provides the possibility of oscillation frequency modulation in the astable mode or even inhibition of oscillation, depending on the applied voltage. In the monostable mode, delay times can be changed by varying the applied voltage to the CONTROL VOLTAGE pin.

$\overline{\text{RESET}}$

The $\overline{\text{RESET}}$ terminal is designed to have essentially the same trip voltage as the standard bipolar 555/6, i.e. 0.6 to 0.7 volts. At all supply voltages it represents an extremely high input impedance. The mode of operation of the $\overline{\text{RESET}}$ function is, however, much improved over the standard bipolar 555/6 in that it controls only the internal flip flop, which in turn controls simultaneously the state of the OUTPUT and DISCHARGE pins. This avoids the multiple threshold problems sometimes encountered with slow falling edges in the bipolar devices.

Note: See other MPS parts in Interface and Military Sections.

HIGH SLEW RATE, WIDE BANDWIDTH, SINGLE SUPPLY QUAD OPERATIONAL AMPLIFIER

A standard low-cost Bipolar technology with innovative design concepts is employed for the MC34074 series of monolithic quad operational amplifiers. These devices offer 4.5 MHz of gain bandwidth product, 13 V/μs slew rate, and fast settling time without the use of JFET device technology. In addition, low input offset voltage can economically be achieved. Although these devices can be operated from split supplies, they are particularly suited for single supply operation, since the common mode input voltage range includes ground potential (V_{EE}). The all NPN output stage, characterized by no deadband crossover distortion and large output voltage swing, also provides high capacitive drive capability, excellent phase and gain margins, low open-loop high frequency output impedance and symmetrical source/sink ac frequency response.

The MC34074/33074/35074 series of devices are available in standard or prime performance (A Suffix) grades and specified over commercial, industrial/vehicular or military temperature ranges.

Features

- Wide Bandwidth: 4.5 MHz
- High Slew Rate: 13 V/μs
- Fast Settling Time: 1.1 μs to 0.10%
- Wide Single Supply Operating Range: 3.0 to 44 Volts
- Wide Input Common Mode Range Including Ground (V_{EE})
- Low Input Offset Voltage: 2.0 mV Maximum (A Suffix)
- Large Output Voltage Swing: −14.7 V to +14.0 V for $V_S = \pm 15$ V
- Large Capacitance Drive Capability: 0 to 10,000 pF
- Low T.H.D. Distortion: 0.02%
- Excellent Phase Margins: 60°

Tight-Tolerance, Low-Drift Voltage Reference Family
The MC1400 series of ICs is a family of temperature-compensated voltage references for precision data conversion and instrumentation applications. Advances in thin-film resistors, laser-trimming techniques, ion-implanted devices, and monolithic fabrication techniques make this reference both temperature and time stable in applications demanding accuracy to the 12-bit level.

PRECISION VOLTAGE REFERENCES

2.5, 5.0, 6.25 and 10-VOLT

LASER-TRIMMED SILICON MONOLITHIC INTEGRATED CIRCUIT

Features
- Four Different Output Voltages: 2.5, 5.0, 6.25, 10 V
- Tight Absolute Accuracy: ±0.2% Maximum Initial Tolerance
- Single-Component Output Trimming Without Degrading Temperature Coefficient
- Wide Input Voltage Range: (V_{out} + 1.0 V) ≤ V_{in} ≤ 40 V
- Three-Terminal Operation: Positive References That Can Source and Sink Current
- Two-Terminal Operation: Positive or Negative References Floating References
- Low Current Consumption: 1.0 mA Typical
- Very Low Temperature Coefficient
- Low Output Noise Voltage
- Excellent Ripple Rejection: 87 dB Typical at 120 Hz
- Excellent Long Term Stability: 25 ppm/1000 Hrs Typical

ADC0844 8-Bit µP Compatible A/D Converter with 4-Channel Multiplexer

General Description

The ADC0844 is a CMOS 8-bit successive approximation A/D converter with a versatile analog input multiplexer. The 4-channel multiplexer can be software configured for single-ended, differential or pseudo-differential modes of operation.

The differential mode provides low frequency input common-mode rejection and allows offsetting the analog range of the converter. In addition, the A/D's reference can be adjusted enabling the conversion of reduced analog ranges with 8-bit resolution.

This A/D is designed to operate from the control bus of the NSC800™ and the wide variety of 8080 µP derivatives. TRI-STATE® output latches that directly drive the data bus permit this A/D to be configured as a memory location or as an I/O device to the microprocessor with no interface logic necessary.

Features

- Compatible with 8080 µP derivatives—no interface logic needed
- Easy interface to all microprocessors
- Operates ratiometrically or with 5 V_{DC} voltage reference
- No zero or full-scale adjust required
- 4-channel multiplexer with address logic
- Internal clock
- 0V to 5V input range with single 5V power supply
- T^2L/MOS input/output compatible
- 0.3″ standard width 20-pin DIP

Key Specifications

Resolution	8 Bits
Total Unadjusted Error	± 1/2 LSB and ± 1 LSB
Single Supply	5 V_{DC}
Low Power	10 mW
Conversion Time	40 µs

LF13006, LF13007 Digital Gain Set

General Description

The LF13006, LF13007 are precision digital gain sets used for accurately setting non-inverting op amp gains. Gains are set with a 3-bit digital word which can be latched in with $\overline{WR}$ and $\overline{CS}$ pins. All digital inputs are TTL and CMOS compatible.

The LF13006 shown below will set binary scaled gains of 1, 2, 4, 8, 16, 32, 64, and 128. The LF13007 will set gains of 1, 2, 5, 10, 20, 50, and 100 (a common attenuator sequence). In addition, both versions have several taps and two uncommitted matching resistors which allow customization of the gain.

The gains are set with precision thin film resistors. The low temperature coefficient of the thin film resistors and their excellent tracking result in gain ratios which are virtually independent of temperature.

The LF13006, LF13007 used in conjunction with an amplifier not only satisfies the need for a digitally programmable amplifier in microprocessor based systems, but is also useful for discrete applications, eliminating the need to find 0.5% resistors in the ratio of 100 to 1 which track each other over temperature.

Features

- TTL and CMOS compatible logic levels
- Microprocessor compatible
- Gain error 0.5% max
- Binary or scope knob gains
- Wide supply range +5V to ±18V
- Packaged in 16-pin DIP

BI-LINE[1]

LM1893 CARRIER-CURRENT TRANSCEIVER[2]

General Description

Carrier-current systems use the power mains to transfer information between remote locations. This bipolar carrier-current chip performs as a power line interface for half-duplex (bi-directional) communication of serial bit streams of virtually any coding. In transmission, a sinusoidal carrier is FSK modulated and impressed on most any power line via a rugged on-chip driver. In reception, a PLL-based demodulator and impulse noise filter combine to give maximum range. A complete system may consist of the LM1893, a COPS[1] controller, and discrete components.

---

[1] BI-LINE and COPS are trademarks of National Semiconductor Corp.

[2] Carrier-current transceivers are also called power line carrier (PLC) transceivers.

Features

- o Noise resistant FSK modulation
- o User-selected impulse noise filtering
- o Up to 4.8 KBaud data transmission rate
- o Strings of 0's or 1's in data allowed
- o Sinusoidal line drive for low RFI
- o Output power easily boosted 10-fold
- o 50 to 300 KHz carrier frequency choice
- o TTL and MOS compatible digital levels
- o Regulated voltage to power logic
- o Drives all conventional power lines

Applications

- o Energy management systems
- o Home convenience control
- o Inter-office communication
- o Appliance control
- o Fire alarm systems
- o Security systems
- o Telemetry
- o Computer terminal interface

TYPICAL APPLICATION

FIGURE 1. Block diagram of carrier - current chip with a complement of discrete components making a complete transceiver. Use caution with this circuit - dangerous line voltage are present.

LM2935 Low Dropout Dual Regulator

General Description

The LM2935 positive voltage regulator features a low quiescent current of 3 mA or less when supplying 10 mA loads from the standby regulator output. This unique characteristic and the extremely low input-output differential required for proper regulation (0.55V for output currents of 10 mA) make the LM2935 the ideal regulator for power systems that include standby memory. Applications include processor power supplies demanding as much as 750 mA of output current.

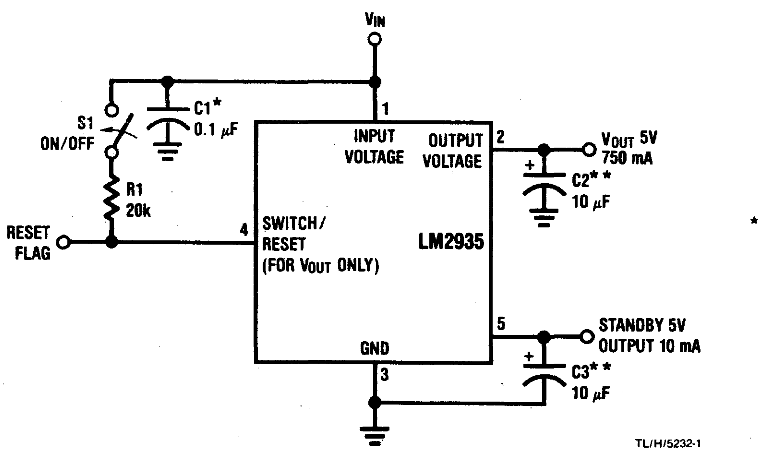
Designed primarily for automotive applications, the LM2935 and all regulated circuitry are protected from reverse battery installations or 2 battery jumps. During line transients, such as a load dump (60V) when the input voltage to the regulator can momentarily exceed the specified maximum operating voltage, the 0.75A regulator will automatically shut down to protect both internal circuits and the load while the standby regulator will continue to power any standby load. The LM2935 cannot be harmed by temporary mirror-image insertion. Familiar regulator features such as short circuit and thermal overload protection are also provided.

Fixed outputs of 5V are available in the plastic TO-220 power package.

Features

- Two regulated outputs
- Output current in excess of 750 mA
- Low quiescent current standby regulator
- Input-output differential less than 0.6V at 0.5A
- Reverse battery protection
- 60V load dump protection
- −50V reverse transient protection
- Short circuit protection
- Internal thermal overload protection
- Available in plastic TO-220
- ON/OFF switch for high current output
- Reset error flag
- 100% electrical burn-in

Typical Application Circuit



* Required if regulator is located far from power supply filter.

** Required for stability. May be increased without bound. Capacitor must be rated to operate at the minimum temperature expected for the regulator system.

MF4 4th Order Switched Capacitor Butterworth Lowpass Filter

General Description

The MF4 is a versatile, easy to use, precision 4th order Butterworth lowpass active filter. Switched capacitor techniques eliminate external component requirements and allow a clock tunable cutoff frequency. The ratio of the clock frequency to the lowpass cutoff frequency is internally set to 50 to 1 (MF4-50) or 100 to 1 (MF4-100). A Schmitt trigger clock input stage allows two clocking options, either self-clocking (via an external resistor and capacitor) for stand-alone applications, or for tighter cutoff frequency control, a TTL or CMOS logic compatible clock can be directly applied. The maximally flat passband frequency response together with a DC gain of 1 V/V allows cascading MF4 sections for higher order filtering.

Features

- Low Cost
- Easy to use
- No external components
- 8-pin mini-DIP
- Cutoff frequency accuracy of ±0.3%
- Cutoff frequency range of 0.1 Hz to 20 kHz
- 5V to 14V operation
- Cutoff frequency set by external or internal clock

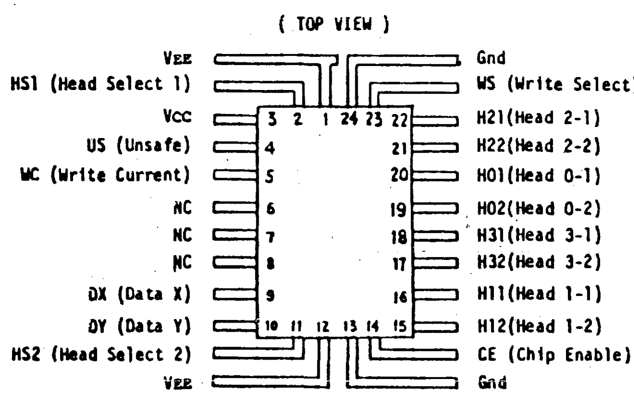
μPC751B/μPC752B BIPOLAR ANALOG INTEGRATED CIRCUITS

Read/Write IC For Disk Drive System

The μPC751B/752B is a monolithic bipolar integrated circuit writing and reading data in a high performance magnetic disk storage system. The circuit is intended for use on a data head support arm. Each circuit can be used with up to four independent heads. Each I.C. contains four write drivers, four read preamplifiers, an output line driver, head select logic, and some fault monitoring circuitry, and has three modes of operation: Read, Write and Idle. The μPC752B is similar to the μPC751B in function, but provides a lower differential gain in the read mode for use with higher inductance and higher output heads. All signal levels and currents are fully compatible with IBM Model 3350 head/arm assembly.

Pin Configuration



Absolute Maximum Ratings

Parameter	Min.	Max.	Units
Positive Supply Voltage, V_{CC}	-0.6	7.0	V
Negative Supply Voltage, V_{EE}	-5.5	0.6	V
Input Voltage	V_{EE}-0.3	V_{CC}+0.3	V
Storage Temperature Range	-65	150	°C
Operating Moving-air Temperature Range	0	70	°C
Operating Junction Temperature Range		150	°C

Recommended Operating Limits

Parameter	Mode	Min.	Max.	Units
V_{CC}	Read/Write/Idle	5.7	6.3	V
V_{EE}	Read/Write/Idle	-4.2	-3.8	V
Unsafe Voltage	Read/Write/Idle	4	V_{CC}+0.3	V
Head Center Tap Voltage	Write	3.2	3.8	V
Write Current (I_{WC})	Write		45	mA

AC Test Conditions
(Unless otherwise specified)

Parameter	Mode		Units
V_{CC}	Read/Write/Idle	6.00±0.01	V
V_{EE}	Read/Write/Idle	-4.00±0.01	V
V_{WS}	Read	0.00±0.01	V
V_{WS}	Write	3.50±0.01	V
V_{CE}	Read/Write	$0.00^{+0.01}_{-0.00}$	V
Lh	Read/Write/Idle	Max. 0.1	μH
Rh	Read/Write/Idle	Max. 0.01	Ω
V_{CT}	Read	0.00±0.01	V
V_{CT}	Write	3.50±0.01	V
V_{US}	Read/Write/Idle	6.00±0.01	V
R_{L1}	Read/Write/Idle	200 ± 1	Ω
R_{L2}	Read/Write/Idle	$101 \pm ^{1}_{0}$	Ω
I_{WC}	Read	0	mA
I_{WC}	Write	40 ± 1	mA
Ambient Temperature	Read/Write/Idle	25 ± 2	°C

Head Selection Table

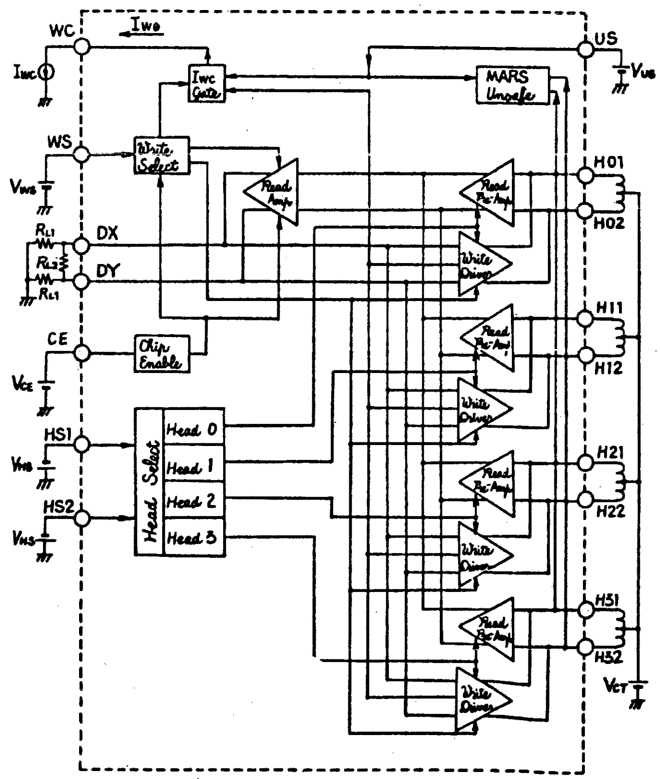
Head Selected	VHS1	VHS2
0	V_{HHS}	V_{HHS}
1	V_{LHS}	V_{HHS}
2	V_{HHS}	V_{LHS}
3	V_{LHS}	V_{LHS}

Mode Select

The Circuit has three modes of operation : Read, Write, and Idle. The state of the Chip Enable and Write Select determines the mode of operation as follows :

Characteristics	Conditions	Min.	Max.	Units
(Chip Enable)				
V_{HCE}	Idle	5.5	6.3	V
V_{LCE}	Read/Write	0.0	0.7	V
I_{HCE}	Idle, V_{CE}=V_{CC} - 0.5V	-110	-50	μA
I_{LCE}	Read/Write, V_{CE}=0.0V	-1.3	-0.7	mA
(Write Select)				
V_{HWS}	Write/Idle	3.2	3.8	V
V_{LWS}	Read/Idle	-0.1	0.1	V
I_{HWS}	Write/Idle (transition unsafe current off)	0.35	2.7	mA
	Write (transition unsafe current on)	0.7	3.5	mA
I_{LWS}	Read/Idle		0.1	mA
Switching Delay	All Modes		0.5	μS

Connection Diagram



Supply Current:

Characteristics	Conditions	Min.	Max.	Units
I_{CC}(R/W)	Read/Write	12	20	mA
I_{CC}(ID)	Idle		150	μA
I_{EE}(R/W)	Read/Write		70	mA
I_{EE}(ID)	Idle		40	mA

Total Head Input Current:

Sum of all head input currents with I_{WC}=0

Characteristics	Conditions	Min.	Max.	Units
I_{HC}(W)	Write, V_{CT}=3.5V		3.0	mA
I_{HC}(R)	Read, V_{CT}=0.0V		0.16	mA
I_{HC}(ID)	Idle, V_{CT}=3.5 or 0.0V		0.10	mA

Head Select:

One of four heads may be selected by controlling the state of two head select inputs. The head is selected as specified below :

Characteristics	Conditions	Min.	Max.	Units
V_{HHS}	Temp=0°C∿70°C	-0.97	-0.61	V
V_{LHS}	Temp=0°C∿70°C	-2.38	-1.52	V
I_{HHS}			240	μA
I_{LHS}			60	μA
Switching Delay			50	ns

Read Mode: (μPC751B)

In the Read mode the circuit functions as a low noise differential amplifier. The state of the head select inputs determines which amplifier is active.

Characteristics	Conditions		Min.	Max.	Units
Input Current	Vin=0v			20	μA
Differential Input Capacity	Vin=0v			18.8	pF

MC4290
BIPOLAR INTEGRATED CIRCUIT

Description

The circuit is an integrated Read/Write chip intended for use with non-center tapped thin film heads in disk drive systems. Each chip controls four heads, and has three modes of operation: read, write and idle.

The chip has four channels of read amplifiers and write drivers. It also has an internal write current source. The write current magnitude is determined by laser trimmed internal resistors. The chip contains fault detection circuits.

μPC1651G BIPOLAR ANALOG INTEGRATED CIRCUIT

Description

The μPC1651G is a silicon monolithic integrated circuit especially designed as wide band amplifier covered from HF band to UHF band.

Features

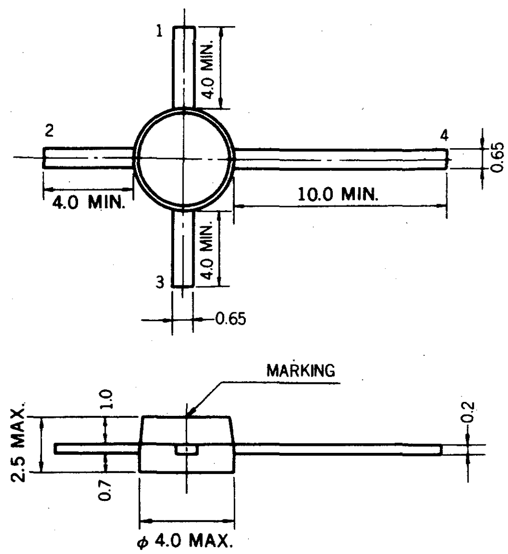
- ☐ Excellent frequency response; TYP. 1200 MHz @3 dB down
- ☐ High power gain; TYP. 19 dB @f = 500 MHz
- ☐ Low voltage operation; 5V
- ☐ Small package

ABSOLUTE MAXIMUM RATINGS (T_a = 25°C)

Supply Voltage	V_{CC}	6	V
Total Power Dissipation	P_T	250	mW
Operating Temperature	T_{opt}	-20 to + 75	°C
Storage Temperature	T_{stg}	-40 to + 125	°C

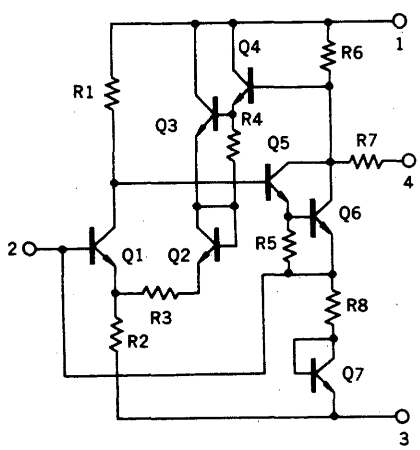
PACKAGE DIMENSIONS

in millimeters



1. V_{CC}
2. INPUT
3. GND
4. OUTPUT

EQUIVALENT CIRCUIT

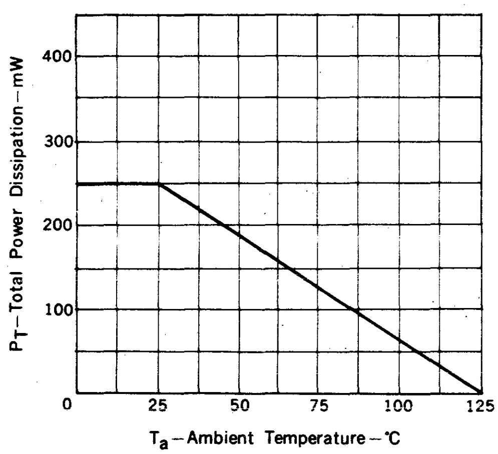


ELECTRICAL CHARACTERISTICS (T_a = 25 °C)

CHARACTERISTIC	SYMBOL	MIN.	TYP.	MAX.	UNIT	TEST CONDITIONS
Circuit Current	I_{CC}	15	20	25	mA	V_{CC} = 5 V
Gain	G_V	16	19		dB	V_{CC} = 5 V, f = 500 MHz
Noise Figure	NF		5.5	6.5	dB	V_{CC} = 5 V, f = 500 MHz
Band Width	BW	1 000	1 200		MHz	V_{CC} = 5 V, 3 dB down
Isolation	I_{so}	20	24		dB	V_{CC} = 5 V, f = 500 MHz
Input Return Loss	$\|S_{11}\|$		15		dB	V_{CC} = 5 V, f = 500 MHz
Output Return Loss	$\|S_{22}\|$		10		dB	V_{CC} = 5 V, f = 500 MHz
Maximum Output Level	V_{OM}		112		dBμV	V_{CC} = 5 V, f = 500 MHz

TYPICAL CHARACTERISTICS ($T_a = 25\,°C$)

TOTAL POWER DISSIPATION vs. AMBIENT TEMPERATURE



CIRCUIT CURRENT vs. SUPPLY VOLTAGE
