SP8612B

1800MHz ÷ 4

The SP8612B is an asynchronous emitter coupled logic counter which provides ECL 10K compatible outputs and can drive 100 ohm lines. They operate from a -6.8V or +5, -1.8V supply but are otherwise similar to the SP8610 and 8611.

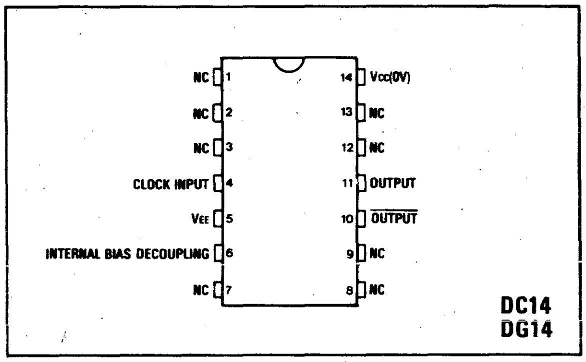

Fig.1 Pin connections - top view

FEATURES

- ECL Compatible Output
- AC Coupled Input (Internal Bias)
- Typical Operating Frequency 2GHz

QUICK REFERENCE DATA

- Supply Voltage: -6.8V
- Power Consumption: 500mW
- Output Voltage Swing: 60mV typ.

ABSOLUTE MAXIMUM RATINGS

- Supply Voltage: (V_{CC}-V_{EE}) 8V
- Output Current: 15mA
- Storage Temperature Range: -55°C to +150°C
- Max. Junction Temperature: +150°C
- Max. Input Voltage: 2.5V p-p

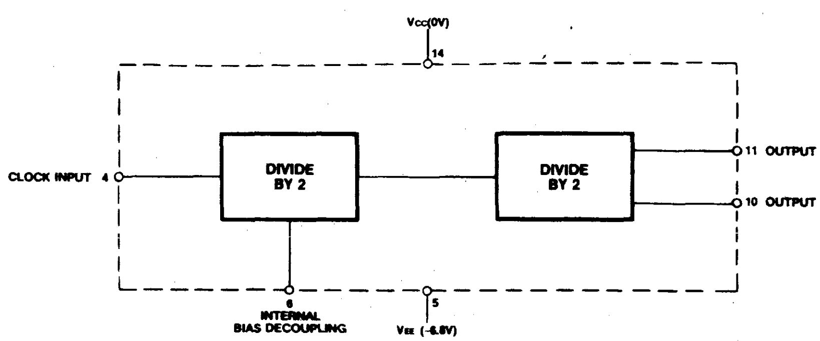

Fig.2 Functional diagram

ELECTRICAL CHARACTERISTICS

Supply voltage: V_{CC} = 0V, V_{EE} =-6.8V ± 0.25V
Temperature: T_{amb} = 0°C to +70°C

Characteristics	Symbol	Value Min.	Value Max.	Units	Conditions	Temperature
Maximum frequency sinewave input	f_{max}	1.8		GHz	Input = 800-1200mV p-p	As specified
Minimum frequency sinewave input	f_{min}		900	MHz	Input = 400-1200mV p-p	As specified
Power supply current	I_{EE}		110	mA	Outputs unloaded V_{EE} = -7.15V	As specified
Output low voltage	V_{OL}	-1.9	-1.62	V	Outputs loaded with 620Ω to V_{EE} = -6.8V	25°C
Output high voltage	V_{OH}	-0.93	-0.75	V	Outputs loaded with 620Ω to V_{EE} + -6.8V	25°C
Minimum output swing	V_{OUT}	500		mV	Outputs loaded with 620Ω to V_{EE} = -6.8V	As specified

NOTES
1. Unless otherwise stated, the electrical characteristics are guaranteed over specified supply, frequency and temperature range.
2. The temperature coefficients of V_{OH} = +1.2mV/°C and V_{OL} = +0.24mV/°C.
3. The test configuration for dynamic testing is shown in Fig. 5.

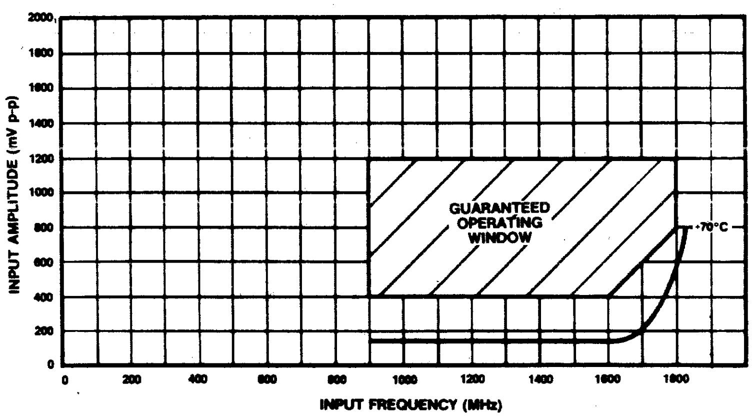

Fig.3 Typical input characteristics SP8612B

OPERATING NOTES

1. The clock input (pin 4) should be capacitively coupled to the signal source. The input signal path is completed by connecting a capacitor from the internal bias decoupling, pin 6 to ground.
2. If no signal is present the device will self-oscillate. If this is undesirable it may be prevented by connecting a 10k resistor from the input to V_{EE} (i.e. pin 4 to pin 7). This reduces sensitivity by approximately 100mV.
3. The input can be operated at very low frequencies but slew rate must be better than 200V/µs.
4. The input impedance of the SP8612 is a function of frequency. See Fig. 4.
5. The emitter follower outputs require external load resistors. These should not be less than 330 ohms, and a value of 620 ohms is recommended. Interfacing to ECL III/10K is shown in Fig. 7.
6. These devices may be used with split supply lines by means of the circuit of Fig. 6. Some improvement in the upper frequency of operation may be obtained under these conditions, but suitable circuit layout must be employed to achieve this improvement.

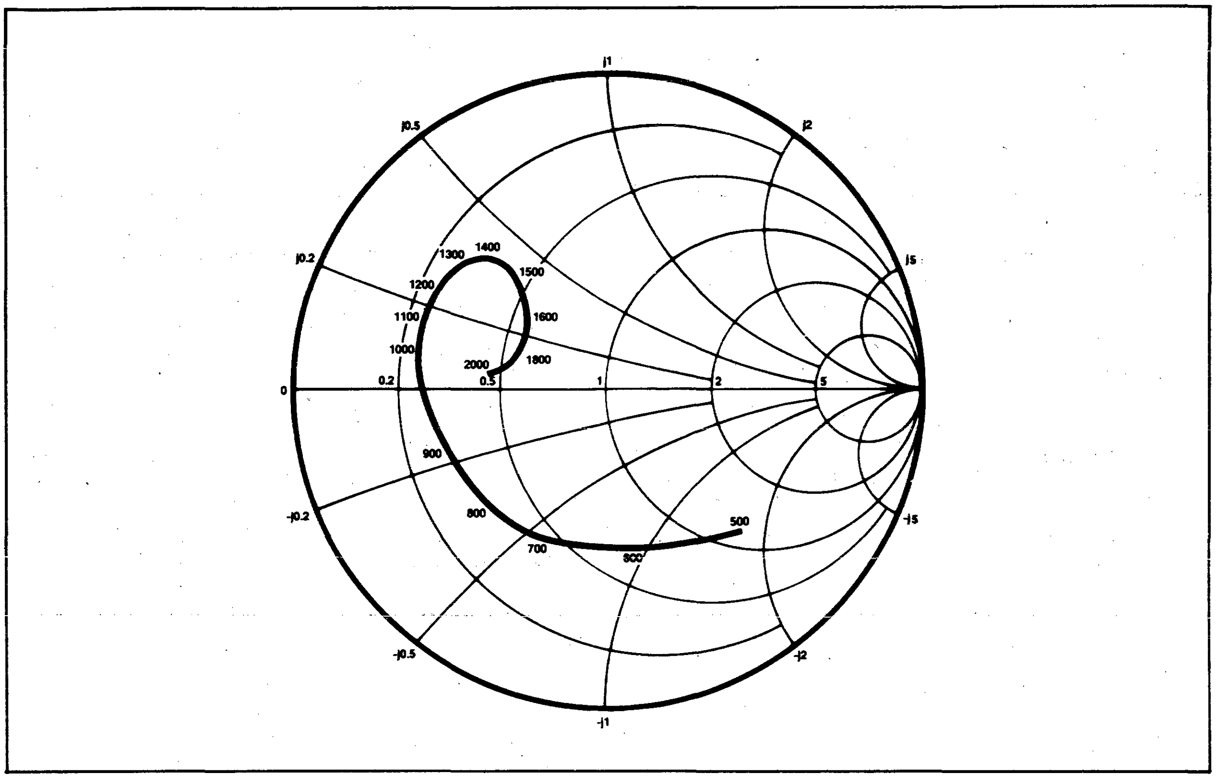

Fig.4 Typical input impedance. Test conditions: supply voltage .6.8V, ambient temperature 25° C. Frequencies in MHz, impedances normalised to 50 ohms.

LINEAR AND CONVERSION PRODUCTS FROM PMI

THE PMI COMMITMENT

PMI is committed to building long term customer relationships resulting in mutual growth.

At PMI we dedicate ourselves to leadership in customer service, quality, and technology.

Our goal is flawless performance and professional excellence.

PMI is a leading manufacturer of precision, high quality, linear integrated circuits. Our full line of analog signal processing products includes:

Operational Amplifiers
Instrumentation Amplifiers
Voltage Followers/Buffers
Voltage Comparators
Matched Transistor Pairs
Voltage References
Digital-to-Analog Converters
Analog Switches/Multiplexers
Sample-and-Hold Amplifiers
Communications Products

Applications range from instrumentation, data acquisition and process control to telecommunications and military/aerospace equipment.

For comprehensive information write to Precision Monolithics, Incorporated on your company letterhead and you'll receive your FREE copy of PMI's 1984 Data Book.

OPERATIONAL —AMPLIFIERS

SELECTION GUIDE

The Operational Amplifier Selection Guide chart highlights PMI's line of operational amplifiers. The matrix indicates the most essential parametric differences for each product group.

"General Purpose" op amps are usually the least expensive and are recommended for applications where impedance levels are relatively low, closed-loop gain is low, and speed requirements are moderate. BIFET inputs provide lower input-bias-currents and better bandwidth than standard bipolar inputs, but input voltage offsets and noise are generally better for the bipolar input amplifiers.

The "High Accuracy" category presents the best amplifiers for high-gain applications. A combination of low input-offset-voltage, high open-loop gain, and high CMRR provide excellent DC accuracy even at high closed-loop gain. The OP-27/37 are best for minimum input voltage noise. The OP-08/12 provide an excellent combination of low input-bias-current, low offset voltage, and moderate power drain. The OP-07 offers a selection of the lowest offset voltages (60μV max to 250μV max) combined with low input-bias-current ($\pm$2nA max to $\pm$12nA max) and has become an industry standard for high-precision applications.

PMI is a leader in op amps featuring low power consumption. The OP-20/21/22 are micropower op amps that operate with only a few microamps of supply drain. PSRR and CMRR are high, and the input-voltage-range is wide. Such features work together to make these amplifiers ideal for battery-powered applications or for operation from a single supply voltage. The OP-22 can be programmed to operate over any supply current from 1μA to 400μA and is excellent for battery-powered designs.

D/A CONVERTERS

SELECTION GUIDE

PMI offers a complete line of digital-to-analog converters (DACs), all which are guaranteed to be monotonic over their operating temperature ranges, and some which have become industry standards. The DACs have been arranged in a matrix which highlights their primary characteristics so that the user can easily narrow the selection according to specific requirements. More detailed specifications are then tabulated in each product group.

LINEAR

Precision Monolithics

PMI Precision Monolithics Incorporated

AMP-01

LOW-NOISE PRECISION INSTRUMENTATION AMPLIFIER

PRELIMINARY

FEATURES

- **Low Offset Voltage** **15μV**
- **Very Low Offset Voltage Drift** .... **0.1μV/°C**
- **Low Noise** .... **$0.2\mu V_{p\text{-}p}$ (0.1Hz to 10Hz)**
- **Excellent Output Drive** .... **±10V at ±50mA**
- **Capacitive Load Stability** .... **to 1μF**
- **Gain Range** .... **0.1 to 10,000**
- **Excellent Linearity** .... **16-Bit at G = 1000**
- **High CMR** .... **140dB (G = 1000)**
- **Low Bias Current** **1nA**
- **May be Configured as a Precision Op-Amp**
- **Output-Stage Thermal Shutdown**

GENERAL DESCRIPTION

The AMP-01 is a monolithic instrumentation amplifier designed for high-precision data acquisition and general instrumentation applications. The design combines the conventional features of an instrumentation amplifier with a high-current output stage. The output remains stable with high capacitance loads (1μF), a unique ability for an instrumentation amplifier. Consequently, the AMP-01 can amplify low-level signals for transmission through long cables without requiring an output buffer. The output stage may be configured as a voltage or current generator.

Input offset voltage is very low (15μV) which generally eliminates the need for an external null potentiometer. Temperature changes have minimal effect on offset; TCV_{IOS} is typically 0.1μV/°C. Excellent low-frequency noise performance is achieved with a minimal compromise on input protection. Bias current is very low, less than 10nA over the industrial temperature range.

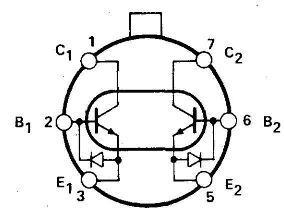
GENERAL DESCRIPTION

The design of the MAT-02 series of NPN dual monolithic transistors is optimized for very low noise, low drift, and low r_{BE}. Precision Monolithics' exclusive Silicon Nitride "Triple-Passivation" process stabilizes the critical device parameters over wide ranges of temperature and elapsed time. Also, the high current gain (h_{FE}) of the MAT-02 is maintained over a wide range of collector current. Exceptional characteristics of the MAT-02 include offset voltage of 50μV max (A/E grades) and 150μV max (B/F grades). Device performance is specified over the full military temperature range as well as at 25°C.

Input protection diodes are provided across the emitter-base junctions to prevent degradation of the device characteristics due to reverse-biased emitter current. The substrate is clamped to the most negative emitter by the parasitic isolation junction created by the protection diodes. This results in isolation between the transistors.

The MAT-02 should be used in any application where low noise is a priority. The MAT-02 can be used as an input stage to make an amplifier with noise voltage of less than 2.0nV/$\sqrt{Hz}$ at 100Hz. Other applications, such as log/antilog circuits may use the excellent logging conformity of the MAT-02. Typical excess emitter resistance is only 0.3Ω to 0.4Ω. The MAT-02 electrical characteristics approach those of an ideal transistor when operated over a collector current range of 1μA to 10mA.

PIN CONNECTIONS



TO-78
(H-Suffix)

NOTE: Substrate is connected to case. Substrate potential is held at one V_{BE} above the most negative emitter potential.

ELECTRICAL CHARACTERISTICS at V_{CB} = 15V, I_C = 10μA, T_A = 25°C, unless otherwise noted.

OP-32

HIGH-SPEED PROGRAMMABLE MICROPOWER OPERATIONAL AMPLIFIER (SINGLE OR DUAL SUPPLY)

PRELIMINARY

FEATURES

- **Programmable Supply Current .... 1μA to 2mA**
- **Single Supply Operation .... +3V to +30V**
- **Dual Supply Operation .... ±1.5V to ±15V**
- **Low Input Offset Voltage 100μV**
- **Low Input Offset Voltage Drift .... 0.75μV/°C**
- **High Common-Mode Input Range ... V− to V+ (−1.5V)**
- **High CMRR and PSRR 115dB**
- **High Open-Loop Gain 2000V/mV**
- **±30V Input Overvoltage Protection**
- **Fast .... 1V/μs @ I_{SET} = 20μA**
- **LM4250 Pinout**
- **Compensated for Minimum Gain of 10**

GENERAL DESCRIPTION

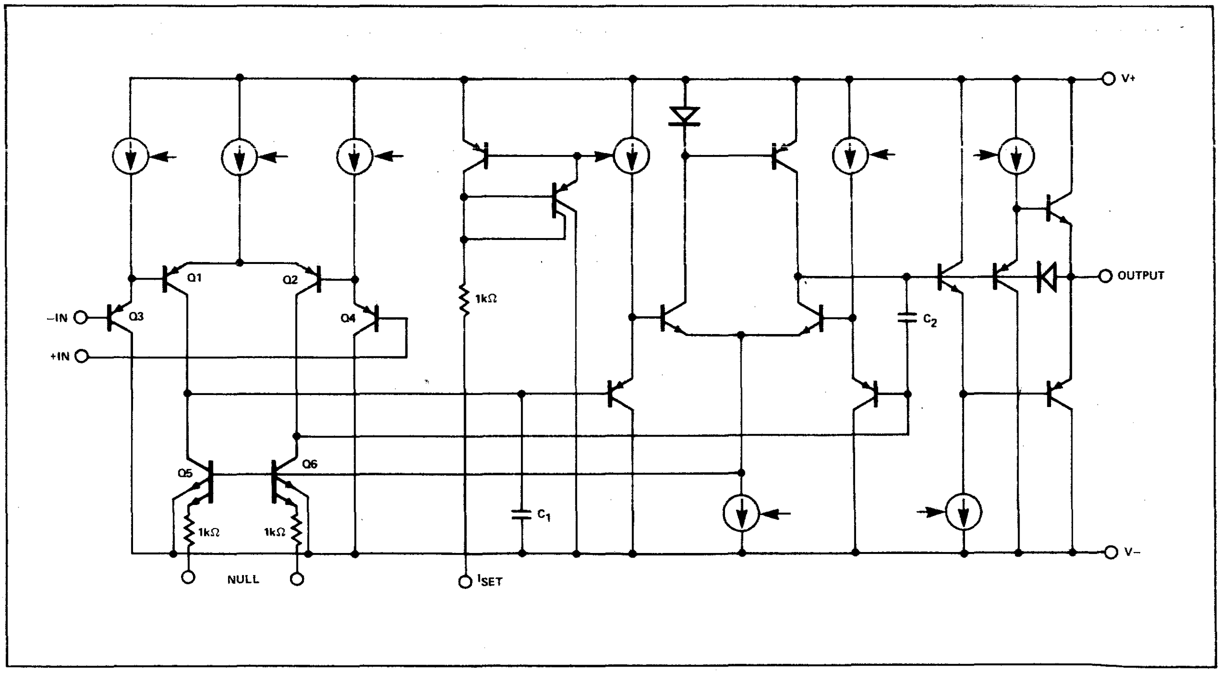
The OP-32 is a high-speed, high-gain programmable operational amplifier. Both offset voltage and offset current are low, and both are stable with changes in temperature, supply voltage, and set current. High CMRR and PSRR ensure precision performance when the OP-32 is used with an unregulated battery or vehicular electrical systems.

The wide input voltage range, including the negative supply or ground, allows use in single-battery applications. The OP-32 is characterized over a wide supply range of ±1.5V to ±15V. This guarantees predictable performance with any commonly available supply.

The ability to operate at relatively high speed with low power consumption makes this amplifier ideal for remote applications where power is limited. The programmability allows each amplifier in a system to be set for the minimum power consumption necessary for each specific application. Programmability also makes it possible to adjust the bandwidth and phase shift.

The OP-32 pinout is identical to the LM4250 and many other micropower operational amplifiers. This allows easy upgrading of system performance.

SIMPLIFIED SCHEMATIC



The premium performance of this product is achieved through an advanced processing technology. All Precision Monolithics products are guaranteed to meet or exceed published specifications.

Inverting Switching Regulator

4391

Features

- Converts a Positive Voltage into a Negative Voltage
- Specifically Designed for Low Power Applications, Including Batteries
- Adjustable Output Voltage
- High Switch Current Capability
- Low Quiescent Supply Current — 175µA Typical
- Eight Pin Mini Package
- Low Battery Detection Circuitry

Description

Raytheon's micro-power inverting switching regulator, RM/RC4391, is a monolithic low power switching regulator specifically designed for low power inverting applications. The RC4391 contains an internal 1.25 Volt bandgap voltage reference, switch transistor, comparator, free running oscillator and low battery detection circuitry. These components are interconnected to minimize the number of external components required in typical inverting applications (see Figure 2). The RC4391 requires an inductor, diode, timing capacitor, and an R2, R1 network to achieve a negative output voltage. The RC4391 allows the designer the flexibility in designing unconventional applications such as replacing the internal bandgap reference with an external or system reference, or using the low battery detection comparator and transistor as voltage level detectors or for signal generation.

A typical application would combine the RC4391 with the RC4193 micro-power switching regulator to convert a single input voltage into a ±12 Volt or ±15 Volt power supply. The single voltage can be either from a battery, bridge rectifier or existing +5.0 Volt line on card for this application (see Figure 3).

Switch Leakage Current	I_{CO}	Pin 5 = -24V		0.1	30	μA

Principles of Operation

The basic switching inverter circuit is the building block on which the complete inverting application is based.

A simplified diagram of the voltage inverter circuit with ideal components and no feedback circuitry is shown in (Figure 1). When the switch S is closed, charging current from the battery flows through the inductor L, which builds up a magnetic field, increasing as the switch is held closed. When the switch is opened, the magnetic field collapses, and the energy stored in the magnetic field is converted into a current which flows through the inductor in the same direction as the charging current. Because there is no path for this current to flow through the switch, the current must flow through the diode to charge the capacitor C. The key to the inversion is the ability of the inductor to become a source when the charging current is removed.

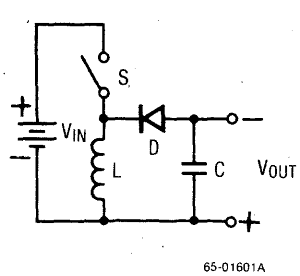

Figure 1. Simplified Voltage Inverter

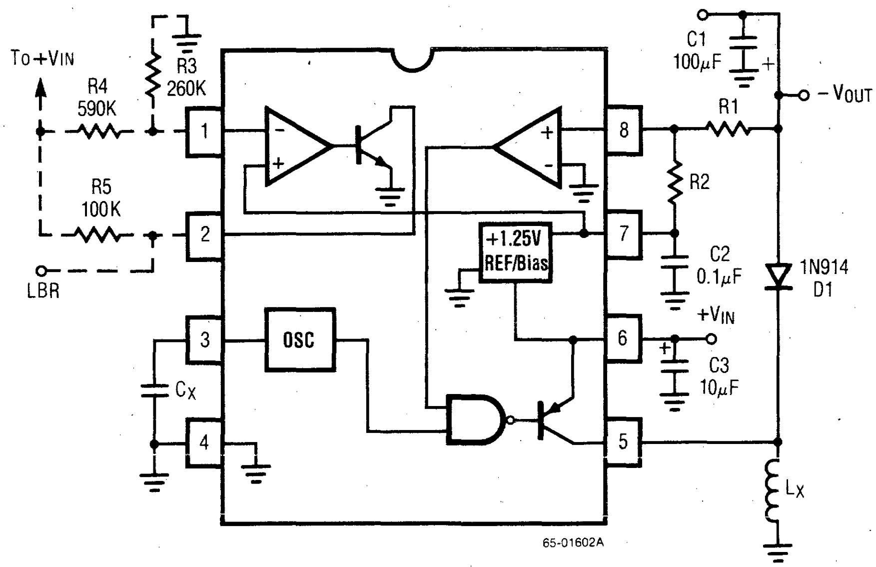
The equation V = (L) (di/dt) gives the maximum possible voltage across the inductor; in the actual application, feedback circuitry and the output capacitor will decrease the output voltage to a regulated fixed value.

A complete schematic for the standard inverting application is shown in (Figure 3). The ideal switch in the simplified diagram is replaced by



Parts List	-5.0V Output	-15V Output
R1	30KΩ	90KΩ
R2	7.5KΩ	7.5KΩ
Cx	150PF	150PF
Lx	1.0mH Dale	TE3 Q4 TA

Optional

Figure 2. 4391 Standard Application Circuit

the PNP transistor switch between pins 5 and 6. C1 functions as the output filter capacitor, and D1 and L_X replace D and L.

When power is first applied, the ground sensing comparator (Pin 8) compares the output voltage to the +1.25V voltage reference. Because C1 is initially discharged a positive voltage is applied to the comparator, and the output of the comparator gates the square wave oscillator. This gated square wave signal turns on, then off, the PNP output transistor. This turning on and off of the output transistor performs the same function as opening and closing the ideal switch in the simplified diagram; i.e., it stores energy in the inductor during the on time and releases it into the capacitor during the off time.

The comparator will continue to gate the oscillator to the switch transistor until enough energy has been stored in the output capacitor to make the comparator input voltage decrease to less than zero volts. The voltage applied to the comparator is set by the output voltage, the reference voltage, and the ratio of R1 to R2. To adjust the output voltage, set R2 to about 10KΩ and change R1 according to the following equation:

$$R1 = \frac{(V_{OUT})\,(R2)}{V_{REF}}$$

Efficiency and load regulation will improve if a quality high Q inductor is used. A ferrite core toroid inductor is recommended. The inductor value and timing capacitor value must be carefully tailored to the ripple, input voltage range, output voltage, switch transistor maximum current, and output load current requirements of the application. The following equation will help select component, values for high output current at input voltages less than or equal to the output voltage.

$$I_{OUT\ (average)} \approx \frac{(V_{IN} - V_{SW})^2}{(L)\,(8.0)\,(f_O)\,(V_{OUT} + V_D)}$$

where L = Inductor Value in Henrys
f_O = Switching Frequency
V_{SW} = Saturation Voltage of Switching Transistor
V_D = Diode Voltage

The input voltage is a squared term; if the input voltage decreases, even by a small amount, the output current capability will decrease sharply. Since the L term is in the denominator, lower inductor values will increase the output current capability (until the inductor current rises so high that the inductor saturates — an air gapped core can help this). Lowering the switching frequency will also help, but will increase the ripple. Also, the frequency should not be so low that the inductor current rises too high and saturates the inductor or exceeds the maximum current rating of the switch transistor, which is 375 milliamps.

For $V_{IN} < |V_{OUT}|$

$$I_{MAX} \approx \frac{(V_{IN} - V_{SW})^2}{2 L f_O}$$

For $V_{IN} > |V_{OUT}|$

$$I_{MAX} \approx 2 \times I_{LOAD}$$

The value of the timing capacitor is set according to the following equation:

$$f_{OP}\,(Hz) = \frac{2.14 \times 10^{-6}}{C_X}$$

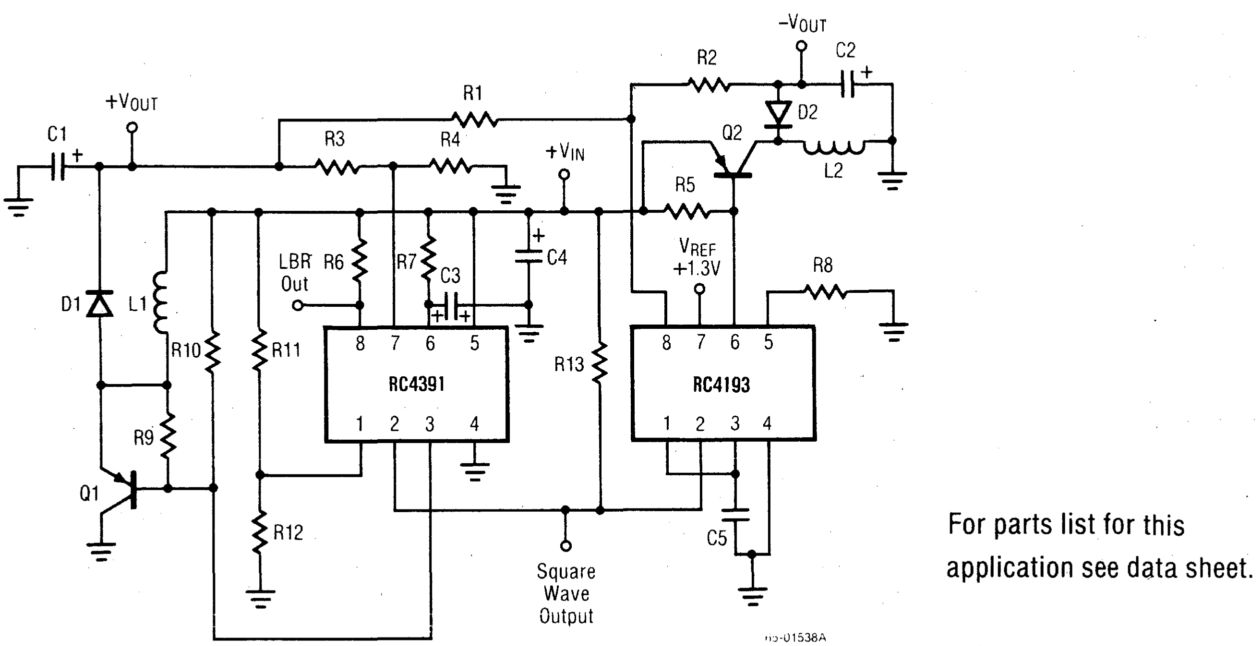
The square wave output of the oscillator is internal and cannot be directly measured, but is equal in frequency to the triangle waveform measurable at pin 3. The switch transistor is normally on when the triangle waveform is ramping up and off when ramping down. Capacitor selection depends on the application; higher operating frequencies will reduce the output voltage ripple while trading off efficiency and load regulation. Keep the capacitor lead length short.

The low battery detector provides a method of signaling a computer system or an LCD display when the battery voltage decays below a set voltage. This voltage is predetermined by a voltage divider tied to the battery input and by the +1.25V voltage reference:

$$V_{TH} = \left(\frac{R4}{R3} + 1.0\right) V_{REF}$$

The open collector output transistor must have an external load resistor selected according to the input drive requirement of the logic family used.

An inverting and non-inverting power supply circuit using a step up RC4193 and an inverting 4391 shown in (Figure 3). The component



For parts list for this application see data sheet.

Figure 3. RC4391/RC4193 Power Supply Schematic

values given will provide a positive 15 Volt output and a negative 15 Volt output. These voltages can be adjusted by changing the value of R1, $V_{OUT} = (R1/R2 + 1.0)(V_{REF})$, but note that the battery voltage must be less than the programmed positive output voltage. The reference for the negative output voltage is derived from the positive output voltage so that the output voltages will track with changes in temperature and battery voltage.

The inductor and timing capacitor values shown were chosen for best operation with a 12 Volt nominal battery input that decays to less than 8.0 Volts, with an output current of 60 milliamps and output ripple of less than 200 millivolts. The inductor value and timing should be adjusted for different applications (see the I_{OUT} equation). The maximum input voltage can be increased by adding a zener diode in series with the supply lead of each IC.

The oscillators are slaved together, using the low battery detection circuitry of the 4391, in order to reduce the electromagnetic interference that would otherwise be caused by having separate unsynchronized oscillator frequencies. The square wave output is available and can be used for other circuitry if the current drawn is low. Also available is the +1.25 Volt DC reference voltage (limit current to 100μA).

A circuit that allows higher input voltages and will deliver more power to the load than the standard application circuit is shown in (Figure 4). The circuit has an external switch transistor, Q1, with a higher maximum current rating than the internal switch transistor. Also, the optional zener diode D2 steps down the applied input voltage. If D2 is not used it should be shorted out.

The circuit operation is similar to that of the standard application circuit, except that the internal switch transistor now drives the base of the external transistor. Note that the on switch voltage will now equal the switch voltage of the internal transistor plus the V_{BE} of Q1. This higher switch voltage will reduce the circuits ability to supply output current with low input voltages. The external transistor circuit of (Figure 3) does not have this problem.

Note that even though the addition of the zener raises the maximum allowable supply voltage, it does not alter the maximum change of supply voltage, which equals the maximum supply voltage minus the minimum supply voltage (ΔV = 30V - 3.0V = 27V). So, with a 10V zener diode, the supply voltage range will be 13V to 40V.

RAYTHEON

Precision High Speed Latching Comparator

4805

Features

- 22nS Propagation Delay
- Low Offset Voltage — 100μV
- Low Offset Current — 15nA
- TTL Compatible Latch
- TTL Output

Description

The RC/RM4805 is the ideal comparator for high speed, high precision applications. The input errors are factory trimmed to less than 1/10 LSB of a 12 bit, 10 volt system. The latch function allows the System Designer additional flexibility. When the latch input is a TTL low, the comparator functions normally. When the input is raised to a TTL high, the comparator output is latched in its current state. The latch functions over the full military temperature range.

The 4805 is ideal for ultra precise, very fast system designs. Typical applications include successive approximation A/D converters of 12 or more bits, zero crossing detectors, high speed sampling, or window detectors.

The 4805 high speed comparator is functionally equivalent to the more popular comparators, HA-4950, AM686, SE527, CMP-05 and μA760. Propagation delay is 35nS with a 1/2 LSB overdrive in a 12 bit, 10 volt system.

+10V Precision Voltage References REF-01

Features

- 10 Volt Output — ±0.3%
- Adjustable — ±3.0%
- Excellent Temperature Stability — 3.0ppm/°C
- Low Noise — 20μV_{p-p}
- Wide Input Voltage Range — 12V to 40V
- No External Components
- Short Circuit Proof
- Low Power Consumption — 15mW

Description

The REF-01 Precision Voltage Reference contains a band-gap reference using thin-film resistors, a step-up amplifier, short circuit protection, and a zener-trim network. The REF-01's 10V output shows excellent stability for large changes of temperature, load current, and input voltage. An adjust pin is provided that can change the output voltage by at least 3.0% with little effect on temperature coefficient.

Simplified Schematic Diagram

RAYTHEON

10-Bit High Speed Multiplying D/A Converter

DAC-10

Features

- Nonlinearity to 0.05% Max Over Temperature Range
- Low Full Scale Drift — 10ppm/°C
- Wide Range Multiplying Capability 1.0MHz bandwidth
- Wide Power Supply Range— +5.0V/-7.5V to ±18V
- Two Quadrant Multiplying
- High Output Compliance
- High Speed — 85nS

Applications

- A/D Converters
- Servo Controls
- Waveform Generators
- Programmable Power Supplies
- High Speed Modems

Description

The DAC-10 is a high speed, 10-bit, monolithic, multiplying Digital-to-Analog Converter. Settling times of 85nS are achieved with low power consumption and minimal output glitches. Full scale (10-bit) accuracy is achieved. The DAC-10 can be operated from almost any logic level input due to its adjustable (V_{LC}) threshold. Monotonicity is guaranteed to 10 bits and nonlinearities of ±0.05% are guaranteed over the full operating temperature range. Power consumption can be reduced to 85mW by lowering supply voltages to +5.0V to -7.5V. Operation at supply voltages up to ±18V does not appreciably affect device performance. Zener-Zap trimming is performed at wafer probe to optimize the converter's accuracy.

Micro-Power Switching Regulators

4191/2/3

Features

- High Efficiency — 80% Typical
- Low Quiescent Current — 135μA
- Adjustable Output — 2.5V to 30V
- Output Current — 150mA
- Internal Reference — 1.31V
- Remote Shutdown Capabilities

Description

Raytheon's micro-power switching regulators, 4191, 92 and 93, are the industry's first monolithic low power switching regulators available in a 8-lead mini-DIP, and designed specifically for battery operated instruments. They each contain a 1.3V temperature compensated bandgap reference, adjustable free running oscillator, voltage comparator, low battery detection circuitry and a 150mA switch transistor with all of the functions required to make a complete low power switching regulator.

These regulators can achieve up to 80% efficiency in most applications while being able to operate over a wide input supply voltage range, 2.4V to 24V, at an ultra low quiescent drain of 135μA.

These regulators have a free running oscillator which provides the drive circuitry for the on chip 150mA switch transistor. The 100Hz to 75kHz oscillator frequency is determined by an external capacitor on pin 2.

These universal regulators can be used as a building block in three basic applications: step-up, step-down, inverting.

In their most popular configuration, step-up, these regulators can use fewer battery cells, making available more board space and lengthen battery life.

A practical example of these advantages would be an instrument designed to operate from a nominal 9 volt supply voltage. If this instrument were powered with just 7 components; a steering diode, an inductor, two resistors, a capacitor, a 4191, 92 or 93 and a 9 volt battery, it would receive a continuous 9 volts until the battery had decayed to a terminal voltage of 2.4 volts. If board space is at a premium, then the designer could remove the 9 volt source and replace it with a single 3 volt Ni-Cad battery without making any other adjustment(s) to the circuitry or affecting the overall operation of this instrument.

The open collector output transistor of these regulators provide the designer a method to have a "Low Battery Indicator" output current that can be used to signal a LCD whenever the battery voltage drops below a programmed level. This programmed level is determined by the designer with the selection of external resistors connected to pin 1.

The 4191, 92 and 93 offer the designer a mechanism to shut down this chip by connecting a zener diode in series with the I_C lead (pin 6). This will shut down the chip whenever the battery voltage drops below the predetermined level. In this application, the circuit can be designed to signal a LCD whenever the battery voltage has dropped to the first programmed level, then shut itself off when the battery has dropped to the second level.

Functional Block Diagram

RAYTHEON Complete High-Speed 12-Bit Monolithic Digital-to-Analog Converter DAC-565

Features

- Nonlinearity 1/2 LSB —0.012%
- Differential Nonlinearity 13 bits — 0.012%
- Settles to 1/2 LSB in 200nS
- On Chip Bandgap Reference
- Linearity Guaranteed Over Temperature
- Low Power: 225mW Including Reference
- Direct Interface to All Major Logic Families

Description

The DAC-565 is a fast 12-bit digital-to-analog converter consisting of 12-bit precision, high-speed bipolar current steering switches, laser-trimmed thin film resistor network, stable bandgap reference, span and bipolar offset resistors to produce an accurate analog output current.

The high performance and flexibility of the DAC-565 was acheived through circuit design and layout, a thin film resistor process and interactive computer-controlled laser trimming. The DAC-565 settles to 1/2 LSB in 200nS, typical, with a maximum settling time of 500nS. Accuracy is specified at a maximum of 1/2 LSB for all grades.

This high speed and accuracy coupled with the inherent high output impedance make the DAC-565 the ideal DAC for high-speed display drivers, high speed control systems, and with the RC4805 high-speed latching comparator, analog-to-digital converters.

The bandgap reference is laser trimmed to optimize both temperature drift and absolute output voltage. The current sourcing capability of the DAC-565 reference (10mA typical) allows this reference to drive the DAC and also other peripheral circuit elements. Typical reference drift is better than 15ppm/°C (S and J grade).

The DAC-565 is available in 3 performance grades. The DAC-565J and DAC-565D grades are specified over 0°C to +70°C, while the DAC-565S grade is specified over the -55°C to +125°C temperature range.

Product Highlights

- The DAC-565 is a self-contained DAC and voltage reference with application resistors on a monolithic chip.
- The device incorporates interdigitizing which minimizes the effects of thin film sputtering, thermal, and diffusion gradients in the most critical portions of the design. Therefore, excellent linearity distributions are achieved prior to trimming, thus insuring optimal stability of the nonlinearity over temperature as well as stability versus time.
- The thin film resistors have a trim tab which is distant from the main body of the resistor. This resistor geometry insures near perfect nonlinearities after trim as well as minimum damage due to laser trimming.
- The internal reference is laser trimmed to 10 Volts with a ±1.0% maximum error. The reference voltage is available externally and can provide typically 10mA beyond that required for the reference and bipolar offset resistors.
  The DAC-565 contains SiCr thin film application resistors which can be used with either an external op amp to provide a precision voltage output DAC or as input resistors for a successive approximation A/D converter. The resistors are inherently matched and are laser trimmed to guarantee minimum full scale and bipolar offset errors.
- The DAC-565S grade guarantees linearity and monotonicity over the -55°C to +125°C range and is available fully processed to MIL-STD-883, Level B.

RAYTHEON

12-Bit High Speed Multiplying D/A Converter

DAC-6012

Features

- Differential Nonlinearity — 0.012% (13 Bits)
- Guaranteed Monotonicity to 12 Bits Over Temperature
- Relative Accuracy — 0.05% All Grades
- Fast Settling Time — 250nS to ±0.5 LSB
- Full Scale Output Current — 4.0mA
- Complementary Current Outputs
- Output Compliance — -5.0V to +10V
- Full Scale Tempco — ±10ppm/°C
- Power Consumption — 230mW
- Direct Interface to All Major Logic Families
- Standard Processing without Resistor Trimming
- Low Cost

Description

The Raytheon DAC-6012 series of monolithic Multiplying Digital-to-Analog Converters guarantee differential nonlinearity to better than ±0.5 LSB (0.012%) for the 6012A and ±1.0 LSB (0.025%) for the 6012 over the full military and commercial temperature ranges. In addition to the excellent Differential Nonlinearity specifications, the 6012 series also include many features that previously were found in expensive hybrid modules or required full use of monolithic thin film laser or zener zap trimming techniques.

The Raytheon DAC-6012 incorporates a segmented design technique which reduces the requirement for high accuracy resistor ladder networks as an integral part of the DAC. The DAC-6012 design is structured with a 3-bit segment decoder, 5-bit master R-2R ladder DAC and 4-bit Slave DAC. This circuit configuration actually contains less ladder resistors than the traditional R-2R ladder approach as well as effectively improving the accuracy of the ladder resistors by a factor of 8.

The performance of the DAC-6012 is virtually independent of supply voltage variations due to the inherent nature of its design and processing. As an example, the DAC-6012 may be operated at any voltage from +4/-10V to ±18V with minimal effect on the full scale current, DNL, relative accuracy and settling time. The 5MΩ output impedance and -5.0V to +10V compliance range make the DAC-6012 ideal for high speed applications where output load resistors can be used in place of an output interface amplifier.

The complementary current outputs of the DAC-6012 are useful in symmetrical offset DAC applications and A/D converters requiring constant current loads to ensure significant reduction of switching transients.

In conjunction with the REF-01 and REF-02 voltage references, and the 4805 fast precision voltage comparator, the DAC-6012 can be used as the main building block in a wide variety of data conversion applications.

8-Bit High Speed Multiplying D/A Converter

DAC-08

Features

- Fast Settling Output Current — 85nS
- Full Scale Current Prematched to ±1.0 LSB
- Direct Interface to TTL, CMOS, ECL, HTL, PMOS
- Nonlinearity to ±0.1% Max. Over Temperature Range
- High Output Impedance and Compliance — -10V to +18V
- Differential Current Outputs
- Wide Range Multiplying Capability — 1.0MHz Bandwidth
- Low FS Current Drift — ±10ppm/°C
- Wide Power Supply Range — ±4.5V to ±18V
- Low Power Consumption — 33mW @ ±5.0V
- Low Cost

Description

The DAC-08 series of 8-bit monolithic multiplying Digital-to-Analog Converters provide very high speed performance coupled with low cost and outstanding applications flexibility.

Advanced circuit design achieves 85nS settling times with very low "glitch" and at low power consumption. Monotonic multiplying performance is attained over a wide 40 to 1 reference current range. Matching to within 1 LSB between reference and full scale currents eliminates the need for full scale trimming in most applications.

Direct interface to all popular logic families with full noise immunity is provided by the high swing, adjustable threshold logic inputs.

High voltage compliance dual complementary current outputs are provided, increasing versatility and enabling differential operation to effectively double the peak-to-peak output swing. In many applications, the outputs can be directly converted to voltage without the need for an external op amp.

All DAC-08 series models guarantee full 8-bit monotonicity, and nonlinearities as tight as ±0.1% over the entire operating temperature range are available. Device performance is essentially unchanged over the ±4.5V to ±18V power supply range, with 33mW power consumption attainable at ±5.0V supplies.

The compact size and low power consumption make the DAC-08 attractive for portable and military/aerospace applications; devices processed to MIL-STD-883A, Level B are available.

DAC-08 applications include 8-bit, 1.0μS A/D converters, servo-motor and pen drivers, waveform generators, audio encoders and attenuators, analog meter drivers, programmable power supplies, CRT display drivers, high speed modems and other applications where low cost, high speed and complete input/output versatility are required.

RAYTHEON

Linear Integrated Circuits

The RCA line of linear integrated circuits (LIC's) covers a broad range of solid-state devices, including BiMOS, bipolar, CMOS, and MOS/FET types for a wide variety of applications in industrial, military, and consumer equipment. These circuits are available in a wide variety of package styles, including hermetic TO-5; dual-in-line plastic, ceramic, and frit-seal ceramic; and TO-220-style (Versa-V) plastic. RCA also offers high-reliability versions of a broad range of these standard circuits processed in accordance with MIL-STD-883 and MIL-M-38510.

BiMOS Circuits
RCA BiMOS op-amps and comparators utilizing both bipolar and p-channel MOS transistors on a common monolithic substrate establish new performance standards in virtually all op-amp categories: general-purpose, FET input, wideband (4 to 70 MHz), micropower (down to 1.5 μW), high-current (to 22 mA), and in comparator applications, particularly in those requiring the added convenience and flexibility of two single-supply comparators in one package with operation up to 44 volts.

Operational Amplifiers
RCA offers a broad line of operational amplifiers, including general-purpose types in single, dual, and quad configurations; types including mixed technologies (e.g., CMOS, PMOS and bipolar, called BiMOS); variable types often referred to as programmable op-amps; micropower; wide-band; high-voltage; high-current; and precision types.

Voltage Comparators
RCA's line of BiMOS and bipolar comparators includes single, dual, quad, and programmable types for a wide variety of applications in instrumentation, communications, and industrial equipment.

Data Conversion Circuits
This category includes A/D converters, 7-segment decoder/drivers, and display drivers.

Arrays
RCA's broad line of arrays includes transistor types (bipolar and CMOS), transistor amplifier types, transistor/diode types, and diode types in a wide variety of configurations: n-p-n, p-n-p, n-p-n/p-n-p, Darlington, superbeta, programmable unijunction transistor (PUT) and SCR.

Power Control Circuits
This category includes an automotive ignition switch, power amplifiers, programmable Schmitt triggers, solenoid and motor drivers, universal controller, voltage regulators and zero-voltage switches.

Differential Amplifiers
The RCA line of differential amplifiers includes a broad variety of general-purpose devices in which the basic signal-processing function is accomplished by a single differential-amplifier stage.

Special Function Circuits
These types include automotive circuits, broadband (video) amplifiers, four-quadrant multipliers, prescalers, single-chip detector alarm systems and a timercircuit.

TV/CATV Circuits
These circuits include AFT, chroma systems, horizontal and vertical deflection systems, sync/AGC circuits, luminance processors, multiplex decoders, PIX IF, remote control, sound IF, tuning and Videodisc circuits.

For a summary of available products refer to the Linear Integrated Circuits product guide CDL-820J for linear integrated circuits and to MOS Field-Effect Transistors catalog MOS-160D for MOS devices. For complete technical data refer to Linear Integrated Circuits DATABOOK SSD-240B.

LIC Operational Amplifiers

BiMOS Types

- **CA3193 BiMOS Precision Operational Amplifier**
- **CA3493 BiMOS Precision Operational Amplifier**

The CA3193 series and CA3493 series are ultra-stable, precision-instrumentation operational amplifiers that employ both PMOS and bipolar transistors on a single chip. They are internally phase-compensated and provide a gain-bandwidth product of 1.2 MHz. The CA3193 series are pin-compatible with the industry 741 series and many other IC op amps, and may be used as replacements for 741-series in most applications.

The CA3493 series are pin-compatible with many industry types such as 725, 108A, OP-5, OP-7, and LM714 where positive nulling is employed.

Features

- Low V_{IO}:
  75 μV max. (CA3493B)
  200 μV max. (CA3493A)
  500 μV max. (CA3493)
- Low $\Delta V_{IO}/\Delta T$:
  2 μV/°C max. (CA3493B)
  3 μV/°C max. (CA3493A)
  5 μV/°C max. (CA3493)
- Low I_{IO} and I_I
- Low $\Delta I_{IO}/\Delta T$:
  50 pA/°C max. (CA3493B)
  150 pA/°C max. (CA3493)
- Low $\Delta I_I/\Delta T$:
  0.5 nA/°C max. (CA3493B)
  3.7 nA/°C max. (CA3493)
- Extremely high gain:
  120 dB min. (CA3493B)
  110 dB min. (CA3493A)
  100 dB min. (CA3493)
- Low V_{IO} vs. time
- High CMRR and PSRR
- Internally compensated: 1.2-MHz gain-bandwidth product
- Low input noise: 0.1 Hz to 10 Hz
  Noise voltage: 0.36 μV_{p-p} typ.
  Noise current: 12 pA_{p-p} typ.

Applications

- Thermocouple preamplifiers
- Strain-gauge bridge amplifiers
- Summing amplifiers
- Differential amplifiers
- Bilateral current sources
- Log amplifiers
- Differential voltmeters
- Precision voltage references
- Active filters
- Buffers
- Integrators
- Sample-and-hold circuits
- Low frequency filters

- **CA3420 Low Supply Voltage, Low-Input Current BiMOS OP-AMP**
- **CA3440 Nanopower BiMOS OP AMP**

The CA3420, CA3420A and CA3420B BiMOS operational amplifiers feature gate-protected PMOS transistors in the input circuit to provide very high input impedance, very low input currents (less than 1 pA). The internal bootstrapping network features a unique guardbanding technique for reducing the doubling of leakage current for every 10° C increase in temperature. The CA3420 series operates at total supply voltages from 2 to 20 volts either single or dual supply.

Features

- 2 V Supply at 300 μA Supply Current
- 0.04 pA (typ) Input Current (Essentially Constant to 85°C)
- Rail-to-Rail Output Swing (Drive ±2 mA into 1 KΩ Load)
- Pin Compatible with 741 Op-Amp
- Low Cost 8-Lead Minidip, TO-5
- Output driving current 1.5 ma. min. (provided by non-linear current mirrors)

Applications

- pH Probe Amplifiers
- Picoammeters
- Electrometer (High Z) instruments
- Portable Equipment
- Inaccessible Field Equipment
- Battery Dependent Equipment (Medical and Military)
- Function generators
- Oscillators

The CA3440-series BiMOS OP AMP features gate-protected PMOS transistors in the input circuit to provide very high input impedance and very low input current (10 pA). These devices operate at total supply voltages from 5 to 15 volts and can be operated over the temperature range from -55 C to +125 C. Their virtues are programmability and very low standby power (300 nW).

Features

- 300-nW (typ.) standby power at $V^+ = 5V$
- Supply current, BW, slew rate programmable using external resistor
- 10-pA (typ.) input current
- 5.0 to 15-V supply (±2.5 to ±7.5V)/5-12 V single supply operation
- Output drives typical bipolar-type loads
- Low-cost 8-lead Mini-DIP, TO-5
- High $I_{out}/I_{standby}$ ratio at 900nW standby (can on demand sink 3.1 mA max (2 K load), source 3mA)
- Very low total standby currents (50 nA)
- Pin-compatible with 741 op amp

Recommended Applications

- Micropower Band-Gap Reference supply circuits
- Micropower Amplifier circuits
- Multimeters
- Audio amplifiers
- Solar-cell powered systems
- Voice-squelched amplifiers
- Battery and portable instruments
- Smoke detectors and security systems
- Biomedical comparators — buffers
- Active filters
- Multivibrators

LIC Operational Amplifiers

BiMOS Types

- **CA3260 Dual OP AMP**

The RCA CA3260 series are operational amplifiers that combine the advantages of both CMOS and bi-polar transistors on a monolithic chip. The CA3260 series are dual versions of the CA3160 series.

Features

- Dual version of the CA3160
- MOS/FET input stage provides:
  very high Z_I = 1.5 TΩ (1.5 × 10^{12}Ω) typ.
  very low II = 5 pA typ. at 15-V operation
  = 2 pA typ. at 5-V operation
- Common-mode input-voltage range includes negative supply rail; input terminals can be swung 0.5 V below negative supply rail
- CMOS output stage permits signal swing to either (or both) supply rails
- Low V_{IO}: 2 mV max. (CA3260B)
  Wide BW: 4 MHz typ. (unity-gain crossover)
  High SR: 10 V/μs typ. (unity-gain follower)
  High output current (I_O): 20 mA typ.
- High A_{OL}: 320,000 (110 dB) typ.
- Internal phase compensation for unity gain
- Same pin-out as CA358, CA1458, CA1558

Applications

- Ground-referenced single-supply amplifiers
- Fast sample-hold amplifiers
- Long-duration timers/monostables
- Ideal interface with digital CMOS
- High-input-impedance wideband amplifiers
- Voltage followers (e.g., follower for single-supply D/A converter)
- Voltage regulators (permits control of output voltage down to zero volts)
- Wien-Bridge oscillators
- Voltage-controlled oscillators
- Photo-diode sensor amplifiers

- **CA3240 Dual-Unit Extended-Voltage-Range Op-Amp**
- **CA3140 Extended-Voltage-Range Op-Amp**

- very high input impedance: 1.5 TΩ typ.
- very low input current: 10 pA typ. at ±15 V
- low input offset voltage: as low as 2 mV max.
- wide common-mode input-voltage range: can be swung 0.5 V below negative rail
- output swing complements input common-mode range, permitting full utilization of low supply voltages (to 4 V) or to within 0.2 V when driving power transistors (no need for level-shifting circuits)
- PMOS input devices are protected by rugged bipolar diodes plus bipolar speed and high supply voltage.
- Operating capability: 4-44 V, single or dual supply

COMPARISON CHART

Symbol (TA = 25°C)	CA3240 Min.	CA3240 Typ.	CA3240 Max.	1458 Min.	1458 Typ.	1458 Max.	Units

A_{OL}	20K	—	—	20K	—	—	V/V

Features

- Internally compensated; needs no external components
- Wide bandwidth (4.5-MHz unity gain) makes possible low-cost video and audio circuits
- Fast settling time (1.4 μs typ. to 10 mV) for low-cost sample-and-hold and data-acquisition use
- Directly replaces industry types 741 (CA3140) and 1458 (CA3240) in most applications
- Characterized for ±15-V operation and for TTL supply systems down to 4 V
- High voltage-follower slew rate (9 V/μs)
- Strobable output stage
- Compared to BiFET devices, the CA3140 and CA3240 offer lower input currents, higher input resistance, improved offset current, and comparable offset voltage

Recommended Applications

- Ground-referenced single-supply amplifers in auto and portable instrumentation
- Long-duration timers/multivibrators (micro-seconds, minutes, hours)
- Interface in 5-V TTL systems and other low-supply-voltage systems
- All standard operational-amplifier applications
- Peak detectors
- Comparators
- Active filters
- Portable supplies

LIC Operational Amplifiers

BiMOS Types

- **CA3100 Wideband Op-Amp**
- **CA3160 Universal Op-Amp with Internal Compensation;**
- **CA3130 without Internal Compensation**

CA3160 Three technologies on a single chip;
CA3100 MOS/FET input stage, bipolar stage, and CMOS output stage

- CMOS output stage can swing output voltage to within 10 mV of either supply rail at very high values of load impedance

CA3130 PMOS and bipolar on a single chip

- Will handle both small and large signal inputs and still produce a true output virtually free of ringing and distortion

Features of CA3130, CA3160

- MOS/FET input features (See CA3140, CA3240)
- Wide bandwidth, typically 15 MHz for CA3130, 4 MHz for CA3160
- High slew rate: 10 V/μs typ. (unity-gain follower)
- High output current (I_o): 20 mA typ.
- High A_{OL}: 320,000 (110 dB) typ.

Features of CA3100

- High open-loop gain: 42 dB typ. at 1 MHz
- High unity-gain f_T: 38 MHz typ.
- Wide power bandwidth (V_o): 18 $V_{p\text{-}p}$ at 1.2 MHz
- High slew rate: 70 V/μs typ. (20-dB amplifier), 25 V/μs (unity-gain amplifier)
- Fast settling time: 0.6 μs typ.
- LM118, LM748, LM101 compatability

Recommended Applications

CA3130, CA3160

- High-input impedance comparators
- Ideal interface with digital CMOS
- Voltage followers
- Voltage regulators
- For other applications, see CA3140, CA3240

CA3100

- Video amplifiers
- Fast peak detectors
- Video pre-drivers
- Multivibrators
- Oscillators
- Meter driver amplifiers
- Oscillators

CA080, CA081, CA082, CA083, CA084 Series

BiMOS Replacements for Industry TL080 Series BiFET Types

The CA080 series offer lower input bias and offset currents, higher input impedances, and wider bandwidth than their BiFET counterparts and other pin-compatible op amps.

Features

- Very low input bias current (50 pA max.) and offset current (30 pA max.)
- Input impedance typically $10^{12}\Omega$
- Low input offset voltage (2mV typ.)
- Wide common-mode input voltage range
- Lower power consumption: 42mW (single amp. channel)
- High slew rate: 13v/us typ.
- Unity-gain bandwidth = 5 MHz (typ.)
- Wide output voltage swing: 25 volts
- Low distortion
- Short-circuit protection
- Noise voltage (1 kHz): 40 nV/$\sqrt{Hz}$
- Direct replacement for industry type TL080 series in most applications

Applications

- Inverters
- High-Q notch filters
- IC preamplifiers
- Unity-gain absolute value amplifiers
- Sample and hold amplifiers
- Active filters
- Low-current amplification circuits
- Data acquisition equipment
- AC voltmeters (front end)

LIC Operational Amplifiers-OTAs

CA3280 Dual Variable OP AMP

The CA3280 series consists of two variable operational amplifiers that are designed to substantially reduce the initial input offset voltage and the offset-voltage variation with respect to changes in programming current. This design results in reduced "AGC thump", an objectional characteristic of many AGC systems. Interdigitation, or cross coupling of critical portions of the circuit reduces the amplifier dependence upon thermal and processing variables.

The CA3280 has all the generic characteristics of an operational voltage amplifier except that the forward transfer characteristic is best described by transconductance rather than voltage gain, and the output is current, not voltage. The magnitude of the output current is equal to the product of transconductance and the input voltage. This type of operational transconductance amplifier has gained wide acceptance as a gateable, gain-controlled building block for instrumentation and audio applications, such as linearization of transducer outputs, standardization of widely changing signals for data processing, multiplexing, instrumentation amplifiers operating from the nanopower range to high-current and high-speed comparators.

Features

- Low initial input-offset voltage: 500μV max. (CA3280A)
- Low Offset-voltage change versus I_{ABC}: <500 μV typ. for all types
- Low offset-voltage drift: 5 μV/C max. (CA3280A)
- Excellent matching of the two amplifiers for all characteristics
- Internal current-driven linearizing diodes reduce the external input current to an offset component
- Differential amplifier emitters brought out for use in emitter-coupled dual-differential amplifier applications
- Low noise: 8 nV/$\sqrt{Hz}$ @ 1 kHz typ.
- Low noise distortion: 0.4% THD typ.
- Two modes of gain control

Recommended Applications

- Voltage-controlled amplifiers
- Voltage-controlled filters
- Voltage-controlled oscillators
- Multipliers
- Demodulators Sample and hold
- Instrumentation amplifiers
- Function generators
- Triangle wave-to-sine wave converters
- Comparators
- Audio preamplifiers

CA3078 A_{OL}: 88 db min., 92 typ. dB

Features

CA3078

- Low standby power: as low as 700 nW
- Wide supply-voltage range: ±0.75 to ±15 V
- High peak output current: 6.5 mA min.
- Adjustable quiescent current
- Output short-circuit protection

CA3060

- Low power consumption: as low as 100μW/amplifier
- Independent biasing for each amplifier
- Programmable range of input characteristics
- Low input bias and input offset current
- No effect on device under output short-circuit conditions
- High foward trandsconductance

Recommended Applications

CA3078

- Portable electronics
- Medical electronics
- Instrumentation
- Telemetry

CA3060

- Active filters
- Gyrators
- Multiplexers
- Strobing and gating functions
- Sample-and-hold functions
- Mixers
- Comparators
- Modulators
- Multipliers

LIC Operational Amplifiers-OTAs

CA3094 Programmable Power Switch/Amplifier
CA3080 Programmable Op-Amp

- Input control permits user to vary voltage, power bandwidth, slew rate, input and output currents
- Devices can be programmed and/or signal-modulated for optimum gain, speed, bandwidth, power
- Outputs can "sink" or "source" currents
- Linear gain is adjustable over 3 decades of amplifier bias current I_{ABC}
- Standby power levels can be adjusted from below 10µW up to 30 mW

† V^+ - 15V ‡ V^- = 15V

Features

CA3094

- Programmable: strobing, gating, squelching, agc capabilities
- Capable of delivering 3 W average or 10 W peak to external loads
- High current-handling capability: 100 mA avg., 300 mA peak
- Sensitivity controlled by varying bias current
- Power output of 0.6 W in high-power, single-ended class A amplifier (1.6 W dissipation)
- THD: 1.4% typ. (at 0.6 W class A)
- Designed for single or dual power supplies

CA3080

- Differential input, single-ended class A output
- I_{ABC} used for either gating or linear gain control
- Slew rate (unity gain, compensated): 50 V/µs
- Flexible supply voltage range: ±2 V to ±15 V
- Fully adjustable gain: 0 to $g_m R_L$ limit
- Tight g_m spread: 2:1 for CA3080, 1.6:1 for CA3094

Recommended Applications

CA3094

- Fire detection and instrusion alarm systems
- Portable GFI detectors • Function generators
- Temperature-measuring equipment
- Driver for complementary power transistors for audio use
- Battery-operated flashers • Power supplies

CA3080

- Communications equipment
- Function generators (1,000,000-to-1 sweep capability) • Peak detector instruments
- Battery-operated paging systems
- Audio-frequency synthesizers

Features

CA3290, CA3290A, CA3290B

- State-of-the-art design, first in the industry
- MOS/FET input/bipolar output BiMOS types
- Wide V_{ICR}, can be swung 1.5 V below the negative supply rail, permits single-supply operation
- Ultra-low input current (3.5 pA typ.), eliminates need for high-impedance buffer circuits
- Wide differential input voltage range (to ± 36 V), allows input circuits to operate at high V+
- No phase reversal of output signal when input transients go below ground
- Very low supply current drain (0.8 mA at +5 V)
- Low output saturation voltage (120 mV at 4 mA)
- 14-pin package to reduce stray capacitances between input and output circuits

CA311

- Directly interchangeable with National LM311 series and other 311 industry types

Recommended Applications

- High-source-impedance voltage comparators
- Long-time-delay circuits
- A/D converters
- Window detector circuits
- Zero-crossing detectors
- Positive and negative peak detectors

V_{REG}	—	—	—	6	7.2	8	V

Features

- Designed to control high-operating-current loads such as thyristors, lamps, relays, LED's
- Can be operated with single power supply (16 V max.) or dual power supply (± 8V)
- Directly control currents up to 150 mA
- Operate with microwatt standby power when current to be controlled is less than 30 mA
- Programmable operating current
- High sensor range: 100 ohms to 100 megohms
- Built-in hysteresis: 20 mV max. for CA3098, 10 mV max. for CA3099
- Programmable hysteresis: 20 mV to V^+ for CA3098, 10 mV to V^+ for CA3099
- Temperature-compensated reference voltage (CA3099)

Recommended Applications

- Signal reconditioning
- On-off motor switching
- Schmitt triggers, level detectors
- Time delays
- Overvoltage, overcurrent, overtemperature protection
- Battery-operated equipment

Quad Types

Sym-bol	Max. Characteristics Limits: T_A=25°C, V^+ =+5V

Features

- Direct replacements for industry types 139, 139A, 239, 239A, 339, 339A
- Low supply-current drain, suitable for battery operation
- Common-mode input-voltage range to ground

Recommended Applications

- Square-wave generators
- Pulse generators
- Time-delay generators
- High-voltage digital logic gates
- Multivibrators
- A/D converters
- MOS clock timers

Data Conversion Circuits

Display Drivers

- **CA3207 BiMOS Sequencer Driver**
- **CA3208 BiMOS Segment Latch-Driver**

The RCA CA3207 and CA3208 sequence-driver and segment latch-driver, respectively, are used in combination to drive vacuum fluorescent display devices of up to 14 characters of display. The CA3207 selects the digit or character to be displayed in sequence and the CA3208 turns on the required number of segments of the character selected.

Features

- Serial input, parallel output
- Total of 14 outputs
- CMOS and T^2L compatible inputs
- Low-power CMOS Logic-Bipolar high-voltage output BiMOS process
- Use with vacuum fluorescent display
- Will operate in an output voltage range of 35 V to 55 V

Sequencer Driver (CA3207E)

- Sequentially turns on 1 of 14 characters (or 2 of 28 when used with 2 CA3208E's)
- Signal dimming through Gates 1 or 2

Latch Driver (CA3208E)

- Drives any combination of 14 outputs selected by DATA input
- Two or more devices may be interconnected by means of the CE and $\overline{CE}$ inputs to drive more than 14 characters

CA3168 2-Digit BCD-to-7-Segment Decoder/Driver

The RCA CA3168 is a monolithic integrated circuit intended for 2-digit display such as "numbers" for TV and "CB" channel selection, and other 0-99 numerical or counting for consumer or industrial indicator applications.

Features

- Separate BCD inputs and segment outputs for each digit
- Input loading less than 15μA
- I^2L logic with buffered inputs and outputs
- Internal input overrange protection circuit
- 5-V supply operation
- Internal biasing circuits
- Output drive capability of 25 mA per segment
- Open collector outputs drive indicators directly

Data Conversion Circuits

A/D Converters

CA3300 CMOS Video Speed 6-Bit Flash A/D Converter
CA3308 CMOS Video Speed 8-Bit Flash A/D Converter

The RCA CA3300 and CA3308 are CMOS parallel (FLASH) A/D converters designed for applications demanding both low power consumption and high-speed digitization. They operate over a wide full-scale input-voltage range with maximum power consumption as low as 50 to 200 mW depending upon the clock frequency selected.

Features
- CMOS low power with speed
- Parallel conversion technique
- 15 MHz sampling rate (66-ns conversion time)
- ±½ LSB accuracy
- 2 units in parallel allow 30-MHz sampling rate

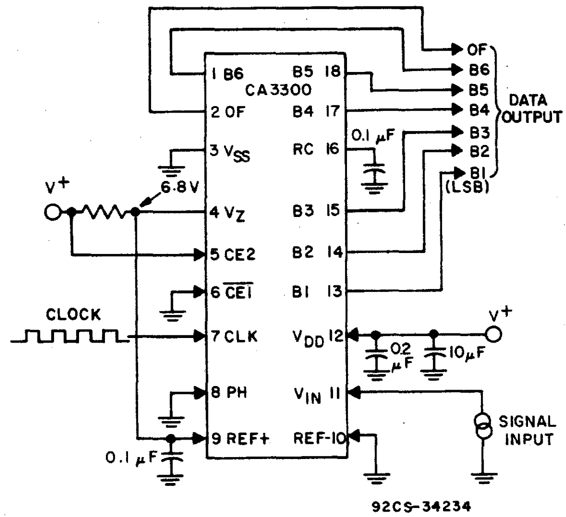
Recommended Applications
- The devices are especially suited for high-speed conversion applications where low power is also important
- High-speed A/D conversion
- Ultrasound signature analysis
- Transient signal analysis
- High-energy physics research
- High-speed oscilloscope storage/display
- General-purpose hybrid ACDs
- Optical character recognition
- Radar pulse analysis
- Motion signature analysis

Features *CA3300*
- 6-bit latched 3-state output with overflow bit
- Single supply voltage (3 to 10V)
- 2 units in series allow 7-bit output
- Internal VREF with ext VREF option

Applications
- TV video digitizing (industrial/security)

Features *CA3308*
- 8-bit latched 3-state output with overflow bit
- Single supply voltage (4 to 8 V)
- 2 units in series allow 9-bit output

Applications
- TV video digitizing (industrial/security/broadcast)
- μP data acquisition systems



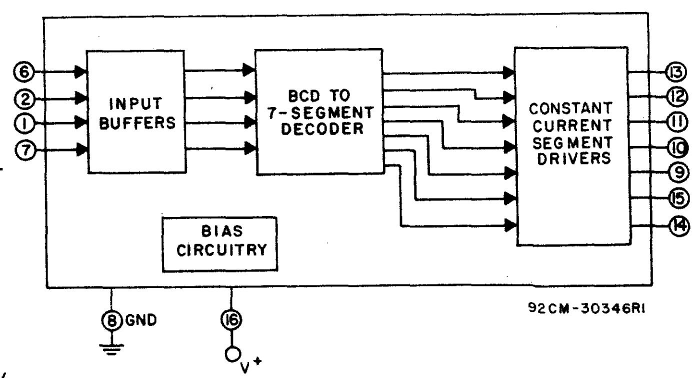
Typical CA3300 6-bit configuration 15-MHz sampling rate.

CA3161 BCD-to-Seven-Segment Decoder/Driver
CA3162 Converter for 3-Digit Digital Readout System

The CA3162E analog-to-digital converter is specially designed for use in low-cost digital readout systems. This circuit and a companion type, the CA3161E BCD-to-7-segment decoder/driver, can be used to implement a 2-chip, 3-digit readout system featuring simplicity of operation and a minimum of external parts. The CA3162E provides highly accurate conversions, exceptional temperature stability, and other features listed below.

Features *CA3162E*
- Dual-slope A/D conversion for excellent accuracy and noise rejection
- On-chip clock and ultra-stable bandgap reference; no additional IC's required
- Reads 99 mV below ground with single +5 V supply
- Choice of low-speed (4-Hz) or high-speed (96-Hz) conversion rate
- Overrange indication
- I²L technology
- Hold function inhibits conversion but maintains display

CA3161E
- TTL-compatible input logic levels
- 15-mA typ. constant-current output drive, eliminates need for current-limiting resistors
- Pin-compatible with industry standard decoders



CA3161 Block Diagram

Recommended Applications
- Medical equipment
- Welding controls
- Electronic scales
- Electronic games
- Temperature measuring instruments
- Power-supply meters
- Analog panel meters
- Auto Accessories
- Industrial Controls

LIC Amplifier, Transistor/Diode, and Diode Arrays

Features

- CA3093 has high I_C (100 mA max. each transistor) and temperature-compensation capability
- CA3097 has PUT with extremely long time constants, SCR with 150-mA forward current, complete isolation between elements
- CA3019 has excellent diode match, low leakage currents, low pedestal voltage when gating
- CA3039 has ultra-low capacitance diodes: 1 ns typ. reverse recovery time, C_D=0.65 pF typ., V_F matched within 5 mV
- CA3141 has $V_{BR(R)}$ of 30 V min., low I_R of 100 nA max., low C_D of 0.3 pF typ., V_F of each diode pair matched to within 0.55 mV at 1-mA I_F
- CA3048, CA3052 include internal dc feedback and bias to provide temperature-stabilized operation

Recommended Applications

- Lamp and relay drivers, differential amplifiers, temperature-compensated amplifiers
- Timers, light dimmers/motor controls, comparators, Schmitt triggers, constant-current sources
- Analog switches, balanced modulators, mixers, diode gates for chopper modulators
- Balanced modulators or demodulators, ring modulators, high-speed diode gates
- Current-ratio detectors, high-voltage diode gates, analog switches
- Low-level preamplifiers, mixers, tone generators, linear signal mixers

LIC Transistor Arrays

Features

- CA3081, CA3082 directly drive 7-segment displays
- CA3127, CA3102, CA3049 are useful in low-power applications up to 500 MHz; low 1/f noise; f_T greater than 1 GHZ
- CA3227, CA3246 consist of five general-purpose silicon n-p-n transistors on a common monolithic substrate, f_T greater than 3GHz
- CA3600 (PMOS and NMOS devices) is specified and tested for linear circuit applications

Each transistor can conduct currents up to 10 mA.

High input resistance (100 GΩ typ.).

Recommended Applications

- Drivers for incandescent display devices, relay controls, thyristor firing
- VHF amplifiers, mixers, rf mixers/oscillators, doubly balanced modulators/demodulators
- Core-memory drivers, high-speed switching, high-current LED drivers, lamp drivers
- For complementary-symmetry circuits at supply voltages of 3 to 15 V and frequencies up to 5 MHz (untuned)
- High-input-impedance, general-purpose amplifiers, preamplifiers, differential amplifiers
- IF converter, IF amplifier, sense amplifiers, synthesizers, synchronous detectors, cascade amplifiers

RCA

LIC Power Control Circuits

Automotive Ignition Switch

• CA3165 Electronic Switching Circuit

The RCA CA3165 is a single-chip electronic switching circuit intended primarily for ignition applications. It includes an oscillator that is amplitude-modulated by the rotor teeth of a distributor, a detector that develops the positive-going modulation envelope, a Schmitt trigger that eliminates switching uncertainties.

Features

- Switching initiated by damping of internal oscillator
- Proximity sensing of rotational motion
- Repeatable timing of switching states
- Five outputs — two complementary pairs and one non-inverting output (CA3165E1)
- Two outputs — one complementary pair (CA3165E)

Solenoid & Motor Driver

• CA3169 Solenoid and Motor Driver

The RCA CA3169 is a monolithic integrated circuit capable of driving lamps and other devices that can be changed between two states (on or off). Transistors, SCRs, and triacs are some of the solid-state devices that can be controlled by the CA3169. The device also can control relays, solenoids (latching or non-latching), motors (DC-forward and reverse) and DC stepping motors.

Features

- Chip encapsulated in a 5-lead plastic TO-220-style package (VERSA-VI)
- Output short-circuit protection
- Thermal overload protection
- Solenoid inductive "kick" protection with internal-clamp diodes
- Output sink and source capacity of 600-mA minimum overtemperature
- Horizontal and vertical mounting packages available.
- Separate sink circuit and source circuit, each individually controlled
- Inputs can be driven by TTL logic levels and CMOS logic levels
- Low V_{CE}(sat)

Applications

- Latching solenoid driver (single and multiple)
- Non-latching solenoid driver
- Relay driver
- Lamp controller
- Lamp driver
- Motor controller (forward and reverse)
- Stepper motor controller
- On-off logic controllers (TTL logic)
- Intermediate power driver
- Triac, SCR, and transistor drivers

• CA3219 Quad-Power NAND Driver

The RCA CA3219 quad power NAND driver contains four NAND gate switches for interfacing low-level logic to inductive and resistive loads such as: relays, solenoids, AC and DC motors, heaters, incandescent displays, and vacuum fluorescent displays.

Features

- Driven outputs capable of switching 600 mA load currents without spurious changes in output state
- Inputs compatible with TTL or 5-volt CMOS logic
- Suitable for resistive or inductive loads

Universal Controller

• CA3228 Speed-Control System

The RCA CA3228 is a monolithic I^2L integrated circuit designed as an automotive speed-control system. The system monitors vehicle speed and compares it to a set reference speed. Any deviation in vehicle speed causes a servo mechanism to open or close the engine throttle as required to eliminate the speed error. The reference speed is set by the driver to hold the existing speed and stored in a 9-bit counter.

Features

- Low power dissipation
- I^2L control logic
- Power-ON reset
- On-chip oscillator for system time reference
- Single line command
- Amplitude encoded control signals
- Transient compensated input commands
- Controlled acceleration mode
- Internal redundant brake and low speed disable
- Braking disable

Voltage Regulators

Features *CA723, CA723C*

- Up to 150 mA output current
- Regulation in excess of 10 A with suitable pass transistors
- Input and output short-circuit protection
- Load and line regulation of 0.03%
- Adjustable output voltage of 2 V to 37 V
- Direct replacements for 723, 723C industry types

Features *CA3085, CA3085A, CA3085B*

- Up to 100 mA output current
- Regulation up to 12 mA without pass transistors, in excess of 100 mA with suitable pass transistors
- Load and line regulation of 0.025%
- Low noise • Frequency compensation
- Input and output short-circuit protection
- Temperature-compensated reference voltage
- Pin-compatible with LM100 series

Recommended Applications

- Series and shunt voltage regulators
- Current regulators • Floating regulators
- Temperature controllers
- High-current voltage regulators
- Dual-tracking regulation
- Combination positive and negative voltage regulators

Features *CA1524, CA2524, CA3524*

- Complete PWM power control Circuitry
- Separate outputs for Single-ended or push-pull operation
- Line and load regulation of 0.2% typ.
- Internal reference supply with 1% max. oscillator and reference voltage variation over full temperature range
- Standby current of less than 10 mA
- Frequency of operation beyond 100kHz
- Variable output dead time of 0.5 to 5 μs
- Low V_{CE}(sat) over the temperature range

Recommended Applications

- Positive and negative regulated supplies
- Dual-output regulators
- Flyback converters
- DC-DC transformer-coupled regulating converters
- Single-ended DC-DC converters
- Variable power supplies

LIC Power Control Circuits

Zero-Voltage Switches

Features

CA3058, CA3059, CA3079

- Operation at 24 V, 120 V, 208/230 V, 227 V at 50, 60, or 400 Hz
- Differential on-off sensing amplifier
- Zero-crossing detector • Triac gating circuit
- Low balanced input current: 1 μA max.
- Built-in protection circuit for open or shorted sensor
- Differential input
- Sensor range of 2 to 100 kilohoms

Recommended Applications

CA3058, CA3059, CA3079

- Relay control • Valve control • Lamp control
- Synchronous switching of flashing lights
- On-off motor switching
- Differential comparators with self-contained power supply for industrial applications
- Photosensitive controls
- Power one-shot controls

LIC Differential Amplifiers

Features

- Balanced differential-amplifier configuration with controlled constant-current source
- RF, if, and video frequency capability
- Balanced agc capability
- Operation from dc to 120 MHz
- CA3028B is controlled for input offset voltage, current, and input bias current, and is intended for "balance" requirements
- CA3005 and CA3006 are identical except for input offset voltage

Applications

- RF amplifiers • Oscillators
- Mixers • Limiters
- IF amplifiers • Product detectors
- Frequency generators • Pulse amplifiers
- Preamplifiers for low-level transducers
- DC, audio, and sense amplifiers

Prescalers

CA3179E

The RCA-CA3179E is an integrated-circuit prescaler intended for use in communications and instrumentation systems, it performs division by 256 in the uhf mode and division by 64 in the vhf mode.

Features

- Broadband operation — DC to 1.25 GHz
- High sensitivity
- Standard T^2L or ECL power supply
- Dual mode operation — VHF/UHF (÷64/÷256)
- Complementary ECL outputs
- Independent VHF and UHF input terminals

CA3199E

The CA3199E is a bipolar integrated fixed-ratio (divide-by-four) counter which operates over the VHF/UHF frequency band (DC to 1.3 GHz). It accepts either single or double-ended ac-coupled input signals and provides complementary emitter follower outputs at sandard ECL logic levels.

Features

- Broadband operation — DC to 1.3 GHz
- High sensitivity
- Standard TTL or ECL power supply of 5V ± 0.5%
- Complementary ECL outputs

Applications *CA3179E, CA3199E*

- Digital frequency synthesizers for: VHF/UHF receivers, Satellite communications, instrumentation
- High-frequency divider for: UHF frequency counters, UHF timers, High-speed computers, Frequency standards, SHF second IF local-oscillator injection, PCM communications, Satellite communications, Radar ranging systems
- High-frequency up-converters

CA3211

The RCA-CA3211E is an integrated-circuit prescaler intended for use in TV frequency synthesis tuning systems over an input frequency range of 90 to 1000 MHz. It performs division by 256 in the UHF and VHF mode.

Features

- Divide by 256
- Input frequency to 1 GHz
- Dual input ports electrically selectable
- Input sensitivity
  $<$10 μW typical
  (Generator available power into a 50-Ω load)
- 5-V power supply
- Balanced output ports

LIC Special Function Circuits

Four Quadrant Multiplier

CA3091

Four-quadrant multiplier that provides an output voltage that is the product of two input (x and y) voltages

Features

- Accuracy of ±4% max.
- Internal bias regulator
- Linearity of 3% max.
- 3-dB bandwidth of 4.4 MHz
- Low-power operation capability: ±6 V, 4-mW drain
- Low power-supply sensitivity: 36 mV/V typ.
- Functions as a multiplier, divider, squarer, square-rooter, power-series approximator

Applications

- Ideal full-wave rectifiers
- Automatic level controllers
- Frequency discriminators
- RMS converters
- Voltage-controlled filters and oscillators

Single-Chip Detector Alarm Systems

CA3164E

The RCA CA3164 is a monolithic BiMOS integrated circuit designed to meet the stringent system requirements of a battery- or line-operated alarm circuit. When used with an ionization chamber and electromechanical or piezoelectric horn, it provides a one-chip approach to smoke detection.

Features

- Interfaces directly with high Z sensors — no external buffer FET required
- Low input current: 1 pA max.
- Gate-protected input terminals
- On-chip beep oscillator for low battery indication
- Self-contained low-battery-voltage detection circuit
  (a) Fixed or adjustable trip point available
  (b) Dynamic battery test when filter capacitor =2μF
- Chamber trigger voltage independent of battery supply voltage (less than 150 mV over temperature and supply variations)
- Reference source current available =5μA (typ.)
- Low standby battery current = 8 μA (typ.)
- Can be used with photoelectric sensors by using a minimum of external passive components in combination with the RCA-CA3078 micropower op-amp
- Multiple-unit interconnect terminal controls a common annunciator circuit
  (a) A fault to ground doesn't prevent local operation
  (b) The low battery alarm signal triggers only the local unit
- LED output indicates status of smoke-detector circuit
- Operates from 11 V (max.) supply (either battery or line)
- Battery reversal protection feature

Timer

CA555, CA555C Types

The RCA-CA555 and CA555C are highly stable timers for use in precision timing and oscillator applications. As timers, these monolithic integrated circuits are capable of producing accurate time delays for periods ranging from microseconds through hours.

Features

- Accurate timing from microseconds through hours
- Astable and monostable operation
- Adjustable duty cycle
- Output capable of sourcing or sinking up to 200 mA
- Output capable of driving TTL devices
- Normally ON and OFF outputs
- High-temperature stability — 0.005%/°C
- Directly interchangeable with SE555, NE555, MC1555, and MC1455

Applications

- Precision timing
- Sequential timing
- Time-delay generation
- Pulse generation
- Pulse-width and position modulation
- Pulse detector

12-BIT MULTIPLYING DIGITAL-TO-ANALOG CONVERTER

Am6012

Preliminary

DESCRIPTION

The Am6012 12-Bit multiplying Digital-to-Analog converter provides high speed and 0.025% differential nonlinearity over its full commercial temperature range.

The D/A converter uses a 3-bit segment generator for the MSBs in conjunction with a 9-bit R-2R diffused resistor ladder to provide 12-bit resolution without costly trimming processes. This technique guarantees a very uniform step size (up to ± ½ LSB from the ideal), monotonicity to 12 bits and integral nonlinearity to 0.05% at its differential current outputs.

The dual complementary outputs of the Am6012 increase its versatility, and effectively double the peak-to-peak output swing. Digital inputs, in addition, can be configured to accept all popular logic families.

While the device requires a reference input of 1mA for a 4mA full scale current, operation is nearly independent of power supply voltage shifts. The power supply rejection ratio is ±0.001%FS/% ΔV. The devices will work from +5, −12V to ±18V rails, with as low as 230mW power consumption typical.

FEATURES

- **12-bit resolution**
- **Accurate to within ±0.025%**
- **Monotonic over temperature**
- **Fast settling time, 250ns typical**
- **Trimless design for low cost**
- **Differential current outputs**
- **High-speed multiplying capability**
- **Full scale current, 4mA (with 1mA reference)**
- **High output compliance voltage, −5 to +10V**
- **Low power consumption, 230mW**

APPLICATIONS

- **CRT displays, computer graphics**
- **Robotics, and machine tools**
- **Automatic test equipment**
- **Programmable power supplies**
- **CAD/CAM systems**
- **Data acquisition and control systems**
- **Analog-to-Digital converter systems**

8-BIT HIGH SPEED MULTIPLYING D/A CONVERTER

DAC-08 SERIES

FORMERLY: NE5007/5008-F,N
SE5008-F

DESCRIPTION

The DAC-08 series of 8-bit monolithic multiplying Digital-to-Analog Converters provide very high speed performance coupled with low cost and outstanding applications flexibility.

Advanced circuit design achieves 85ns settling times with very low glitch and at low power consumption. Monotonic multiplying performance is attained over a wide 20 to 1 reference current range. Matching to within 1 LSB between reference and full scale currents eliminates the need for full scale trimming in most applications. Direct interface to all popular logic families with full noise immunity is provided by the high swing, adjustable threshold logic inputs.

Dual complementary outputs are provided, increasing versatility and enabling differential operation to effectively double the peak-to-peak output swing. True high voltage compliance outputs allow direct output voltage conversion and eliminate output op amps in many applications.

All DAC-08 series models guarantee full 8-bit monotonicity and linearities as tight as 0.1% over the entire operating temperature range are available. Device performance is essentially unchanged over the ±4.5V to ±18V power supply range, with 33mW power consumption attainable at ±5V supplies.

The compact size and low power consumption make the DAC-08 attractive for portable and military/aerospace applications.

FEATURES

- **Fast settling output current—70ns**
- **Full scale current prematched to ±1 LSB**
- **Direct interface to TTL, CMOS, ECL, HTL, PMOS**
- **Relative accuracy to 0.1% maximum over temperature range**
- **High output compliance −10V to +18V**
- **True and complemented outputs**
- **Wide range multiplying capability**
- **Low FS current drift—±10ppm/°C**
- **Wide power supply range—±4.5V to ±18V**
- **Low power consumption—33mW at ±5V**

APPLICATIONS

- **8-bit, 1μs A-to-D converters**
- **Servo-motor and pen drivers**
- **Waveform generators**
- **Audio encoders and attenuators**
- **Analog meter drivers**
- **Programmable power supplies**
- **CRT display drivers**
- **High speed modems**
- **Other applications where low cost, high speed and complete input/output versatility are required**
- **Programmable gain and attentuation**
- **Analog-Digital Multiplication**
- **Stepping motor drive**

8-BIT μP-COMPATIBLE D/A CONVERTER

NE/SE5019

DESCRIPTION

The NE5019 is a complete 8-bit digital to analog converter subsystem on one monolithic chip. The data inputs have input latches, controlled by a latch enable pin. The data and latch enable inputs are ultra-low loading for easy interfacing with all logic systems. The latches appear transparent when the $\overline{LE}$ input is in the low state. When $\overline{LE}$ goes high, the input data present at the moment of transition is latched and retained until $\overline{LE}$ again goes low. This feature allows easy compatibility with most micro-processors.

The chip also comprises a stable voltage reference (5V nominal) and a high slew rate buffer amplifier. The voltage reference may be externally trimmed with a potentiometer for easy adjustment of full scale, while maintaining a low temperature co-efficient.

The output of the buffer amplifier may be offset so as to provide bipolar as well as unipolar operation.

FEATURES

- **8-bit resolution**
- **Input latches**
- **Low-loading data inputs**
- **On-chip voltage reference**
- **Output buffer amplifier**
- **Accurate to ± 1/4 LSB (.1%)**
- **Monotonic to 8 bits**
- **Amplifier and reference both short-circuit protected**
- **Compatible with 8085, 6800 and many other μP's**

APPLICATIONS

- **Precision 8-bit D/A converters**
- **A/D converters**
- **Programmable power supplies**
- **Test equipment**
- **Measuring instruments**

10-BIT μP-COMPATIBLE D/A CONVERTER

NE5020

DESCRIPTION

The NE5020 is a microprocessor-compatible monolithic 10-bit digital to analog converter subsystem. This device offers 10-bit resolution and ±0.1% accuracy and monotonicity guaranteed over full operating temperature range.

Low loading latches, adjustable logic thresholds and addressing capability allow the NE5020 to directly interface with most microprocessor and logic controlled systems.

The NE5020 contains internal voltage reference, DAC switches and resistor ladder. Also, the input buffer and output summing amplifier are included. In addition, the matched application resistors for scaling either unipolar or bipolar output values are included on a single monolithic chip.

The result is a near minimum component count 10-bit resolution DAC system.

FEATURES

- **10-bit resolution**
- **Guaranteed monotonicity over operating range**
- **±0.1% relative accuracy**
- **Unipolar (0V to +10V) and Bipolar (±5V) output range**
- **Logic bus compatible**
- **5μsec settling time**

APPLICATIONS

- **Precision 10-bit D/A converters**
- **10-bit Analog to Digital converters**
- **Programmable power supplies**
- **Test equipment**

8-BIT GENERAL PURPOSE A/D CONVERTER

NE5034

DESCRIPTION

The NE5034 is a high-speed microprocessor-compatible 8-bit Analog-to-Digital converter. It uses the successive approximation conversion technique, and includes the comparator, reference DAC, SAR, an internal clock and three-state buffers all on the same chip.

The converter can accommodate a wide analog input voltage range, bipolar or unipolar, selectable through external input resistors. An external capacitor controls the internal clock frequency, providing conversion times down to 17μs. Faster conversion times are possible using an external clock.

Microprocessor interfacing requirements are simple, allowing analog-to-digital conversion with a minimum of external components.

FEATURES

- **8-bit resolution and accuracy**
- **Accepts unipolar or bipolar inputs**
- **Three-state output buffers for easy microprocessor interface**
- **Choice of internal or external clocking**
- **Short conversion time, 17μs typical using internal clock**

APPLICATIONS

- **All microprocessor-based monitoring and control systems requiring analog signal inputs.**
- **Typical applications include: Automated process control, machine tools, robots, test and measurement instruments, environmental controls**
- **Other applications include: Ratiometric A/D conversion, very high resolution A/D conversion systems requiring high speed 8-bit building blocks**

6-BIT A/D CONVERTER (PARALLEL OUTPUTS) NE5037

DESCRIPTION

The NE5037 is a low cost, complete successive approximation analog to digital (A/D) converter, fabricated in Bipolar/I^{2}L technology. With an external reference voltage, the NE5037 will accept input voltages between 0V and V_{REF}. An external $\overline{START}$ pulse of at least 300ns in duration will provide the 6-bit result of the conversion in parallel format. Full conversion with no missing codes occurs in 9μs.

FEATURES

- **T^{2}L compatible inputs and outputs**
- **Three state output buffer**
- **Easy interface to CMOS μProcessors**
- **Fast conversion—9μs**
- **Guaranteed no missing codes over full temp range**
- **Single supply operation, +5V**
- **Positive true binary outputs**
- **High impedance analog inputs**

APPLICATIONS

- **Temperature control**

Figure 1

DESCRIPTION

The NE5410/SE5410 are 10-Bit Multiplying Digital-to-Analog Converters pin-and-function compatible with the industry-standard MC3410, but with improved performance. These are capable of high-speed performance, and are used as general-purpose building blocks in cost-effective D/A systems.

The NE/SE5410 provides complete 10-bit accuracy and differential nonlinearity over temperature, and a wide compliance voltage range. Segmented current sources, in conjunction with an R/2R DAC provides the binary weighted currents. The output buffer amplifier and voltage reference have been omitted to allow greater speed, lower cost, and maximum user flexibility.

FEATURES

- **Pin-and-function compatible with MC3410**
- **10-bit resolution and accuracy (±0.05%)**
- **Guaranteed differential non-linearity over temperature**
- **Wide compliance voltage range— −2.5 to +2.5V**
- **Fast settling time—250ns typical**
- **Digital inputs are TTL and CMOS compatible**
- **High-speed multiplying input slew rate —20mA/μs**
- **Reference amplifier internally compensated**

SPATIAL, STEREO AND PSEUDO-STEREO SOUND CIRCUIT — TDA3810

Preliminary

DESCRIPTION

The TDA3810 is an integrated circuit which can provide three switched functions for radio and television equipment: spatial sound from a stereo source; stereo sound from a stereo source; pseudo-stereo sound from a mono source.

FEATURES

- **Three switched functions:**
  - **spatial**
  - **stereo**
  - **pseudo-stereo**
- **Muting circuit prevents LED flickering**
- **LED driving outputs (pins 7 and 8)**
- **TTL compatible inputs for selecting operating mode**

DESCRIPTION

The NE570/571 is a versatile low cost dual gain control circuit in which either channel may be used as a dynamic range compressor or expandor. Each channel has a full wave rectifier to detect the average value of the signal; a linerarized, temperature compensated variable gain cell; and an operational amplifier.

The NE570/571 is well suited for use in telephone subscriber and trunk carrier systems, communications systems and hi-fi audio systems.

FEATURES

- **Complete compressor and expandor in 1 IC**
- **Temperature compensated**
- **Greater than 110dB dynamic range**
- **Operates down to 6Vdc**
- **System levels adjustable with external components**
- **Distortion may be trimmed out**

CIRCUIT DESCRIPTION

The NE570/571 compandor building blocks, as shown in the block diagram, are a full wave rectifier, a variable gain cell, an operational amplifier and a bias system. The arrangement of these blocks in the IC result in a circuit which can perform well with few external components, yet can be adapted to many diverse applications.

The full wave rectifier rectifies the input current which flows from the rectifier input, to an internal summing node which is biased at V_{REF}. The rectified current is averaged on an external filter capacitor tied to the C_{RECT} terminal, and the average value of the input current controls the gain of the variable gain cell. The gain will thus be proportional to the average value of the input signal for capacitively coupled voltage inputs as shown in the following equation. Note that for capacitively coupled inputs there is no offset voltage capable of producing a gain error. The only error will come from the bias current of the rectifier (supplied internally) which is less than .1μA.

$$G \propto \frac{|V_{IN} - V_{REF}|\ \text{avg.}}{R_1}$$

or

$$G \propto \frac{|V_{IN}|\ \text{avg.}}{R_1}$$

The speed with which gain changes to follow changes in input signal levels is determined by the rectifier filter capacitor. A small capacitor will yield rapid response but will not fully filter low frequency signals. Any ripple on the gain control signal will modulate the signal passing through the variable gain cell. In an expandor or compressor application, this would lead to third harmonic distortion, so there is a tradeoff to be made between fast attack and decay times, and distortion. For step changes in amplitude, the change in gain with time is shown by this equation.

$$G(t) = (G_{initial} - G_{final})\ e^{-t/\tau} + G_{final};\ \tau = 10K \times C_{RECT}$$

The variable gain cell is a current in, current out device with the ratio I_{OUT}/I_{IN} controlled by the rectifier. I_{IN} is the current which flows from the ΔG input to an internal summing node biased at V_{REF}. The following equation applies for capacitively coupled inputs. The output current, I_{OUT}, is fed to the summing node of the op amp.

$$I_{IN} = \frac{V_{IN} - V_{REF}}{R_2} = \frac{V_{IN}}{R_2}$$

A compensation scheme built into the ΔG cell compensates for temperature, and cancels out odd harmonic distortion. The only distortion which remains is even harmonics, and they exist only because of internal offset voltages. The THD trim terminal provides a means for nulling the internal offsets for low distortion operation.

The operational amplifier (which is internally compensated) has the non-inverting input tied to V_{REF}, and the inverting input connected to the ΔG cell output as well as brought out externally. A resistor, R_3, is brought out from the summing node and allows compressor or expandor gain to be determined only by internal components.

Note:
1. Supplied only in large SO (Small Outline) package.

APPLICATIONS

- **Telephone trunk compandor—570**
- **Telephone subscriber compandor—571**
- **High level limiter**
- **Low level expandor—noise gate**
- **Dynamic noise reduction systems**
- **Voltage controlled amplifier**
- **Dynamic filters**

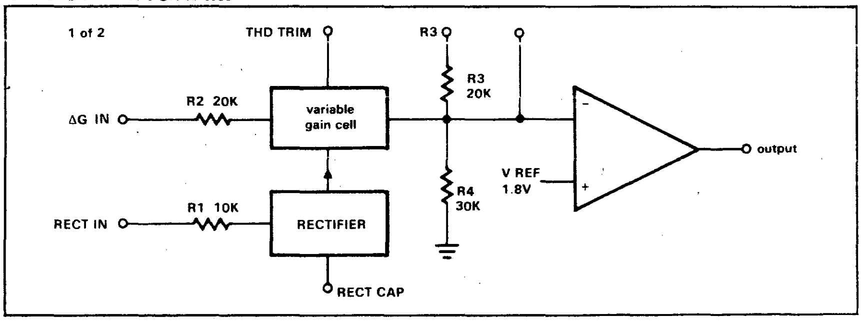
BLOCK DIAGRAM



The output stage is capable of ±20mA output current. This allows a +13dBm (3.5V rms) output into a 300Ω load which, with a series resistor and proper transformer, can result in +13dBm with a 600Ω output impedance.

A band gap reference provides the reference voltage for all summing nodes, a regulated supply voltage for the rectifier and ΔG cell, and a bias current for the ΔG cell. The low tempco of this type of reference provides very stable biasing over a wide temperature range.

The typical performance characteristics illustration shows the basic input-output transfer curve for basic compressor or expandor circuits.

LINEAR

Signetics

PROGRAMMABLE ANALOG COMPANDOR

NE572

DESCRIPTION

The NE572 is a dual channel, high performance gain control circuit in which either channel may be used for dynamic range compression or expansion. Each channel has a full wave rectifier to detect the average value of input signal; a linearized, temperature compensated variable gain cell (ΔG) and a dynamic time constant buffer. The buffer permits independent control of dynamic attack and recovery time with minimum external components and improved low frequency gain control ripple distortion over previous compandors.

The NE572 is intended for noise reduction in high performance audio systems. It can also be used in a wide range of communication systems and video recording applications.

FEATURES

- **Independent control of attack and recovery time.**
- **Improved low frequency gain control ripple**
- **Complementary gain compression and expansion with external Op Amp**
- **Wide dynamic range—greater than 110dB**
- **Temperature compensated gain control**
- **Low distortion gain cell**
- **Low noise—6μV typical**
- **Wide supply voltage range—6V-22V**
- **System level adjustable with external components.**

APPLICATIONS

- **Dynamic noise reduction system**
- **Voltage control amplifier**
- **Stereo expandor**
- **Automatic level control**
- **High level limiter**
- **Low level noise gate**
- **State variable filter**

VOLTAGE COMPARATOR

NE/SE527

DESCRIPTION

The SE/NE527 is a high speed analog voltage comparator which, in the first time mates state-of-the-art Schottky diode technology with the conventional linear process. This allows simultaneous fabrication of high speed T2L gates with a precision linear amplifier on a single monolithic chip. The SE/NE527 is similar in design to the Signetics SE/NE529 voltage comparator except that it incorporates a "Emitter Follower" input stage for extremely low input currents. This opens the door to a whole new range of applications for analog voltage comparators.

FEATURES

- **15ns propagation delay**
- **Complementary output gates**
- **TTL or ECL compatible outputs**
- **Wide common mode and differential voltage range**
- **Mil std 883A,B,C available**
- **Typical Gain of 5000**

APPLICATIONS

- **A/D conversion**
- **ECL to TTL interface**
- **TTL to ECL interface**
- **Memory sensing**
- **Optical data coupling**

VACUUM FLUORESCENT DISPLAY DRIVER

NE/SA594

DESCRIPTION

The NE/SA594 is a display driver interface for vacuum fluorescent displays. The device is comprised of 8 drivers and a bias network and is capable of driving the digits and/or segments of most vacuum fluorescent displays.

The inputs are designed to be compatible with TTL, DTL, NMOS, PMOS or CMOS output circuitry.

There is an active pull-down circuit on each output so that display ghosting is minimized and no external components are required for most fluorescent display applications.

FEATURES

- **Digit and/or segment drivers**
- **Active output pull-down circuitry**
- **High output breakdown voltage**
- **Low supply voltage**
- **Input compatible with all logic outputs**

APPLICATIONS

- Digital clocks
- Dashboard displays
- Panel displays

ADDRESSABLE RELAY DRIVER

NE5090

DESCRIPTION

The NE/SE5090 addressable relay driver is a high current latched driver, similar in function to the 9934 address decoder. The device has 8 open collector Darlington power outputs, each capable of 150mA load current. The outputs are turned on or off by respectively loading a logic "1" or logic "0" into the device data input. The required output is defined by a 3 bit address. The device must be enabled by a $\overline{CE}$ input line which also serves the function of further address decoding. A common clear input, $\overline{CLR}$, turns all outputs off when a logic "0" is applied. The device is packaged in a 16 pin plastic or CERDIP package.

FEATURES

- **8 high current outputs**
- **Low-loading bus compatible inputs**
- **Power-on clear ensures safe operation**
- **Will operate in addressable or demultiplex mode**
- **Allows random (addressed) data entry**
- **Easily expandable**
- **Pin compatible with 9334**

APPLICATIONS

- **Relay driver**
- **Indicator lamp driver**
- **Triac trigger**
- **LED display digit driver**
- **Stepper motor driver**

ADDRESSABLE PERIPHERAL DRIVERS

NE590/NE591

DESCRIPTION

The NE590/591 addressable peripheral drivers are high current latched drivers, similar in function to the 9334 address decoder. The device has 8 Darlington power outputs, each capable of 250mA load current. The outputs are turned on or off by respectively loading a logic high or logic low into the device data input. The required output is defined by a 3-bit address. The device must be enabled by a $\overline{CE}$ input line. A common clear input, $\overline{CLR}$, turns all outputs off when a logic low is applied.

The NE590 has 8 open collector Darlington outputs which sink current to ground. The device is packaged in a 16-pin molded or cerdip package.

The NE591 has 8 open emitter Darlington outputs which source current to an external load from a common collector line, V_S. This V_S line need not necessarily be the same as the 5 volt V_{CC} supply. The device is packaged in an 18-pin molded or cerdip package.

FEATURES

- **8 high current outputs**
- **Low-loading bus compatible inputs**
- **Power-on clear ensures safe operation**
- **NE590 will operate in addressable or demultiplex mode**
- **Allows random (addressed) data entry**
- **Easily expandable**
- **NE590 is pin compatible with 9334**

APPLICATIONS

- **Relay driver**
- **Indicator lamp driver**
- **Triac trigger**
- **LED display digit driver**
- **Stepper motor driver**

PIN DESIGNATION

590 PIN NO.	591 PIN NO.	SYMBOL	NAME & FUNCTION
1-3	2-4	A_0-A_2	A 3-bit binary address on these pins defines which of the 8 output latches is to receive the data.
4-7, 9-12	5-8, 11-14	Q_0-Q_7	The 8 device outputs. The NE590 has open collector Darlington outputs. The NE591 has open emitter follower outputs.
13	15	D	The data input. When the chip is enabled, this data bit is transferred to the defined output such that: "1" turns output switch "ON" "0" turns output switch "OFF" Thus in logic terms, the NE590 inverts data to the relevant output. The NE591 retains true data at the output.
14	16	$\overline{CE}$	The chip enable. When this input is low, the output latches will accept data. When $\overline{CE}$ goes high, all outputs will retain their existing state, regardless of address or data input conditions.
15	17	$\overline{CLR}$	The clear input. When $\overline{CLR}$ goes low all output switches are turned "OFF". On the NE590, a high data input will override the clear function on the addressed latch. On the NE591, $\overline{CLR}$ low will override any other condition.
—	1	$\overline{CS}$	The chip select input provides for an additional level of address decoding.
—	10	V_S	The V_S line provides the power to all 8 output devices. It is connected to the collectors of all 8 output transistors. This pin may be connected to the V_{CC} or another supply.

PROGRAMMABLE SEVEN CHANNEL RC ENCODER — NE5044

DESCRIPTION

The NE5044 is a programmable parallel input, serial output pulsewidth encoder. A multiplexed dual linear ramp technique is used to allow up to 7 inputs to be converted to a serial pulsewidth modulated signal with excellent linearity and minimal crosstalk. Fixed or variable frame rates can be used, externally controlled, for ease of demodulation. An onboard 5V regulator eliminates power supply sensitivities and provides up to 20mA current capability for driving external loads.

FEATURES

- **3 to 7 channels, externally selectable**
- **Constant current dual linear ramp for linearity better than .3%**
- **Internal voltage regulator for low drift**
- **Wide supply range 4.5 – 16V**
- **Fixed or variable frame rate set by external R-C**
- **External control for channel gain or range**
- **Versatile applications; exponential rates, mixing, dual rate, reversing etc.**
- **Compatible with all transmission mediums**

APPLICATIONS

- **Radio controlled aircraft, cars, boats, trains**
- **Industrial controllers**
- **Remote controlled entertainment systems**
- **Security systems**
- **Instrumentation recorders/controls**
- **Remote Analog/digital data transmission**
- **Automotive sensor systems**

SEVEN CHANNEL RC DECODER

NE5045

DESCRIPTION

The NE5045 is a serial input, parallel output, decoder intended for applications in pulse width or pulse position modulation systems. The serial input pulse, either positive or negative, is shaped and amplified before being fed to the counter/decoder. An integrating type sync. separator detects pulses greater than $T_W = R_S C_S$. The amplified input pulse triggers an internal one-shot (minimum pulse) which in turn clocks the counter-decoder, thereby enhancing system noise rejection. A missing pulse detector resets the decoder during the sync. pause. An internal voltage regulator supplies power for the radio receiver providing excellent isolation from the power supply as well as the decoder logic.

FEATURES

- **Decodes up to 7 channels**
- **High gain input amplifier**
- **Externally set sync. pause and minimum pulse**
- **Wide supply voltage range, 3.6V–8V.**
- **Positive or negative pulse inputs**
- **Noise and flutter rejection**
- **Outputs reset to zero without inputs**
- **Compatible with all transmission mediums**

APPLICATIONS

- **Radio controlled aircraft, cars, boats, trains**
- **Industrial controllers**
- **Remote controlled entertainment systems**
- **Security systems**
- **Instrumentation recorders/controls**
- **Remote Analog/digital data transmission**
- **Automotive sensor systems**

NE544

DESCRIPTION

The NE544 is a servo amplifier and pulse-width demodulator with internal motor drive transistors. It is designed for remote control applications in digital proportional systems but can be used in many other closed loop position control applications. It incorporates a linear one shot for improved positional accuracy and outputs for external pnp motor drive transistors.

FEATURES

- **500mA load current capability**
- **Bidirectional bridge output with single power supply**
- **Low standby power drain**
- **Adjustable deadband and trigger thresholds**
- **High linearity, 0.5% maximum error**
- **Output drive for external PNP transistors (optional)**
- **Wide supply voltage range**

APPLICATIONS

- **Miniature position Servo**
- **Robotics**
- **Control devices**
- **Remote positioning**

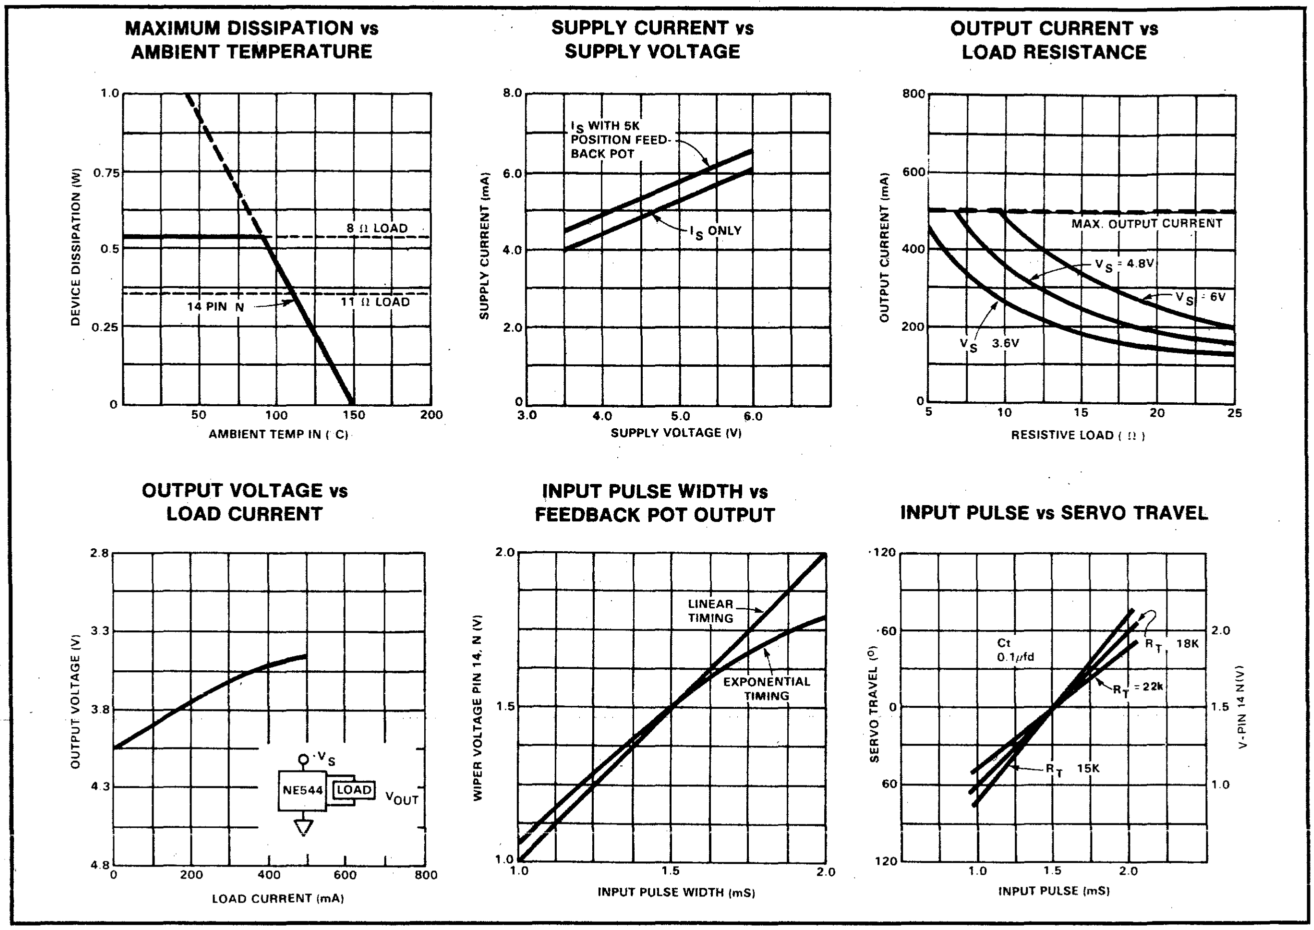
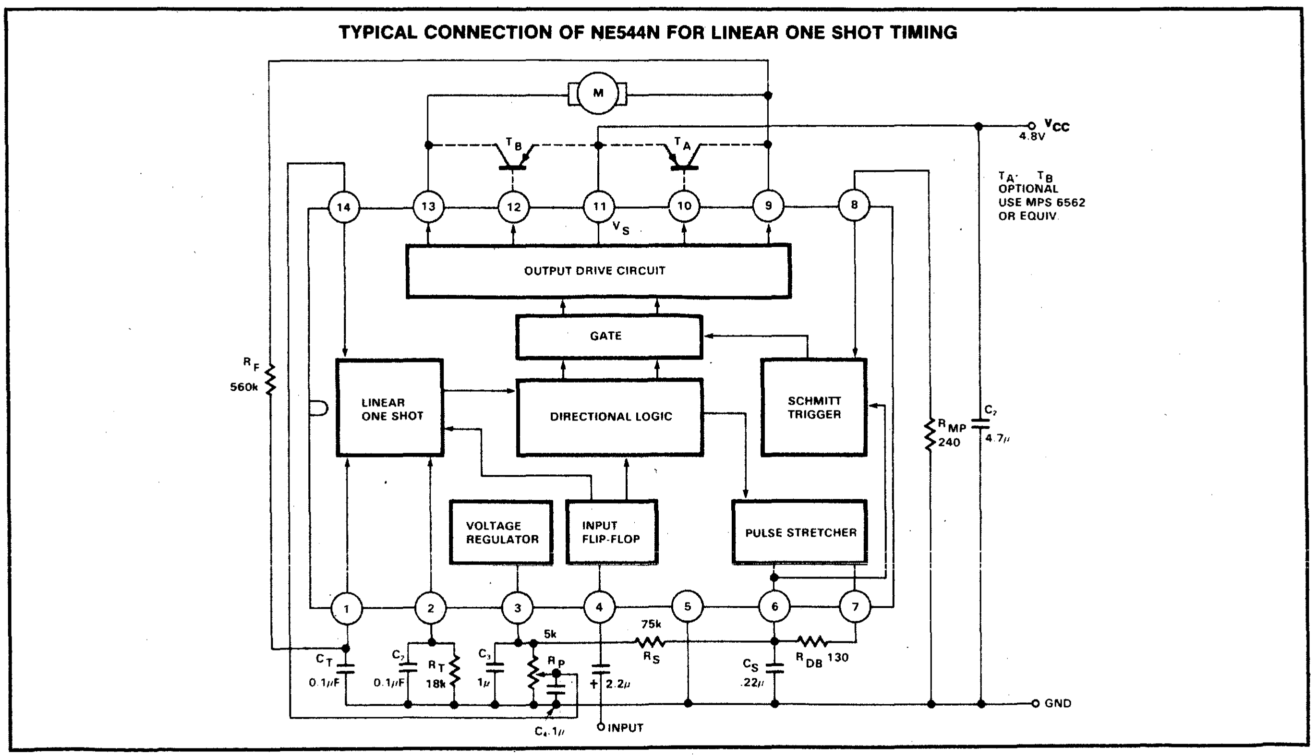
TYPICAL PERFORMANCE CHARACTERISTICS





LVDT SIGNAL CONDITIONER

NE5520

DESCRIPTION

The NE5520 is a signal conditioning circuit for use with Linear Variable Differential Transformers (LVDT). The chip includes a low distortion amplitude stable sine wave oscillator with programmable frequency to drive the primary of the LVDT; a synchronous demodulator to convert the LVDT output amplitude and phase to position information; and an output amp to provide gain and filtering.

FEATURES

- Oscillator frequency: 1kHz to 20kHz
- Low distortion
- Capable of ratiometric operation
- Single supply operation 5V to 20V or dual supply ±2.5V to ±10V
- Low power consumption

APPLICATIONS

- LVDT signal conditioning
- RVDT signal conditioning

OPERATIONAL TRANSCONDUCTANCE AMPLIFIERS LM13600/13600A

DESCRIPTION

The LM13600 series consists of two current controlled transconductance amplifiers each with differential inputs and a push pull output. The two amplifiers share common supplies but otherwise operate independently. Linearizing diodes are provided at the inputs to reduce distortion and allow higher input levels. The result is a 10 dB signal-to-noise improvement referenced to 0.5 percent THD. Controlled impedance buffers are provided which are specifically designed to complement the dynamic range of the amplifiers.

FEATURES

- **gm adjustable over 6 decades**
- **Excellent gm linearity**
- **Excellent matching between amplifiers**
- **Linearizing diodes**
- **Controlled impedance buffers**
- **High output signal to noise ratio**
- **Wide supply range ±2V to ±22V.**

APPLICATIONS

- **Current controlled amplifiers**
- **Current controlled impedances**
- **Current controlled filters**
- **Current controlled oscillators**
- **Multiplexers**
- **Timers**
- **Sample and hold circuits**

NOTES
1. For selections to a supply voltage above ±22V, contact factory.
2. For operating at high temperatures, the device must be derated based on a 150°C maximum junction temperature and a thermal resistance of 175° C/W which applies for the device soldered in a printed circuit board, operating in still air.
3. Buffer output current should be limited so as to not exceed package dissipation.
4. These specifications apply for V_S = ± 15V, T_A = 25°C, amplifier bias current (I_{ABC}) = 500μA, pins 2 and 15 open unless otherwise specified. The inputs to the buffers are grounded and outputs are open.
5. These specifications apply for V_{SS} = ± 15V, I_{ABC} = 500 μA, R_{OUT} = 5KΩ connected from the buffer output to $-V_S$ and the input of the buffer is connected to the transconductance amplifier output.

LINEAR

Signetics

DUAL HIGH PERFORMANCE OPERATIONAL AMPLIFIER — NE/SE5512

DESCRIPTION
The 5512 series of high performance operational amplifier provides very good input characteristics. These amplifiers feature low input bias and voltage characteristics such as a 108 op amp with improved CMRR and a high differential input voltage limit achieved through the use of a bias cancellation and PNP input circuits with collector to emitter clamping. The output characteristics are like those of a 741 op amp with improved slew rate and drive capability yet have low supply quiescent current.

APPLICATIONS
- AC amplifiers
- RC active filters
- Transducer amplifiers
- DC gain block
- Battery operation
- Instrumentation amplifiers

FEATURES
- **Low input bias < ±3nA**
- **Low input offset current < ±3nA**
- **Low input offset voltage < 1mV**
- **Low V_{OS} temperature drift 4μV/°C**
- **Low input bias temperature drift 30pA/°C**
- **Low input voltage noise 25nV/√Hz**
- **Low supply current 1.5mA/amp**
- **High slew rate 1.0V/μs**
- **High CMRR 100dB**
- **High input impedance 100MΩ**
- **High PSRR 110dB**
- **High differential input voltage limit**
- **No cross-over distortion**
- **Indefinite output short circuit protection**
- **Internally compensated for unity gain**

For operation at elevated temperature, N package must be derated based on a thermal resistance of 120°/W junction to ambient. Thermal resistance of the FE package is 125°/W.

QUAD HIGH PERFORMANCE OP AMP

NE/SE5514

DESCRIPTION

The NE/SE5514 family of Quad Operational Amplifiers sets new standards in Bipolar Quad Amplifier Performance. The amplifiers feature low input bias current and low offset voltages. Pin-out is identical to LM324/LM348 which facilitates direct product substitution for improved system performance. Output characteristics are similar to a μA741 with improved slew and drive capability.

FEATURES

- **Low input bias current: $<\pm 3nA$**
- **Low input offset current: $<\pm 3nA$**
- **Low input offset voltage: $<1mV$**
- **Low supply current: 1.5mA/Amp**
- **1 V/μsec slew rate**
- **High input impedance: 100MΩ**
- **High common mode impedance: 10GΩ**
- **Internal compensation for unity gain**

APPLICATIONS

- **AC amplifiers**
- **RC active filters**
- **Transducer amplifiers**
- **DC gain block**
- **Instrumentation amplifier**

DUAL OPERATIONAL TRANSCONDUCTANCE AMPLIFIER NE5517/5517A

DESCRIPTION

The NE5517 contains two current controlled transconductance amplifiers, each with a differential input and push-pull output. The NE5517 offers significant design and performance advantages over similar devices for all types of programmable gain applications. Constant impedance buffers are provided which effectively eliminate changes in output offset voltage as the amplifier bias current is varied. Circuit performance is enhanced through the use of linearizing diodes at the inputs which enable a 10 dB signal to noise improvement referenced to .5 percent THD. The NE5517 is suited for a wide variety of industrial and consumer applications and is recommended as the preferred circuit in the Dolby* HX (Headroom Extension) system.

FEATURES

- **Constant impedance buffers**
- **ΔV_{BE} of buffer is constant with amplifier I_{BIAS} change**
- **Pin compatible with LM13600**
- **Excellent matching between amplifiers**
- **Linearizing diodes**
- **High output signal-to-noise ratio**

APPLICATIONS

- **Multiplexers**
- **Timers**
- **Electronic music synthesizers**
- **Dolby* HX Systems**
- **Current-controlled amplifiers, filters**
- **Current-controlled oscillators, impedances**

NOTE

*Dolby is a registered trademark of Dolby Laboratories Inc., San Francisco, Calif.

Peak buffer output voltage	5	10			10			V
ΔV_{BE} of buffer	6 Refer to Buffer V_{BE} test circuit		0.5	5		0.5	5	mV

NOTES
1. For selections to a supply voltage above ±22V, contact factory.
2. For operating at high temperatures, the device must be derated based on a 150°C maximum junction temperature and a thermal resistance of 175° C/W which applies for the device soldered in a printed circuit board, operating in still air.
3. Buffer output current should be limited so as to not exceed package dissipation.
4. These specifications apply for V_S = ±15V, T_A = 25°C, amplifier bias current (I_{ABC}) = 500μA, pins 2 and 15 open unless otherwise specified. The inputs to the buffers are grounded and outputs are open.
5. These specifications apply for V_S = ±15V, I_{ABC} = 500μA, R_{OUT} = 5kΩ connected from the buffer output to $-V_S$ and the input of the buffer is connected to the transconductance amplifier output.
6. V_S = ±15, R_{OUT} = 5KΩ connected from Buffer output to $-V_S$ and 5μA ≤ I_{ABC} ≤ 500μA.

INTERNALLY COMPENSATED DUAL LOW NOISE OP AMP — NE/SE5532/5532A

DESCRIPTION

The 5532 is a dual high-performance low noise operational amplifier. Compared to most of the standard operational amplifiers, such as the 1458, it shows better noise performance, improved output drive capability and considerably higher small-signal and power bandwidths.

This makes the device especially suitable for application in high quality and professional audio equipment, instrumentation and control circuits, and telephone channel amplifiers. The op amp is internally compensated for gains equal to one. If very low noise is of prime importance, it is recommended that the 5532A version be used which has guaranteed noise voltage specifications.

FEATURES

- Small-signal bandwidth: 10MHz
- Output drive capability: 600Ω, 10V (rms)
- Input noise voltage: $5nV/\sqrt{Hz}$ (typical)
- DC voltage gain: 50000
- AC voltage gain: 2200 at 10kHz
- Power bandwidth: 140kHz
- Slew-rate: 9V/μs
- Large supply voltage range: ±3 to ±20V

SINGLE AND DUAL LOW NOISE OP AMP NE5533/5533A / NE/SE5534/5534A

DESCRIPTION

The 5533/5534 are dual and single high-performance low noise operational amplifiers. Compared to other operational amplifiers, such as TL083, they show better noise performance, improved output drive capability and considerably higher small-signal and power bandwidths.

This makes the devices especially suitable for application in high quality and professional audio equipment, in instrumentation and control circuits and telephone channel amplifiers. The op amps are internally compensated for gain equal to, or higher than, three. The frequency response can be optimized with an external compensation capacitor for various applications (unity gain amplifier, capacitive load, slew-rate, low overshoot, etc.) If very low noise is of prime importance, it is recommended that the 5533A/5534A version be used which has guaranteed noise specifications.

FEATURES

- **Small-signal bandwidth: 10MHz**
- **Output drive capability: 600Ω, 10V (rms) at $V_S = \pm 18V$**
- **Input noise voltage: 4nV/$\sqrt{Hz}$**
- **DC voltage gain: 100000**
- **AC voltage gain: 6000 at 10kHz**
- **Power bandwidth: 200kHz**
- **Slew-rate: 13V/μs**
- **Large supply voltage range: ±3 to ±20V**

PHASE LOCKED LOOP

NE/SE564

DESCRIPTION

The NE564 is a versatile, high guaranteed frequency Phase Locked Loop designed for operation up to 50MHz. As shown in the block diagram, the NE564 consists of a VCO, limiter, phase comparator, and post detection processor.

APPLICATIONS

- High speed modems
- FSK receivers and transmitters
- Frequency synthesizers
- Signal generators
- Various satcom/TV systems

FEATURES

- Operation with single 5V supply
- TTL compatible inputs and outputs
- Guaranteed operation to 50MHz
- External loop gain control
- Reduced carrier feedthrough
- No elaborate filtering needed in FSK applications
- Can be used as a modulator
- Variable loop gain (Externally Controlled)

ABSOLUTE MAXIMUM RATINGS

	PARAMETER		RATING	UNIT
V+	Supply voltage			V
	Pin 1		14	
	Pin 10		6	
P_D	Power dissipation		600	mW
T_A	Operating temperature	NE	0 to 70	°C
,	Operating temperature	SE	−55 to +125	
t_{stg}	Storage temperature		−65 to 150	°C

NOTE:
Operation above 5 volts will require heatsinking of the case.

OUTLINE OF SETUP PROCEDURE

1. Determine operating frequency of the VCO−.
   If ÷ N in feedback loop, then $f_o = N \times f_{in}$.
2. Calculate value of the VCO frequency set capacitor:
   $$C_O \approx \frac{1}{2500\, f_o}$$
3. Set I_2 (current sinking into Pin 2) for ≅ 200µA. After operation is obtained, this value may be adjusted for best dynamic behavior.
4. Check VCO output frequency with digital counter at Pin 9 of device (loop open, VCO to ϕ det.). Adjust C_O trim or frequency adj. Pin 4-5 for exact center frequency if needed.
5. Close loop and inject input signal to Pin 6. Monitor Pin 3 and 6 with two channel scope. Lock should occur with $\Delta\phi_{3-6}$ equal to 90° (phase error).
6. If pulsed burst or ramp frequency is used for input signal, special loop filter design may be required in place of simple single capacitor filter on Pin 4 and 5. (See PLL application section in Analog Manual.)
7. The input signal to Pin 6 and the VCO feedback signal to Pin 3 must have a duty cycle of 50% for proper operation of the phase detector. Due to the nature of a balanced mixer if signals are not 50% in duty cycle, D.C. offsets will occur in the loop which tend to create an artificial or biased VCO offset.
8. For multiplier circuits where phase jitter is a problem, loop filter capacitors may be increased to a value of 10-50µF on Pin 4, 5. Also careful supply decoupling may be necessary. This includes the counter chain V_{CC} lines.

SWITCHED-MODE POWER SUPPLY CONTROL CIRCUIT — NE/SE5560

DESCRIPTION

The NE/SE5560 is a control circuit for use in switched mode power supplies. This single monolithic chip incorporates all the control and housekeeping (protection) functions required in switched mode power supplies, including an internal temperature compensated reference source, internal Zener reference, sawtooth generator, pulse width modulator, output stage and various protection circuits.

FEATURES

- **Stabilized power supply**
- **Temperature compensated reference source**
- **Sawtooth generator**
- **Pulse width modulator**
- **Remote on/off switching**
- **Current limiting**
- **Low supply voltage protection**
- **Loop fault protection**
- **Demagnetization/overvoltage protection**
- **Maximum duty cycle clamp**
- **Feed forward control**
- **External synchronization**

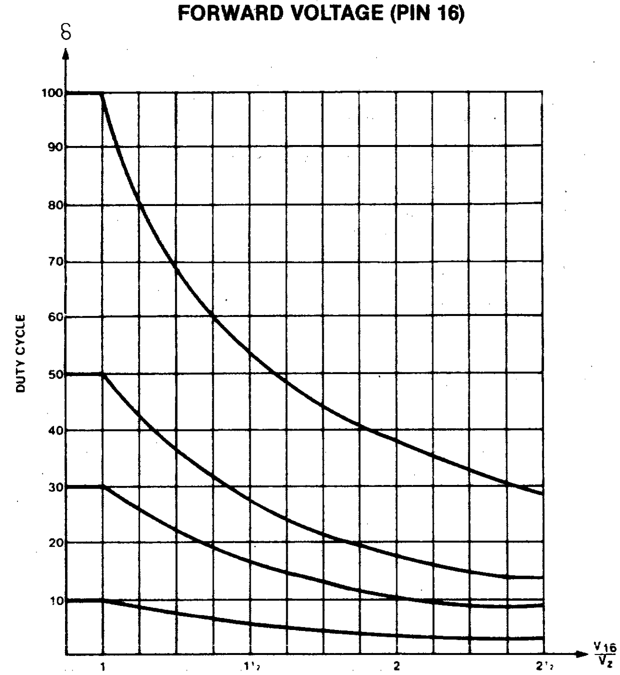
DUTY CYCLE SENSITIVITY TO FEED FORWARD VOLTAGE (PIN 16)



THEORY OF OPERATION

The following functions are incorporated:

- A temperature compensated reference source.
- An error amplifier with pin 3 as input. The output is connected to pin 4 so that the gain is adjustable with external resistors.
- A sawtooth generator with a TTL-compatible synchronization input (pins 7,8,9).
- A pulse-width modulator with a duty-cycle range from 0 to 95%.

(The PWM has two additional inputs:

Pin 6 can be used for a precise setting of δ max.

Pin 5 gives a direct access to the modulator, allowing for real constant current operation:)

- A gate at the output of the PWM provides a simple dynamic current limit.
- A latch that is set by the flyback of the sawtooth and reset by the output pulse of the above-mentioned gate prohibits double pulsing.
- Another latch functions as a start-stop circuit; it provides a fast switch-off and a slow start.
- A current protection circuit that operates via the start-stop circuit. This is a combined function with the current limit circuit, therefore pin 11 has two trip-on levels; the lower one for cycle-by-cycle current limiting, the upper one for current protection by means of switch-off and slow-start.
- A TTL-compatible remote on/off input at pin 10, also operating via the start-stop circuit.
- An inhibit input at pin 13. The output pulse can be inhibited immediately.
- An output gate that is commanded by the latches and the inhibit circuit.
- An output transistor of which both the collector (pin 15) and the emitter (pin 14) are externally available. This allows for normal or inverse output pulses.
- A power supply that can be either voltage or current driven (pins 1 and 12). The internally generated stabilized output voltage V_Z is connected to pin 2.
- A special function is the so-called feed-forward at pin 16. The amplitude of the sawtooth generator is modulated in such a way that the duty cycle becomes inversely proportional to the voltage on this pin: $\delta \sim 1/V16$
- Loop fault protection circuits assure that the duty-cycle is reduced to zero or a low value for open or short-circuited feedback loops.

Stabilized Power Supply (Pins 1, 2, 12)

The power supply of the NE5560 is of the well known series regulation type and provides a stablized output voltage of typically 8.5 volts.

This voltage V_Z is also present at pin 2 and can be used for precise setting of δ max. and to supply external circuitry. Its maximum current capability is 5mA.

The circuit can be fed directly from a DC voltage source between 10.5V and 18V or can be current driven via a limiting resistor. In the latter case, internal pinch-off resistors will limit the maximum supply voltage; typical 23V for 10mA and maximum 30V for 30mA.

The low supply voltage protection is active when V(1-12) is below 10.5V and inhibits the output pulse (no hysteresis).

When the supply voltage surpasses the 10.5V level, the IC starts delivering output pulses via the slow-start function.

The current consumption at 12V is less than 10mA, provided that no current is drawn from V_Z and R(7-12) ≥ 20kΩ.

SWITCHED MODE POWER SUPPLY CONTROLLER

NE/SE5561

DESCRIPTION

The NE5561/SE5561 is a control circuit for use in switched mode power supplies. It contains an internal temperature compensated supply, PWM, sawtooth oscillator, over-current sense latch, and output stage. The device is intended for low cost SMPS applications where extensive housekeeping functions are not required.

FEATURES

- **Micro-miniature (D) package**
- **Pulse-width modulator**
- **Current limiting (cycle by cycle)**
- **Sawtooth generator**
- **Stabilized power supply**
- **Double pulse protection**
- **Internal temperature compensated reference**

APPLICATIONS

- **Switch mode power supplies**
- **D/C motor controller inverter**
- **DC/DC converter**

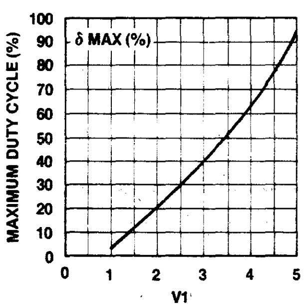
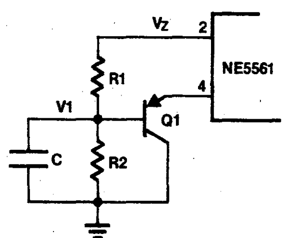
MAXIMUM DUTY CYCLE VS BASE VOLTAGE ON Q1

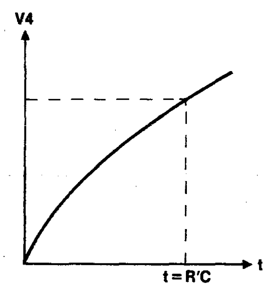


START-UP CIRCUIT



$$\delta_{max} = f\left[\frac{R2}{R1+R2}\; V_Z + V_{BE\,Q1}\right]$$

SLOW START VOLTAGE



NE5561 Start-Up

The start-up, or initial turn on, of this device requires some degree of external protective duty cycle limiting to prevent the duty cycle from initially going to the extreme maximum ($\delta > 90\%$). Either over-current limit or slow start circuitry must be employed to limit duty cycle to a safe value during start-up. Both may be used if desired.

To implement slow-start, the start-up circuit can be used. The divider R1 and R2 sets a voltage, buffered by Q1, such that the output of the error amplifier is clamped to a maximum output voltage, thereby limiting the maximum duty cycle. The addition of capacitor C will cause this voltage to ramp up slowly when power is applied, causing the duty cycle to ramp up simultaneously.

Over-current limit may be used also. To limit duty cycle in this mode, the switch current is monitored at pin 6 and the output of the 5561 is disabled on a cycle by cycle basis when current reaches the programmed limit. With current limit control of slow-start, the duty cycle is limited to that value just allowing maximum switch current to flow. (Approximately 0.50V measured at pin 6.)

APPLICATIONS

5V, 0.5A Buck Regulator Operates from 15V

The converter design shows how simple it is to derive a TTL supply from a system supply of 15V (see Figure 1). The NE5561 drives a 2N4920 PNP transistor directly to provide switching current to the inductor.

Overall line regulation is excellent and covers a range of 12V to 18V with minimal change (< 10 mV) in the output operating at full load.

As with all NE5561 circuits, the auxiliary slow start and δ_{max} circuit is required, as evidenced by Q1. The δ_{max} limit may be calculated by using the relationship (Figure 5a, b).

$$\frac{R2}{R1+R2}(8.2V) = V_{\delta(max)}.$$

The maximum duty cycle is then determined from the pulse-width modulator transfer graph, and R1, R2 are defined from the desired conditions.

REGULATING PULSE WIDTH MODULATOR

SG3524

DESCRIPTION

This monolithic integrated circuit contains all the control circuitry for a regulating power supply inverter or switching regulator. Included in a 16-pin dual-in-line package is the voltage reference, error-amplifier, oscillator, pulse width modulator, pulse steering flip-flop, dual alternating output switches and current limiting and shut-down circuitry. This device can be used for switching regulators of either polarity, transformer coupled DC to DC converters, transformerless voltage doublers and polarity converters, as well as other power control applications. The SG3524 is designed for commercial applications of 0°C to +70°C.

FEATURES

- **Complete PWM power control circuitry**
- **Single ended or push-pull outputs**
- **Line and load regulation of 0.2%**
- **1% maximum temperature variation**
- **Total supply current is less than 10mA**
- **Operation beyond 100kHz**

FM RADIO CIRCUIT

TDA 7000

Preliminary

DESCRIPTION

The TDA7000 is a monolithic integrated circuit for mono FM portable radios where a minimum of peripheral components is important (small dimensions and low costs).

The IC has an FLL (Frequency-Locked-Loop) system with an intermediate frequency of 70 kHz. The I.F. selectivity is obtained by active RC filters. The only function which needs alignment is the resonant circuit for the oscillator, thus selecting the reception frequency. Spurious reception is avoided by means of a mute circuit, which also eliminates too-noisy input signals. Special precautions are taken to meet the radiation requirements.

FEATURES

- **R.F. input stage**
- **Mixer**
- **Local oscillator**
- **I.F. amplifier/limiter**
- **Phase demodulator**
- **Mute detector**
- **Mute switch**

SAMPLE AND HOLD AMPLIFIER

NE/SE5537

DESCRIPTION

The NE5537 monolithic Sample and Hold amplifier combines the best features of ion implanted JFET's with bipolar devices to obtain high accuracy, fast acquisition time, and low droop rate. This device is pin compatible with the LF198, and features superior performance in droop rate and output drive capability. The circuit shown in Figure 1 contains two operational amplifiers which function as a unity gain amplifier in the Sample mode. The first amplifier has bipolar input transistors which gives the system a low offset voltage. The second amplifier has JFET input transistors to achieve low leakage current from the hold capacitor. A unique circuit design for leakage current cancellation using current mirrors gives the NE5537 a low droop rate at higher temperature. The output stage has the capability to drive a 2KΩ load. The logic input is compatible with TTL, PMOS or CMOS logic. The differential logic threshold is 1.4V with the Sample mode occurring when the logic input is high. It is available in 8-lead TO-5 and 8-pin plastic DIP packages.

FEATURES

- Operates from ±5V to ±18V supplies
- Hold leakage current 6pA @ T_j25°C
- Less than 10μs acquisition time
- TTL, PMOS, CMOS compatible logic input
- 0.5mV typical hold step at C_h = 0.01μF
- Low input offset: 1MV (typical)
- 0.002% gain accuracy with R_L = 2kΩ
- Low output noise in hold mode
- Input characteristics do not change during hold mode
- High supply rejection ratio in sample or hold
- Wide bandwidth

ABSOLUTE MAXIMUM RATINGS

PARAMETER	RATING	UNIT
Supply voltage	±18	V
Power dissipation (package limitation)[1]	500	mW
Operating ambient temperature range		
SE5537	−55 to +125	°C
NE5537	0 to +70	°C
Storage temperature range	−65 to +150	°C
Input voltage	Equal to supply voltage	
Logic to logic reference differential voltage[2]	+7, −30	V
Output short circuit duration	Indefinite	
Hold capacitor short circuit duration	10	sec
Lead temperature (soldering, 10sec)	300	°C

NOTES
1. The maximum junction temperature of the SE5537 is 150°C and for the NE5537 is 100°C. When operating at elevated ambient temperature, the TO-5 and plastic DIP packages must be derated based on a thermal resistance (θja) of 150°C/W.
2. Although the differential voltage may not exceed the limits given, the common mode voltage on the logic pins may be equal to the supply voltages without causing damage to the circuit. For proper logic operation, however, one of the logic pins must always be at least 2V below the positive supply and 3V above the negative supply.

BLOCK DIAGRAM

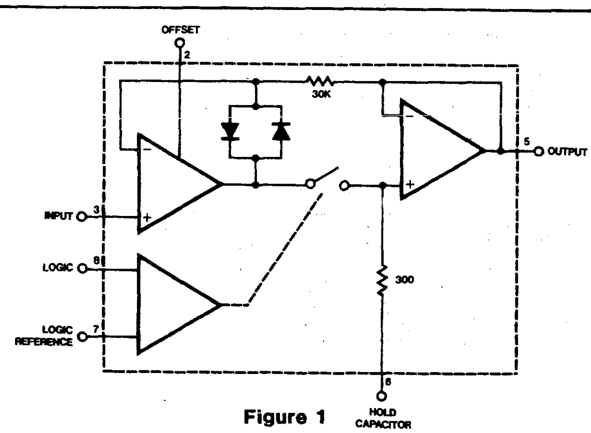

Figure 1

DESCRIPTION

The 558 Quad Timers are monolithic timing devices which can be used to produce four entirely independent timing functions. The 558 output sinks current. These highly stable, general purpose controllers can be used in a monostable mode to produce accurate time delays, from microseconds to hours. In the time delay mode of operation, the time is precisely controlled by one external resistor and one capacitor. A stable operation can be achieved by using two of the four timer sections.

The four timing sections in the 558 are edge triggered; therefore, when connected in tandem for sequential timing applications, no coupling capacitors are required. Output current capability of 100mA is provided in both devices.

FEATURES

- **100mA output current per section**
- **Edge triggered (no coupling capacitor)**
- **Output independent of trigger conditions**
- **Wide supply voltage range 4.5V to 18V**
- **Timer intervals from microseconds to hours**
- **Time period equals RC**
- **Military qualifications pending**

APPLICATIONS

- **Sequential timing**
- **Time delay generation**
- **Precision timing**
- **Industrial controls**
- **Quad one-shot**

Risetime of output	I_L = 100mA		100			100		ns
Falltime of output	I_L = 100mA		100			100		ns

NOTES

1. The trigger functions only on the falling edge of the trigger pulse only after previously being high. After reset the trigger must be brought high and then low to implement triggering.
2. For reset below 0.8 volts, outputs set low and trigger inhibited. For reset above 2.4 volts, trigger enabled.
3. The 558 output structure is open collector which requires a pull up resistor to V_{CC} to sink current. The output is normally low sinking current.

LINEAR

Signetics

VOICE SYNTHESIZER

MEA8000

Preliminary

DESCRIPTION

The MEA8000 is a 24-pin N MOS integrated circuit for generating good quality speech from digital code with a programmable bit rate. The circuit is primarily intended for applications in microprocessor controlled systems, where the speech code is stored separately in a Read-Only Memory. An efficient, easy-to-use speech editing and encoding system with EPROM programming capability, has been specially developed.

APPLICATIONS

- Telephony
- Automotive
- Computer response/prompt.
- Video games.
- General industrial.

FEATURES

- **Microprocessor interface cability including an 8-bit data bus, an enable and a read/write input control signals.**
- **32-bit data buffer holding speech frame codes.**
- **Digital filter of 8th order with 3 programmable formant frequencies, one fixed formant frequency, and 4 programmable formant bandwidths. 4 KHZ bandwidth.**
- **Programmable amplitudes.**
- **Programmable duration of each frame: 8, 16, 32, or 64 milliseconds.**
- **Low data rate: average 1000 bits/sec.**
- **Operates from standard EPROMs/ROMs.**
- **Minimal external audio filter requirement.**
- **Crystal controlled oscillator or external (TTL) clock.**
- **Single +5V power supply.**

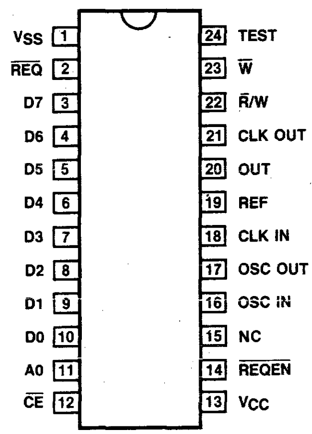
FUNCTIONAL PIN DESCRIPTION



PIN NO.	SYMBOL	NAME AND FUNCTION
		CONTROL
2	$\overline{REQ}$	**DATA REQUEST** output signal (open drain) which follows the inverse of the status REQ bit, but only if enabled by either the ROE bit in the command register or the external $\overline{REQEN}$ input pin.
3 to 10	D7 to D0	**Data bus** to which command or encoded speech parameters can be written. D7 is a bidirectional line through which the status bit can be read.
11	A0	**Data/control** input. Discriminates between speech code input buffer (A0 = '0') and command register (A0 = '1') during a 'write' operation.
12 22 23	$\overline{CE}$ $\overline{R}$/W $\overline{W}$	**Chip enable, Read/Write, Write** These control signals provides an easy interface to most microprocessors or microcomputers (see timing diagrams).
14	$\overline{REQEN}$	**Request enable** input. $\overline{REQEN}$ = '0' enables the status REQ bit to appear inverted on the $\overline{REQ}$ output, independent of the command register.
		TIMING
16 17	OSC IN OSC OUT	Connections for internal clock oscillator. Nominal crystal frequency is 3.84 MHz. OSC IN must be tied to ground if CLK IN is used.
18	CLK IN	**Clock input** for external clock, TTL compatible, 3.84 MHz. Must be tied to ground when not used.
21	CLK OUT	A buffered output of the internal clock cycle (= CLK IN divided by 3).
		OUTPUT
19	REF	**Reference Current** input pin for biasing the audio output level. This reference current can be derived from a resistor to the positive supply.
20	OUT	**Speech output.** This output is a 64 kHz pulse, modulated in both width and amplitude. It is configured as a current sink with a saturating voltage of about 3V.
		SUPPLY
1	V_{SS}	**Ground.**
13	V_{CC}	**Single supply voltage.** Nominally 5V, but battery operation is also possible.
15	NC	No connection.
24	TEST	Used for testing purposes. Changes other pin functions. Must be tied to ground for user operation.

t_{ROE}	Request output enable response.				750	ns
t_{CS}	Control set-up time.				20	ns
t_{CH}	Control hold time.				20	ns

NOTES
1. The circuit will continue to operate from a supply of up to 6.5V, but without necessarily meeting the specification.
2. This is also valid for V_{CC} = 0V.
3. This permits connection of the output load to a supply higher than that supplying the synthesizer.
4. Timing reference level is 1.5V.
5. An external pull up resistor is required, as this is an open drain output. The time (t_{RH}) to reach 2.0V is specified at a load to 5V of 3.3 kΩ and 50 pF.
6. Between two data write operations of one speech frame.
7. Levels greater than 2.0V for a '1' or less than 0.8V for a '0' are reached with a load of one TTL input and 50 pF.
8. Typical voltage level at the REF pin is 2.5V.

VIDEO AMPLIFIER

NE/SE592

DESCRIPTION

The SE/NE592 is a monolithic, two stage, differential output, wideband video amplifier. It offers fixed gains of 100 and 400 without external components and adjustable gains from 400 to 0 with one external resistor. The input stage has been designed so that with the addition of a few external reactive elements between the gain select terminals, the circuit can function as a high pass, low pass, or band pass filter. This feature makes the circuit ideal for use as a video or pulse amplifier in communications, magnetic memories, display, video recorder systems, and floppy disk head amplifiers. Now available in an 8-pin version with fixed gain of 400 without external components and adjustable gain from 400 to 0 with one external resistor.

FEATURES

- **120MHz bandwidth**
- **Adjustable gains from 0 to 400**
- **Adjustable pass band**
- **No frequency compensation required**
- **Wave shaping with minimal external components**

APPLICATIONS

- **Floppy disk head amplifier**
- **Video amplifier**
- **Pulse amplifier in communications**
- **Magnetic memory**
- **Video recorder systems**

ULTRA HIGH FREQUENCY OPERATIONAL AMPLIFIER

NE/SE5539

DESCRIPTION

The Signetics NE5539 is a very wide bandwidth, high slew rate, monolithic operational amplifier for use in video amplifiers, RF amplifiers, and extremely high slew rate amplifiers.

Emitter follower inputs provide a true differential high input impedance device. Proper external compensation will allow design operation over a wide range of closed loop gains, both inverting and non-inverting, to meet specific design requirements.

FEATURES

- **Gain bandwidth product: 1.2GHz at 17dB**
- **Slew rate: 600V/μsec**
- **Full power response: 48MHz**
- **A_{VOL}: 52dB typical**

APPLICATIONS

- **Fast pulse amplifiers**
- **RF oscillators**
- **Fast sample and hold**
- **High gain video amplifiers (BW > 20MHz)**

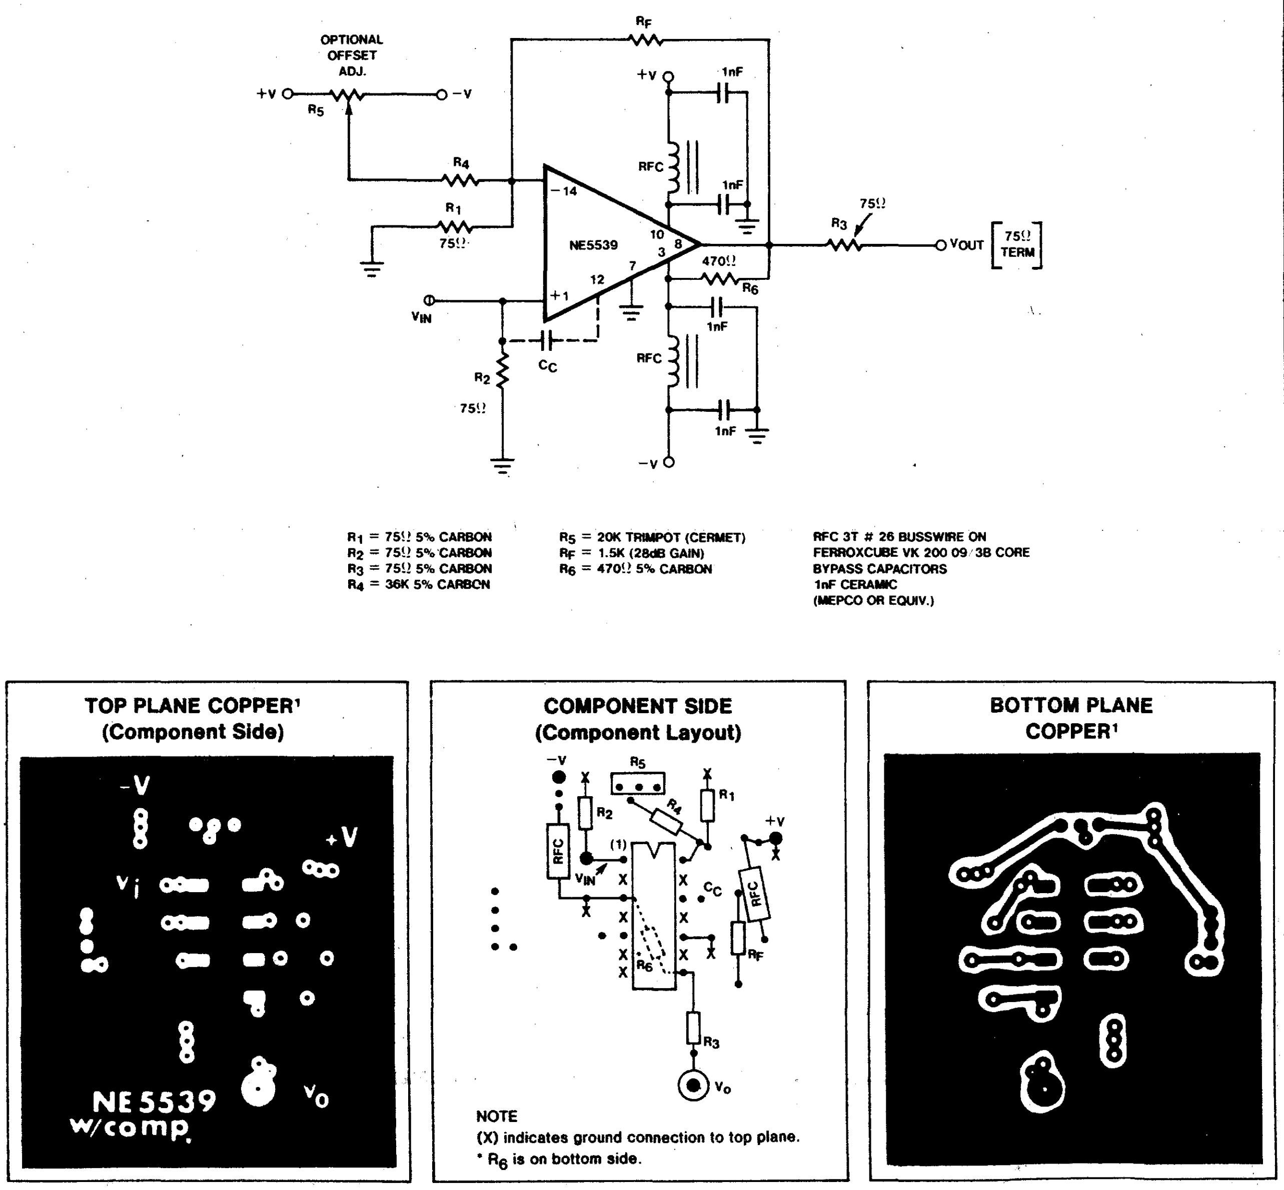
CIRCUIT LAYOUT CONSIDERATIONS

As may be expected for an ultra-high frequency, wide gain bandwidth amplifier, the physical circuit layout is extremely critical. Breadboarding is not recommended. A double-sided copper clad printed circuit board will result in more favorable system operation. An example utilizing a 28dB non-inverting amp is shown in Figure 1.



NOTE 1: Bond edges of top and bottom ground plane copper.

Figure 1. 28dB Non-Inverting Amp Sample P.C. Layout

VIDEO AMPLIFIER

NE5592

Preliminary

DESCRIPTION

The NE5592 is a dual monolithic, two stage, differential output, wideband video amplifier. It offers fixed gain of 400 without external components or adjustable gains from 400 to 0 with one external resistor. The input stage has been designed so that with the addition of a few external reactive elements between the gain select terminals, the circuit can function as a high pass, low pass, or band pass filter. This feature makes the circuit ideal for use as a video or pulse amplifier in communications, magnetic memories, display, video recorder systems, and floppy disk head amplifiers.

FEATURES

- **120MHz bandwidth**
- **Adjustable gains from 0 to 400**
- **Adjustable pass band**
- **No frequency compensation required**
- **Wave shaping with minimal external components**

APPLICATIONS

- **Floppy disk head amplifier**
- **Video amplifier**
- **Pulse amplifier in communications**
- **Magnetic memory**
- **Video recorder systems**

SSi Telecommunications Integrated Circuit Capabilities

Silicon Systems offers a broad line of standard telecommunications circuits aimed at providing cost-effective solutions for common customer application problems. At the heart of SSi's efforts in the communications market is its pioneering work with CMOS switched capacitor filters. Our early success with the DTMF receiver has enabled us to develop a family of chips utilizing the switched capacitor filter technology.

As a trendsetter in the field, Silicon Systems is leading the way towards a whole new era of VLSI circuits for telecommunications. Our broad selection of DTMF receivers demonstrates not only technological leadership in our own semiconductor field but also our capability to anticipate the growing needs of the fast-paced telecommunications marketplace.

PROCESSES
Silicon Systems offers circuits in junction-isolated, bipolar, single and double-layer metal. Plus, SSi has a CMOS capability that includes not only a metal-gate process but also a silicon-gate process that produces circuits packed with more functions in a smaller size for high-speed, low-power performance. These are the most popular and reliable processes in the two basic technologies, and SSI's advanced ultra-clean wafer fab produces higher yields than ordinary facilities.

PRODUCT QUALITY
Silicon Systems has made a major investment in product test and in-line quality control equipment. For example, a state-of-the-art LTX CP80 is used for functional and parametric testing of sophisticated analog, digital, and combination A/D circuits. In this way, SSi is dedicated to the delivery of complex VLSI circuits to meet the incoming quality level you require.

Here are a few completed circuits that demonstrate our broad telecommunications IC capability:

BIPOLAR

Integrated Circuit Function	Application
Audio System Receiver	Telephone Answering Machine
VHF/UHF Gain Mixer	Radio Receiver
Pulse Width Modulator	Switching Power Supply
Controller	Home Appliance
Digital Receiver	Remote Control
PCM Encoder/Decoder	Telecom System
Digital Correlator/ Integrator	Radio Telescope

MOS

Integrated Circuit Function	Application
DTMF Receiver	*Decodes Touch-Tone® Telephone Signals
300 Baud Modem	Data Transmission

description

These devices are high-speed operational amplifiers designed for applications requiring wide bandwidth and a fast slew rate. These monolithic circuits incorporate new high-frequency P-N-P transistors that eliminate the need for large feed-forward capacitors required in previous moderately high-frequency designs to pass the signal around slow lateral P-N-P stages.

These operational amplifiers have a typical full-power bandwidth of 400 kilohertz for a 20-volt peak-to-peak output swing. because of the higher 20-megahertz unity-gain bandwidth, the typical open-loop gain at the 400-kilohertz full-power bandwidth is a very respectable 34 decibels.

The TL291 single-channel operational amplifier pinout includes offset nulling, which is easily accomplished by connecting a potentiometer across the offset null pins with the wiper connected to the V_{CC-} pin.

The TL291M, TL292M, and TL294M will be characterized for operation over the full military temperature range of −55°C to 125°C. The TL291C, TL292C, and TL294C will be characterized for operation from 0°C to 70°C.

description

The TLC251 and TLC271 series are low-cost, low-power programmable operational amplifiers designed to operate with single or dual supplies. Unlike traditional metal-gate CMOS op amps, these devices utilize the Texas Instruments silicon gate LinCMOS™ process, giving them stable input offset voltages without sacrificing the advantages of metal-gate CMOS. This series of parts is available in selected grades of input offset voltage and can be nulled with one external potentiometer. Because the input common-mode range extends to the negative rail and the power consumption is extremely low, this family is ideally suited for battery-powered or energy-conserving applications. A bias-select pin can be used to program one of three ac performance and power-dissipation levels to suit the application. The TLC251 offers the same operation as the TLC271, but also features guaranteed operation down to a 1 V supply. Both devices are stable at unity gain.

ADVANCE INFORMATION

This document contains information on a new product. Specifications are subject to change without notice.

These devices have internal Electrostatic Discharge (ESD) protection circuits which will prevent catastrophic failures at voltages up to 2000 volts as tested under MIL-STD-883B Method 3015.1. However, care should be exercised in handling these devices as exposure to ESD may result in a degradation of the device parametric performance.

Because of the extremely high input impedance and low input bias and offset currents, applications for the TLC251 and TLC271 series include many areas that have previously been limited to BIFET and NFET product types. Any circuit using high-impedance elements and requiring small offset errors is a good candidate for cost-effective use of these devices. Many features associated with bipolar technology are available with LinCMOS operational amplifiers without the power penalties of traditional bipolar devices. General applications such as transducer interfacing, analog calculations, amplifier blocks, active filters, and signal buffering are all easily designed with the TLC271. Remote and inaccessible equipment applications are possible using the low-voltage and low-power capabilities of the TLC251. In addition, by driving the bias-select input with a logic signal from a microprocessor, these operational amplifiers can have software-controlled performance and power consumption. The TLC251 is well suited to solve the difficult problems associated with single-battery and solar-cell-powered applications.

Devices having an "M" suffix are characterized for operation over the temperature range of −55°C to 125°C, those with an "I" suffix are characterized for operation from −40°C to 85°C, and those with a "C" suffix are characterized for operation from 0°C to 70°C.

description

This device is fabricated using LinCMOS™ technology and consists of two independent voltage comparators designed to operate from a single power supply. Operation from dual supplies is also possible so long as the difference between the two supplies is 2 to 18 volts. Each of these devices features extremely high input impedance (typically greater than 10^{12} ohms) allowing direct interfacing with high-impedance sources. The outputs are n-channel open-drain configurations, and can be connected to achieve positive-logic wired-AND relationships.

These devices have internal Electrostatic Discharge (ESD) protection circuits which will prevent catastrophic failures at voltages up to 2000 volts as tested under MIL-STD-883B Method 3015.1. However, care should be exercised in handling these devices as exposure to ESD may result in a degradation of the device parametric performance.

The TLC372M is characterized for operation over the full military temperature range of −55°C to 125°C. The TLC372C is characterized for operation from 0°C to 70°C.

description

This device is fabricated using LinCMOS™ technology and consists of four independent voltage comparators designed to operate from a single power supply. Operation from dual supplies is also possible so long as the difference between the two supplies is 2 to 18 volts. Each of these devices features extremely high input impedance (typically greater than 10^{12} ohms) allowing direct interfacing with high-impedance sources. The outputs are n-channel open-drain configurations, and can be connected to achieve positive-logic wired-AND relationships. The TLC374C is designed as a pin-compatible, functional replacement for the LM339, offering twice the speed while consuming typically one-half of the power.

These devices have internal Electrostatic Discharge (ESD) protection circuits which will prevent catastrophic failures at voltages up to 2000 volts as tested under MIL-STD-883B Method 3015.1. However, care should be exercised in handling these devices as exposure to ESD may result in a degradation of the device parametric performance.

The TLC374M is characterized for operation over the full military temperature range of −55°C to 125°C. The TLC374C is characterized for operation from 0°C to 70°C.

				Full range			700			700	mV
I_{OL}	Low-level output current	V_{ID} = −1 V, V_{OL} = 1.5 V		25°C	6	16		6	16		mA
I_{CC}	Supply current (four comparators)	V_{ID} = −1 V, No load		25°C		0.4	1		0.4	1	mA

†All characteristics are measured with zero common-mode input voltage unless otherwise specified.

NOTE 5: The offset voltages and offset currents given are the maximum values required to drive the output up to 4 V or down to 400 mV with a pull-up resistor of 2.5 kΩ to V_{CC}. Thus, these parameters actually define an error band and take into account the worst-case effects of voltage gain and input impedance. Full range for T_A is −55°C to 125°C for TLC374M, 0°C to 70°C for TLC374C.

switching characteristics, V_{CC} = 5 V, T_A = 25°C

PARAMETER	TEST CONDITIONS		MIN	TYP	MAX	UNIT
Response time	R_L connected to 5 V through 5.1 kΩ, C_L = 15 pF‡, See Note 6	100-mV input step with 5-mV overdrive		0.9		μs

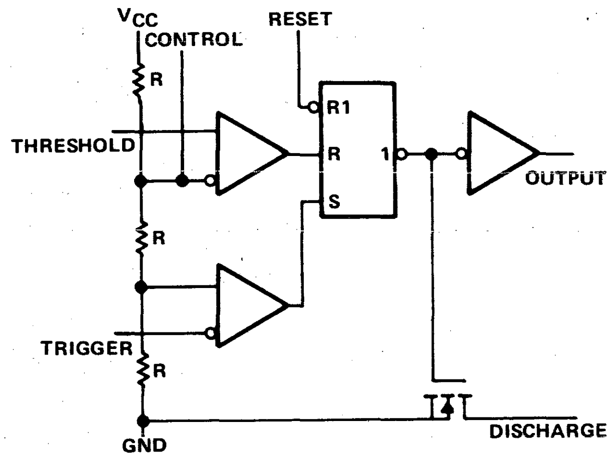
functional block diagram



Reset can override Trigger, which can override Threshold.

description

The TLC555 is a monolithic timing circuit fabricated using TI's LinCMOS™ process. Due to its high-impedance inputs (typically 10^{12} Ω), it is capable of producing accurate time delays and oscillations while using less expensive, smaller timing capacitors than the NE555. Like the NE555, the TLC555 achieves both monostable (using one resistor and one capacitor) and astable (using two resistors and one capacitor) operation. In addition, 50% duty cycle astable operation is possible using only a single resistor and one capacitor. The LinCMOS™ process allows the TLC555 to operate at frequencies up to 2 MHz and be fully compatible with CMOS, TTL, and MOS logic. It also provides very low power consumption (typically 1 mW at V_{DD} = 5 V) over a wide range of supply voltages ranging from 2 volts to 18 volts.

Like the NE555, the threshold and trigger levels are normally two-thirds and one-third respectively of V_{DD}. These levels can be altered by use of the control voltage terminal. When the trigger input falls below trigger level, the flip-flop is set and the output goes high. If the trigger input is above the trigger level and the threshold input is above the threshold level, the flip-flop is reset and the output is low. The reset input can override all other inputs and can be used to initiate a new timing cycle. When the reset input goes low, the flip-flop is reset and the output goes low. Whenever the output is low, a low impedance path is provided between the discharge terminal and ground.

While the complementary CMOS output is capable of sinking over 100 mA and sourcing over 10 mA, the TLC555 exhibits greatly reduced supply current spikes during output transitions. This minimizes the need for the large decoupling capacitors required by the NE555.

These devices have internal Electrostatic Discharge (ESD) protection circuits that will prevent catastrophic failures at voltages up to 2000 volts as tested under MIL-STD-883B Method 3015.1. However, care should be exercised in handling these devices as exposure to ESD may result in a degradation of the device parametric performance.

All unused inputs should be tied to an appropriate logic level to prevent false triggering.

The TLC555M is characterized for operation over the full military temperature range of −55 °C to 125 °C; the TLC555C is characterized for operation from 0 °C to 70 °C.

ADVANCE INFORMATION

TDC1018
Advance Information

D/A Converter
8 bit, 125 MSPS

The TRW TDC1018 is a 125 MegaSample Per Second (MSPS), 8-bit digital-to-analog converter, capable of directly driving a 75-ohm load. Most applications require no extra registering, buffering, or deglitching. Four special level controls make the device ideal for video applications. All data and control inputs are ECL compatible.

The TDC1018 is built with TRW's OMICRON-B™ 1-micron dual-layer metal bipolar process. On-chip data registers and precise matching of propagation delays make the TDC1018 inherently low-glitching. The TDC1018 offers high performance, low power consumption, and video compatibility in a 24 Lead DIP package.

Features

- 125 MSPS Conversion Rate
- 8-Bit
- 1/2 LSB Linearity
- Differential Current Outputs
- Video Controls: Sync, Blank, Bright, Force High
- Low Glitch Energy
- ECL Compatible
- Power Dissipation < 800 mW
- Available In 24 Lead DIP Package
- Single −5.2V Power Supply

Applications

- RGB Graphics
- Digital Synthesizers
- Automated Test Equipment
- Raster Graphic Displays
- High-Resolution Video
- Digital Transmitters/Modulators

TDC1048

Preliminary Information

TRW

Monolithic Video A/D Converter

8 bit, 20 MSPS

The TRW TDC1048 is a 20 MegaSample Per Second (MSPS) full-parallel (flash) analog-to-digital converter, capable of converting an analog signal with full-power frequency components up to 7 MHz into 8-bit digital words. A sample-and-hold circuit is not necessary. Low power consumption eases thermal considerations, and board space is minimized with a 28 Lead package. All digital inputs and outputs are TTL compatible.

The TDC1048 consists of 255 clocked latching comparators, combining logic, and an output buffer register. A single convert signal controls the conversion operation. The unit can be connected to give either true or inverted outputs in binary or offset two's complement coding.

Features

- 8-Bit Resolution
- 20 MSPS Conversion Rate
- Low Power Consumption, 1.4W (Worst Case)
- Sample-And-Hold Circuit Not Required
- Differential Phase 1°
- Differential Gain 2%
- 1/2 LSB Linearity
- TTL Compatible
- Selectable Output Format
- Available In 28 Lead DIP, CERDIP, Or Contact Chip Carrier

Applications

- Low-Cost Video Digitizing
- Radar Data Conversion
- Data Acquisition
- Medical Imaging

A/D Converters

All TRW A/D converters, except the TDC1001 and TDC1002, are fully parallel "flash" types, which accurately sample and convert high-frequency input signals without a track-and-hold circuit. Resolutions from 4 to 9 bits and speeds from 1 to 100 MSPS (MegaSamples Per Second) offer the best choice for most signal processing requirements. The parts are TTL compatible, except as noted below.

Product	Resolution (bits)	Conversion Rate* (MSPS)	Power Dissipation* (watts)	Package	Available	Extended Temperature Range Available	Notes
TDC1001	8	2.5	0.6	J8	Now	−20°C to 85°C	Successive approximation
TDC1002	8	1.0	0.6	J8	Now	−20°C to 85°C	Successive approximation
TDC1007	8	20	2.6	J1, C1, L1	Now	−30°C to 125°C	
				E1, P1	Now	no	Evaluation boards
TDC1014	6	25	1.0	J7, C3, B7	Now	−55°C to 125°C	
				E1, P1	Now	no	Evaluation boards
TDC1019	9	15	2.6	J1, C1, L1	Now	3Q83	ECL-compatible
				E1	Now	no	Evaluation board
TDC1021	4	25	0.3	J9	Now	−55°C to 125°C	
TDC1025	8	50	4.5	C1, L1	3Q83	3Q83	ECL-compatible
				E1	Now	no	Evaluation board
TDC1027	7	18	1.6	J7, B7	Now	4Q83	
TDC1029	6	100	1.6	J7	Now	3Q83	ECL-compatible
				E1	Now	no	Evaluation board

*Guaranteed, Worst Case, T_A = 0°C to 70°C.

D/A Converters

These D/A converters offer 75-ohm, 1V outputs to drive video filters or transmission lines directly. On-chip data registers and careful internal timing to matched current sources result in output glitches that are so small (less than 100 picovolt-seconds worst case) that no resampling circuit or deglitcher is necessary. The TDC1016 has 10 input data bits and is available in three integral linearity grades equivalent to 1/2 LSB error at 8, 9, and 10 bit resolution. The parts have dual-level input buffers which operate with TTL or ECL signals: In ECL mode, only a single −5V power supply is required. The TDC1016 in the J5 or C2 package can operate in a fully differential ECL mode, as well as single-ended ECL or TTL.

Product	Bits	Integral Linearity Error (%)	Conversion Rate * (MSPS)	Power Dissipation* (watts)	Package	Available	Extended Temperature Range Available	Notes
TDC1016	8**	0.20	20	0.7	J5, J7, C2, B7	Now	−55°C to 125°C	
	9**	0.10	20	0.7	J5, J7, C2, B7	Now	3Q83	
	10**	0.05	20	0.7	J5, J7, C2, B7	Now	3Q83	

* Guaranteed, Worst Case, T_A = 0°C to 70°C.

**The TDC1016 has 10 bit resolution, and is available in three linearity grades to meet 8, 9, and 10 bit system requirements.

TDC1025
Preliminary Information

Monolithic A/D Converter
8 Bit, 50 MSPS

The TRW TDC1025 is a 50 MegaSample Per Second (MSPS) full-parallel (flash) analog-to-digital converter, capable of converting an analog signal with full-power frequency components up to 12 MHz into 8-bit digital words. A sample-and-hold circuit is not necessary. All digital inputs and outputs are ECL compatible.

The TDC1025 consists of 255 latching comparators, combining logic, and an output buffer register. A single convert signal controls the conversion operation. The digital outputs will interface with differential or single-ended ECL. The device requires a single −5.2V power supply.

Features
- 8-Bit Resolution
- 50 MSPS Conversion Rate
- Sample-and-Hold Circuit Not Required
- Differential or Single-Ended ECL Compatible
- Available in 68 Leaded Chip Carrier and 68 Contact Chip Carrier
- Advanced 1-micron (OMICRON-B™) Technology
- Complete Evaluation Board (TDC1025E1C) Available

Applications
- Medical Electronics
- Fluid Flow Analysis
- Seismic Analysis
- Radar/Sonar
- Transient Analysis
- High-Speed Image Processing

TDC1027
Preliminary Information

Monolithic Video A/D Converter
7 Bit, 18 MSPS

The TRW TDC1027 is an 18 MegaSample Per Second (MSPS) full-parallel (flash) analog-to-digital converter, capable of converting an analog signal with full-power frequency components up to 5 MHz into 7-bit digital words. A sample-and-hold circuit is not necessary. All digital inputs and outputs are TTL compatible.

The TDC1027 consists of 127 latching comparators, combining logic, and an output buffer register. A single convert signal controls the conversion operation. The unit can be connected to give either true or inverted outputs in binary or offset two's complement coding.

Features

- 7-Bit Resolution
- ½ LSB Linearity
- Sample-And-Hold Circuit Not Required
- TTL Compatible
- 18 MSPS Conversion Rate
- Selectable Output Format
- Available in 24 Lead DIP

Applications

- Low-Cost Video Digitizing
- Medical Imaging
- Data Acquisition
- TV Special Effects
- Video Simulators
- Radar Data Conversion

TDC1029
Preliminary Information

TRW

Monolithic A/D Converter
6 bit, 100 MSPS

The TRW TDC1029 is a 100 MegaSample Per Second (MSPS) full-parallel (flash) analog-to-digital converter, capable of converting an analog signal with full power frequency components up to 50 MHz into 6-bit digital words. A sample-and-hold circuit is not necessary. All digital inputs and outputs are ECL compatible.

The TDC1029 consists of 63 clocked latching comparators, combining logic, and an output buffer register. A single differential convert signal controls the conversion operation. The digital outputs are single-ended ECL with the exception of the MSB which is differential. Binary or offset two's complement output format is available.

Features

- 6-Bit Resolution
- 100 MSPS Conversion Rate
- 50 MHz Input Bandwidth
- Low Cost
- 1/2 LSB Linearity
- Sample-And-Hold Circuit Not Required
- 1V Input Range
- Aperture Error < 50 psec
- Binary Or Two's Complement Output Format
- Available In 24 Lead DIP

Applications

- Transient Digitizers
- Direct Digital Receivers
- Radar Data Conversion
- Data Acquisition
- Telecommunications
- Medical Imaging

INTRODUCTION TO MEMORY

The Master Selection Guide provides sufficient information for making initial product selections. All devices that appear in this section, both in the initial selection guide and the data pages, are included in the indexes. These index listings lead to the page and line on that page where each device appears.

The Memory Section provides initial selection information and data on PROMs, RAMs, and ROMs as well as other memory devices. In these particular sections, the devices are characterized by organization (words and bits/word) and by access times. In order to assure that the access times are comparable, whenever possible the values have been shown in nanoseconds over the full rated temperature range for the devices (i.e., 0° to 70°C for commercial units and −55°C to 125°C for military units). The full temperature nanosecond value is marked "nsF." When this value isn't specified, the guaranteed nanosecond value at room temperature is listed followed by "nsR." In some cases a guaranteed value has not been established; then the typical value is shown followed by "ns*". "Typical" values are invariably much faster than the guaranteed ones so that such listings place these memories higher on the list than they otherwise would appear.

CATEGORY

Detailed Product Information provided by:

The manufacturers listed above have provided detailed information on their latest and most significant products.

EINFÜHRUNG SPEICHER

Der Master Selection Guide für Speicher enthält alle Informationen, die Sie für die Erstauswahl Ihres Produkts benötigen. Die Bauteile, die in diesem Abschnitt erscheinen, sowohl im Selection Guide als auch auf den Datenblättern, sind in allen Master Indexes enthalten. Diese Register verweisen auf die Seite und Zeile, auf der das entsprechende Bauelement vorkommt.

Der Speicherteil bestert aus einem Selection Guide und Daten über PROMs, RAMs und ROMs sowie andere Speicher-Bauteile. In diesen einzelnen Abschnitten sind die Bauteile nach Organisation (Worte und Bits/Wort) und nach Zugriffszeiten eingeteilt. Um sicherzustellen, daß die Zugriffszeiten verglichbar sind, wurden die Werte nach Möglichkeit in Nanosekunden für de vollen zugfelassenen Temperaturbereich (d.h. 0° bis 70°C für kommerzielle Bauteile und —55° bis 125°C für militärische Bauteile) angegeben. Der nsec-Wert für den vollen Temperaturbereich ist mit "nsF" bezeichnet. Wenn dieser Wert nicht genannt ist, so ist der garantierte nsec-Wert bei Raumtemperatur mit "nsR" angegeben. In einigen Fällen wurde ein garantierter Wert nicht festgelegt. Dann wird der typische Wert mit einem nachfolgenden "ns*" markiert. "Typische" Werte sind durchwegs schneller als garantierte, so daß solche Eintragungen die Speicher weiter oben in der Liste erscheinen lassen als dies sonst der Fall wäre.

INTRODUCTION AUX MEMOIRES

Le Guide Général de Sélection fournit suffisamment de renseignements pour permettre des sélections initiales de produits. Tous les apareils énumérés dans cette section, tant dans le Premier Guide de Sélection que dans les feuilles de données, sont inclus dans tous les index. Ces index vous procurent la possibilité de retrouver à quelle page et à quelle ligne tel ou tel appareil a été mentionné.

La Section "Mémoires" contient des données et des renseignements de sélection initiale sur les PROMs, les RAMs et les ROMs, ainsi que sur d'autres appareils mémoires. Dans ces sous-sections, les appareils sont distingués par définition (mots et bit/mot) et par temps d'acces. Afin d'être sûr que les temps d'accès soient comparables, chaque fois que cela a été possible, les valeurs ont été indiquées en nanosecondes pour toute la fourchette de température (exemple: 0° à 70° pour les produits industriels, et —55°C à 125°C pour les produits militaires). La valeur entière de température en nanosecondes est désignée par "nsf". Lorsque cette valeur n'est pas donnée, une valeur garantie à température ambiante, exprimée en nanosecondes, est suivie par "nsR". Dans certains cas aucune valeur garantie en nanosecondes n'a pu être établie, la valeur "typique" est alors traduite par "ns". Les valeurs "typiques" sont invariablement beaucoup plus rapides que celles dites "garanties", de sorte que ces mémoires "typiques" apparaissent plus haut sur la liste qu'elles ne le seraient sur d'autres.

INTRODUCCIÓN A MEMORIA

La Guía Maestra de Selección provee suficiente información para hacer selecciones iniciales del producto. Todas las componentes que aparecen en esta sección, ya sea en la guía de selección inicial o en las páginas de datos, están incluídas en todos los otros índices. Estas listas de índices los conduce a la página y linea de aquella página donde se encuentra cada componente.

La Sección de Memoria provee información para la selección inicial y datos de PROMs, RAMs, and ROMs así como otras piezas de memoria. En estas secciones en particular, las componentes se caracterizan por organización (palabras y bits/palabras) y por tiempo de acceso. Con objeto de asegurar que los tiempos de acceso son comparables, cuando es posible, los valores aparecen en nanosegundos sobre el intérvalo completo de temperature para las componentes (en otras palabras, 0° to 70°C para piezas de uso comercial y —55° a 125°C para piezas de uso militar). El valor del intérvalo completo de temperatura esta marcado "nsF". Cuando este valor no está especificado, el valor de nanosegundon está garantizado para temperatura ambiental y aparece seguido por "nsR". En algunos casos el valor no ha sido establecido; entonces el valor tipico aparece seguido por "ns*". Valores "típocos" son sin falta más rápido que los garantizados de tal manera que las listas ubica estas memorias antes que normalmente los mostraría.

メモリーへの案内

マスターセレクションガイドは選択に取りかかる充分な資料を揃えています。セレクションガイド，データ掲載ページにのっている製品は全てのインデックスに入っており，そのインデックスによりページ数，行数はすぐ見つけられます。

このセクションにはPROM，RAM，ROM他のメモリーのデーターが入っています。製品はその構成（ワード，ビット／ワード）とアクセスタイム毎に分類されています。アクセスタイムが同等であるかどうか確認する為可能な限り夫々の全温度範囲（一般0℃～70℃；ミリタリ－55℃～125℃）でのアクセスタイムをナノセカンドで表示しています。全温度範囲でのアクセスタイムは"nsF"と表示，規定されていないものすなわち室温での保証値は"nsR"となっています。保証値が決められていない場合は代表的値として"ns★"がついています。"Typical"値は通常保証値よりも速くつけられるのでリスト上では他に記載されているものより高い場所に記載されています。

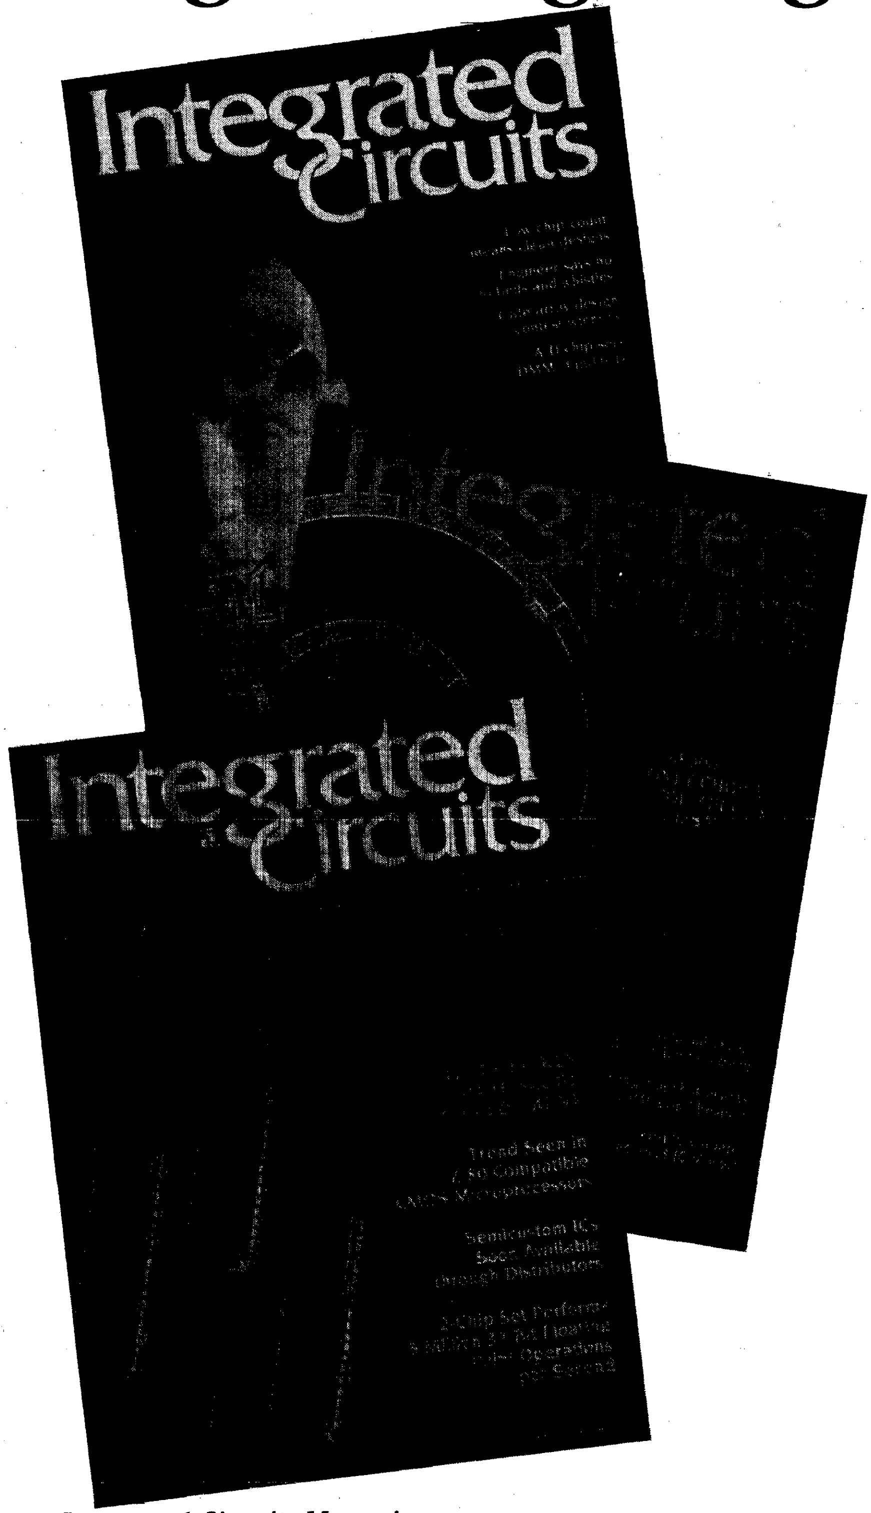
Integrated Circuits Magazine The magazine for the engineering design strategist*



Integrated Circuits Magazine is the only publication written for senior design engineers and engineering managers who specialize in the specifying and use of ICs and related components in the design of instruments, equipment and systems.

It is unique in that it concentrates on reporting *from the viewpoint of the user.*

Each issue of *Integrated Circuits Magazine* includes staff-written interviews with leading designers at major IC customers, as well as articles written by IC users themselves.

Regular features include: IC User Feedback Reports, Semicustom Design Techniques, IC Design Problems and Solutions. What's New in ICs, and much more.

To receive *Integrated Circuits Magazine* absolutely FREE† simply give us your authorization right now! Just fill out, sign, date and return the subscription card located inside the back cover of Volume I.

Card missing? Additional subscription cards available from publisher upon request.

Integrated Circuits Magazine is designed for *YOU.*

✱*Designers who must keep pace with contemporary engineering design techniques, practices and trends, and how they affect the selection and application of integrated circuits, microcomputers, boards, and systems.*

†Integrated Circuits Magazine is made available on a complimentary basis to those qualified recipients within the United States only.

Canadian and Foreign Subscriptions are available, prepaid by check or money order payable in United States currency, at the following rates: $35.00 per year Canadian/Foreign; $55.00 per year Foreign via Air Mail; $18.00 per year non-qualified Domestic United States.

Advanced Micro Devices

Bipolar Memories
Am27S35A/35/37A/37

DISTINCTIVE CHARACTERISTICS

- Member of AMD's Generic Family of 8-bit wide registered PROMs
- On-chip edge-triggered registers – ideal for pipelined microprogrammed systems
- Versatile synchronous and asynchronous enables for simplified word expansion
- Versatile programmable register INITIALIZE either asynchronous (Am27S35A/35) or synchronous (Am27S37A/37)
- Slim, 24-pin, 300-mil lateral center package occupies approximately 1/3 the board space required by standard discrete PROM and register
- Consumes approximately 1/2 the power of separate PROM/register combination for improved system reliability
- Fast standard version – 40ns max setup and 25ns max clock-to-output allows system speed improvements
- "A" version offers improved AC performance in critical paths (35ns max setup and 20ns max clock-to-output)
- Platinum-Silicide fuses guarantee high reliability, fast programming, and exceptionally high programming yields (typ>98%)
- AC performance is factory tested utilizing programmed test words and columns

GENERIC SERIES CHARACTERISTICS

The Am27S35A/35 and Am27S37A/37 are members of an Advanced PROM series incorporating common electrical characteristics and programming procedures. All parts in this series are produced with a fusible link at each memory location storing a logic LOW and can be selectively programmed to a logic HIGH by applying appropriate voltages to the circuit.

All parts are fabricated with AMD's fast programming highly reliable Platinum-Silicide Fuse technology. Utilizing easily implemented programming (and common programming equipment) these products can be rapidly programmed to any customized pattern. Extra test words are preprogrammed during manufacturing to insure extremely high field programming yields and produce excellent parametric correlation.

Platinum-Silicide was selected as the fuse link material to achieve a well controlled melt rate resulting in large nonconductive gaps that ensure long-term reliability. Extensive operating testing has shown that this low-field, large-gap technology offers the best reliability for fusible link PROMs.

Common design features include active loading of all critical AC paths regulated by a built-in temperature and voltage-compensated bias network to provide excellent parametric performance over the full military power supply and temperature ranges. Selective feedback techniques have been employed to minimize delays through all critical paths producing the fastest speeds possible from Schottky processed PROMs.

SERIAL SHADOW REGISTER (SSR) DIAGNOSTICS CAPABILITIES

- Serial access to output register to allow input of diagnostic control information
- Serial access of output register allows observation of register data
- Eliminates the need for diagnostics code internal to the PROM, allowing increased applications code density
- Simplified diagnostics increases system reliability
- Separate diagnostic register allows real time "snap shot" of machine state

DISTINCTIVE CHARACTERISTICS

- Highest density fastest performance PROM organization
- On-chip edge-triggered registers – ideal for pipelined microprogrammed systems
- On-chip diagnostic shift register for serial observability and controllability of the output register
- Fast standard version: 30ns max setup and 15ns max clock-to-output allows system speed improvements
- "A" version offers improved AC performance in critical paths (25ns max setup and 12ns max clock-to-output)
- User-programmable synchronous and asynchronous Enables
- User-programmable for synchronous or asynchronous Initialize
- Increased drive capability, 24mA I_{OL}
- THINDIP, 24-pin, 300-mil lateral center package increases overall board density
- Platinum-Silicide fuses guarantee high reliability, fast programming and exceptionally high programming yields (typ >98%)
- AC performance is factory tested utilizing programmed test rows and columns

GENERIC SERIES CHARACTERISTICS

The Am27S65, Am27S75, and Am27S85 are members of an advanced PROM series incorporating common electrical characteristics and programming procedures. All parts in this series are produced with a fusible link at each memory location storing a logic LOW which can be selectively programmed to a logic HIGH by applying appropriate programming voltages to the circuit.

All parts are fabricated with AMD's fast-programming highly reliable Platinum-Silicide Fuse technology. Utilizing easily implemented programming algorithms (and common programming equipment), these products can be rapidly programmed to any customized pattern. Extra test words are preprogrammed during manufacturing to insure extremely high field programming yields and produce excellent AC and DC parametric correlation.

Platinum-Silicide was selected as the fuse link material to achieve a well controlled melt rate resulting in large nonconductive gaps that ensure very stable long-term reliability. Extensive operating testing has proven that this low-field, large-gap technology offers the best reliability for fusible link PROMs.

Common design features include active loading of all critical AC paths, which are regulated by a built-in temperature- and voltage-compensated bias network to provide excellent parametric performance over the full military power supply and temperature ranges. Selective feedback techniques have been employed to minimize delays through all critical paths producing the fastest speeds possible from Schottky processed PROMs.

DISTINCTIVE CHARACTERISTICS

- Platinum-Silicide fuses guarantee high reliability, fast programming and exceptionally high programming yields (typ > 98%)
- AC performance is factory tested utilizing programmed test words and columns
- Voltage and temperature compensated providing extremely flat AC performance over military range
- Members of Generic PROM series utilizing standard programming algorithm

GENERIC SERIES CHARACTERISTICS

These 8K PROMs are members of an Advanced PROM series incorporating common electrical characteristics and programming procedures. All parts in this series are produced with a fusible link at each memory location storing a logic LOW and can be selectively programmed to a logic HIGH by applying appropriate voltages to the circuit.

All parts are fabricated with AMD's fast programming highly reliable Platinum-Silicide Fuse technology. Utilizing easily implemented programming (and common programming equipment) these products can be rapidly programmed to any customized pattern. Extra test words are pre-programmed during manufacturing to insure extremely high field programming yields and produce excellent parametric correlation.

Platinum-Silicide was selected as the fuse link material to achieve a well controlled melt rate resulting in large non-conductive gaps that ensure very stable long-term reliability. Extensive operating testing has proven that this low-field, large-gap technology offers the best reliability for fusible link PROMs.

Common design features include active loading of all critical AC paths regulated by a built-in temperature and voltage compensated bias network to provide excellent parametric performance over MIL supply and temperature ranges. Selective feedback techniques have been employed to minimize delays through all critical paths.

These PROMs are manufactured using Advanced Micro Devices' selective oxidation process, IMOX. This advanced process combined with a merged fuse array permits an increase in density and a decrease in internal capacitance resulting in the fastest possible PROMs.

FUNCTIONAL DESCRIPTION

These 8K PROMs are high speed electrically programmable Schottky read only memories. Organized in the industry standard 1024 x 8 configuration, they are available in both open collector (Am27S180A/180 and Am27S280A/280) and three-state (Am27S181A/181 and Am27S281/281) output versions. After programming, stored information is read on outputs O_0-O_7 by applying unique binary addresses to A_0-A_9 and holding $\overline{CS}_1$ and $\overline{CS}_2$ LOW and CS_3 and CS_4 HIGH. All other valid input conditions on $\overline{CS}_1$, $\overline{CS}_2$, CS_3 and CS_4 place O_0-O_7 into the OFF or high impedance state.

DISTINCTIVE CHARACTERISTICS

- Ultra fast access time "A" version (35ns max) – Fast access time Standard version (50ns max) – allow tremendous system speed improvements
- Platinum-Silicide fuses guarantee high reliability, fast programming and exceptionally high programming yields (typ > 98%)
- AC performance is factory tested utilizing programmed test words and columns
- Voltage and temperature compensated providing extremely flat AC performance over military range
- Member of generic PROM series utilizing standard programming algorithm

GENERIC SERIES CHARACTERISTICS

These 16K PROMs are members of an Advanced PROM series incorporating common electrical characteristics and programming procedures. All parts in this series are produced with a fusible link at each memory location storing a logic LOW and can be selectively programmed to a logic HIGH by applying appropriate voltages to the circuit.

All parts are fabricated with AMD's fast programming highly reliable Platinum-Silicide Fuse technology. Utilizing easily implemented programming (and common programming personality card sets) these products can be rapidly programmed to any customized pattern. Extra test words are pre-programmed during manufacturing to insure extremely high field programming yields, and produce excellent parametric correlation.

Platinum-Silicide was selected as the fuse link material to achieve a well controlled melt rate resulting in large non-conductive gaps that ensure very stable long-term reliability. Extensive operating testing has proven that this low-field, large-gap technology offers the best reliability for fusible link PROMs.

Common design features include active loading of all critical AC paths regulated by a built-in temperature and voltage compensated bias network to provide excellent parametric performance over MIL supply and temperature ranges. Selective feedback techniques have been employed to minimize delays through all critical paths.

These PROMs are manufactured using Advanced Micro Devices' selective oxidation process, IMOX™. This advanced process combined with a merged fuse array permits an increase in density and a decrease in internal capacitance resulting in the fastest possible PROMs.

FUNCTIONAL DESCRIPTION

The Am27S40A, Am27S41A, Am27S40, and Am27S41 are high speed electrically programmable Schottky read only memories. Organized in 4096 x 4 configuration, they are available in both open collector (Am27S40A and Am27S40) and three-state (Am27S41A and Am27S41) output versions. After programming, stored information is read on outputs O_0-O_3 by applying unique binary addresses to A_0-A_{11} and holding the chip select inputs, $\overline{CS}_1$ and $\overline{CS}_2$, LOW. If either chip select input goes to a logic HIGH, O_0-O_3 go to the OFF or HIGH impedance state.

Advanced Micro Devices

Bipolar Memories
Am10415SA/415A/415

DISTINCTIVE CHARACTERISTICS

- Fast access time (10ns typ.) – improves system cycle speeds
- Fully compatible with standard voltage compensated 10K series ECL – no board changes required
- Internally voltage compensated providing flat AC performance
- Outputs preconditioned during write cycle eliminating write recovery glitch
- Emitter follower outputs – easy wire-ORing
- Power dissipation decreases with increasing temperature

FUNCTIONAL DESCRIPTION

The Am10415SA, Am10415A and Am10415 are fully decoded 1024-bit ECL RAMs organized 1024 words by one bit. Bit selection is achieved by means of a 10-bit address, A_0 through A_9. Easy memory expansion is provided by an active LOW chip select ($\overline{CS}$) input and an unterminated OR tieable emitter follower output.

An active LOW write line ($\overline{WE}$) controls the write/read operation of the memory. When the chip select and write lines are LOW, the data input (D_{IN}) is written into the addressed memory word simultaneously preconditioning the output so true data is present when the write cycle is complete. This preconditioning operation insures minimum write recovery times by eliminating the "write recovery glitch".

Reading is performed with the chip select line LOW and the write line HIGH. The information stored in the addressed word is read out on the noninverting output (D_{OUT}).

During the writing operation or when the chip select line is HIGH the output of the memory goes to a LOW state.

Advanced Micro Devices

MOS Memories
Am2167

DISTINCTIVE CHARACTERISTICS

- High speed – access times as fast as 35ns maximum
- 16K x 1 organization
- Single +5 volt power supply
- Fully static storage and interface circuitry
- No clocks or timing signals required
- Automatic power down when deselected
- Low power dissipation
  - Am2167: 660mW active, 110mW power down
- Standard 20-pin, .300 inch dual in-line package
- High output drive
  - Up to seven standard TTL loads or six Schottky TTL loads
- TTL compatible interface levels
- No power-on current surge

GENERAL DESCRIPTION

The Am2167 is a high performance, 16,384-bit, static, read/write, random access memory. It is organized as 16,384 words by one bit per word. All interface signal levels are identical to TTL specifications, providing good noise immunity and simplified system design. All inputs are purely capacitive MOS loads. The outputs will drive up to six standard Schottky TTL loads or up to seven standard TTL loads.

Only a single +5 volt power supply is required. When deselected ($\overline{CE} \geq V_{IH}$), the Am2167 automatically enters a power-down mode which reduces power dissipation by 80%.

Data In and Data Out use separate pins and are the same polarity allowing them to be connected together for operation in a common data bus environment. Data Out is a three-state output allowing similar devices to be wire-OR'd together.

Advanced Micro Devices

MOS Memories
Am9122/L22

DISTINCTIVE CHARACTERISTICS

- High performance replacement for 93422/93L422
- 256 x 4 organization for small memory systems
- Fast access times – down to 25ns (Commercial)
  – down to 35ns (Military)
- Low operating power dissipation
  – Standard power: 660mW (Commercial)
    745mW (Military)
  – Low power: 248/440mW (Commercial)
    495mW (Military)
- Single 5 volt power supply – ±10% tolerance both commercial and military
- Guaranteed 0.1% AQL

FUNCTIONAL DESCRIPTION

The Am9122/Am91L22 series is a MOS pin-for-pin and functional replacement for the 93422/93L422 bipolar memories. These devices are high-performance, low-power, 1024-bit, static, read/write random access memories. They offer a wide range of access times including versions as fast as 25ns. Each memory is implemented as 256 words by 4 bits per word. This organization permits efficient design of small memory systems and allows finer resolution of incremental memory depth.

The Am9122/91L22 employs an output enable and two chip enable inputs to give the user better data control. High noise immunity, high output drive (4 TTL loads) and TTL logic voltage levels allow easy conversion from bipolar to MOS. 10% power supply tolerances give better margins in the memory system. As with all AMD MOS RAMs, the Am9122/91L22 is guaranteed to 0.1% AQL.

Advanced Micro Devices

MEMORY

Advanced Micro Devices

MOS Memories
Am9128

DISTINCTIVE CHARACTERISTICS

- 2,048 x 8-bit organization
- Logic voltage levels compatible with TTL
- Three-state output buffers-common I/O
- Fully static; no clocks or refresh required
- Single +5V power supply ±10% tolerance
- I_{CC} max as low as 100mA
- t_{AA}/t_{ACS} as low as 70ns
- Power down mode (I_{SB} as low as 15mA)
- Commercial and full military temperature ranges

GENERAL DESCRIPTION

The Am9128 is a 16,384-bit static Random Access Read-write Memory organized as 2048 words of 8 bits. It uses fully static circuitry, requiring no clocks or refresh to operate. Directly TTL-compatible inputs and outputs and operation from a single +5V supply simplify system designs. Common data I/O pins using three-state outputs are provided. The Am9128 is available in an industry-standard 24-pin DIP package with 0.6-inch pin row spacing. The Am9128 uses the JEDEC standard pinout for byte-wide memories (compatible to 16K EPROM's).

Advanced Micro Devices

MOS Memories
Am9016

DISTINCTIVE CHARACTERISTICS

- High density 16K x 1 organization
- Replacement for MK4116
- Low maximum power dissipation – 462mW active, 20mW standby
- High-speed operation – 150ns access, 320ns cycle (COM'L)
  200ns access, 375ns cycle (MIL)
- ±10% tolerance on standard +12, +5, −5 voltages
- TTL compatible interface signals
- Three-state output
- RAS only, RMW and Page mode clocking options
- 128 cycle refreshing
- Unlatched data output
- Standard 16-pin, .3 inch wide dual-in-line package
- JEDEC standard 18-pin, Chip-Pak™ leadless chip carrier
- Double poly N-channel silicon gate MOS technology
- Extended ambient operating temperature (−55 to +85°C) available

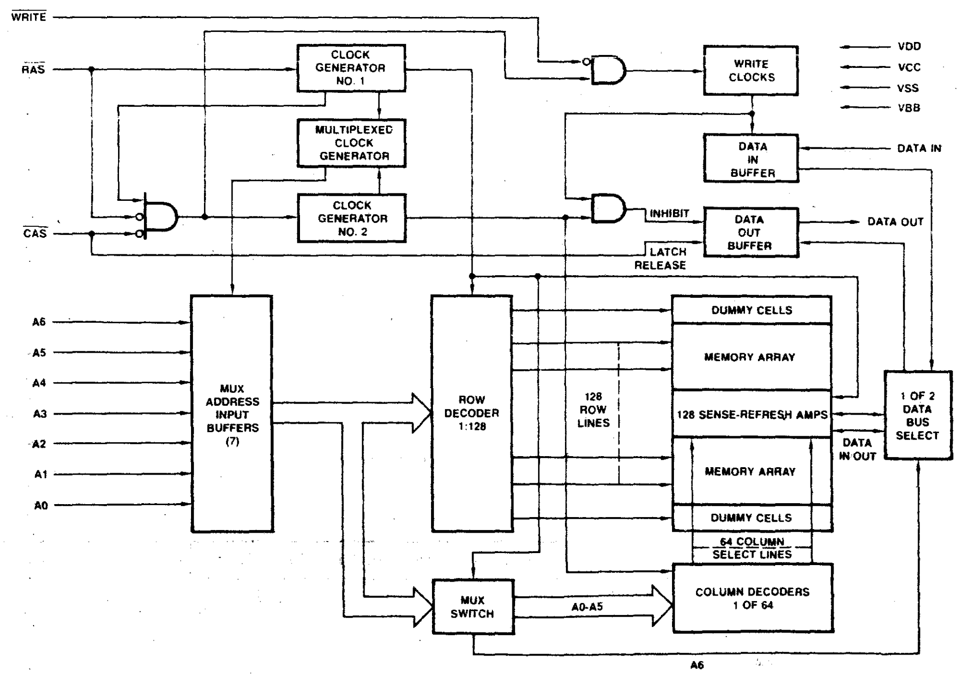
GENERAL DESCRIPTION

The Am9016 is a high-speed, 16K-bit, dynamic, read/write random access memory. It is organized as 16,384 words by 1 bit per word and is packaged in a standard 16-pin DIP or 18-pin leadless chip carrier. The basic memory element is a single transistor cell that stores charge on a small capacitor. This mechanism requires periodic refreshing of the memory cells to maintain stored information.

All input signals, including the two clocks, are TTL compatible. The Row Address Strobe (RAS) loads the row address and the Column Address Strobe (CAS) loads the column address. The row and column address signals share seven input lines. Active cycles are initiated when RAS goes low, and standby mode is entered when RAS goes high. In addition to normal read and write cycles, other types of operations are available to improve versatility, performance and power dissipation.

The 3-state output buffer turns on when the column access time has elapsed and turns off after CAS goes high. Input and output data are the same polarity.

BLOCK DIAGRAM



MOS-190

Chip-Pak is a trademark of Advanced Micro Devices, Inc.

Advanced Micro Devices

MOS Memories
Am9064

DISTINCTIVE CHARACTERISTICS

- High speed $\overline{RAS}$ access of 100 and 120ns
- Fast cycle time of 190 and 220ns
- Single +5V ± 10% power supply
- Temperature and power supply compensated on-chip substrate-bias generator
- Low power 22mW standby
  - 330mW active – 220ns cycle time
  - 385mW active – 190ns cycle time
- Read, Write, Read-Modify-Write, Page-Mode and RAS-Only refresh capability
- Early write common I/O capability
- $\overline{CAS}$ controlled three-state output
- 128 refresh cycles in 2ms
- Double poly NMOS silicon gate technology

GENERAL DESCRIPTION

The Am9064 is a high speed, high-performance dynamic RAM, organized 65,536 x 1 and manufactured using advanced NMOS silicon-gate technology. The design is optimized for both high speed and low power dissipation, and only a single +5V supply is needed because the on-chip substrate-bias generator (compensated for temperature and supply variations) provides the necessary back bias.

The Am9064 features multiplexed addressing, and all input signals, including clocks, are TTL-compatible; input and output signals are the same polarity, and the three-state output buffer is $\overline{CAS}$ controlled. The Hi-C single-transistor memory cell is used to enhance signal margin and reduce the α-particle-induced soft-error rate.

Refresh is achieved by performing $\overline{RAS}$-only cycles or normal read/write cycles on 128 address combinations of ($A_0 - A_6$) within a 2ms period.

BLOCK DIAGRAM

Advanced Micro Devices

MOS Memories
Am2168/69

DISTINCTIVE CHARACTERISTICS

- High speed – access times as fast as 45ns maximum
- 4K x 4 organization
- Single +5 volt power supply
- Fully static storage and interface circuitry
- No clocks or timing signals required
- Automatic power down when deselected
- Power dissipation
  - Am2168: 660mW active; 165mW power down
    Am2169: 660mW
- Standard 20-pin, .300 inch dual-in-line package
- High output drive
  - Up to seven standard TTL loads or six Schottky TTL loads
- TTL compatible interface levels
- IMOS processing

GENERAL DESCRIPTION

The Am2168 and Am2169 are high performance, static, N-Channel, read/write, random access memories organized as 4096 words of 4 bits. Operation is from a single 5V supply, and all input/output levels are identical to standard TTL specifications. The Am2168 and Am2169 are the same except that the Am2168 offers an automatic $\overline{CE}$ power down feature.

The Am2168 remains in a low-power standby mode as long as $\overline{CE}$ remains high, thus reducing its power requirements. The Am2168 power decreases from 660mW to 165mW in the standby mode. The $\overline{CE}$ input does not affect the power dissipation of the Am2169.

Data readout is not destructive and has the same polarity as data input. $\overline{CE}$ provides for easy selection of an individual device when the outputs are OR-tied.

Advanced Micro Devices

MEMORY

Advanced Micro Devices

MOS Memories
Am9150

DISTINCTIVE CHARACTERISTICS

- 1024 x 4 organization
- High speed – 25ns max access time
- Separate data inputs and outputs
- Memory reset function
- High density SLIM 24-pin 300-MIL package
- Three-state output buffers
- Single +5V power supply ±10%

GENERAL DESCRIPTION

The Am9150 is a high-performance, static, n-channel, read/write, random access memory organized as 1024 x 4. It features single 5V supply operation, TTL-compatible input and output levels, and separate input and output pins for improved system performance and ease of use.

The Am9150 also incorporates a reset feature which will reset the entire contents of the memory to a logical LOW in two cycle times by controlling $\overline{R}$ ($\overline{RESET}$) and $\overline{S}$ ($\overline{CS}$).

The Am9150 has four control signals, $\overline{R}$, $\overline{S}$, $\overline{W}$ and $\overline{G}$. The $\overline{S}$ input controls read, write and reset operations of the device and provides for easy selection of an individual device when the outputs are tied together. The $\overline{W}$ ($\overline{WE}$) input controls the normal read and write operations, and the $\overline{G}$ ($\overline{OE}$) controls the state of the outputs.

MOS Memories
Am9264

DISTINCTIVE CHARACTERISTICS

- Enhanced manufacturability with post-metal programming
- Access time – 250ns (max)
- Single +5V ±10% power supply
- Fully static operation
- Completely TTL compatible
- Standard 24 pin DIP
- Pin compatible with 16K/32K/64K EPROMs/ROMs
- Military version (−55 to +125°C) – Available – 450ns (max) access time

FUNCTIONAL DESCRIPTION

The Am9264 high performance read only memory is organized 8192 words by 8 bits with access times of less than 250ns. This organization simplifies the design of small memory systems and permits incremental memory sizes of 8192 words. The fast access times provided allow the ROM to service high performance microcomputer applications without stalling the processor.

The programmable chip select input signal is provided to control the output buffers. Chip Select Polarity may be provided by the customer thus allowing the addressing of 2 memory chips without external gating. The outputs of the unselected chips are turned off and assume a high impedance state. This permits wire-ORing with additional Am9264 devices and other three state components.

This memory is fully static and requires no clock signals of any kind. A selected chip will output data from a location specified by the address present on the address input lines. Input and output levels are compatible with TTL specifications.

The ability to program customer code at the last step of fabrication (Post Metal Programming Technique) will result in faster turn around time for new or old patterns. This technique will allow us to test wafers before committing customer patterns to categorize speed and power dissipation requirements.

OPERATING RANGE

Part Number	Ambient Temperature	V_{CC}	V_{SS}
Am9265DC/PC/CC	$0°C \leq T_A \leq +70°C$	+5.0V ±10%	0V
Am9265DM	$-55°C \leq T_A \leq +125°C$	+5.0V ±10%	0V

FUNCTIONAL DESCRIPTION

The Am9265 high performance read only memory is organized 8192 words by 8 bits with access times of less than 250ns. This organization simplifies the design of small memory systems and permits incremental memory sizes of 8192 words. The fast access times provided allow the ROM to service high performance microcomputer applications without stalling the processor.

Two programmable chip select inputs are provided to control the output buffers. Chip select polarity may be specified by the customer thus allowing the addressing of 4 memory chips without external gating. The outputs of the unselected chips are turned off and assume a high impedance state. This permits wire-ORing with additional Am9265 devices and other three state components. No-connect option on chip selects can be provided if desired by the customer.

This memory is fully static and requires no clock signals of any kind. A selected chip will output data from a location specified by the address present on the address input lines. Input and output levels are compatible with TTL specifications. A separate $\overline{OE}$, output enable pin, controls outputs providing greater system flexibility and eliminating bus contention.

The Am9265 features an automatic stand-by mode. When deselected by $\overline{CE}$, the maximum supply current is reduced from 80mA to 20mA, a 75% reduction.

The ability to program customer code at the last step of fabrication (Post Metal Programming Technique) results in faster turn around time for new or old patterns. This technique also allows testing of wafers to categorize speed and power dissipation before committing customer patterns.

MOS Memories
Am2732

DISTINCTIVE CHARACTERISTICS

- 0.3% AQL guaranteed
- Direct replacement for Intel 2732
- Pin compatible with Am9233 – 32K ROM
- Single +5V power supply
- Fast access time – 350ns and 450ns
- Low power dissipation
  –787mW active
  –157mW standby
- Fully static operation – no clocks
- Three-state outputs
- TTL compatible inputs/outputs

GENERAL DESCRIPTION

The Am2732 is a 32768-bit ultraviolet erasable and programmable read-only memory. It is organized as 4096 words by 8 bits per word, operates from a single +5V supply, has a static standby mode, and features fast single address location programming.

Because the Am2732 operates from a single +5V supply, it is ideal for use in microprocessor systems. All programming signals are TTL levels, requiring a single pulse. For programming outside of the system, existing EPROM programmers may be used. Locations may be programmed singly, in blocks, or at random. Total programming time for all bits is 200 seconds.

Advanced Micro Devices

MOS Memories
Am2732A

DISTINCTIVE CHARACTERISTICS

- Fast access times – 200ns, 250ns, 300ns, 450ns
- New low-cost plastic package for applications not requiring reprogramming
- Low power dissipation
  – 525mW active, 130mW standby
- ±10% V_{CC} supply tolerance available
- Three-state outputs
- 24-pin JEDEC approved 2732 pin-out
- Pin compatible with Am9233 – 32K-bit ROM
- Separate chip enable and output enable

GENERAL DESCRIPTION

The Am2732A is a 32768-bit UV-light erasable and electrically programmable read-only memory, organized as 4096 words by 8-bits. The standard Am2732A offers an access time of 250ns, allowing operation with high-speed microprocessors without any WAIT state.

To eliminate bus contention in a multiple-bus microprocessor system, Am2732A offers separate Output Enable ($\overline{OE}$) and Chip Enable ($\overline{CE}$) controls.

All signals are TTL levels, including programming signals. Bit locations may be programmed singly, in blocks or at random.

The part is available in an economical plastic package for applications which do not require reprogramming.

S2333

32,768 BIT (4096x8) STATIC NMOS ROM

Features

- ☐ Fast Access Time: 350ns Maximum
- ☐ Fully Static Operation
- ☐ Single +5V ±5% Power Supply
- ☐ Directly TTL Compatible Inputs
- ☐ Three-State TTL Compatible Outputs
- ☐ Two Programmable Chip Selects
- ☐ EPROM Pin Compatible (2732)
- ☐ Extended Temperature Range Available

General Description

The AMI S2333 is a 32,768 bit static mask programmable NMOS ROM organized as 4096 words by 8 bits. The device is fully TTL compatible on all inputs and outputs and has a single +5V power supply. The three state outputs facilitate memory expansion by allowing the outputs to be OR-tied to other devices.

The S2333 is pin compatible with UV EPROMs making system development much easier and more cost effective. The fully static S2333 requires no clocks for operation. The two chip selects are mask programmable with the active level for each being specified by the user.

The S2333 is fabricated using AMI's N-Channel MOS technology. This permits the manufacture of very high density, high performance mask programmable ROMs.

65,536 BIT (8192x8) STATIC NMOS ROM

Features

- ☐ Fast Access Time: S68A364-350ns Maximum
  S58B364-250ns Maximum
- ☐ Low Standby Power: 85mW Maximum
- ☐ Late Mask Programmable
- ☐ Fully Static Operation
- ☐ Single +5V ±10% Power Supply
- ☐ Directly TTL Compatible Inputs
- ☐ Three-State TTL Compatible Outputs
- ☐ Programmable Chip Enable

General Description

The AMI S68364 family are 65,536 bit static mask programmable NMOS ROMs organized as 8192 words by 8 bits. The devices are fully TTL compatible on all inputs and outputs and have a single +5V power supply. The three-state outputs facilitate memory expansion by allowing the outputs to be OR-tied to other devices.

The devices are fully static, requiring no clocks for operation. The chip enable is mask programmable, the active level being specified by the user. When not enabled, power supply current is reduced to a maximum of 15mA.

The S68364 family of devices are fabricated using AMI's NMOS ROM technology. This permits the mask programmable ROMs.

65,536 BIT (8192x8) STATIC NMOS ROM

Features

- ☐ Fast Access Time: S2364A 350ns Maximum
  S2364B 250ns Maximum
- ☐ Low Standby Power: 85mW Maximum
- ☐ Fully Static Operation
- ☐ Single +5V ±10% Power Supply
- ☐ Directly TTL Compatible Inputs
- ☐ Three-State TTL Compatible Outputs
- ☐ Three Programmable Chip Enables/Selects
- ☐ EPROM Pin Compatible (2764)
- ☐ Late Mask Programmable

General Description

The AMI S2364 is a 65,536 bit static mask programmable NMOS ROM organized as 8192 words by 8 bits.

The device is fully TTL compatible on all inputs and outputs and has a single +5V power supply. The three state outputs facilitate memory expansion by allowing the outputs to be OR-tied to other devices.

The S2364 is pin compatible with the 2764 UV EPROM making system development much easier and more cost effective. It is fully static, requiring no clocks for operation. The three chip enables are mask programmable; the active level for each being specified by the user. When not enabled, power supply current is reduced to a 10mA maximum.

The S2364 is fabricated using AMI's N-Channel MOS technology. This permits the manufacture of very high density, high performance mask programmable ROMs.

S23128A/S23128B

131,072 BIT (16384x8) STATIC NMOS ROM

Features

- ☐ Fast Access Time: S23128A-350ns Maximum
  S23128B-250ns Maximum
- ☐ Low Standby Power: 110mW Max.
- ☐ Fully Static Operation
- ☐ Single +5V ± 10% Power Supply
- ☐ Directly TTL Compatible Outputs
- ☐ Three-State TTL Compatible Outputs
- ☐ Two Programmable Chip Enables/Selects
- ☐ EPROM Pin Compatible (27128)
- ☐ Late Mask Programmable
- ☐ Programmable Output/Chip Enable

General Description

The AMI S23128 is a 131,072 bit static mask programmable NMOS ROM organized as 16,384 words by 8 bits.

The device is fully TTL compatible on all inputs and outputs and has a single +5V power supply. The three state outputs facilitate memory expansion by allowing the outputs to be OR-tied to other devices.

The S23128 is pin compatible with the 27128 EPROM making system development easier and more cost effective. The fully static S23128 requires no clocks for operation. The three control pins are mask programmable with the active level and function being specified by the user. The pins can also be programmed as no connections. If CE functions are selected, automatic powerdown is available. The power supply current is reduced to 12mA when the chip is disabled.

The S23128 is fabricated using AMI's NMOS technology. This permits the manufacture of high density, high performance ROMs.

MEMORY

262,144 BIT (32,768x8) STATIC NMOS ROM

Features

- ☐ Fast Access Time:
  - S23256B: 250ns Maximum
  - S23256C: 150ns Maximum
- ☐ Low Power Dissipation
  - Active Current: 40mA Maximum
  - Standby Current: 10mA Maximum
- ☐ Fully Static Operation
- ☐ Two User-Defined and Programmable Control Lines: CE/CS, OE/CE
- ☐ EPROM Pin Compatible
- ☐ Late Mask Programmable
- ☐ Three-State TTL Compatible Outputs

General Description

The AMI S23256 is a 262,144 bit static mask programmable NMOS ROM organized as 32,768 words by 8 bits. The devices are fully TTL compatible on all inputs and outputs and operate from a single +5V ±10% power supply. The three state outputs facilitate memory expansion by allowing the outputs to be OR-tied to other devices.

The S23256 is pin compatible with the 27128 UV EPROM making system development much easier and more cost effective. It is fully static, requiring no clocks for operation.

The S23256 is fabricated using AMI's N-Channel MOS ROM technology. This permits the manufacture of very high density, high performance mask programmable ROMs.

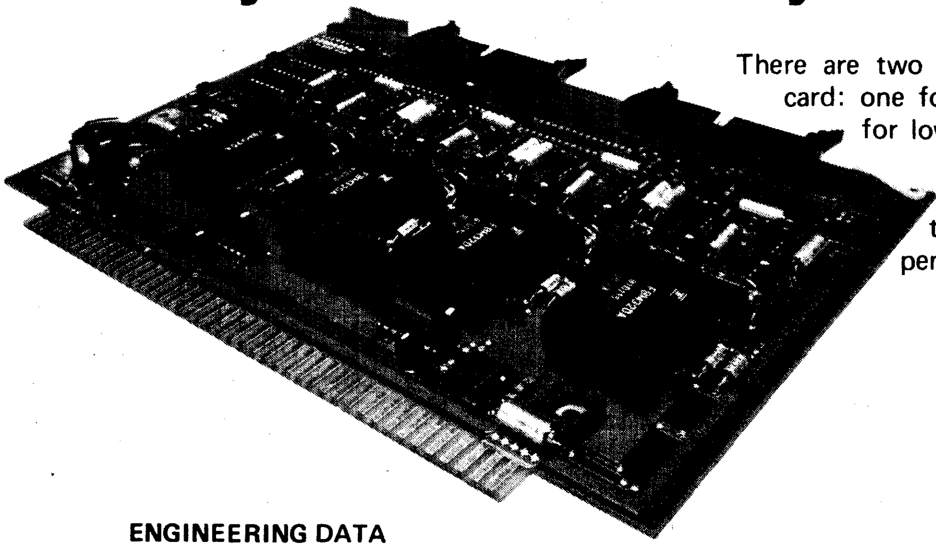
32K byte Bubble Memory Card

FUJITSU



There are two kinds of Fujitsu bubble memory card: one for high-speed file memory and one for low-speed file memory.

Both can be connected to the 8-bit micro-processor buss and the capacity is easily increased depending on a system.

ENGINEERING DATA

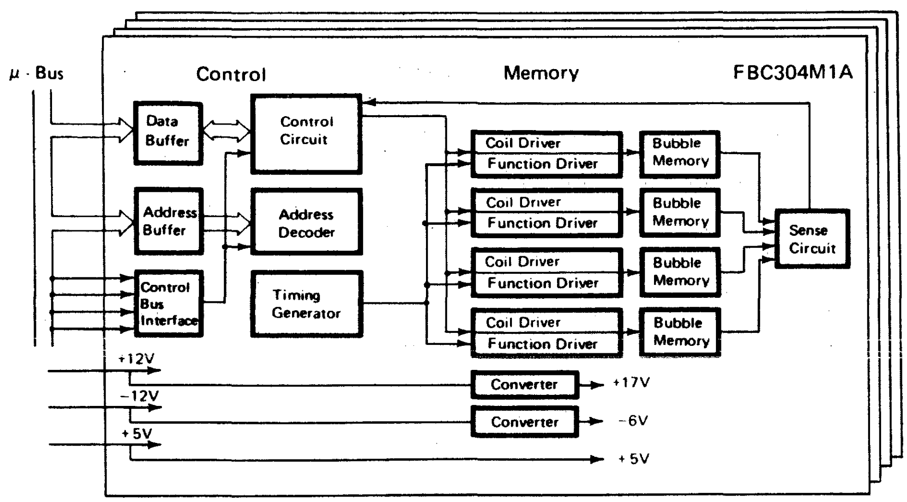
	FBC304M1A	FBC304D2A
Devices	FBM31DB	FBM32DA
Number of Devices	4	4
Organization	Serial loop	Major/Minor loop
Capacity	296,128 bits	324,024 bits
Average Access Time	370 ms	4.5 ms
Drive Frequency	100KHz	100KHz
Data Rate	100K bits/sec.	200K bits/sec.
Interface	TTL Compatible	TTL Compatible
Power Consumption Operating Stand-by	 9 W 6 W	 11 W 2.5 W
Power Requirement *	+12 V (± 5 %) 0.3A Max. −12 V (± 5 %) 0.2A Max. + 5 V (± 5 %) 1.6A Max.	+12 V (± 5 %) 1.0A Max. −12 V (± 5 %) 0.2A Max. + 5 V (± 5 %) 0.7A Max.
Temperature Range Operating Non-volatile Storage	 0°C to +50°C −40°C to +85°C	 0°C to +50°C −40°C to +85°C
Card Dimension	230 x 160 mm²	230 x 160 mm²

* Sequencial power-on and power-off are unnecessary.

Fijutsu 32K byte Bubble Memory Card

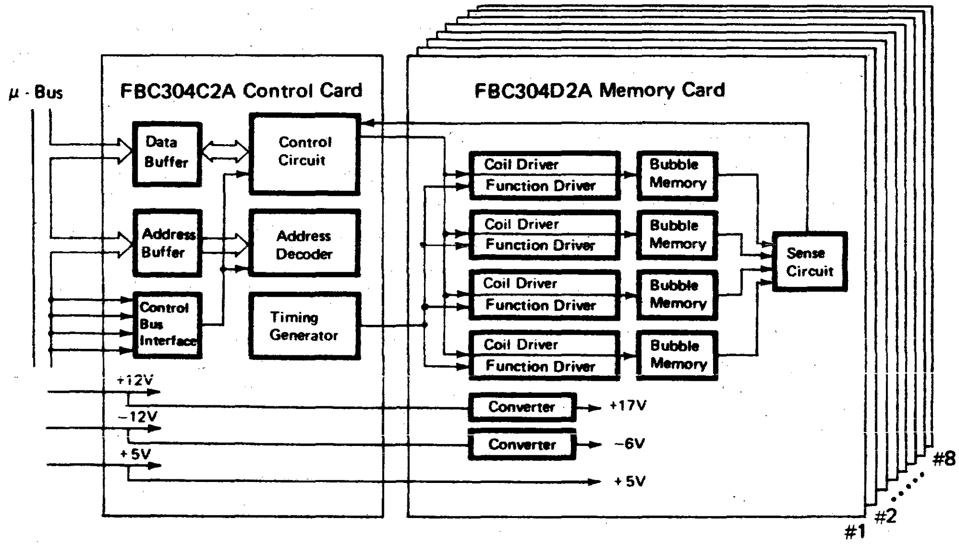
FBC304M1A is a 32K byte bubble memory card containing four 74K bit serial loop organized Bubble Memory Devices FBM31DB.

The timing and control circuits, in addition to coil drivers, function drivers, sense amplifier, etc., are also mounted on the same card, which can be directly connected to the 8-bit micro-processor as a low-speed data file and program memory.



Fujitsu America, Inc., 918 Sherwood Drive, Lake Bluff, Illinois 60044

FBC304D2A is a 32K byte high-speed bubble memory card with a TTL interface, containing four 83K bit major/minor loop organized Bubble Memory Devices FBM32DA with peripheral circuits. As a high-speed random access file memory this card can be connected to the 8 bit microprocessor buss via a control card FBC304C2A and the number of cards can be increased up to 256K bytes (8 cards), according to a system scale.



EXPECTED BUBBLE MEMORY APPLICATIONS

System Memory Capacity (Byte)	10K	100K	1M	10M
Chip Capacity (bit)	64K ~ 100K	256K ~ 1M	> 1 M

64K bit Bubble Memory Device

FUJITSU

FBM31DB and FBM32DA are 18-pin DIP packages that contain a 64K bit serial loop chip and a 64K bit major/minor loop chip, respectively, orthogonal coils for rotating magnetic field, and a magnet for biasing which makes the bubbles stable to keep data.

These bubble memory devices serve as the heart of the Fujitsu bubble memory card mounted on a printed circuit board.

ENGINEERING DATA

	FBM31DB	FBM32DA
Capacity:	74,032 bits	83,354 bits (total) 81,006 bits (effective)
Organization:	Serial loop	Major/Minor loop
Drive Frequency:	100KHz	100KHz
Transfer Rate:	100K bits/sec.	50K bits/sec.
Average Access Time:	370 ms	4.5 ms
Power Consumption:	500 mW	500 mW
Temperature Range Operating: Non-volatile Storage:	 0°C to + 55°C −40°C to + 85°C	 0°C to + 55°C −40°C to + 85°C
External Magnetic Field Operating: Non-Volatile Storage:	 50 Oe Max. 100 Oe Max.	 50 Oe Max. 100 Oe Max.
Physical Structure:	18 pin DIP	18 pin DIP
Dimensions:	27.94 x 31 x 10 mm^3	27.94 x 31 x 10 mm^3
Weight	30 g	30 g

256K bit Bubble Memory Device

FUJITSU

The FBM42DA is a major/minor bubble memory device in a 16 DIP package containing a 256K bit chip; the FBM43DA is a block replicator transfer bubble memory device in a 20 pin DIP package containing a 256K bit chip. Both devices are mountable on a printed circuit board and have orthogonal coils for rotating magnetic field. They also incorporate magnets for biasing, thereby providing the bubbles with stability to retain data.

ENGINEERING DATA

	FBM42DA	FBM43DA
Capacity	283,026 bits (effective) 1,097 bits X 258 loops	273,745 bits (effective) 1,033 bits X 265 loops
Organization	Major/minor loop	Major/minor loop (Block replicator transfer system)
Drive Frequency	100KHz	100KHz
Transfer Rate	50K bits/sec	100K bits/sec
Average Access Time	8.5 ms	6.0 ms
Power Consumption	670 mW	670 mW

IC MASTER BELONGS ON YOUR BOOKSHELF

If you use IC MASTER frequently, you can obtain your own copy by ordering now. Use the order cards contained in this publication, or order by telephone as described below.

IC MASTER is a two-volume set of technical data carefully organized to direct the engineer to the integrated circuits and related products that are closest to his specific needs. It is the surest way to find the optimum device to answer an engineering design requirement. By ordering now, you won't have to borrow or search for IC MASTER the next time you need it.

Typical Use of IC MASTER

Can an engineer find out who makes a 64K dynamic RAM with an access time of 120 nanoseconds or faster in less than 30 seconds?
He can if he turns to the Memory section of IC MASTER and looks for the 64K organization (words and bits per word) that he needs.
Because each device is listed in order of access time, he can easily determine the devices that satisfy his speed requirements.

In the United States only:

You can order IC MASTER simply by charging it to your VISA or Master Card credit card. To place your order, call now: (516) 222-2500.
Ask for Extension 314.

ORDER YOUR COPY NOW

HM-7602/03

32 x 8 PROM

HM-7602 — Open Collector Outputs
HM-7603 — "Three State" Outputs

Description

The HM-7602/03 is a fully decoded high speed Schottky TTL 256/Bit Field Programmable ROM in a 32 word by 8 bit/word format with open collector (HM-7602) or "Three State" (HM-7603) outputs. These PROMs are available in a 16 pin D.I.P. (ceramic or power plastic).

All bits are manufactured storing a logical "1" (Positive Logic) and can be selectively programmed for a logical "0" in any one bit position.

Nickel-chromium fuse technology is used on this and all other Harris Bipolar PROMs.

The HM-7602/03 contains test rows which are in addition to the storage array to assure high programmability and guarantee parametric and A.C. performance. The fuses in these test rows are blown prior to shipment.

There is one chip enable input on the HM-7602/03. $\overline{CE}$ low enables the chip.

HM-7649

HIGH SPEED 512 x 8 PROM

Description

The HM-7649 is a fully decoded high speed Schottky TTL 4096 bit Field Programmable ROM in a 512 word by 8 bit/word format with "Three State" outputs. This PROM is available in a 20 pin D.I.P. (ceramic or power plastic).

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.

Nickel Chromium fuse technology is used on this and all other Harris Bipolar PROMs.

The pinout is identical to the 74S473 PROM.

The HM-7649 contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametic and A. C. performance. The fuses in these test rows and columns are blown prior to shipment.

There is a chip enable input on the HM-7649 where $\overline{CE}$ low enables the device.

HM-7685

HIGH SPEED 2K x 4 PROM

Description

The HM-7685 is a fully decoded high speed Schottky TTL 8192- bit Field Programmable ROM in a 2K word by a 4 bit/word format with "Three State" outputs. This PROM is available in an 18 pin DIP (ceramic or power plastic).

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.

Nickel-chromium fuse technology is used on this and all other Harris Bipolar PROMs.

The HM-7685 contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A. C. performance. The fuses in these test rows and columns are blown prior to shipment.

There is a chip enable on the HM-7685. $\overline{CE}$ low enables the chip.

HARRIS

HM-76161

HIGH SPEED 2K x 8 PROM

Description

The HM-76161 is a fully decoded high speed Schottky TTL 16,384 bit Field Programmable ROM in a 2K word by 8 bit/word format with "Three State" outputs. This PROM is available in a 24 pin DIP (ceramic or power plastic).

All bits are manufactured storing a logical "1" (Positive Logic) and can be selectively programmed for a logical "0" in any bit position.

The nickel-chromium fuse technology used is the same as all other Harris Bipolar PROMs and the JAN approved MIL-M-38510 PROMs.

The HM-76161 contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.

There are three chip enable inputs on the HM-76161. $\overline{CE}_1$ low, CE_2 high, and CE_3 high enables the device.

PROGRAMMING THE HM-76XXX PROMS

The HM-76XXX PROMs are manufactured with all bits storing a logical "1" (output high). Any desired bit can be programmed to a logical "0" (output low) by following the simple procedure shown below. One may build his own programmer to satisfy the specifications described in the table, or use any of the commercially available programmers which can meet these specifications.

PROGRAMMING SPECIFICATIONS

SYMBOL	PARAMETER	MINIMUM	RECOMMENDED OR TYPICAL	MAXIMUM	UNITS
V_{IH} V_{IL}	Address Input Voltage (1)	2.4 0.0	5.0 0.4	5.0 0.5	V V
V_{PH} (2) V_{PL} (3)	Programming/Verify Voltage to V_{CC}	12.0 4.5	12.0 4.5	12.5 5.5	V V
I_{ILP}	Programming Input Low Current at V_{PH}	—	-300	-600	μA
tr tf	Programming (V_{CC}) Voltage Rise and Fall Time	1.0 1.0	1.0 1.0	10 0 10.0	μs μs
td	Programming Delay	10	10	100.	μs
tp	Programming Pulse Width (4)	90	100	110	μs
P.D.C.	Programming Duty Cycle	—	50	90	%
VOPE VOPD	Output Voltage – Enable (5) Output Voltage – Disable (6)	10.5 4.5	10.5 5.0	11.0 5.5	V V
T_a	Ambient Temperature	—	25	75	°C

During programming the chip must be disabled for proper operation.

NOTES:
1. No inputs should be left open for V_{IH}.
2. V_{PH} source must be capable of supplying one ampere.
3. It is recommended that dual verification be made at V_{PL} min and V_{PL} max.
4. Note step 10 in programming procedure.
5. V_{OPE} source must be capable of supplying 10mA minimum.
6. Disable condition will be met with output open circuit.

PROGRAMMING PROCEDURE

1. Address the PROM with the binary address of the word to be programmed. Address inputs are TTL compatible. An open circuit should not be used to address the PROM.
2. Bring the $\overline{CE}_X$ input(s) high and the CE_X input(s) low to disable the device. The disabling of the device during programming is an essential step in correctly programming all HARRIS PROMs. The chip enables are TTL compatible. An open circuit should not used to disable the device.
3. Disable the programming circuitry by applying a voltage of V_{OPD} to the outputs of the PROM. Any output may be left open to achieve the disable.
4. Raise V_{CC} to V_{PH} with rise time less than or equal to t_r.
5. After a delay equal to or greater than t_d, apply a pulse with amplitude of V_{OPE} and duration of t_p to the output selected for programming. Note that the PROM is supplied with fuses intact, which generates an output high. Programming a fuse will cause the output to go low.
6. Other bits in the same word may be programmed while the V_{CC} input is raised to V_{PH} by applying output enable pulses to each output which is to be programmed. The output enable pulses must be separated by a minimum interval of t_d.
7. Lower V_{CC} to 4.5 volts following a delay of t_d from last programming enable pulse applied to an output.
8. Enable the PROM for verification by applying V_{IL} to $\overline{CE}_X$ and V_{IH} to CE_X.
9. Repeat verification (step 8) at V_{CC} = 5.5 volts.
10. If any bit does not verify as programmed, repeat steps 2 through 9 until the bit has received a total of 1ms of programming time. Bits which do not program within 1ms are programming rejects. No further at empt to program these parts should be made.
11. Repeat steps 1 through 10 for all other bits to be programmed in the PROM.
12. Programming rejects returned to the factory must be accompanied by data giving address, desired data, and actual output data of the location in which a programming failure has occurred.

TYPICAL PROGRAMMING CIRCUIT

The circuit and timing diagrams shown in Figures 1 and 2 will establish the proper programming conditions for the output enable pulses. This allows the use of standard TTL parts for all logic inputs to the PROM. Note the gate which senses the output must withstand inputs up to 11.0 volts during programming.

Description

The HPL-77153/82S153 is a programmable logic device designed to be cost effective and space saving replacement for discrete logic designs. This device is a two-level logic element, consisting of 32 product terms (AND) and 10 sum terms (OR) with fusible links for programming I/O polarity and direction.

All product terms can be linked to 8 inputs (I) and 10 bidirectional I/O lines (B) allowing variable I/O configurations using the 10 direction control gates (D), ranging from 17 inputs and 1 output to 8 inputs and 10 outputs.

On chip T/C buffers allow either True (I,B) and/or Complement ($\overline{I},\overline{B}$) signals to be linked to any of the product terms, the outputs of which may be used as inputs to any or all of the sum terms. The output polarity of the sum terms is individually programmable by means of a fuse link controlled EX-OR gate to allow implemention of Sum Of Products (SOP) or Inverted Sum Of Products (ISOP) expressions.

The HPL-77153/82S153 is field programmable, enabling the user to quickly generate custom patterns using standard programming equipment.

Nickel-chromium fuse technology is used on these and all other HARRIS HPL-77XXX programmable logic devices. The HPL-77153/82S153 is available in 20 pin slimline DIP packages with a pinout identical to the 82S153.

The HPL-77153/82S153 contains unique test circuitry developed by HARRIS which is enabled at the time of manufacture to allow complete AC and DC testing.

Description

The HPL-77215/216/209 are programmable logic devices designed to be cost effective and space saving replacements for discrete logic designs. These devices are two-level logic elements consisting of 7 product terms (AND) summed (OR) together to generate each of the 8 outputs. An eighth product term associated with each output can drive it to a high impedance state allowing 6 (B0-B5) of the 8 outputs to be used as inputs, either permanently or dynamically.

The HPL-77209 is functionally identical to the industry standard 16L8, and implements logic expressions of the Inverted Sum Of Products (ISOP) form.

The HPL-77215 is a similar device to the 16L8 but does not include the associated output inversion. It implements logic expressions of the Sum Of Products (SOP) form.

The HPL-77216 is a more flexible device, it includes 8 EX-OR gates in each output path, controlled by 8 extra fuses, allowing the polarity of each output to be user configured. This device can implement a combination of SOP and ISOP expressions.

The HPL-77215/216/209 are field programmable, enabling the user to quickly generate custom patterns using standard programming equipment.

Nickel-chromium fuse technology is used on these and all other HARRIS HPL-77XXX programmable logic devices. The HPL-77215/216/209 are available in 20 pin slimline DIP packages with pinouts identical to the 16L8.

The HPL-77215/216/209 contain unique test circuitry developed by HARRIS which is enabled at the time of manufacture to allow complete AC and DC testing.

Description

The HPL-77317/318 are programmable logic devices designed to be cost effective and space saving replacements for discrete logic designs. These devices are two-level logic elements consisting of 8 product terms (AND) summed (OR) together to generate each of the 8 outputs. To achieve 8 product terms per output, the ability to force the outputs to a high impedance state has not been included. All eight outputs are permanently active.

The HPL-77317 is similar to the industry standard 16L8, and implements logic expressions of the Inverted Sum Of Products (ISOP) form.

The HPL-77318 is a similar device to the HPL-77317, but does not include the associated output inversion. It implements logic expressions of the Sum Of Products (SOP) form.

Six of the 8 outputs feature feedback into the fuse matrix, allowing output functions to be utilized for other output functions.

The HPL-77317/318 are field programmable, enabling the user to quickly generate custom patterns using standard programming equipment.

Nickel-chromium fuse technology is used on these and all other HARRIS HPL-77XXX programmable logic devices. The HPL-77317/318 are available in 20 pin slimline DIP packages with pinouts similar to the 16L8.

The HPL-77317/318 contain unique test circuitry developed by HARRIS, which is enabled at the time of manufacture to allow complete AC, DC and functional testing.

Description

The HPL-77319/320 are programmable logic devices designed to be cost effective and space saving replacements for discrete logic designs. These devices are two-level logic elements consisting of 8 product terms (AND) summed (OR) together to generate each of the 8 outputs. An extra fuse associated with each bi-directional pin can drive it to a high impedance state allowing 6 (B0-B5) of the 8 outputs to be used as inputs.

An extra fuse associated with each output pin can be used to control output polarity which is active high on an unprogrammed part.

The HPL-77319 is similar to the industry standard 16L8, and implements logic expressions of the Inverted Sum of Products (ISOP) form.

The HPL-77320 is a similar device to the HPL-77319 but does not include the associated output inversion. It implements logic expressions of the Sum of Products (SOP) form.

The HPL-77319/320 are field programmable, enabling the user to quickly generate custom patterns using standard programming equipment.

Nickel-chromium fuse technology is used on these and all other HARRIS HPL-77XXX programmable logic devices. The HPL-77319/320 are available in 20 pin slimline DIP packages with pinouts identical to 16L8.

The HPL-77319/320 contain unique test circuitry developed by HARRIS which is enabled at the time of manufacture to allow complete AC, DC and functional testing.

PROGRAMMING HARRIS PROGRAMMABLE LOGIC (HPL)

Following is the programming procedure which is used for the HPL-77XXX devices. These devices are manufactured with all fuses intact. Any desired fuse can be programmed by following the simple procedure shown on the following page. One may build a programmer to satisfy the specifications described in the table, or use any of the commercially available programmers which meet these specifications.

PROGRAMMING SPECIFICATIONS

TABLE 1

SYMBOL	PARAMETER	TEST CONDITIONS	LIMITS MIN	TYP	MAX	UNITS
V_{CCP}	V_{CC} Supply During Programming[1]	I_{CCP} = 550 mA min	8.25	8.5	8.75	V
I_{CCP}	I_{CC} Limit During Programming	V_{CCP} = +8.50V±0.25V	550	—	1000	mA
V_{IH}	Input Voltage (High)		2.4	—	5.5	V
V_{IL}	Input Voltage (Low)		0.0	—	0.8	V
I_{IHP}	Input Current (High) During Prog.	V_{IH} = +5.5V	—	—	50	μA
I_{ILP}	Input Current (Low) During Prog.	V_{IL} = 0V	—	—	−500	μA
V_{OPF}	Forced Output Voltage[2]	I_{OPF} = 300mA±25mA Transient or Steady State	16.0	16.5	18.0	V
I_{OPF}	Forced Output Current	V_{OPF} = 17.5V±0.5V	275	300	325	mA
PW_V	Verify Pulse Width		1	5	50	μS
PW_P	Programming Pulse Width		90	100	110	μS
T_D	Pulse Sequence Delay		1	5	50	μS
t_{r2}	Forced Output Voltage Rise Time	10% to 90%	4	14	40	μS
t_{r1}	V_{CC} Supply Rise Time	10% to 90%	2	7	20	μS
t_{f2}	Forced Output Voltage Fall Time	90% to 10%	2	7	20	μS
t_{f1}	V_{CC} Supply Fall Time	90% to 10%	1	4	10	μS
T_{PP}	Programming Period		100	160	350	μS
F_L	Fusing Attempts per Link		—	1	2	Cycle
V_S	Verify Threshold[3]		1.4	1.5	1.6	V

NOTES:

1. Bypass V_{CC} to GND with a 0.01 μF capacitor to reduce voltage spikes. The V_{CC} power supply must be capable of handling 1 Ampere maximum.
2. Care should be taken to ensure that the voltage is maintained during the entire fusing cycle. The recommended supply is a constant current source clamped at the specified voltage limit.
3. V_S is the sensing threshold of the device output voltage for a programmed link. It normally constitutes the reference voltage applied to a comparator circuit to verify a successful fusing attempt.

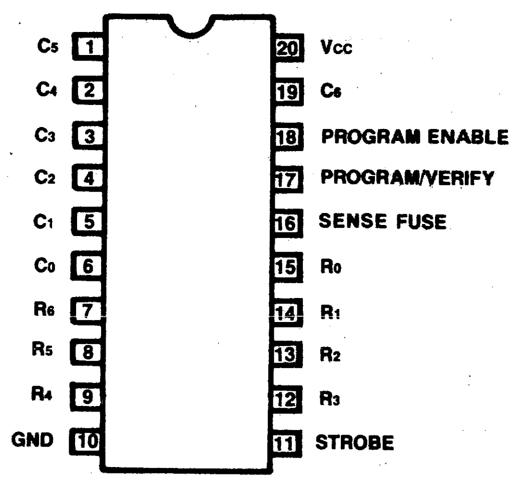

Figure 1
EDIT MODE PINOUT
HPL-77XXX

*NOTE: While programming HPL-77XXX devices, no pins should be left floating. Pin 16 (SENSE FUSE) appears as an open collector output during programming. It should be tied to VCC through a 10K ohm resistor. It is recommended that all unused row and column address pins be tied to GND. Consult individual HPL data sheets for information pertaining to selection of fuses.

HPL PROGRAMMING PROCEDURE & WAVEFORMS

PROGRAMMING PROCEDURE

1. Set-Up:
   a. During programming, no pins should be left floating. Pin 16 should be terminated with a 10k ohm resistor to V_{CC}.
   b. Set GND (Pin 10) to OV.
2. Select the EDIT Mode:
   a. Apply OV to Pin 20.
   b. Apply V_{IL} to Pin 18.
   c. Apply V_{IH} to Pin 11.
   d. Apply V_{IL} to Pin 17.
3. Select the Fuse to be Programmed:
   a. Wait T_D and select a ROW by specifying the appropriate binary ROW address according to Table 2.
   b. Select a COLUMN by specifying the appropriate binary COLUMN address according to Table 3.
4. Program the Fuse:
   a. Wait T_D and raise Pin 20 to V_{CCP}.
   b. Wait T_D and raise Pin 17 to V_{IH}.
   c. Wait T_D and raise Pin 18 to V_{OPF}.
   d. Wait T_D and pulse Pin 11 to V_{IL} for a duration of PWp.
   e. Return Pin 11 to V_{IH}.
   f. Wait T_D and lower Pin 18 to V_{IL}.
   g. Wait T_D and lower Pin 17 to V_{IL}.
5. Verify Programmed Fuse:
   a. Wait T_D and lower Pin 11 to V_{IL}.
   b. At the end of PW_V, monitor Pin 16 for a level of Vs.
   c. Return Pin 11 to V_{IH}.
   d. Wait T_D and lower Pin 20 to OV.
   e. If Pin 16 has indicated a V_{OL}, return to step 4 and repeat so that the fuse receives a maximum of two (2) fusing attempts.
6. Repeat Steps 3 Through 5 for All Fuses to be Blown.

PROGRAMMING WAVEFORMS

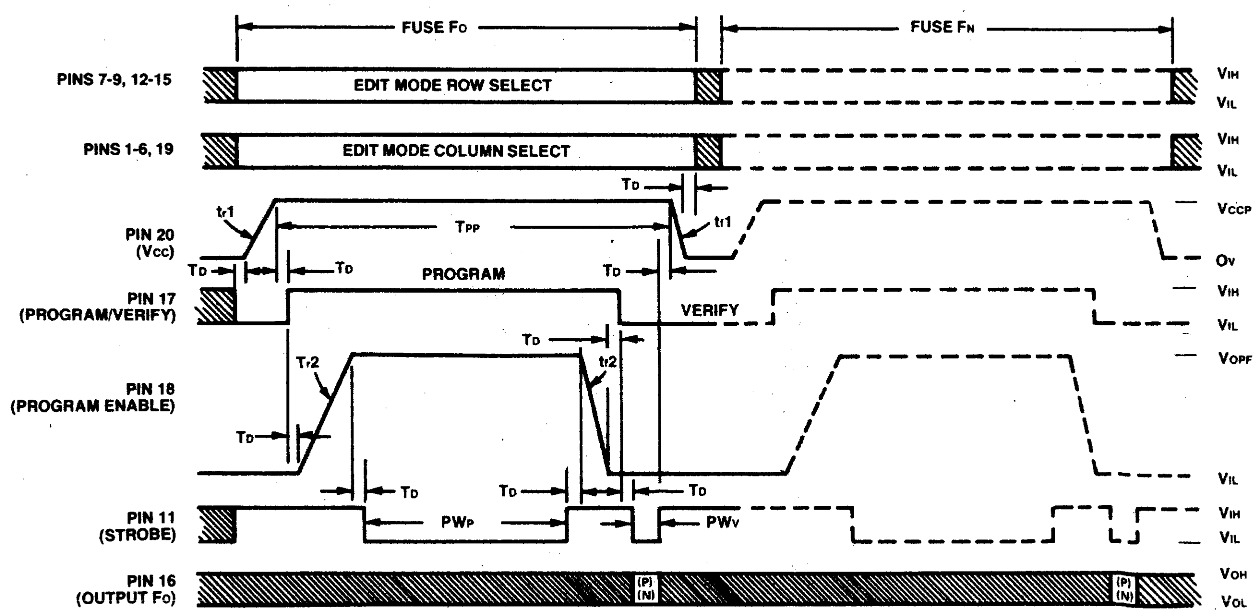

Figure 2

HARRIS

HPL-77061

Product Preview HPL™ Harris Programmable Logic

The HPL-77061 is a proprietary device designed by Harris Semiconductor. It is a 24 pin device with 12 input pins, 6 bi-directional pins, and 4 output pins. The architecture consists of a programmable AND array, followed by a fixed OR array, followed by a programmable INVERTER. This configuration generates a device that implements logic expressions in either SUM OF PRODUCTS (SOP) or INVERTED SUM OF PRODUCTS (ISOP) form. Two fuses associated with each output and bi-directional pin allow their three state buffers to be configured as permanently active, permanently inactive, or under the control of a common CHIP SELECT(CS) signal. When under the control of the CS signal, they may be configured to be active when CS is high and inactive when low, or active when CS is low and inactive when high.

The HPL-77061 is intended to be used as an address decoder in 8, 16 or 32 bit microprocessor systems, and is known as a FIELD PROGRAMMABLE ADDRESS DECODER (FPAD). When used as an address decoder, it is possible to contiguously concatenate the address spaces of large and small system components. This allows more efficient use to be made of available memory space, as well as making the memory decoder design easier. The HPL-77061 may also be used to replace several TTL packages in many random logic designs. In both the above applications, a significant reduction in board space, power consumption, package count, and an increase in reliability may be realized. The HPL-77061 incorporates Harris designed test circuitry which allows complete parametric and logical testing of unprogrammed devices at the time of manufacture. The benefits for the user of this exhaustive testing are very high POST PROGRAMMING FUNCTIONAL YIELD (95% guaranteed; 97% typically) and pretested AC and DC parametrics.

The HPL-77061 uses the standard HPL programming algorithm which is also used for all Harris Programmable Logic parts. Special test fuses are included in the HPL-77061. These are selectively programmed during post manufacturing testing. This allows all the programming circuitry to be tested for correct operation.

The Harris policy is to ship pretested devices, removing the test burden from the small user and assuring the large user the highest possible quality.

262144-word × 1-bit Dynamic Random Access Memory

■FEATURES

- Industry Standard 16-Pin DIP
- Single 5V (±10%)
- On chip substrate bias generator
- Low Power: 350mW active, 23mW standby
- High speed: Access Time 120ns/150ns/200ns(max.)
- Common I/O capability using early write operation
- Page mode capability
- TTL compatible
- 256 refresh cycles.....(4 ms)
- 3 variation of refresh . . . $\overline{RAS}$ only refresh
  $\overline{CAS}$ before $\overline{RAS}$ refresh
  Hidden refresh

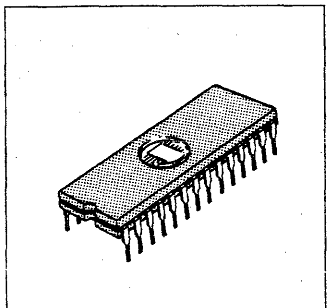
HN4827128G-25, HN4827128G-30, HN4827128G-45

16384-Word x 8-bit UV Erasable and Programmable Read Only Memory

The HN4827128 is a 16384 word by 8 bit erasable and electrically programmable ROM. This device is packaged in a dual-in-line package with transparent lid. The transparent lid allows the user to expose the chip to ultraviolet light to erase the bit pattern, whereby a new pattern can then be written into the device.



(DG-28)

■FEATURES

- Single Power Supply . . . . +5V ± 5%
- Simple Programming . . . . Program Voltage: +21V DC
  Program with One 50ms Pulse
- Static . . . . No Clocks Required
  Inputs and Outputs TTL Compatible During Both Read and Program Mode.

High Performance 16Kx1 Static RAM

IMS1400

FEATURES

- 35, 45 and 55ns Chip Enable access
- Maximum active power 660mW
- Maximum standby power 110mW
- Single 5 volt ± 10% supply
- $\overline{E}$ ($\overline{CE}$) power down function
- TTL compatible inputs and output
- Fully static—no clocks for timing
- Three-state output

IMS1400L

FEATURES

- 70 and 100ns Chip Enable access
- Maximum active power 495mW
- Maximum standby power 83mW
- Single 5V ± 10% Supply
- $\overline{E}$ power down function
- TTL compatible inputs and output
- Fully static - no clocks for timing
- Three-state output

High Performance 8Kx8 Dynamic RAM

FEATURES
- 8Kx8 Byte-Wide Organization
- High Speed Chip Enable Access of 120, 150 and 200ns
- 28-Pin Package—JEDEC Standard Pinout
- 256 Cycle/4ms Refresh
- On-Chip Refresh Counter
- Hidden Refresh Using Pin 1 Refresh
- Single +5V ± 10% Supply
- Latched Chip Select and Address
- High Speed Output Enable Control
- Low Power
  - 42mW Standby
  - 358mW Max @ 190ns cycle
  - 275mW Max @ 240ns cycle
  - 220mW Max @ 310ns cycle

TYPICAL APPLICATIONS
- Cost-Effective Alternative to 8Kx8 SRAMs
- Easily Interfaced with Microprocessors
- Buffer Memory
- Controllers
- Terminals
- Printers
- Displays
- Personal Computers
- Games
- Instrumentation

IMS3630

8Kx8 EEPROM

inmos

FEATURES

- High Speed, Chip Enable Access of 200ns
- +5 Volt Only Operation For All Modes
- Advanced Nitrox Process
- Row Or Full Array Erase Mode
- Single Byte Or Multiple Byte Modification
- Row Programming—Provides Up To 64 Times Faster Programming
- Latched Addresses and Data
- Latched Program/Erase Allows Processor To Perform Other Functions During Non-Volatile Modification
- Clocked Operation Provides Low Standby Power
- Industry Standard 28 Pin Dual-In-Line Pinout

TYPICAL APPLICATIONS

- Computer Systems
- Point of Sale Terminals
- Communication Systems
- Process Controllers
- Telemetry Systems
- Control Systems
- Instrumentation

The IMS3630 has been optimized for in-system operation. All modes of operation, including Chip Erase, are executed with a single +5 volt supply and standard TTL signal levels. Furthermore, all programming and erasing operations are controlled by using a simple sequence of initiate and terminate cycles. This eliminates the need to hold control signals, addresses, or data during the extended intervals required for programming or erasing.

  - —COMMERCIAL
    IDT6116S 70/90/120 ns (max.)
    IDT6116L 90/120/150 ns (max.)
- Low power consumption
  - IDT6116S: Active: 180 mW (Typ.), Standby: 100 μW (Typ.)
  - IDT6116L: Active: 160 mW (Typ.), Standby: 20 μW (Typ.)
- Battery backup operation — 2V data retention voltage
- Produced with advanced CEMOS™ I high-performance technology
- CEMOS™ I process virtually eliminates alpha particle soft-error rates (with no organic die coatings)
- Single 5V (±10%) power supply
- Input and output directly TTL compatible
- Three-state output
- Static operation: no clocks or refresh required
- Standard 24-pin dual-in-line ceramic sidebrazed package or 28-pin and 32-pin LCC
- Pin compatible with standard 16K static RAM and EPROM
- Standard product 100% screened to MIL-STD-883, Class C
- Military product available 100% screened to Class B

DESCRIPTION:

The IDT6116 is a 16,384-bit high-speed static RAM organized as 2K x 8. It is fabricated using IDT's high-performance, high-reliability technology—CEMOS™ I. This state-of-the-art technology, combined with innovative circuit design techniques, provides a cost-effective alternative to bipolar and fast NMOS memories.

Access times as fast as 70ns are available with maximum power consumption of only 550mW. The circuit also offers a reduced power standby mode. When $\overline{CS}$ goes high, the circuit will automatically go to, and remain in, a standby power mode as long as $\overline{CS}$ remains high. In the standby mode, the low power device consumes less than 20μW typically. This capability provides significant system level power and cooling savings. Both versions also offer a battery backup data retention capability where the circuit typically consumes only 1 μW to 4 μW operating off of a 2V battery.

All inputs and outputs of the IDT6116 are TTL compatible and operation is from a single 5V supply, simplifying system designs. Fully static asynchronous circuitry is used, requiring no clocks or refreshing for operation, providing equal access and cycle times for ease of use.

The IDT6116 is packaged in either a 24-pin, 600 mil or 300 mil DIP, 32-pin and 28-pin leadless chip carriers, or 24-pin flatpack, providing high board-level packing densities.

The IDT6116 Military RAM is 100% processed in compliance to the test methods of MIL-STD-883, Method 5004, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

ABSOLUTE MAXIMUM RATINGS[1]

TEMPERATURE RANGE		−55°C to +125°C	−40°C to +85°	0°C to +70°C	
SYMBOL	PARAMETER	RATING			UNIT
V_{TERM}	Voltage on any Pin with Respect to GND	−0.5 to +7.0	−0.5 to +7.0	−0.5 to +7.0	V
T_A	Operating Temperature	−55 to +125	−40 to +85	0 to +70	°C
T_{BIAS}	Temperature Under Bias	−65 to +135	−55 to +125	−10 to +85	°C
T_{STG}	Storage Temperature	−65 to +150	−65 to +150	−55 to +125	°C
P_T	Power Dissipation	1.0	1.0	1.0	W
I_{OUT}	DC Output Current	50	50	50	mA

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum ratings conditions for extended periods may affect reliability.

RECOMMENDED OPERATING CONDITIONS

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
V_{CC}	Supply Voltage	4.5	5.0	5.5	V
GND	Supply Voltage	0	0	0	V
V_{IH}	Input High Voltage	2.2	3.5	6.0	V

TRUTH TABLE

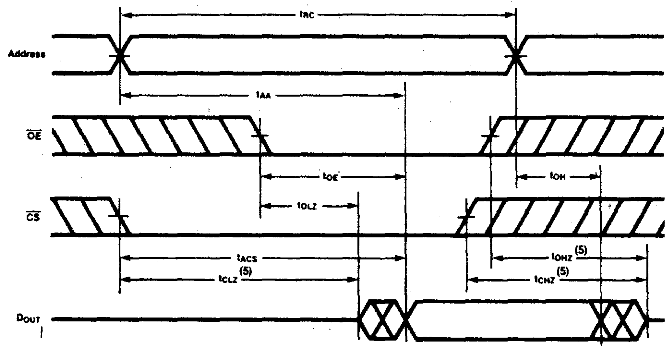
MODE	$\overline{CS}$	$\overline{OE}$	$\overline{WE}$	I/O OPERATION
Standby	H	X	X	High Z
Read	L	L	H	D_{OUT}
Read	L	H	H	High Z
Write	L	X	L	D_{IN}

CAPACITANCE(1) ($T_A = 25°C$, f = 1.0 MHz)

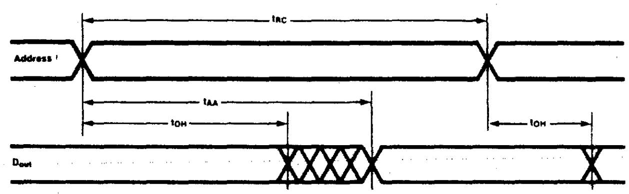
SYMBOL	PARAMETER	CONDITIONS	MAX.	UNIT
C_{IN}	Input Capacitance	$V_{IN} = 0V$	6	pF
$C_{I/O}$	Input/Output Capacitance	$V_{I/O} = 0V$	8	pF

1. This parameter is sampled and not 100% tested.

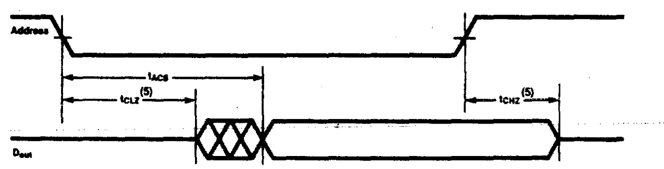
TIMING WAVEFORMS OF READ CYCLE NO. 1(1)



READ CYCLE 2(1,2,4)

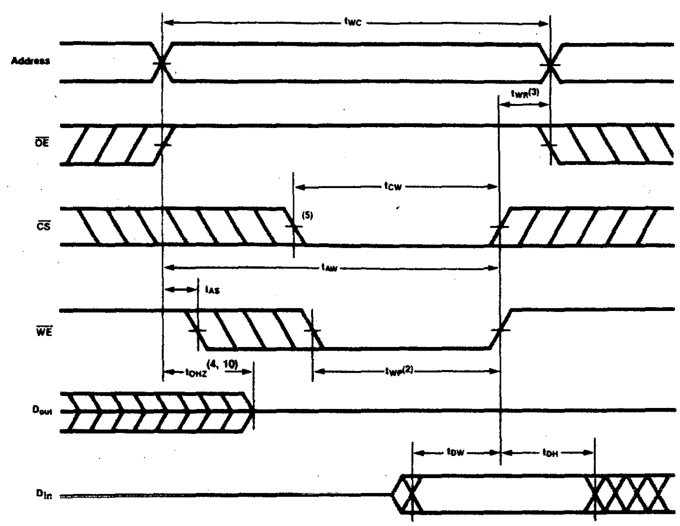


READ CYCLE 3(1,3,4)



NOTES: 1. $\overline{WE}$ is High for Read Cycle.
2. Device is continuously selected, $\overline{CS} = V_{IL}$.
3. Address valid prior to or coincident with $\overline{CS}$ transition low.
4. $\overline{OE} = V_{IL}$.
5. Transition is measured ±500mV from steady state. This parameter is sampled and not 100% tested.

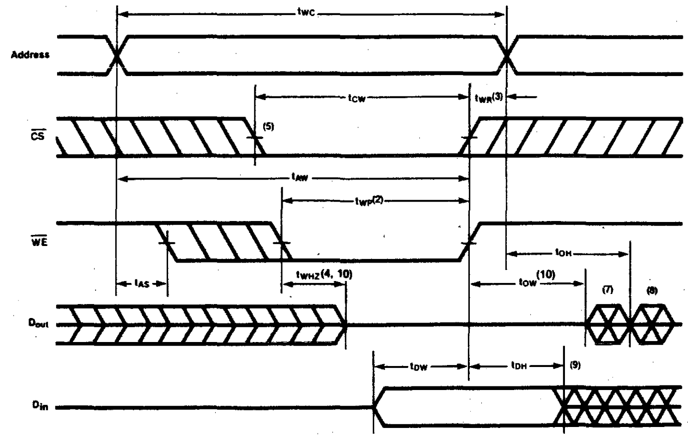
TIMING WAVEFORMS OF WRITE CYCLE 1(1)



NOTE: See footnotes on next page.

Integrated Device Technology, Inc. 3236 Scott Blvd., Santa Clara, CA 95051
Telephone: (408) 727-6116 • TWX 910-338-2070

TIMING WAVEFORM OF WRITE CYCLE 2[1,6]



NOTES: 1. $\overline{WE}$ must be high during all address transitions.
2. A write occurs during the overlap (t_{WP}) of a low $\overline{CS}$ and a low $\overline{CE}$.
3. t_{WR} is measured from the earlier of $\overline{CS}$ or $\overline{WE}$ going high to the end of write cycle.
4. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the $\overline{CS}$ low transition occurs simultaneously with the $\overline{WE}$ low transitions or after the $\overline{WE}$ transition, outputs remain in a high impedance state.
6. $\overline{OE}$ is continuously low ($\overline{OE} = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If $\overline{CS}$ is low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured ±500mV from steady state. This parameter is sampled and not 100% tested.

CMOS STATIC RAMS 16K (16K×1 BIT)

IDT6167S IDT6167L

Integrated Device Technology, Inc

MILITARY / INDUSTRIAL / COMMERCIAL TEMPERATURE RANGES

FEATURES:

- High-speed (equal access and cycle time)
  - —MILITARY/INDUSTRIAL
    IDT6167S 55/70/85/100ns (max.)
    IDT6167L 55/70/85/100ns (max.)
  - —COMMERCIAL
    IDT6167S 45/55/70/85ns (max.)
    IDT6167L 45/55/70/85ns (max.)
- Low power consumption

IDT6167S	IDT6167L
Active: 150mW (typ.)	Active: 125mW (typ.)
Standby: 100μW (typ.)	Standby: 10μW (typ.)

- Battery backup operation — 2V data retention voltage (IDT6167L only)
- High-density 20-pin dual-in-line package and 20-pin leadless chip carriers
- Produced with advanced CEMOS™ I high-performance technology
- CEMOS™ I process virtually eliminates alpha particle soft-error rates (with no organic die coatings)
- Separate data input and output
- Single 5V (±10%) power supply
- Input and output directly TTL-compatible
- Three-state output
- Static operation: no clocks or refresh required
- Pin-compatible with standard 16K×1 static RAMs
- Standard product 100% screened to MIL-STD-883 Class C
- Military product available 100% screened to Class B

DESCRIPTION:

The IDT6167 is a 16,384-bit high-speed static RAM organized as 16K×1. It is fabricated using IDT's high-performance, high-reliability technology — CEMOS™ I. This state-of-the-art technology, combined with innovative circuit design techniques, provides a cost effective alternative to bipolar and fast NMOS memories.

Access times as fast as 45ns are available with maximum power consumption of only 330mW. The circuit also offers a reduced power standby mode. When $\overline{CS}$ goes high, the circuit will automatically go to, and remain in, a standby mode as long as $\overline{CS}$ remains high. In the standby mode, the device consumes less than 100μW, typically. This capability provides significant system-level power and cooling savings. The low power, (L), version also offers a battery backup data retention capability where the circuit typically consumes only 1μW operating off of a 2V battery.

All inputs and the output of the IDT6167 are TTL-compatible and operate from a single 5V supply, thus simplifying system designs. Fully static asynchronous circuitry is used, which requires no clocks or refreshing for operation, and provides equal access and cycle times for ease of use.

The IDT6167 is packaged in either a space-saving 20-pin, 300 mil DIP, a 20-pin leadless chip carrier, or 20-pin flatpack providing high board-level packing densities.

The IDT6167 Military RAM is 100% processed in compliance to the test methods of MIL-STD-883, Method 5004, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

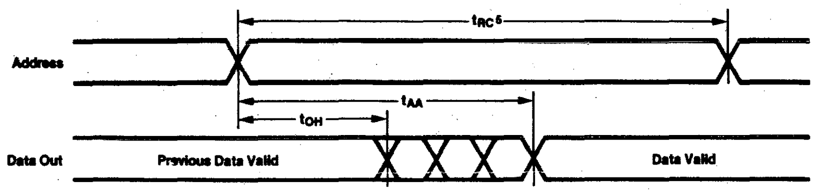
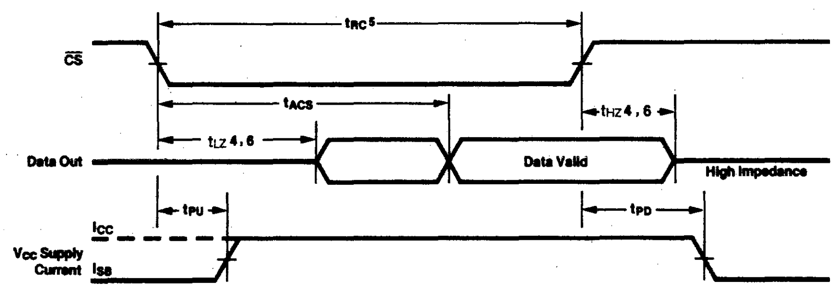
TIMING WAVEFORM OF READ CYCLE NO. 1[1,2]

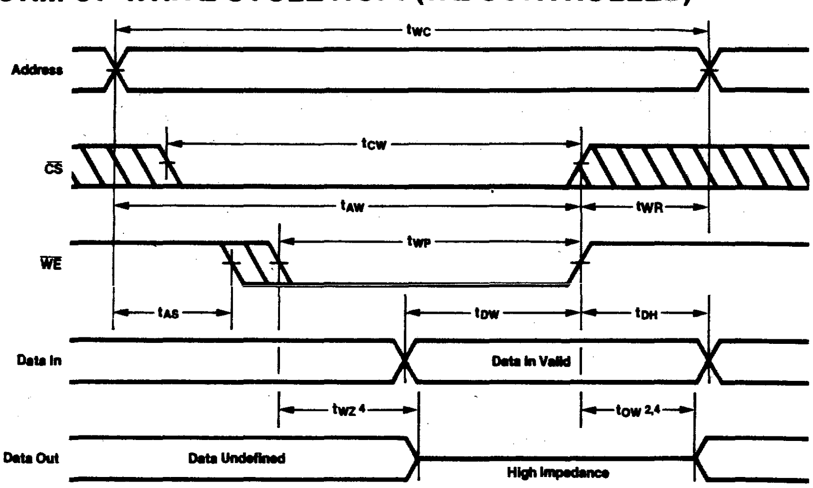


TIMING WAVEFORM OF READ CYCLE NO. 2[1,3]



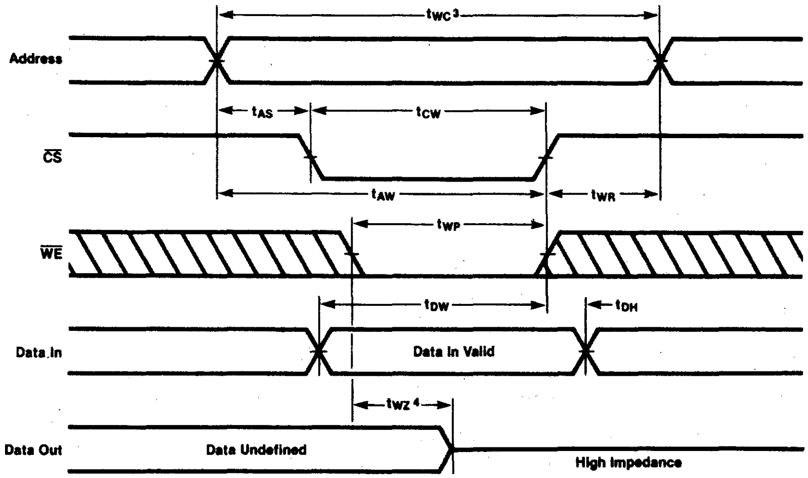
NOTES: 1. $\overline{WE}$ is high for READ cycle.
2. $\overline{CS}$ is low for READ cycle.
3. Address valid prior to or coincident with $\overline{CS}$ transition low.
4. Transition is measured ±500mV from steady state voltage with specified loading in Figure 2. This parameter is sampled, not 100% tested.
5. All READ cycle timings are referenced from the last valid address to the first transitioning address.
6. For any given speed grade, operating voltage and temperature, t_{HZ} will be less than or equal to t_{LZ}.

TIMING WAVEFORM OF WRITE CYCLE NO. 1 ($\overline{WE}$ CONTROLLED)[1]



NOTES: 1. $\overline{CS}$ or $\overline{WE}$ must be high during address transitions.
2. If $\overline{CS}$ goes high simultaneously with $\overline{WE}$ high, the output remains in a high impedance state.
3. All write cycle timings are referenced from the last valid address to the first transitioning address.
4. Transition is measured ±500mV from steady state voltage with specified loading in Figure 2. This parameter is sampled and not 100% tested.

TIMING WAVEFORM OF WRITE CYCLE NO. 2 ($\overline{CS}$ CONTROLLED)[1]



NOTES: 1. $\overline{CS}$ or $\overline{WE}$ must be high during address transitions.
2. If $\overline{CS}$ goes high simultaneously with $\overline{WE}$ high, the output remains in a high impedance state.
3. All write cycle timings are referenced from the last valid address to the first transitioning address.
4. Transition is measured ±500mV from steady state voltage with specified loading in Figure 2. This parameter is sampled and not 100% tested.

LOW V_{CC} DATA RETENTION CHARACTERISTICS FOR L VERSION ONLY (T_A = −55°C to +125°C/−40°C to +85°C/0°C to +70°C)

CMOS STATIC RAMS
16K (4K x 4 BIT)

IDT6168S/L
IDT71681S/L
IDT71682S/L

MILITARY / INDUSTRIAL / COMMERCIAL TEMPERATURE RANGES

FEATURES:

- High-speed (equal access and cycle time)
  IDT6168S/IDT6168L 45 (com'l)/55/70/85/100 ns (max.)
  IDT71681S/IDT71681L 45 (com'l)/55/70/85/100 ns (max.)
  IDT71682S/IDT71682L 45 (com'l)/55/70/85/100 ns (max.)
- Low power consumption
  — IDT6168S/IDT71681S/IDT71682S
  Active: 225 mW (typ.)
  Standby: 100 μW (typ.)
  — IDT6168L/IDT71681L/IDT71682L
  Active: 225 mW (typ.)
  Standby: 10 μW (typ.)
- Bidirectional data input and output (IDT6168 only)
- Separate data inputs and outputs (IDT71681 and IDT71682 only)
- Outputs in high impedance in WRITE mode (IDT71682 only)
- Battery backup operation — 2V data retention voltage (L versions only)
- Produced with advanced CEMOS™ I high-performance technology
- CEMOS I process virtually eliminates alpha particle soft-error rates (with no organic die coatings)
- Single 5V (±10%) power supply
- Input and output directly TTL-compatible
- Three-state output
- Static operation: no clocks or refresh required
- Standard product 100% screened to MIL-STD-883 Class C
- Military product available 100% screened to Class B

DESCRIPTION:

The IDT6168, IDT71681 and IDT71682 are 16,384-bit high-speed static RAMs organized as 4K x 4. They are fabricated using IDT's high-performance, high-reliability technology — CEMOS™ I. This state-of-the-art technology, combined with innovative circuit design techniques, provides a cost effective alternative to bipolar and fast NMOS memories.

The IDT71681 and IDT71682 are manufactured with separate data inputs and outputs. This feature allows for improved system architectures. The external latches of a bidirectional bus system are not needed, improving both board density and system power levels. The absence of bus contention allows a streamlined approach, enhancing system speeds. Also, they fit readily into a pipeline structure.

Access times as fast as 45 ns are available with maximum power consumption of only 495 mW. The circuit also offers a reduced power standby mode. When $\overline{CS}$ goes high, the circuit will automatically go to, and remain in, a standby mode as long as $\overline{CS}$ remains high. In the standby mode, the device consumes less than 100 μW, typically. This capability provides significant system-level power and cooling savings. The low power (L) version also offers a battery backup data retention capability where the circuit typically consumes only 1 μW operating off a 2V battery.

All inputs and outputs of the IDT6168, IDT71681 and IDT71682 are TTL-compatible and operate from a single 5V supply, thus simplifying system designs. Fully static asynchronous circuitry is used, which requires no clocks or refreshing for operation, and provides equal access and cycle times for ease of use.

The IDT6168 is packaged in either a space-saving 20-pin, 300 mil DIP, a 20-pin leadless chip carrier or a 20-pin flatpack and the IDT71681 and IDT71682 in a 24-pin, 300 mil DIP or a 28-pin leadless chip carrier, providing high board-level packing densities.

The Military RAMs are 100% processed in compliance to the test methods of MIL-STD-883, Method 5004, making them ideally suited to military temperature applications demanding the highest level of performance and reliability.

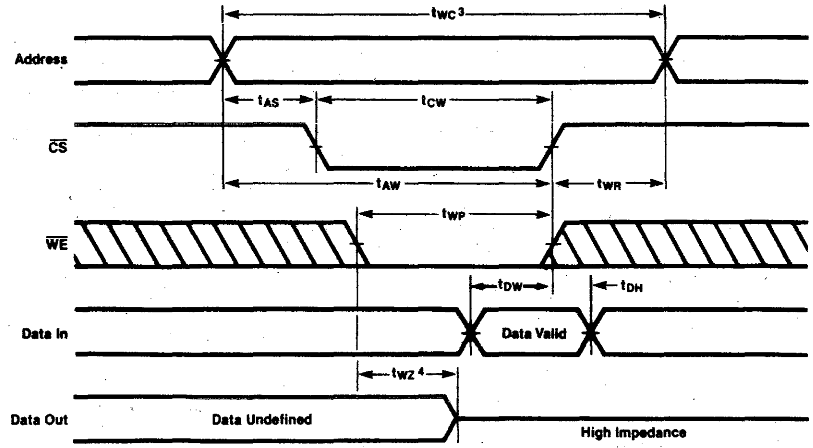
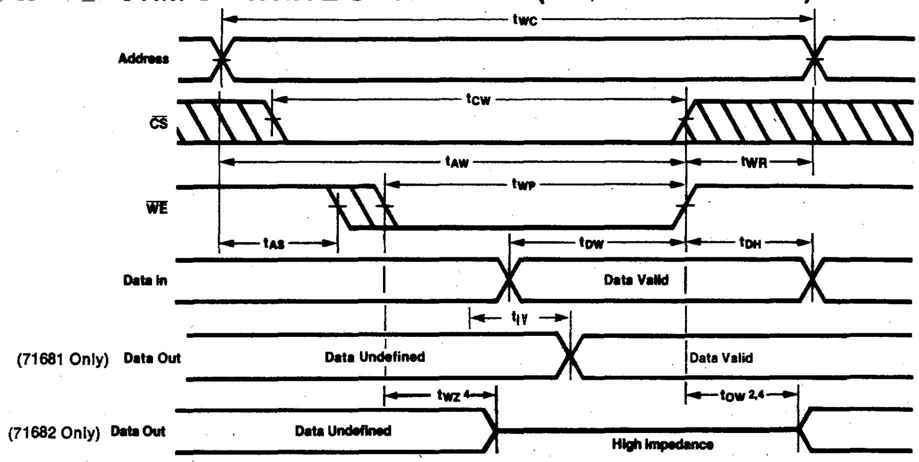
TIMING WAVEFORM OF WRITE CYCLE NO. 2 ($\overline{CS}$ CONTROLLED)[1] For IDT6168

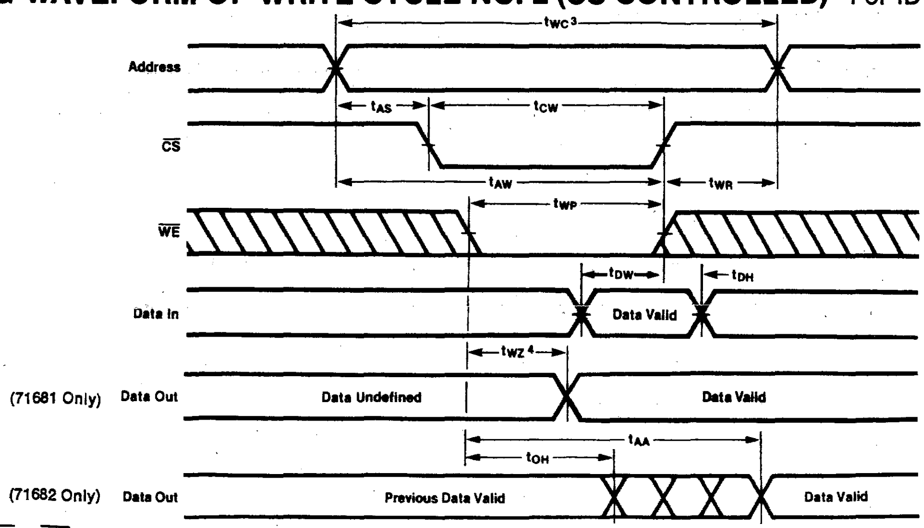


NOTES: 1. $\overline{CS}$ or $\overline{WE}$ must be high during address transitions.
2. If $\overline{CS}$ goes high simultaneously with $\overline{WE}$ high, the output remains in a high impedance state.
3. All write cycle timings are referenced from the last valid address to the first transitioning address.
4. Transition is measured ±200mV from steady state voltage with specified loading in Figure 2. This parameter is sampled and not 100% tested.

TIMING WAVEFORM OF WRITE CYCLE NO. 1 ($\overline{WE}$ CONTROLLED)[1] For IDT71681 and IDT71682



TIMING WAVEFORM OF WRITE CYCLE NO. 2 ($\overline{CS}$ CONTROLLED)[1] For IDT71681 and IDT71682



NOTES: 1. $\overline{CS}$ or $\overline{WE}$ must be high during address transitions.
2. If $\overline{CS}$ goes high simultaneously with $\overline{WE}$ high, the output remains in a high impedance state.
3. All write cycle timings are referenced from the last valid address to the first transitioning address.
4. Transition is measured ±200mV from steady state voltage with specified loading in Figure 2. This parameter is sampled and not 100% tested.

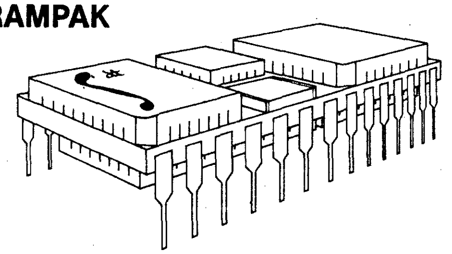
64K (8K x 8) CMOS STATIC RAMPAK

IDT7M864 IDT8M864

MILITARY / COMMERCIAL TEMPERATURE RANGES

64K RAMPAK



FEATURES:

- 8,192 x 8 static RAM module complete with decoder and decoupling capacitor
- High-speed 85 (commercial only)/120/150/200ns (equal access and cycle times)
- Low power consumption; 300 mW typ.
- Two pinout options (64K EPROM & 64K static RAM)
- Utilizes IDT6116s — high performance 16K RAMs produced with advanced CEMOS™ I technology
- CEMOS I process virtually eliminates alpha particle soft error rates (with no organic die coating)
- Single 5V (± 10%) power supply
- Input and output directly TTL-compatible
- Static operation: no clock or refresh required
- Standard military components 100% screened to MIL-STD-883 Class C
- Military components available 100% screened to Class B

DESCRIPTION:

The IDT7M864/IDT8M864 are 64K (8,192 x 8 bit) high speed static RAMs constructed on a ceramic substrate using 4 IDT6116 (2,048 x 8) static RAMs in leadless chip carriers. Functional equivalence to a monolithic 64K static RAM is achieved by utilization of an on-board decoder circuit that interprets the higher order addresses A_{11} and A_{12} to select one of the four 2Kx8 RAMs. Extremely fast speeds can be achieved with this technique due to use of the IDT6116 fabricated in IDT's high performance, high-reliability technology - CEMOS I. This state-of-the-art technology, combined with innovative circuit design techniques, provides the fastest 16K static RAMs available.

The IDT7M864/IDT8M864 are available with access times as fast as 85ns for commercial and 120ns for military temperature ranges, with maximum power consumption of only 825mW. The circuit also offers a reduced power standby mode. When $\overline{CS}_1$ goes high, and/or CS_2 (7M864) goes low, the circuit will automatically go to, and remain in, a standby mode as long as these conditions are held. In the standby mode, the module consumes less than 275mW. Substantially lower power levels can be achieved in the ISB_1 mode (less than 25mW max.) and 2V data retention mode (less than 3mW max.) - see "DC Characteristics" and "Data Retention Characteristics" for details.

Pinout of the IDT8M864 is equivalent to the 64K EPROMs (no connect on pin 26), ideal for applications requiring easy microcode changes during prototyping. The IDT7M864's pinout is compatible with monolithic 64K static RAMs (CS_2 on pin 26).

All inputs and outputs of the IDT7M864/IDT8M864 are TTL-compatible and operate from a single 5V supply, thus simplifying system designs. Full asyncronous circuitry is used, requiring no clocks or refreshing for operation, and provides equal access and cycle times for ease of use.

All IDT military module components are 100% processed to the test methods of MIL-STD-883, Method 5004, making them ideally suited to applications demanding the highest level of performance and reliability.

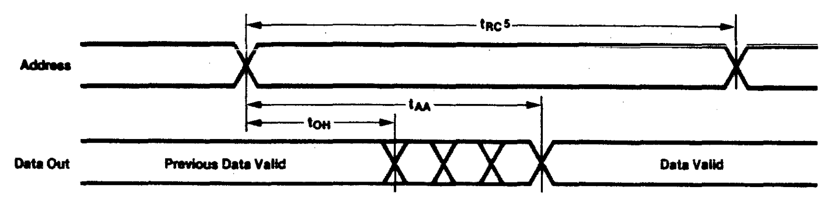
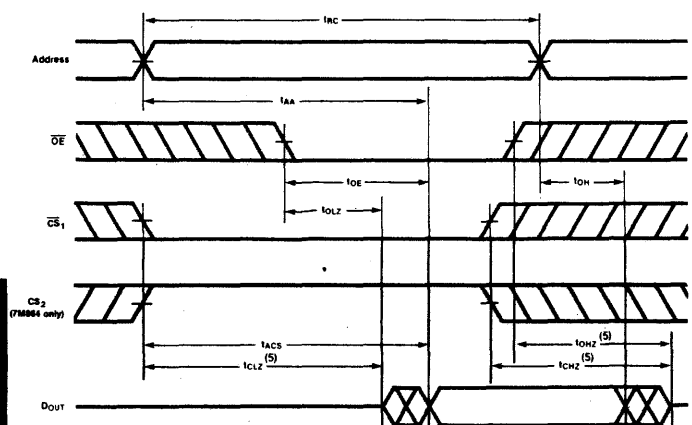
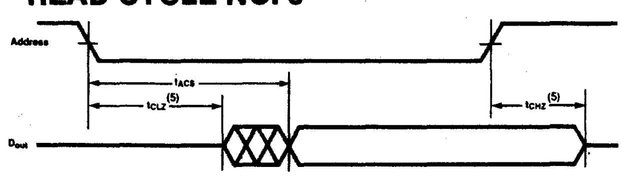
TIMING WAVEFORM OF READ CYCLE NO. 1[1,2]



TIMING WAVEFORM OF READ CYCLE NO. 2[1,3]

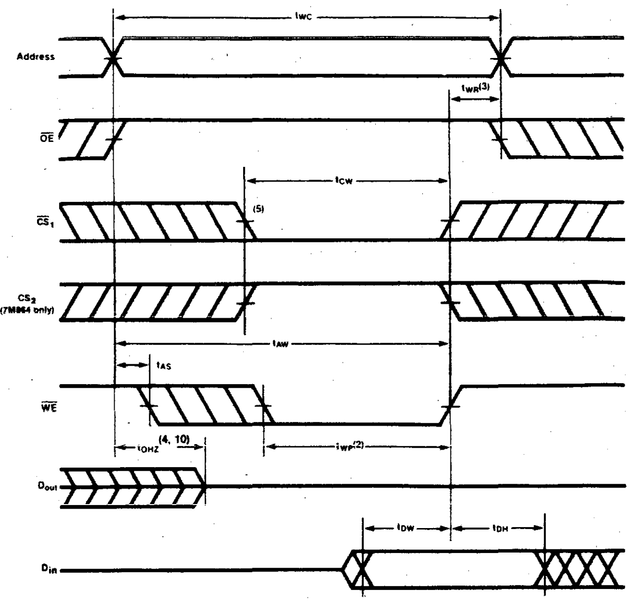


TIMING WAVEFORM OF READ CYCLE NO. 3[1,3,4]

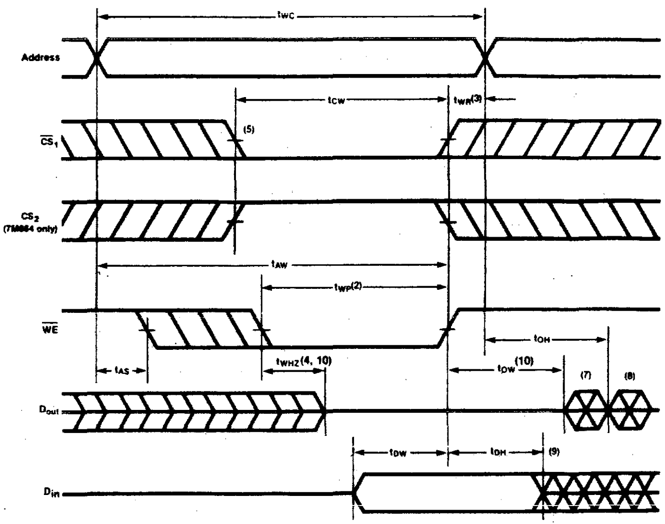


NOTES: 1. $\overline{WE}$ is High for Read Cycle.
2. Device is continuously selected, $\overline{CS}_1$ = V_{IL}, CS_2 = V_{IH} (7M864 only).
3. Address valid prior to or coincident with $\overline{CS}_1$ transition low, CS_2 transition high (7M864 only).
4. $\overline{OE}$ = V_{IL}.
5. Transition is measured ±500mV from steady state. This parameter is sampled and not 100% tested.

TIMING WAVEFORM OF WRITE CYCLE 1(1)



TIMING WAVEFORM OF WRITE CYCLE 2(1,6)



NOTES: 1. $\overline{WE}$ is high during all address transitions.
2. A write occurs during the overlap (t_{WP}) of a low $\overline{CS}_1$, or high CS_2 (7M864 only) and a low $\overline{WE}$.
3. t_{WR} is measured from the earlier of $\overline{CS}_1$ or $\overline{WE}$ going high or CS_2 going low to the end of write cycle.
4. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the $\overline{CS}_1$ low transition or CS_2 high transition occurs simultaneously with the $\overline{WE}$ low transitions or after the $\overline{WE}$ transition, outputs remain in a high impedance state.
6. $\overline{OE}$ is continously low ($\overline{OE} = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If $\overline{CS}_1$ is low or CS_2 is high during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured ±500mV from steady state. This parameter is sampled and not 100% tested.

LOW V_{CC} DATA RETENTION CHARACTERISTICS (T_A = −55°C to +125°C and 0°C to +70°C)

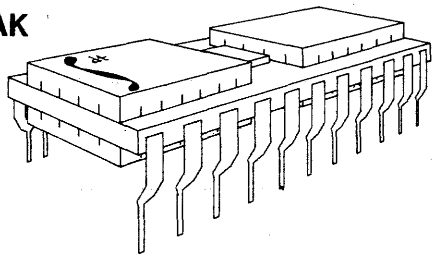
64K (16K x 4) CMOS STATIC RAMPAK

IDT7M464

MILITARY / COMMERCIAL TEMPERATURE RANGES

64K RAMPAK



FEATURES:

- 65,536x1 bit static RAM module complete with decoder and decoupling capacitor
- High-speed 70 (commercial only)/100/120/150ns (equal access and cycle times)
- Low power consumption; 250mW typically
- Offered in a 22 pin, 300 mil center sidebraze DIP
- Pin compatible with proposed monolithics
- Utilizes IDT6167s — high performance 16K RAMs produced with advanced CEMOS™I technology
- CEMOS I process virtually eliminates alpha particle soft error rates (with no organic die coating)
- Single 5V (± 10%) power supply
- Input and output directly TTL-compatible
- Static operation: no clock or refresh required
- Standard military components 100% screened to MIL-STD-883 Class C
- Military components available 100% screened to Class B

DESCRIPTION:

The IDT7M464 is a 64K (16,384 x 4 bit) high speed CMOS static RAM constructed on a ceramic substrate using 4 IDT6167 (16,384 x 1 bit) CMOS static RAMs in leadless chip carriers. Functional equivalence to proposed monolithic 16Kx4 static RAMS is achieved by utilization of tungsten traces within the substrate to connect the four 16K RAMs in a 16Kx4 configuration. Extremely fast speeds can be achieved with this technique due to use of the IDT6167 fabricated in IDT's high-performance, high-reliability technology — CEMOS™I. This state-of-the-art technology, combined with innovative circuit design techniques, provides the fastest 16K static RAMs available.

The IDT7M464 is available with access times as fast as 55ns for commercial and 65ns for military temperature ranges, with maximum power consumption of only 1.1 watt. The circuit also offers a reduced power standby mode. When $\overline{CS}$ goes high, the circuit will automatically go to, and remain in, a standby mode as long as $\overline{CS}$ remains high, consuming only 300mW maximum. Substantially lower power levels can be achieved in the I_{SB1} mode (less than 6mW max.) and 2V data retention mode (less than 2mW max.) - see "DC Characteristics" and "Data Retention Characteristics" for details.

The IDT7M464 is offered in a space saving 22-pin, 300 mil pin center package, providing equivalent pinout to the proposed monolithic 16Kx4 static RAMs.

All inputs and outputs of the IDT7M464 are TTL-compatible and operate from a single 5V supply, thus simplifying system designs. Full asyncronous circuitry is used, requiring no clocks or refreshing for operation, and provides equal access and cycle times for ease of use.

All IDT military module components are 100% processed to the test methods of MIL-STD-883, Method 5004, making them ideally suited to applications demanding the highest level of performance and reliability.

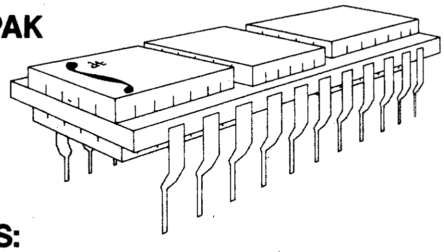
64K (64K × 1) CMOS STATIC RAMPAK

IDT7M164
PRELIMINARY

64K RAMPAK



FEATURES:

- 65,536 bit CMOS static RAM module with decoupling capacitor
- High-speed: 55/65/85ns max. commercial
  65/85/100ns max. military
- Low power consumption: 1.1W max.
- Pinout identical to proposed monolithic 64Kx1 static RAMs
- Utilizes IDT6167s — high performance 16K RAMs produced with advanced CEMOS™I technology
- CEMOS I process virtually eliminates alpha particle soft error rates (with no organic die coating)
- Single 5V (± 10%) power supply
- Input and output directly TTL-compatible
- Static operation: no clock or refresh required
- Standard military components 100% screened to MIL-STD-883 Class C
- Military components available 100% screened to Class B

DESCRIPTION:

The IDT7M164 is a 64K (65,536x1 bit) high speed static RAM constructed on a ceramic substrate using 4 IDT6167 (16Kx1) static RAMs in leadless chip carriers. Functional equivalence to proposed monolithic 64Kx1 static RAMs is achieved by utilization of an on-board decoder circuit that interprets the higher order addresses A_{14} and A_{15} to select one of the four 16Kx1 RAMs. Extremely fast speeds can be achieved with this technique due to use of the IDT6167 fabricated in IDT's high performance, high-reliability technology — CEMOS™I. This state-of-the-art technology, combined with innovative circuit design techniques, provides the fastest 16K static RAMs available.

The IDT7M164 is available with access times as fast as 70ns for commercial and 100ns for military temperature ranges, with maximum power consumption of only 660mW. The circuit also offers a reduced power standby mode. When $\overline{CS}$ goes high, the circuit will automatically go to, and remain in, a standby mode as long as this condition is held. In the standby mode, the module typically consumes less than 100 mW. Substantially lower power levels can be achieved in the ISB_1 mode (less than 50 μW typ.) and 2V data retention mode (less than 4 μW typ.) - see "DC Characteristics" and "Data Retention Characteristics" for details.

The IDT7M164 is offered in a space saving 22-pin, 300 mil pin center package, providing equivalent pinout to the proposed monolithic 64Kx1 static RAMs.

All inputs and outputs of the IDT7M164 are TTL-compatible and operate from a single 5V supply, thus simplifying system designs. Full asyncronous circuitry is used, requiring no clocks or refreshing for operation, and provides equal access and cycle times for ease of use.

All IDT military module components are 100% processed to the test methods of MIL-STD-883, Method 5004, making them ideally suited to applications demanding the highest level of performance and reliability.

16x16 BIT PARALLEL CMOS MULTIPLIER

IDT7216 IDT7217

MILITARY / COMMERCIAL TEMPERATURE RANGES

FEATURES:

- 16x16 parallel multiplier with double precision product
- High-speed 75ns maximum clock to multiply time
- Produced with advanced CEMOS™I high-performance technology
- Low power consumption - 150mW typical, less than 1/10th the power of compatible bipolar parts
- IDT7216 is pin and functionally compatible with TRW MPY-16HJ and AMD AM29516
- IDT7217 requires only single clock with register enables making it pin and functionally compatible with AMD AM29517
- Configured for easy array expansion
- User controlled option for transparent output register mode
- Round control for rounding the MSP
- Single 5V power supply
- Input and output directly TTL-compatible
- Three-state output
- Available in DIP, LCC or Flat-Pak
- Standard product 100% screened to MIL-STD-883 Class C
- Military product available 100% screened to Class B

DESCRIPTION:

The IDT7216/IDT7217 are high speed, low power 16x16 multipliers, ideal for fast, real time digital signal processing applications. Utilization of a modified Booths algorithm and IDT's high-performance, high reliability technology - CEMOS I, has achieved speeds comparable to bipolar (75ns max.) at 1/10th the power consumption.

The IDT7216/IDT7217 are ideal for applications requiring high speed multiplications such as fast Fourier transform analysis, digital filtering, graphic display systems, speech synthesis and recognition, and in any system requirement where multiplication speeds of a mini/micro computer are inadequate.

All input registers, as well as LSP and MSP output registers, use the same positive edge triggered D type flip-flop. In the IDT7216, there are independent clocks (CLKX, CLKY, CLKM, CLKL) associated with each of these registers. The IDT7217 has only a single clock input (CLK) and three register enables. $\overline{\text{ENX}}$ and $\overline{\text{ENY}}$ control the two input registers, while $\overline{\text{ENP}}$ controls the entire product.

The IDT7216/7217 offer additional flexability with the FA control and $\overline{\text{MSPSEL}}$ functions. The FA control formats the output for 2's complement by shifting the MSP up one bit and then repeating the sign bit in the MSP of the LSP. The $\overline{\text{MSPSEL}}$ low selects the MSP to be available at the product output port, while a high selects the LSP to be available. Keeping this pin low will ensure total compatibility with the TRW MPY-16HJ.

The IDT7216/IDT7217 Multipliers are 100% processed in compliance to the test methods of MIL-STD-883, Method 5004, making them ideally suited to applications demanding the highest level of performance and reliability.

DEFINITION OF TERMS

X_{15}-X_0	Multiplicand Data inputs.
Y_{15}-Y_0	Multiplier Data inputs.
X_M, Y_M (TCX, TCY)*	Mode control inputs for each data word; LOW for unsigned data and HIGH for two's complement data.
FA (RS)*	Format adjust control selects either a full 32-bit product (HIGH) or a left shifted 31-bit product with the sign bit replicated in the LSP (LOW). This control is normally high, except for certain fractional two's complement applications. (See Multiplier output formats table).
FT	Feedthrough control (HIGH) makes both MSP and LSP registers transparent.
$\overline{MSPSEL}$	Selects either MSP (LOW) or LSP (HIGH) to be available at the product output port.
RND	Round control for the rounding of the MSP.
$\overline{OEP}$ (TRIM)*	Three-state enable for product output port.
$\overline{OEL}$ (TRIL)*	Three-state enable for routing LSP through Y input/output port.
IDT7216 ONLY	
CLKX	Register Clock, X_{15}-X_0, X_M, RND
CLKY	Register Clock, Y_{15}-Y_0, Y_M, RND
CLKM	MSP Register Clock
CLKL	LSP Register Clock
IDT7217 ONLY	
CLK	Clock, All Registers
$\overline{ENX}$	Register Enable, X_{15}-X_0, X_M, RND
$\overline{ENY}$	Register Enable, Y_{15}-Y_0, Y_M, RND
$\overline{ENP}$	Register Enable, MSP, LSP

IDT MILITARY PROCESSING TO MIL-STD-883

Maintaining the highest standards of quality in our memory products is the basis of IDT's standard manufacturing systems and procedures. IDT products begin with stringent design rules derived for use in high reliability programs. This is followed by a dedicated commitment to reliable workmanship as well as rigid controls throughout wafer fab, device assembly and electrical test, all of which are designed to produce products that are inherently reliable.

All monolithic memory products, including commercial grade, are manufactured and screened to the demanding requirements of MIL-STD-883, Method 5004, Class C. Documentation, design, processing and assembly workmanship guidelines for these monolithic components are patterned after MIL-M-38510 specifications.

For customer applications requiring higher levels of reliability screening, we supply full military range monolithic components completely screened to the Class B criteria of Method 5004. This includes 100% 160-hour burn-in at $T_A = +125°C$ (or equivalent) per Method 1015 followed by 100% temperature testing of all DC and AC parameters and DC functional characteristics over the full −55°C to +125°C temperature range.

In the case of module assemblies, additional screening of the fully assembled RAMPAKs is performed per Figure 3 to assure package integrity and mechanical reliability. Finally, 100% electrical tests are performed.

Samples of the monolithic product which have been processed to Method 5004 100% screening requirements are submitted to the Quality Conformance inspection requirements of MIL-STD-883. These Quality Conformance inspections, as shown in Figure 2, are performed to the criteria of Method 5005, Group A (electrical), Group B (mechanical), Group C (chip integrity), and Group D (package environmental integrity).

For special customer specifications or quality requirements beyond Class B levels of MIL-STD-883 — such as SEM analysis, X-ray, or other screening flows to meet specific needs — contact your local IDT sales office.

MONOLITHIC COMPONENT SCREENING PROCEDURES

PRELIMINARY

BPK 72A
1MBIT BUBBLE MEMORY PROTOTYPE KIT

Device	Case Operating Temperature
BPK 72A-1	0 To 75°C
BPK 72A-4	10°C To 55°C
BPK 72A-5	– 20°C To 85°C

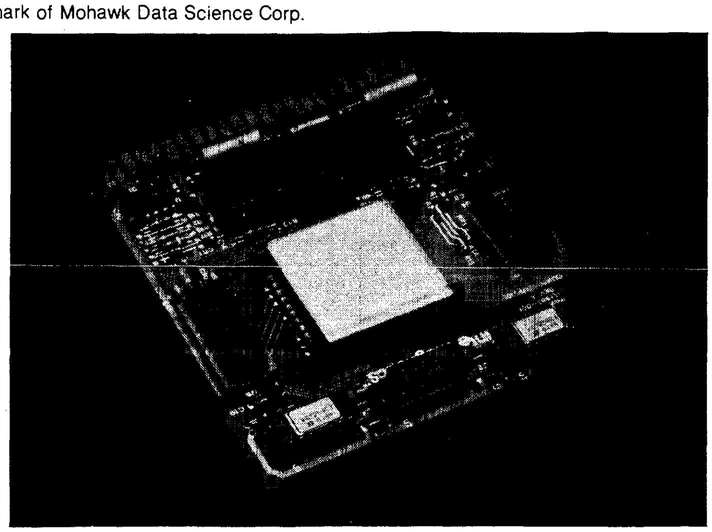
- **Assembled and Tested 1MBit Bubble Memory Prototype Kit on 4" x 4" PC Board**
- **Complete with Powerfail Data Protection and Clock Circuitry**
- **Built-in Error Detection/Correction**
- **Interfaces with Intel 8080/85/86/88 186/286 and Other Microprocessors**
- **Software Driver for Bubble Memory Kit Diskette for Intel MDS* System**
- **1Mbit, Non-Volatile, Read-Write, Solid-State Memory in Leaded Dense Package**
- **Average Random Access Time of 48ms**
- **Maximum Data Rate of 100K bit/sec**
- **Operates from +5V and +12V Power Supplies**
- **Complete Documentation and Interfacing Information Included**

The BPK 72A prototype kit is a completely assembled and tested 1Mbit bubble memory evaluation tool. It is ideal for the design engineer that wants the opportunity to fast evaluate how a bubble memory solution improves and adds value to an end-product by providing a compact solid-state memory that also reliably keeps the data at any powerdown.

Application information on microprocessor interfacing is included in the kit. A Bubble Memory Kit software driver is also included on a diskette for the Intel MDS* System.

For production purposes, the bubble memory and the support circuit components can be ordered as the BPK 70A Subsystem. The 7220, controlling up to eight BPK 70A's, is ordered separately.

*MDS is a registered trademark of Mohawk Data Science Corp.



OCTOBER 1983
ORDER NO. 210804-002

BPK 70A
1MBIT BUBBLE MEMORY SUBSYSTEMS

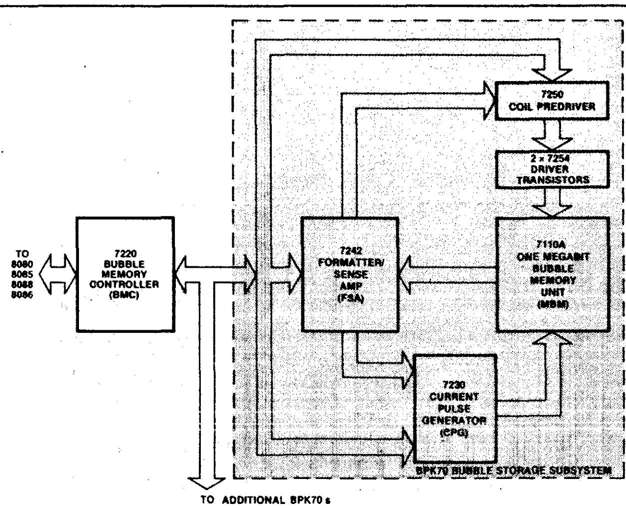
Device	Case Operating Temperature
BPK 70A-1	0 To 75°C
BPK 70A-4	10°C To 55°C
BPK 70A-5	– 20°C To 85°C

- **1 Mbit (128K Bytes) Non-Volatile, Solid-State, Read/Write Bubble Memory Subsystem**
- **Interfaces to Host Microprocessor Via Additional Bubble Memory Controller**
- **Maximum Data Rate of 100K Bit/Sec with One Subsystem**
- **Maximum Data Rate of 800K Bit/Sec with Eight Subsystems in Parallel**
- **Contains Bubble Memory and ICs for Production with 1Mbit Bubble Memory**
- **Modularity Provides Expansion Up to Eight Subsystems Per Controller**
- **Average Random Access Time of 48ms**
- **Bubble Memory in 20-Pin, Dual-In-Line Leaded Package**

A BPK 70A Bubble Storage Subsystem is a modular building block consisting of one 1Mbit Magnetic Bubble Memory and five support ICs (Shown in the figure below). The MBM is in a leaded package requiring no socket. These are the basic components to build a non-volatile, solid-state, read-write memory system utilizing 1Mbit bubble memory.

An additional 1Mbit Bubble Memory Controller (BMC) 7220 provides the interface between the host microprocessor and the Bubble Memory Subsystem and provides all the timing and control signals to the Subsystem. The user interface of the BMC is compatible with microprocessor bus systems for 8080, 8085, 8086, 8088, 80186, 80286 and other standard microprocessors. The BMC is a software driven device utilizing 16 convenient commands. The design engineer's primary responsibility is the interfacing to the BMC. This interfacing is comparable to the one of a disk drive controller.

The modular Intel Subsystem provides a path for density expansion. One BMC can interface up to eight BPK 70A subsystems. Thus a 1Mbit (128K byte) system can be expanded up to 8Mbit (1M byte) by using additional subsystems.



CONFIGURATION OF ONE BPK 70 BUBBLE STORAGE SUBSYSTEM WITH THE 7220 CONTROLLER

ADVANCE INFORMATION

2004
4K (512 x 8) NON-VOLATILE RANDOM ACCESS MEMORY

- **5 Volt Only Operation**
- **Fast Static RAM Read/Write Cycles**
  2004-2, 200ns Max.
  2004, 250ns Max.
  2004-3, 300ns Max.
- **Single Line STORE & RECALL**
- **10ms Self-Timed STORE Cycles for 2004-2 and 2004 (20ms for 2004-3)**
- **Automatic Recall on Power Up**
- **Write Protect Circuit to Preserve Data On Power-Up and Power-Down**
- **Lower Power Standby Mode**
- **10-Year Data Retention for each STORE**
- **Minimum 10,000 Non-Volatile STORE Cycle Endurance**
- **Unlimited Endurance for Read, Write, and RECALL Cycles**
- **HMOS*-E FLOTOX Cell Design**
- **Conforms to JEDEC Byte-Wide Universal Site**

The Intel 2004 Non-Volatile Random Access Memory (NVRAM) is a 4K device with 512 × 8 architecture. It provides the real-time read/write functions of a static RAM together with the reliable non-volatile storage capability of an E^2PROM array to preserve its memory contents when power is removed.

Internally, the 2004 NVRAM consists of a high speed static RAM array backed up, bit-for-bit, by an E^2PROM array for non-volatile storage. The transfer of memory data between the static RAM and the E^2PROM array occurs in parallel for fast storage and recall as well as minimal system support.

Two functions are provided to transfer data between the volatile RAM and its non-volatile E^2PROM counterpart. The STORE function transfers RAM data into the E^2PROM while the RECALL function fetches E^2PROM data and places it in the RAM array. Both functions are controlled by a single $\overline{NE}$ signal which can easily be activated with traditional circuitry in memory mapped space, through an I/O port, or from the output of a power-fail detector.

The RAM operating characteristics of the 2004 NVRAM provides high speed microprocessor performance with unlimited endurance. In the non-volatile storage mode, data retention is specified at over 10 years for each STORE operation. Over 10,000 STORE operations can be performed reliably.

The 2004 NVRAM is furnished in a 28-pin byte wide package with its address, data and control lines configured according to the standard JEDEC universal 28-pin site.

*HMOS is patent process of Intel Corporation.

- **Reliable Intel HMOS*-E FLOTOX Cell Design Technology**
- **READY/$\overline{BUSY}$ Line for End-of-Write Signal**
- **10 Year Data Retention For Each Write**

The Intel 2817A is a 16,384 bit Electrically Erasable Programmable Read Only Memory. Like the Intel 2816A it has completely Non-Volatile Data Storage. In addition, it offers a high degree of integrated functionality which enables in-circuit byte writes to be performed with minimal hardware and software overhead. The Intel 2817A is a product of Intel's advanced E^2PROM technology and uses the powerful HMOS*-E process for reliable, non-volatile data storage.

*HMOS is a patented process of Intel Corporation.

PRELIMINARY

27256
256K (32K x 8) UV ERASABLE PROM

- **Software Carrier Capability**
- **250 ns Maximum Access Time**
- **Two-Line Control**
- **int$_e$ligent Identifier™ Mode —Automated Programming Operations**
- **TTL Compatible**
- **Industry Standard Pinout . . . JEDEC Approved**
- **Low Power —100 mA max. Active — 40 mA max. Standby**
- **int$_e$ligent Programming™ Algorithm —Fastest EPROM Programming**

The Intel 27256 is a 5V only, 262,144-bit ultraviolet Erasable and Electrically Programmable Read Only Memory (EPROM). Organized as 32K words by 8 bits, individual bytes are accessed in under 250ns. This is compatible with high performance microprocessors, such as the Intel 8MHz iAPX 186, allowing full speed operation without the addition of performance-degrading WAIT states. The 27256 is also directly compatible with Intel's 8051 family of microcontrollers.

The 27256 enables implementation of new, advanced systems with firmware intensive architectures. The combination of the 27256's high density, cost effective EPROM storage, and new advanced microprocessors having megabit addressing capability provides designers with opportunities to engineer user-friendly, high reliability, high-performance systems.

The 27256's large storage capability of 32K bytes enables it to function as a high density software carrier. Entire operating systems, diagnostics, high-level language programs and specialized application software can reside in a 27256 EPROM directly on a system's memory bus. This permits immediate microprocessor access and execution of software and eliminates the need for time consuming disk accesses and downloads.

Several advanced features have been designed into the 27256 that allow for fast and reliable programming —the int$_e$ligent identifier™ mode and the int$_e$ligent Programming™ Algorithm. Programming equipment that takes advantage of these innovations will electronically identify the 27256 and then rapidly program it using an efficient programming method.

Two-line control and JEDEC-approved, 28-pin packaging are standard features of all Intel high-density EPROMs. This assures easy microprocessor interfacing and minimum design efforts when upgrading, adding, or choosing between nonvolatile memory alternatives.

The 27256 is manufactured using Intel's advanced HMOS*II-E technology.

*HMOS is a patented process of Intel Corporation.

MEMORY

JUNE 1983
ORDER NUMBER: 210827-004

High Performance Ti-W PROM Family

53/63SXXX   53/63SXXXA

Features/Benefit

- From 256 Bit to 32768 Bit of memory
- Reliable Titanium-Tungsten fuses (Ti-W)
- Low voltage programming
- Highest speed Schottky PROM family available
- Pin compatible with standard Schottky PROMs
- PNP inputs for low input current
- Compatible pin configurations for upward expansion

Applications

- Microprogram control store
- microprocessor program store
- Look up table
- Character generator
- Random logic
- Code converter

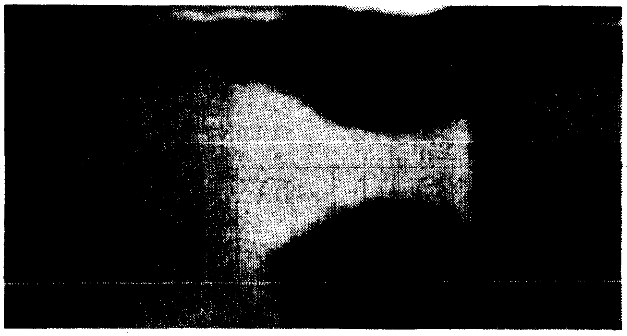
Description

The family features common electrical parameters and programming algorithm, low input current PNP inputs, full Schottky clamping and three-state and open collector outputs. The titanium-tungsten fuses store a logical low and are programmed to the high state. Special on chip circuitry and extra fuses provide preprogramming testing which assure high programming yields and high reliability.

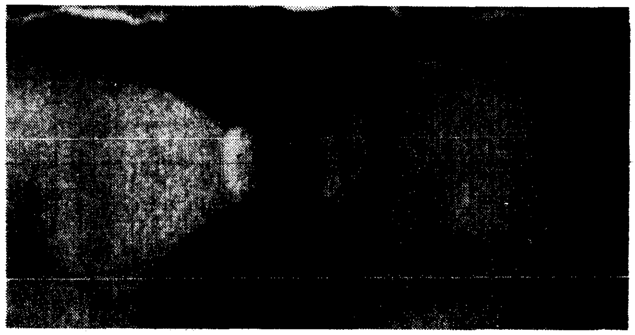
The 63 series is specified for operation over the commercial temperature and voltage range. the 53 series is specified for the military ranges.

New Programming Technique:

Our new HIGH Performance PROMs use an elevated voltage at V_{CC} instead of using a separate programming pin (one of the enables) as in the Standard Performance PROMs using nichrome fuses. Changes in the internal circuitry were made to optimize speed and accordingly the unblown fuse represents a LOW at the output. When a fuse is programmed it reflects a high at the output.



Unblown Fuse



Blown Fuse

High Performance Registered 1024x4 PROM
53/63RA441

Features/Benefits

- Edge triggered "D" registers
- Advanced Schottky processing
- 4-bit-wide in 18 pin for high board density
- Lower system package counts
- Lower system power
- Faster cycle times
- 16mA I_{OL} output drive capability

Applications

- Pipelined microprogramming
- State sequencers
- Next address generation
- Mapping PROM

Description

A family of registered PROMs offers new savings for designers of pipelined microprogrammable systems. The wide instruction register which holds the micro-instruction during execution, is now incorporated into the PROM chip.

SIZE	ORGANIZATION	PINS	TYPE	MIL	COM
4K	1024x4	18	J, N	53RA441	63RA441

Edge Triggered Register

The PROM output is loaded into a 4-bit register on the rising edge of the clock. The use of the term "register" is to be distinguished from the term "latch," in that a register contains master slave flip-flops and the latch contains gated flip-flops. The advantages of using a register are that system timing is simplified, and faster micro cycle times can be obtained.

The output of the register is buffered by three-state drivers which are compatible with the new low-power Schottky three-state bus standard.

High Performance 1024x8 Registered PROM

53/63RS881 53/63RS881A

Features/Benefits

- Edge triggered "D" registers
- Synchronous and Asynchronous enables
- Versatile 1:16 initialization words
- 8-bit-wide in 24 pin SKINNYDIP® for high board density
- Simplifies system timing
- Faster cycle times
- 16mA I_{OL} output drive capability
- Reliable titanium-tungsten fuses (Ti-W)

Applications

- Microprogram control store
- State sequencers
- Next address generation
- Mapping PROM

Description

The 53/63RS881 and 53/63RS881A are 1Kx8 PROMs with on chip "D" type registers, versatile output enable control through synchronous and asynchronous enable inputs, and flexible start up sequencing through programmable initialization.

Data is transferred into the output registers on the rising edge of the clock. Provided that the asynchronous ($\overline{E}$) and synchronous ($\overline{E_S}$) enables are low, the data will appear at the outputs. Prior to the positive clock edge, register data are not affected by changes in addressing or synchronous enable inputs.

Memory expansion and data control is made flexible with synchronous and asynchronous enable inputs. Outputs may be set to the high impedance state at any time by setting $\overline{E}$ to a high or if $\overline{E_S}$ is high when the rising clock edge occurs. When V_{CC} power is first applied the synchronous enable flip-flop will be in the set condition causing the outputs to be in the high impedance state.

The flexible initialization feature allows start up and time out sequencing with 1:16 programmable words to be loaded into the output registers. With the synchronous INITIALIZE ($\overline{I_S}$) pin low, one of the 16 column words (A_3-A_0) will be set in the output registers independent of the row addresses (A_9-A_4). The unprogrammed state of $\overline{I_S}$ words are low, presenting a CLEAR with $\overline{I_S}$ pin low. With all $\overline{I_S}$ column words (A_3-A_0) programmed to the same pattern, the $\overline{I_S}$ function will be independent of both row and column addressing and may be used as a single pin control. With all $\overline{I_S}$ words programmed high a PRESET function is performed.

2048x8 Registered Prom with Asynchronous Enable

53/63RA1681 53/63RA1681A

Features/Benefits

- Asynchronous output enable
- Edge-triggered "D" registers
- Versatile 1:16 user programmable initialization words
- 8-bit-wide in 24 pin SKINNYDIP® for high board density
- Simplifies system timing
- Faster cycle times
- 16mA I_{OL} output drive capability
- Reliable titanium-tungsten fuses (Ti-W)

Applications

- Microprogram control store
- State sequencers
- Next address generation
- Mapping PROM

Description

The 53/63RS1681 and 53/63RS1681A are 2 K x 8 PROMs with on chip "D" type registers. Output enable control through an asynchronous enable input and flexible start up sequencing through programmable initialization words.

Ordering Information

MEMORY		PACKAGE		DEVICE TYPE	
SIZE	PERFORMANCE	PINS	TYPE	MIL	COM
16K	Standard	24	JS	53RA1681	63RA1681
	Enhanced			53RA1681A	63RA1681A

Data is transferred into the output registers on the rising edge of the clock. Provided that the asynchronous ($\overline{E}$) enable is LOW, the data will appear at the outputs. Prior to the positive clock edge, register data are not affected by changes in addressing.

Memory expansion and data control is made flexible with asynchronous enable input. Outputs may be set to the high impedance state at any time by setting $\overline{E}$ to a HIGH.

The flexible initialization feature allows start up and time out sequencing with 1:16 programmable words to be loaded into the output registers. With the synchronous INITIALIZE ($\overline{I_S}$) pin LOW, one of the 16 column words (A_3-A_0) will be set in the output registers independent of the row addresses (A_{10}-A_4). With all $\overline{I_S}$ column words (A_3-A_0) programmed to the same pattern, the $\overline{I_S}$ function will be independent of both row and column addressing and may be used as a single pin control. With all $\overline{I_S}$ words programmed HIGH a PRESET function is performed. The unprogrammed state of $\overline{I_S}$ words are LOW, presenting a CLEAR with $\overline{I_S}$ pin LOW.

Description

The 53/63RS1681 and 53/63RS1681A are 2 K x 8 PROMs with on chip "D" type registers, versatile output enable control through synchronous enable input and flexible start up sequencing through programmable initialization words.

Data is transferred into the output registers on the rising edge of the clock. Provided that the synchronous ($\overline{E}_S$) enable is LOW, the data will appear at the outputs. Prior to the positive clock edge, register data are not affected by changes in addressing or synchronous enable inputs.

Memory expansion and data control is made flexible with the synchronous enable input. Outputs may be set to the high impedance state by setting $\overline{E}_S$ HIGH before the rising clock edge occurs. When V_{CC} power is first applied the synchronous enable flip-flop will be in the set condition causing the outputs to be in the high impedance state.

The flexible initialization feature allows start up and time out sequencing with 1:16 programmable words to be loaded into the output registers. With the synchronous INITIALIZE ($\overline{I}_S$) pin LOW, one of the 16 column words (A_3-A_0) will be set in the output registers independent of the row addresses (A_{10}-A_4). With all $\overline{I}_S$ column words (A_3-A_0) programmed to the same pattern, the $\overline{I}_S$ function will be independent of both row and column addressing and may be used as a single pin control. With all $\overline{I}_S$ words programmed HIGH a PRESET function is performed. The unprogrammed state of $\overline{I}_S$ words are LOW, presenting a CLEAR with $\overline{I}_S$ pin LOW.

4096x4 Diagnostic Registered PROM with Asynchronous Enable

53D1641 63D1641

Patent Pend.

Features/Benefits

- **Asynchronous output enable**
- **Provides system diagnostic testing for system controllability and observability**
- **Shadow register eliminates shifting hazards**
- **Edge-triggered "D" registers simplifies system timing**
- **Casadable for wide control words used in microprogramming**
- **24-pin SKINNYDIP® saves space**
- **24 mA output drive capability**
- **Replaces embedded diagnostic code**

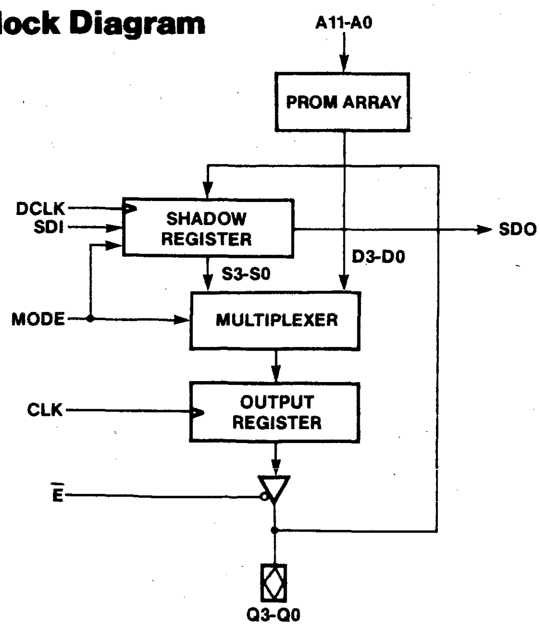
Applications

- **Microprogram control store with built-in system diagnostic testing**
- **Serial character generator**
- **Serial code converter**
- **Parallel in/serial out memory**
- **Cost-effective board testing**

Description

The 53/63D1641 is a 4Kx4 PROM with registered three-state outputs and a shadow register for diagnostic capabilities.

Block Diagram



SKINNYDIP® is a registered trademark of Monolithic Memories.

Ordering Information

MEMORY		TEMP.	PACKAGE		PART NO.

		COM			63D1641

Shadow register diagnostics allow observation and control of the system without introducing intermediate illegal states. The output register, which can receive parallel data from either the PROM array or the shadow register, is loaded on the rising edge of CLK. The shadow register, which can receive parallel data from the output register or serial data from SDI, is loaded on the rising edge of DCLK. When the output drivers are disabled, the shadow register receives its parallel data from the output bus. During diagnostics, data loaded into the output register from the PROM array can be parallel-loaded into the shadow register and serially shifted out through SDO, allowing observation of the system. Similarly, diagnostic data can be serially shifted into the shadow register through SDI, and parallel-loaded into the output register, allowing control and test scanning to be imposed on the system. Since the output register and the shadow register are loaded by different input signals, they can be operated independent of one another. In addition, diagnostic PROMs can be cascaded to construct wide control words used in microprogramming.

L	X	↑	↑	Qn ← PROM	$S_n \leftarrow S_{n-1}$ $S_0 \leftarrow$ SDI	S_3	Load output register from PROM array while shifting shadow register data
H	X	↑	*	$Q_n \leftarrow S_n$	HOLD	SDI	Load output register from shadow register
H	L	*	↑	HOLD	$S_n \leftarrow Q_n$	SDI	Load shadow register from output bus
H	H	*	↑	HOLD	HOLD	SDI	No operation†

* Clock must be steady or falling.
† Reserved operation for SN54/74S818 8-Bit Diagnostic Register.

Definition of Signals

MODE The MODE pin controls the output register multiplexer and the shadow register. When MODE is LOW, the output register receives data from the PROM array and the shadow register is configured as a shift register with SDI as its input. When MODE is HIGH, the output register receives data from the shadow register. The shadow register is controlled by SDI as well as MODE. With MODE HIGH and SDI LOW, the shadow register receives parallel data from the output bus. With MODE and SDI both HIGH, the shadow register holds its present data.

SDI The Serial Data In pin is the input to the least significant bit of the shadow register when operating in the shift mode. SDI is also a control input to the shadow register when it is not in the shift mode.

SDO The Serial Data Out pin is the output from the most significant bit of the shadow register when operating in the shift mode. When the shadow register is not in the shift mode, SDO displays the logic level present at SDI, decreasing serial shift time for cascaded diagnostic PROMs.

CLK The clock pin loads the output register on the rising edge of CLK.

DCLK The diagnostic clock pin loads or shifts the shadow register on the rising edge of DCLK.

Q_3-Q_0 Q_n represents the data outputs of the output register. During a shadow register load with outputs enabled these pins are the internal data inputs to the shadow register. With the outputs three-stated these pins are external data inputs to the shadow register.

S_3-S_0 S_n represents the internal shadow register outputs.

A_{11}-A_0 A_n represents the address inputs to the PROM array.

$\overline{E}$ The Output Enable pin operates independent of CLK. When $\overline{E}$ is LOW the outputs are enabled. When $\overline{E}$ is HIGH, the outputs are in the high impedance state.

Memory Selector Guide

Motorola has developed a very broad range of reliable MOS and bipolar memories for virtually any digital data processing system application. And for those whose requirements go beyond individual components, Motorola also supplies Memory Systems and Micromodules.

New Motorola memories are being introduced continually. **This selector guide lists all those available as of November 1983.** For later releases, additional technical information or pricing, contact your nearest authorized Motorola distributor or Motorola sales office.

MCM4517

Advance Information

16,384-BIT DYNAMIC RAM

The MCM4517 is a 16,384-bit, high-speed, dynamic Random-Access Memory. Organized as 16,384 one-bit words and fabricated using HMOS high-performance, N-channel, silicon-gate technology. This new breed of 5-volt only dynamic RAM combines high performance with low cost and improved reliability.

By multiplexing row- and column-address inputs, the MCM4517 requires only seven address lines and permits packaging in standard 16-pin dual-in-line packages. Complete address decoding is done on chip with address latches incorporated. Data out is controlled by $\overline{CAS}$ allowing for greater system flexibility.

All inputs and outputs, including clocks, are fully TTL compatible. The MCM4517 incorporates a one-transistor cell design and dynamic storage techniques.

- Organized as 16,384 Words of 1 Bit
- Single +5 Volt Operation
- Fast 100 ns Operation
- Low Power Dissipation:
  170 mW Maximum (Active)
  14 mW Maximum (Standby)
- Maximum Access Time
  MCM4517-10 — 100 ns
  MCM4517-12 — 120 ns
  MCM4517-15 — 150 ns
  MCM4517-20 — 200 ns
- Three-State Data Output
- Internal Latches for Address and Data Input
- Early-Write Common I/O Output Capability
- 64K Compatible 128-cycle, 2 ms Refresh
- $\overline{RAS}$-only Refresh Mode
- $\overline{CAS}$ Controlled Output
- Upward Pin Compatibility from the 16K RAM (MCM4116) to the 64K RAM (MCM6664)
- Allows Undershoot V_{IL} min = −2 V
- Hidden $\overline{RAS}$ Only Refresh Capability

MCM6665B

Advance Information

64K BIT DYNAMIC RAM

The MCM6665B is a 65,536-bit, high-speed, dynamic Random-Access Memory. It is organized as 65,536 one-bit words and fabricated using HMOS high-performance N-channel silicon-gate technology, and is a yield enhanced version of our popular MCM6664A, featuring a smaller die size and redundancy.

By multiplexing row- and column-address inputs, the MCM6665B requires only eight address lines and permits packaging in standard 16-pin dual-in-line packages. Complete address decoding is done on chip with address latches incorporated. Data out is controlled by CAS allowing for greater system flexibility.

All inputs and outputs, including clocks, are fully TTL compatible. The MCM6665B incorporates a one-transistor cell design and dynamic storage techniques.

- Organized as 65,536 Words of 1 Bit
- Single 5 V Operation (± 10%)
- Maximum Access Time
  MCM6665B-15 = 150 ns
  MCM6665-20 = 200 ns
- Low Power Dissipation
  302.5 mW Maximum (Active) MCM6665B-15)
  22 nW Maximum (Standby)
- Three-State Data Output
- Internal Latches for Address and Data Input
- Early-Write Common I/O Capability
- 16K Compatible 128-Cycle, 2 ms Refresh
- $\overline{RAS}$-only Refresh Mode
- $\overline{CAS}$ Controlled Output
- Upward Pin Compatible from the 16K RAM (MCM4116, MCM4517)
- Fast Page Mode Cycle Time

MCM6256

Product Preview

256K-BIT DYNAMIC RAM

The MCM6256 is a 262,144 bit, high-speed, dynamic Random Access Memory. Organized as 262,144 one-bit words and fabricated using Motorola's high-performance silicon-gate MOS (HMOS) technology, this new single +5 volt supply dynamic RAM combines high performance with low cost and improved reliability. The MCM6256 has the capability of using laser fuse redundancy and is manufactured using advanced direct-step on wafer photolithographic equipment.

By multiplexing row and column address inputs, the MCM6256 requires only nine address lines and permits packaging in standard 16-pin 300 mil wide dual-in-line packages. Complete address decoding is done on-chip with address latches incorporated. Data out (Q) is controlled by $\overline{CAS}$ allowing greater system flexibility.

All inputs and outputs, including clocks, are fully TTL compatible. The MCM6256 incorporates a one transistor cell design and dynamic storage techniques. In addition to the $\overline{RAS}$-only refresh mode, a $\overline{CAS}$ before $\overline{RAS}$ automatic refresh is available. Another special feature of the MCM6256 is nibble mode, allowing the user to serially access 4 bits of data at a high data rate. Nibble mode address is controlled by the addresses on pin 1 (A8 row and A8 column).

- Organized as 262,144 Words of 1 Bit
- Single +5 Volt Operation (±10%)
- Maximum Access Time:
  MCM6256-10 = 100 ns
  MCM6256-12 = 120 ns
  MCM6256-15 = 150 ns
- Low Power Dissipation:
  70 mA maximum (Active) MCM6256-10
  4 mA maximum (Standby)
- Three-State Data Output
- Early-Write Common I/O Capability
- 256 Cycle, 4 ms Refresh
- $\overline{RAS}$-Only Refresh Mode
- Automatic ($\overline{CAS}$ before $\overline{RAS}$) Refresh Mode
- Fast Nibble Mode on Read and Write Cycles
  20 ns Access Time
  40 ns Cycle Time

MCM2016H

Advance Information

MOS

(N-CHANNEL, SILICON-GATE)

2,048 × 8 BIT STATIC RANDOM ACCESS MEMORY

FAST 16K BIT STATIC RAM

The MCM2016H is a 16,384-bit Static Random Access Memory organized as 2048 words by 8 bits, fabricated using Motorola's High-performance silicon-gate MOS (HMOS) technology. It uses an innovative design approach which combines the ease-of-use features of fully static operation (no external clocks or timing strobes required) with the reduced standby power dissipation associated with clocked memories. To the user this means low standby power dissipation without the need for address setup and hold times, nor reduced data rates due to cycle times that are no longer than access times. Perfect for cache and sub-100 ns buffer memory systems, this high speed static RAM is intended for applications that demand superior performance and reliability.

Chip Enable ($\overline{E}$) controls the power-down feature. It is not a clock but rather a chip control that affects power consumption. In less than a cycle time after chip enable ($\overline{E}$) goes high, the part automatically reduces its power requirements and remains in this low-power standby mode as long as the chip enable ($\overline{E}$) remains high. This feature provides significant system-level power savings.

The MCM2016H is in a 24-pin dual-in-line 600 mil wide package with the industry standard JEDEC approved pinout and is pinout compatible with the industry standard 16K EPROM/ROM. A 24 pin dual-in-line 300 mil wide package will also be available.

- Single +5 Volt Operation (±10%)
- Fully Static: No Clock or Timing Strobe Required
- Fast Access Time: MCM2016H-45 — 45 ns (max)
  MCM2016H-55 — 55 ns (max)
  MCM2016H-70 — 70 ns (max)
- Power Dissipation: 120 mA Maximum (Active)
  20 mA Maximum (Standby)
- Three-State Output

Advance Information

FAST 16K BIT STATIC RAM

The MCM2167H is a 16,384-bit Static Random Access Memory organized as 16,384 words by 1 bit, fabricated using Motorola's High-performance silicon-gate MOS (HMOS) technology. It uses an innovative design approach which combines the ease-of-use features of fully static operation (no external clocks or timing strobes required) with the reduced standby power dissipation associated with clocked memories. To the user this means low standby power dissipation without the need for address setup and hold times, nor reduced data rates due to cycle times that are no longer than access times. Perfect for cache and sub-100 ns buffer memory systems, this high speed static RAM is intended for applications demanding superior performance and reliability.

Chip Enable ($\overline{E}$) controls the power-down feature. It is not a clock but rather a chip control that affects power consumption. In less than a cycle time after Chip Enable ($\overline{E}$) goes high, the part automatically reduces its power requirements and remains in this low-power standby mode as long as the Chip Enable ($\overline{E}$) remains high. This feature provides significant system-level power savings.

The MCM2167H is in a 20 pin dual-in-line package with the industry standard pinout. It is TTL compatible in all respects. The data out has the same polarity as the input data. A data input and a separate three-state output provide flexibility and allow easy OR-ties.

- Single +5 V Operation (± 10%)
- Fully Static Memory — No Clock or Timing Strobe Required
- Fast Access Time: MCM2167H-35 — 35 ns Max.
  MCM2167H-45 — 45 ns Max.
- Power Dissipation: 120 mA Maximum (Active)
  20 mA Maximum (Standby)
- Low Power Also Available: MCM21L67H
- Automatic Power Down

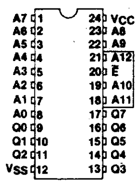
Nonvolatile Memories

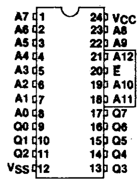
24 PIN-COMPATIBLE 64K ROM FAMILY

MCM68364



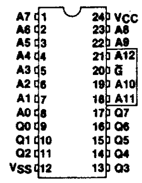
- EDGE ACTIVATED
- POWER DOWN
- ADDRESS LATCH

MCM68365



- FULLY STATIC
- POWER DOWN
- $t_{ACC} = t_{CYCLE}$

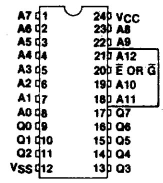
MCM68366



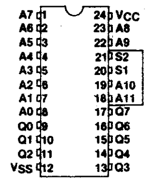
- FULLY STATIC
- OUTPUT ENABLE
- FAST ACCESS

24 PIN-COMPATIBLE 64K ROM FAMILY (CONTINUED)

MCM68364/5/6

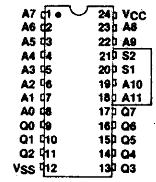


MCM68367



- FULLY STATIC
- PAGE MODE

MCM68368



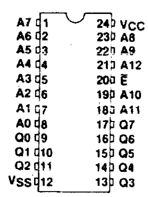
- FULLY STATIC
- BANK SELECT

MCM68365

CHARACTERISTICS

- 8192 × 8 MASK PROGRAMMABLE ROM
- SINGLE +5 VOLT 10% SUPPLY
- PIN COMPATIBLE WITH 8K, 16K, AND 32K ROMs
- FULLY STATIC OPERATION
- AUTOMATIC POWER DOWN
- LOW POWER DISSIPATION
  225 mW ACTIVE (TYPICAL)
  30 mW STANDBY (TYPICAL)
- MAXIMUM ACCESS TIMEs:
  68365C30 — 300 ns
  68365C35 — 350 ns

PINOUT

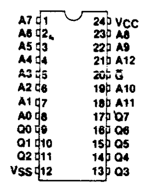


MCM68366

CHARACTERISTICS

- 8192 × 8 MASK PROGRAMMABLE ROM
- SINGLE +5 VOLT 10% SUPPLY
- INDUSTRY STANDARD 24 PIN PACKAGE
- FULLY STATIC OPERATION (NO CLOCKS OR STROBES)
- FAST 150 ns ACCESS TIME FROM OUTPUT ENABLE
- LOW POWER DISSIPATION
  225 mW ACTIVE (TYPICAL)
- FULLY TTL COMPATIBLE
- MASK PROGRAMMABLE OUTPUT ENABLE
- PIN COMPATIBLE WITH MCM68766 (64K EPROM)

PINOUT

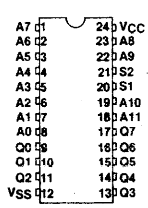


MCM68367

CHARACTERISTICS

- 8K × 8 HMOS MASK PROGRAMMABLE ROM
- PAGE MODE — ACCESS TOP HALF OR BOTTOM HALF OF THE 4K BYTES
- APPEARS TO OUTSIDE WORLD AS 4K × 8 STANDARD ROM
- FULLY STATIC OPERATION (NO CLOCKS)
- SUPPLY CURRENT
  100 mA ACTIVE (MAX)
- MAXIMUM ACCESS TIME — 450 ns
- PROGRAM LAYER LATE IN PROCESS

PINOUT



MCM68368

CHARACTERISTICS

- 8K × 8 HMOS MASK PROGRAMMABLE ROM
- MEMORY IS DIVIDED INTO EIGHT 1K × 8 BYTES WHICH ARE SELECTED BY INDIRECT ADDRESSING
- APPEARS TO OUTSIDE WORLD AS 4K × 8 ROM STANDARD PACKAGE
- FULLY STATIC OPERATION (NO CLOCKS)
- SUPPLY CURRENT
  125 mA ACTIVE (MAX)
- MAX ACCESS TIME — 450 ns
- PROGRAM LAYER LATE IN PROCESS

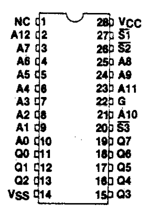
CHARACTERISTICS

- 8K × 8 NMOS MASK PROGRAMMABLE ROM
- INDUSTRY STANDARD 28 PIN PACKAGE
- FULLY STATIC OPERATION (NO CLOCKS OR STROBES)
- SUPPLY CURRENT
  100 mA ACTIVE (MAXIMUM)
- MAXIMUM ACCESS TIME — 350 ns
- MASK PROGRAMMABLE CHIP SELECTS AND OUTPUT ENABLE
- PROGRAM LAYER LATE IN PROCESS

PINOUT

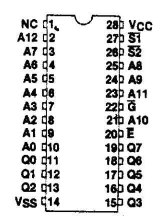


MCM68370

CHARACTERISTICS

- 8K × 8 NMOS MASK PROGRAMMABLE ROM
- INDUSTRY STANDARD 28 PIN PACKAGE
- FULLY STATIC OPERATION (NO CLOCKS OR STROBES)
- SUPPLY CURRENT
  100 mA ACTIVE (MAXIMUM)
  15 mA STANDBY (MAXIMUM)
- MAXIMUM ACCESS TIME — 350 ns
- MASK PROGRAMMABLE CHIP ENABLE, OUTPUT ENABLE, AND CHIP SELECTS
- PROGRAM LAYER LATE IN PROCESS

PINOUT

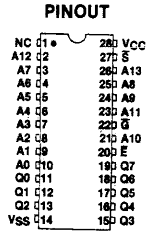


MCM63128

CHARACTERISTICS

- 16K × 8 HMOS MASK PROGRAMMABLE ROM
- INDUSTRY STANDARD 28 PIN PACKAGE
- FULLY STATIC OPERATION (NO CLOCKS OR STROBES)
- SUPPLY CURRENT
  100 mA ACTIVE (MAXIMUM)
  15 mA STANDBY (MAXIMUM)
- MAXIMUM ACCESS TIME — 200 ns
- MASK PROGRAMMABLE CHIP AND OUTPUT ENABLES
- PROGRAM LAYER LATE IN PROCESS
- THE FUNCTIONS $\overline{E}$ AND $\overline{S}$ ON PINS 20 AND 27 CAN BE INTERCHANGED AT USER OPTION
- $\overline{G}$ CAN BE ORed OR ANDed WITH $\overline{S}$ OR $\overline{E}$ AT USER OPTION

PINOUT



MCM63256

CHARACTERISTICS

- 32,768x8 HMOS MASK PROGRAMMABLE ROM
- INDUSTRY STANDARD 28 PIN PACKAGE
- FULLY STATIC OPERATION (NO CLOCKS OR STROBES)
- SUPPLY CURRENT
  100 mA ACTIVE (MAXIMUM)
  15 mA STANDBY (MAXIMUM)
- MAXIMUM ACCESS TIME — 150 ns
- MASK PROGRAMMABLE CHIP AND OUTPUT ENABLES
- ADDRESS (A14) IS USER SELECTABLE FOR EITHER PIN 27 OR PIN 1
- PROGRAM LAYER LATE IN PROCESS

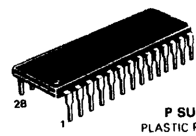
MCM63128

Advance Information

HMOS
(N-CHANNEL, SILICON GATE)

16,384 × 8 BIT READ ONLY MEMORY



128K BIT READ ONLY MEMORY

The MCM63128 is a MOS mask programmable, byte-oriented, Read-Only Memory (ROM). The MCM63128 is organized as 16×8 and is fabricated using Motorola's high performance N-channel silicon gate technology (HMOS). This device is designed to provide maximum circuit density and reliability with the highest possible performance. It remains fully compatible with TTL inputs and outputs while maintaining low power dissipation and wide operating margins. The MCM63128 also contains circuitry for current surge suppression which maintains the chip in an internal deselect mode until V_{CC} approaches 2.5 volts, at which time the chip is internally selected.

There are numerous logical nor or NAND combinations between Chip Enable ($\overline{E}$), Chip Select ($\overline{S}$), and Output Enable ($\overline{G}$) that tri state the device. This feature is selected by the user and placed into effect with the mask programming. The active level of the Chip Enable ($\overline{E}$), Chip Select ($\overline{S}$), and the Output Enable ($\overline{G}$), along with the memory contents, are defined by the user.

The Chip Enable input cotntrols the automatic power down feature which deselects the outputs and reduces the power consumption.

- Single + 5 Volt (±10%) Supply
- Fully Static Periphery — No Clocking Required on Chip Enable
- Power Dissipation
  100 mA Active (Maximum) (Unloaded)
  15 mA Standby (Maximum)
- Program Layer Late in Process for Quick Turnaround Time
- 150 ns — MCM63128P15
  200 ns — MCM63128P20
- Maximum Access from Address and Chip Enable
  60 ns — MCM63128P15
  80 ns — MCM63128P20
- Active Level for Chip Enable and Output Enable are User Selectable
- 28-Pin JEDEC Standard Package and Pinout

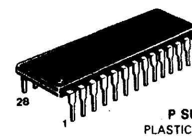
MCM63256

Advance Information

HMOS
(N-CHANNEL, SILICON GATE)

32,768 × 8 BIT READ ONLY MEMORY



256K BIT READ ONLY MEMORY

The MCM63256 is a MOS mask programmable byte-oriented, Read-Only Memory (ROM). The MCM63256 is organized as 32K×8 and is fabricated using Motorola's high performance N-channel silicon gate technology (HMOS). This device is designed to provide maximum circuit density and reliability with the highest possible performance. It remains fully compatible with TTL inputs and outputs while maintaining low power dissipation and wide operating margins. The MCM63256 also contains circuitry for current surge suppression which maintains the chip in an internal deselect mode until V_{CC} approachs 2.5 volts, at which time the chip is internally selected.

The active level of the Chip Enable and the Output Enable, along with the memory contents, are defined by the user. The user can also define the pinout assignment for address (A14) to either pin 27 or pin 1.

The Chip Enable input controls the automatic power down feature which deselects the outputs and reduces the power consumption.

- Single + 5 Volt (±10%) Supply
- Fully Static Periphery — No Clocking Required on Chip Enable
- Power Dissipation
  100 mA Active (Maximum) (Unloaded)
  15 mA Standby (Maximum)
- Program Layer Late in Process for Quick Turnaround Time
- Maximum Access from Address and Chip Enable
  150 ns—MCM63256P15
  200 ns—MCM63256P20
- Maximum Access from Output Enable
  60 ns—MCM63256P15
  80 ns—MCM63256P20
- Address (A14) is User Selectable for Either Pin 27 or Pin 1
- Active Level for Chip Enable and Output Enable are User Selectable
- 28-Pin JEDEC Standard Package and Pinout

ADI-989

Introduction

GENERAL

This generic Schottky PROM family by National Semiconductor makes available to the industry one of the widest selections in sizes and organizations. Four-bit wide PROMs are provided with 256 to 4096 words in pin compatible 16 and 18 pin dual-in-line packages. The 8-bit wide devices range from 32 to 4096 words in a variety of packages. Being 'generic,' all PROMs share a common programming algorithm.

TITANIUM-TUNGSTEN FUSES

National's new Programmable Read-Only Memories (PROMs) feature titanium-tungsten (Ti:W) fuse links designed to program efficiently with only 10.5 Volts applied. The high performance and reliability of these PROMs are the result of fabrication by a Schottky bipolar process, of which the titanium-tungsten metalization is an integral part, and the use of an on-chip programming circuit.

A major advantage of the titanium-tungsten fuse technology is the low programming voltage of the fuse links. At 10.5 Volts, this virtually eliminates the need for guard-ring devices and wide spacings required for other fuse technologies. Care is taken, however, to minimize voltage drops across the die and to reduce parasitics. The device is designed to ensure that worst-case fuse operating current is low enough for reliable long-term operation. The Darlington programming circuit is liberally designed to insure adequate power density for blowing the fuse links. The complete circuit design is optimized to provide high performance over the entire operating ranges of V_{CC} and temperature.

TESTABILITY

The Schottky PROM die includes extra rows and columns of fusable links for testing the programmability of each chip. These test fuses are placed at the worst-case chip locations to provide the highest possible confidence in the programming tests in the final product. A ROM pattern is also permanently fixed in the additional circuitry and coded to provide a parity check of input address levels. These and other test circuits are used to test for correct operation of the row and column-select circuits and functionality of input and enable gates. All test circuits are available at both wafer and assembled device levels to allow 100% functional and parametric testing at every stage of the test flow.

RELIABILITY

As with all National products, the Ti:W PROMs are subjected to an on-going reliability evaluation by the Reliability Assurance Department. These evaluations employ accelerated life tests, including dynamic high-temperature operating life, temperature-humidity life, temperature cycling, and thermal shock. To date, nearly 7.4 million Schottky Ti:W PROM device hours have been logged, with samples in Epoxy B molded DIP (N-package) and CERDIP (J-package). Device performance in all package configurations is excellent.

Note 3: These limits apply over the entire operating range unless stated otherwise. All typical values are for V_{CC} = 5.0V and T_A = 25°C.
Note 4: During I_{OS} measurement, only one output at a time should be grounded. Permanent damage may otherwise result.

Non-Registered PROM Programming Procedure

National Schottky PROMs are shipped from the factory with all fuses intact. As a result, the outputs will be low (logical "0") for all addresses. To generate high (logical "1") levels at the outputs, the device must be programmed. Information regarding commercially available programming equipment may be obtained from National. If it is desired to build your own programmer, the following conditions must be observed:

1. Programming should be attempted only at ambient temperatures between 15 and 30 degrees Celsius.

2. Address and enable inputs must be driven with TTL logic levels during programming and verification.

3. Programming will occur at the selected address when V_{CC} is at 10.5 volts, and at the selected bit location when the output pin, representing that bit, is at 10.5 volts, and the device is subsequently enabled. To achieve these conditions in the appropriate sequence, the following procedure must be followed:

   a) Select the desired word by applying high or low levels to the appropriate address inputs. Disable the device by applying a high level to one or more "active low" chip enable inputs.

   b) Increase V_{CC} from nominal to 10.5 volts (plus or minus 0.5V) with a slew rate between 1.0 and 10.0V/μs. Since V_{CC} is the source of the current required to program the fuse as well as the I_{CC} for the device at the programming voltage, it must be capable of supplying 750mA at 11.0 volts.

   c) Select the output where a logical high is desired by raising that output voltage to 10.5 volts (plus or minus 0.5V). Limit the slew rate from 1.0 to 10.0V/μs. This voltage change may occur simultaneously with the increase in V_{CC}, but must not precede it. It is critical that only one output at a time be programmed since the internal circuits can only supply programming current to one bit at a time. Outputs not being programmed must be left open or connected to a high impedance source of 20kΩ minimum (Remember that the outputs of the device are disabled at this time).

   d) Enable the device by taking the chip enable(s) to a low level. This is done with a pulse of 10μs. The 10μs duration refers to the time that the circuit (device) is enabled. Normal input levels are used and rise and fall times are not critical.

   e) Verify that the bit has been programmed by first removing the programming voltage from the output and then reducing V_{CC} to 4.0 volts (plus or minus 0.2V). Verification at a V_{CC} level of 4.0 volts will guarantee proper output states over the V_{CC} and temperature range of the programmed part. The device must be enabled to sense the state of the outputs. During verification, the loading of the output must be within specified I_{OL} and I_{OH} limits. Steps b, c, and d must be repeated up to 10 times or until verification that the bit has been programmed.

   f) Following verification, apply five additional programming pulses to the bit being programmed. The programming procedure is now complete for the selected bit.

   g) Repeat steps a through f for each bit to be programmed to a high level. If the procedure is performed on an automatic programmer, the duty cycle of V_{CC} at the programming voltage must be limited to a maximum of 25%. This is necessary to minimize device junction temperatures. After all selected bits are programmed, the entire contents of the memory should be verified.

Note: Since only an enabled device is programmed, it is possible to program these parts at the board level if all programming parameters are complied with.

National Semiconductor

Programming Parameters Do not test or you may program the device

Sym	Parameters	Conditions	Min	Recommended Value	Max	Units
V_{CCP}	Required V_{CC} for Programming		10.0	10.5	11.0	V

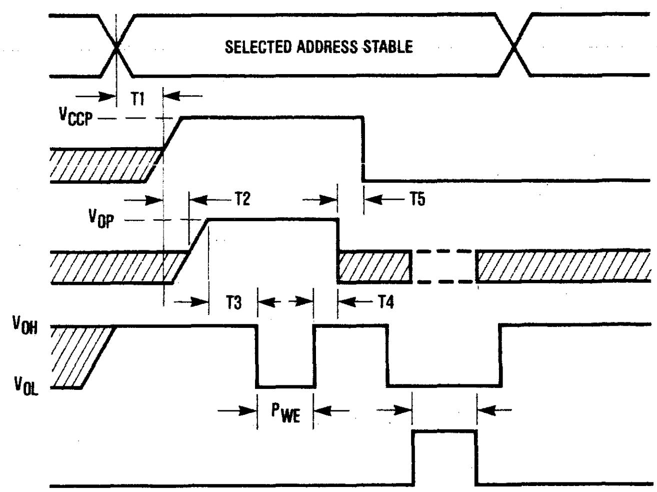
Programming Waveforms Non-Registered PROM

T1 = 100ns min.
T2 = 5μs min. T2 may be > 0 if V_{CCP} rises at the same rate or faster than (V_{OP})
T3 = 100ns min.
T4 = 100ns min.
T5 = 100ns min.

P_{WE} is repeated for 5 additional pulses after verification of V_{OH} indicates a bit has been programmed.



National Semiconductor

Registered PROM Programming Procedure

National Schottky PROMs are shipped from the factory with all fuses intact. As a result, the outputs will be low (logical '0') for all addresses. To generate high (logical '1') levels at the outputs, the device must be programmed. Information regarding commercially available programming equipment may be obtained from National. If it is desired to build your own programmer, the following conditions must be observed.

1. Programming should be attempted only at ambient temperatures between 15°C and 30°C.
2. Address and Enable inputs must be driven with TTL logic levels during programming and verification.
3. Programming will occur at the selected address when V_{CC} is at 10.5V, and at the selected bit location when the output pin, representing that bit, is at 10.5V, and the device is subsequently enabled. To achieve these conditions in the appropriate sequence, the following procedure must be followed:
   a) Select the desired word by applying high or low levels to the appropriate address inputs. Disable the device by applying a high level to asynchronous chip Enable input $\overline{G}$. $\overline{GS}$ is held low during the entire programming time.
   b) Increase V_{CC} from nominal to 10.5V (±0.5V) with a slew rate between 1.0 and 10V/μs. Since V_{CC} is the source of the current required to program the fuse as well as the I_{CC} for the device at the programming voltage, it must be capable of supplying 750mA at 11V.
   c) Select the output where a logical high is desired by raising that output voltage to 10.5V (±0.5V). Limit the slew rate from 1.0 to 10V/μs. This voltage change may occur simultaneously with the increase in V_{CC}, but must not precede it. It is critical that only one output at a time be programmed since the internal circuits can only supply programming current to one bit at a time. Outputs not being programmed must be left open or connected to a high impedance source of 20kΩ minimum. (Remember that the outputs of the device are disabled at this time.)
   d) Enable the device by taking the chip enable ($\overline{G}$) to a low level. This is done with a pulse of 10μs. The 10μs duration refers to the time that the circuit (device) is enabled. Normal input levels are used and rise and fall times are not critical.
   e) Verify that the bit has been programmed by first removing the programming voltage from the output and then reducing V_{CC} to 4.0V (±0.2V). Verification at a V_{CC} level of 4.0V will guarantee proper output states over the V_{CC} and temperature range of the programmed part. Each data verification must be preceded by a positive going (low to high) clock edge to load the data from the array into the output register. The device must be enabled to sense the state of the outputs. During verification, the loading of the output must be within specified I_{OL} and I_{OH} limits. Steps b, c, and d must be repeated up to 10 times or until verification that the bit has been programmed.
   f) The initialize word is programmed by setting $\overline{INIT}$ input to a logic low and programming the initialize word output by output in the same manner as any other address. This can be accomplished by inverting the A9 address input from the PROM programmer and applying it to the $\overline{INIT}$ input. Using this method, the initialize word will program at address 512.
   g) Following verification, apply five additional programming pulses to the bit being programmed. The programming procedure is now complete for the selected bit.
   h) Repeat steps a through f for each bit to be programmed to a high level. If the procedure is performed on an automatic programmer, the duty cycle of V_{CC} at the programming voltage must be limited to a maximum of 25%. This is necessary to minimize device junction temperatures. After all selected bits are programmed, the entire contents of the memory should be verified.

NMC9306/COP494 256-Bit Serial Electrically Erasable Programmable Memory

General Description

The NMC9306/COP494 is a 256-bit non-volatile sequential access memory fabricated using advanced floating gate N-channel E^{2}PROM technology. It is a peripheral memory designed for data storage and/or timing and is accessed via the simple MICROWIRE™ serial interface. The device contains 256 bits of read/write memory divided into 16 registers of 16 bits each. Each register can be serially read or written by a COP400 series controller. Written information is stored in a floating gate cell with at least 10 years data retention and can be updated by an erase-write cycle. The NMC9306/COP494 has been designed to meet applications requiring up to 1×10^4 erase/write cycles per register. A power down mode reduces power consumption by 70 percent.

Features

- Low cost
- Single supply operation (5V ± 10%)
- TTL compatible
- 16 × 16 serial read/write memory
- MICROWIRE compatible serial I/O
- Compatible with COP400 processors
- Low standby power
- Non-volatile erase and write
- Reliable floating gate technology

NMC9346/COP495 1024-Bit Serial Electrically Erasable Programmable Memory (5V Only)

General Description

The NMC9346/COP495 is a 1024-bit non-volatile, sequential E^2PROM, fabricated using advanced N-channel E^2PROM technology. It is an external memory with the 1024 bits of read/write memory divided into 64 registers of 16 bits each. Each register can be serially read or written by a COP400 controller, or a standard microprocessor. Written information is stored in a floating gate cell until updated by an erase and write cycle. The NMC9346/COP495 has been designed for applications requiring up to 10^4 erase/write cycles per register. A power-down mode is provided by CS to reduce power consumption by 75 percent.

Features

- Low cost
- Single supply read/write/erase operations (5V ± 10%)
- TTL compatible
- 64 × 16 serial read/write memory
- MICROWIRE™ compatible serial I/O
- Simple interfacing
- Low standby power
- Non-volatile erase and write
- Reliable floating gate technology
- Self-timed programming cycle
- Device status signal during programming

NMC9716 16k (2k × 8) Electrically Erasable PROM

Max Access/Current	NMC9716-25	NMC9716-35	NMC9716-45
Max Access Time (ns)	250	350	450
Max Active Current (mA)	110	110	110
Max Standby Current (mA)	50	50	50

General Description

The NMC9716 is a 16,384-bit electrically erasable and programmable read-only memory (E^2PROM) fabricated using National's high speed, low power, N-channel double silicon gate technology. The electrical erase/write capability of the NMC9716 makes it ideal for a wide variety of applications requiring in-system, non-volatile erase and write.

The NMC9716 is pin and functionally compatible with the NMC2816 E^2PROM, with the added system feature of erasing/writing with a 5V TTL pulse on chip enable ($\overline{CE}$), while the VPP is held at 21V. The erase/write cycle is very similar to the industry standard 2716 EPROM programming cycle.

The device operates from a 5V power supply in the read mode and, with its very fast read access speed, is compatible with high performance microprocessors.

The NMC9716 is deselected when $\overline{CE}$ input is high and is automatically placed in the standby mode. This mode provides a 52% reduction in power with no increase in access time. The NMC9716 also has an output enable control to eliminate bus contention in a system environment.

The NMC9716 can be easily erased and reprogrammed in a byte-by-byte mode and the entire memory array can be erased with a single programming pulse in the chip erase mode. Byte erase is identical to byte write, with all inputs at logic one (TTL high).

Features

- Erase/write with a 5V TTL pulse or a 21V pulse
- Pin and functionally compatible with the NMC2816
- No rise time restriction on erase/write pulse
- 2048 × 8 organization
- Conforms to JEDEC byte-wide family standard
- Microprocessor compatible architecture
- Single byte erase/write capability
- 10 ms byte erase/write time
- 10 ms chip erase mode
- Low power dissipation
  610 mW max (active power ICC + IPP)
  295 mW max (standby power ICC + IPP)

NMC9817 16,384-Bit (2k × 8) E²PROM

General Description

The NMC9817 is a fast 5V-only E²PROM which offers many desired application features, making it ideally suited for efficiency and ease in system design. The added features on the NMC9817 include: 5V-only operation provided by an on-chip V_{PP} generation during erase-write; address and data latches to reduce part count and to free the microprocessor while the chip is busy during erase-write; 'ready' line indicator to indicate status of chip to the microprocessor and automatic erase before byte-write. It can meet applications requiring up to 10^4 write cycles per byte. The NMC9817 is a product of National's advanced E²PROM stepper technology and uses the powerful XMOS™ process for reliable, non-volatile data storage.

The NMC9817 sharply minimizes the interfacing hardware logic and firmware required to perform data writes. The device has complete self-timing which leaves the processor free to perform other tasks until the NMC9817 signals 'ready'. With an automatic erase before write, the user benefits by saving an erase command contributing to efficient usage of system processing time. On-chip address and data latching further enhances system performance.

The NMC9817's very fast read access times make it compatible with high performance microprocessor applications. It uses the proven two line control architecture which eliminates bus contention in a system environment. Combining these features with the NMC9817's 'ready' signal makes the device an extremely powerful, yet simple to use, E² memory.

The density, and level of integrated control, make the NMC9817 suitable for users requiring no hardware overhead, high system performance, minimal board space and design ease. Designing with and using the NMC9817 is extremely cost effective as the required high voltage and interfacing hardware required for other E²PROM devices has been eliminated by 5V-only operation and on-chip latches. See *Figures 1, 2, and 3* for the NMC9817 block diagram, pinout, and simple interface requirements.

Features

- Single 5V supply (eliminates an external 21V V_{PP})
- Self-timed byte-write with auto erase
- No external capacitor or pulse shaping circuits
- On-chip address and data latches
- Two line output control
- TRI-STATE® outputs
- RDY pin indicator
- Fast byte-writing
  - Write cycle (2 ms typical)
  - E/W cycle (4 ms typical)
- Very fast access times
  - NMC9817-20—200 ns
  - NMC9817-25—250 ns
  - NMC9817-35—350 ns
- Direct microprocessor interface capability
- No support components needed
- Reliable E²PROM XMOS stepper technology

HS2649 65,536 x 9 Bit Dynamic Random-Access Memory Module

General Description

The HS2649 is a high speed high density 589,824 bit, dynamic random-access memory organized into 65,536 words of 9 bits each (8 bit data plus parity). Single +5 volt power supply operation with internal decoupling capacitors allows for very compact layout of large memory systems.

The HS2649 is in a 30 pin single-in-line package (SIP) which uses a minimum of board space. This SIP package features ceramic construction, high strength, and good thermal conductivity.

Applications

- Mainframe memory
- Buffer memory
- Peripheral storage
- Transportable computers

Features

- 65536×9 Bit Dynamic Ram
- SIP package
- 200 ns access time
- 335 ns cycle time
- Single +5 volt supply ±10%
- Common I/O except parity bit
- All inputs TTL compatible
- 256 refresh cycles/4 ms
- Power 2.8W active max, 180 mW standby max.

μPD416-2/-3/-5
16384 x 1-BIT DYNAMIC MOS RANDOM ACCESS MEMORY

DESCRIPTION

The NEC μPD416 is a 16384 words by 1 bit Dynamic MOS RAM. It is designed for memory applications where very low cost and large bit storage are important design objectives.

The μPD416 is fabricated using a double-poly-layer N channel silicon gate process which affords high storage cell density and high performance. The use of dynamic circuitry throughout, including the sense amplifiers, assures minimal power dissipation.

Multiplexed address inputs permit the μPD416 to be packaged in the standard 16 pin dual-in-line package. The 16 pin package provides the highest system bit densities and is available in either ceramic or plastic. Noncritical clock timing requirements allow use of the multiplexing technique while maintaining high performance.

FEATURES

- 16384 Words x 1 Bit Organization
- High Memory Density – 16 Pin Ceramic and Plastic Packages
- Multiplexed Address Inputs
- Standard Power Supplies +12V, −5V, +5V
- Low Power Dissipation; 462 mW Active (MAX), 20 mW Standby (MAX)
- Output Data Controlled by $\overline{CAS}$ and Unlatched at End of Cycle
- Read-Modify-Write, $\overline{RAS}$-only Refresh, and Page Mode Capability
- All Inputs TTL Compatible, and Low Capacitance
- 128 Refresh Cycles
- 5 Performance Ranges:

	ACCESS TIME	R/W CYCLE	RMW CYCLE
μPD416-2	200 ns	375 ns	375 ns
μPD416-3	150 ns	320 ns	320 ns
μPD416-5	120 ns	320 ns	320 ns

Refresh V_{BB} Current		I_{BB3}			200	μA	$\overline{RAS}$ cycling, $\overline{CAS}$ V_{IHC}, t_{RC} 375 ns
Page Mode V_{BB} Current		I_{BB4}			200	μA	$\overline{RAS}$ V_{IL}, $\overline{CAS}$ cycling; t_{PC} 225 ns
Input Leakage (any input)		$I_{I(L)}$	-10		10	μA	V_{BB} = 5V, 0V V_{IN} ≤ +7V, all other pins not under test = 0V
Output Leakage		$I_{O(L)}$	-10		10	μA	D_{OUT} is disabled, 0V ≤ V_{OUT} ≤ +5.5V
Output High Voltage (Logic 1)		V_{OH}	2.4			V	I_{OUT} = 5 mA ③
Output Low Voltage (Logic 0)		V_{OL}			0.4	V	I_{OUT} = 4.2 mA

Notes: ① T_a is specified here for operation at frequencies to t_{RC} ≥ t_{RC} (min). Operation at higher cycle rates with reduced ambient temperatures and high power dissipation is permissible, however, provided AC operating parameters are met. See Figure 1 for derating curve.

② All voltages referenced to V_{SS}.

③ Output voltage will swing from V_{SS} to V_{CC} when activated with no current loading. For purposes of maintaining data in standby mode, V_{CC} may be reduced to V_{SS} without affecting refresh operations or data retention. However, the V_{OH} (min) specification is not guaranteed in this mode.

④ I_{DD1}, I_{DD3}, and I_{DD4} depend on cycle rate. See Figures 2, 3 and 4 for I_{DD} limits at other cycle rates.

⑤ I_{CC1} and I_{CC4} depend upon output loading. During readout of high level data V_{CC} is connected through a low impedance (135Ω typ) to data out. At all other times I_{CC} consists of leakage currents only.

AC CHARACTERISTICS

T_a = 0°C to +70°C, V_{DD} = +12V ± 10%, V_{CC} = +5V ± 10%, V_{BB} = −5V ± 10%, V_{SS} = 0V

$\overline{CAS}$ to $\overline{WRITE}$ delay	t_{CWD}	95		70		80		ns	⑩
$\overline{RAS}$ to $\overline{WRITE}$ delay	t_{RWD}	160		120		120		ns	⑩

Notes:
① AC measurements assume t_T = 5 ns.
② V_{IHC} (min) or V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IHC} or V_{IH} and V_{IL}
③ The specifications for t_{RC} (min) and t_{RWC} (min) are used only to indicate cycle time at which proper operation over the full temperature range (0°C ≤ T_a ≤ 70°C) is assured.
④ Assumes that $t_{RCD} \leq t_{RCD}$ (max). If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will increase by the amount that t_{RCD} exceeds the values shown.
⑤ Assumes that $t_{RCD} \geq t_{RCD}$ (max).
⑥ Measured with a load equivalent to 2 TTL loads and 100 pF.
⑦ t_{OFF} (max) defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
⑧ Operation within the t_{RCD} (max) limit ensures that t_{RAC} (max) can be met, t_{RCD} (max) is specified as a reference point only, if t_{RCD} is greater than the specified t_{RCD} (max) limit, then access time is controlled exclusively by t_{CAC}
⑨ These parameters are referenced to $\overline{CAS}$ leading edge in early write cycles and to $\overline{WRITE}$ leading edge in delayed write or read-modify-write cycles.
⑩ t_{WCS}, t_{CWD} and t_{RWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}$ (min), the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) ≥ t_{RWD} (min), the cycle is a read-write cycle and the data out will contain data read from the selected cell; if neither of the above sets of conditions is satisfied the condition of the data out (at access time) is indeterminate.

μPD4164-12/-15/-20 65,536 x 1-BIT DYNAMIC RANDOM ACCESS MEMORY

DESCRIPTION

The NEC μPD4164 is a 65,536 words by 1 bit Dynamic N-Channel MOS RAM designed to operate from a single +5V power supply. The negative-voltage substrate bias is internally generated — its operation is both automatic and transparent.

The μPD4164 utilizes a three-poly N-channel silicon gate process which provides high storage cell density, high performance and high reliability.

The μPD4164 uses a single transistor dynamic storage cell and advanced dynamic circuitry throughout, including the 512 sense amplifiers, which assures that power dissipation is minimized. Refresh characteristics have been chosen to maximize yield (low cost to user) while maintaining compatibility between Dynamic RAM generations.

The μPD4164 three-state output is controlled by $\overline{\text{CAS}}$, independent of $\overline{\text{RAS}}$. After a valid read or read-modify-write cycle, data is held on the output by holding $\overline{\text{CAS}}$ low. The data out pin is returned to the high impedance state by returning $\overline{\text{CAS}}$ to a high state. The μPD4164 hidden refresh feature allows $\overline{\text{CAS}}$ to be held low to maintain output data while $\overline{\text{RAS}}$ is used to execute $\overline{\text{RAS}}$ only refresh cycles.

Refreshing is accomplished by performing $\overline{\text{RAS}}$ only refresh cycles, hidden refresh cycles, or normal read or write cycles on the 128 address combinations of A_0 through A_6 during a 2 ms period.

Multiplexed address inputs permit the μPD4164 to be packaged in the standard 16 pin dual-in-line package. The 16 pin package provides the highest system bit densities and is compatible with widely available automated handling equipment.

FEATURES

- High Memory Density
- Multiplexed Address Inputs
- Single +5V Supply
- On Chip Substrate Bias Generator
- Access Time: μPD4164-20 — 200 ns
  μPD4164-15 — 150 ns
  μPD4164-12 — 120 ns
- Read, Write Cycle Time: μPD4164-20 — 335 ns
  μPD4164-15 — 270 ns
  μPD4164-12 — 260 ns
- Low Power Dissipation: 250 mW (Active); 28 mW (Standby)
- Non-Latched Output is Three-State, TTL Compatible
- Read, Write, Read-Write; Read-Modify-Write, RAS Only Refresh, and Page Mode Capability
- All Inputs TTL Compatible, and Low Input Capacitance
- 128 Refresh Cycles (A_0-A_6 Pins for Refresh Address)
- CAS Controlled Output Allows Hidden Refresh
- Available in Both Ceramic and Plastic 16 Pin Packages

PIN CONFIGURATION

Notes:
① T_a is specified here for operation at frequencies to $t_{RC} > t_{RC}$ (min). Operation at higher cycle rates with reduced ambient temperatures and higher power dissipation is permissible, however, provided AC operating parameters are met.
② An initial pause of 100 μs is required after power-up followed by any 8 $\overline{RAS}$ cycles before proper device operation is achieved.
③ AC measurements assume $t_T = 5$ ns.
④ V_{IHC} (min) or V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IHC} or V_{IH} and V_{IL}.
⑤ The specifications for t_{RC} (min) and t_{RWC} (min) are used only to indicate cycle times at which proper operation over the full temperature range ($0°C < T_a < 70°C$) is assured.
⑥ Assumes that $t_{RCS} \leq t_{RCD}$ (max). If t_{RCS} is greater than the maximum recommended value shown in this table, t_{RAC} will increase by the amount that t_{RCD} exceeds the values shown.
⑦ Assumes that $t_{RCD} > t_{RCD}$ (max).
⑧ Measured with a load equivalent to 2 TTL loads and 100 pF.
⑨ t_{OFF} (max) defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
⑩ Operation within the t_{RCD} (max) limit ensures that t_{RAC} (max) can be met, t_{RCD} (max) is specified as a reference point only, if t_{RCD} is greater than the specified t_{RCD} (max) limit, then access time is controlled exclusively by t_{CAC}.
⑪ These parameters are referenced to $\overline{CAS}$ leading edge in early write cycles and to $\overline{WRITE}$ leading edge in delayed write or read-modify-write cycles.
⑫ t_{WCS}, t_{CWD} and t_{RWD} are restrictive operating parameters in read-write and read-modify-write cycles only. If $t_{WCS} > t_{WCS}$ (min), the cycle is an early write cycle and the data output will remain open circuit throughout the entire cycle. If $t_{CWD} > t_{CWD}$ (min) and $t_{RWD} > t_{RWD}$ (min), the cycle is a read-write and the data output will contain data read from the selected cell. If neither of the above conditions are met the condition of the data out (at access time and until $\overline{CAS}$ goes back to V_{IH}) is indeterminate.
⑬ Either t_{RRH} or t_{RCH} must be satisfied for a read cycle.

μPD2147A HIGH-SPEED 4096 x 1-BIT STATIC RAM

Description

The μPD2147A is a 4096-bit static Random Access Memory organized as 4096 words by 1 bit, using a scaled MOS technology. It uses a uniquely innovative design approach which provides the ease-of-use features associated with non-clocked static memories and the reduced standby power dissipation associated with clocked static memories. To the user this means low standby power dissipation without the need for clocks, address setup and hold times, nor reduced data rates due to cycle times that are longer than access times.

$\overline{CS}$ controls the power-down feature. In less than a cycle time after $\overline{CS}$ goes high — deselecting the μPD2147A — the part automatically reduces its power requirements and remains in this low power standby mode as long as $\overline{CS}$ remains high. This device feature results in system power savings as great as 85% in larger systems, where the majority of devices are deselected.

The μPD2147A is placed in an 18-pin cerdip package configured with the industry standard 2147 pinout. It is directly TTL compatible in all respects: input, output, and a single +5V supply. The data is read out nondestructively and has the same polarity as the input data. A data input and a separate three-state output are used.

Features

- Pinout, Function, and Power Compatible to Industry Standard 2147
- Scaled MOS Technology
- Completely Static Memory — No Clock or Timing Strobe Required
- Equal Access and Cycle Times
- Single +5V Supply
- Direct Performance Upgrade for 2147
- Automatic Power-Down
- High Density 18-Pin Package
- Directly TTL Compatible — All Input and Output
- Separate Data Input and Output
- Three-State Output

	Max Access Time	Supply Current

DC Output Current	20mA
Power Dissipation	1.2 W

Note: ① with respect to ground

*COMMENT: Exposing the device to stresses above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational sections of this specification. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC and Operating Characteristics

$T_a = 0°C$ to $+70°C$; $V_{CC} = +5V \pm 10\%$①

Parameter	Symbol	Limits Min	Typ②	Max	Unit	Test Conditions
Input Load Current (All Input Pins)	I_{LI}		0.01	10	μA	V_{CC} = Max, V_{IN} = GND to V_{CC}
Output Leakage Current	I_{LO}		0.01	10	μA	$\overline{CS} = V_{IH}$, V_{CC} = Max, V_{OUT} = GND to V_{CC}
Operating Current	I_{CC}		120	150	mA	$T_a = 25°C$ V_{CC} = Max, $\overline{CS} = V_{IL}$,
				160	mA	$T_a = 0°C$ Output Open
Standby Current	I_{SB}		12	20	mA	V_{CC} = Min to Max, $\overline{CS} = V_{IH}$
Peak Power-On Current	I_{PO} ③		25	50	mA	V_{CC} = GND to V_{CC} = Min, $\overline{CS}$ = Lower to V_{CC} or V_{IH} Min
Input Low Voltage	V_{IL}	−3.0		0.8	V	
Input High Voltage	V_{IH}	2.0		6.0	V	
Output Low Voltage	V_{OL}			0.4	V	I_{OL} = 8 mA
Output High Voltage	V_{OH}	2.4			V	I_{OH} = −4.0 mA
Output Short Circuit Current	I_{OS}			±130	mA	V_{OUT} = GND to V_{CC}

Notes: ① The operating ambient temperature range is guaranteed with transverse air flow exceeding 400 linear feet per minute.
② Typical limits are V_{CC} = 5V, T_a = 25°C and specified loading.
③ A pull-up resistor to V_{CC} on the $\overline{CS}$ input is required to keep the device deselected; otherwise, power-on current approaches I_{CC} active.

AC Test Conditions

Input Pulse Levels	GND to 3.0V
Input Rise and Fall Times	5ns
Input Timing Reference Levels	1.5V
Output Timing Reference Levels	1.5V

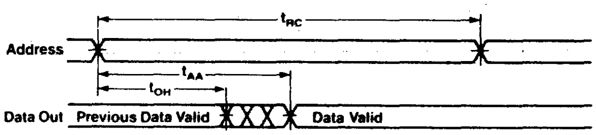
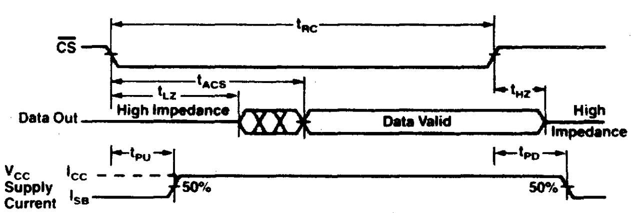
Timing Waveforms

Read Cycle No. 1 ⑤⑥

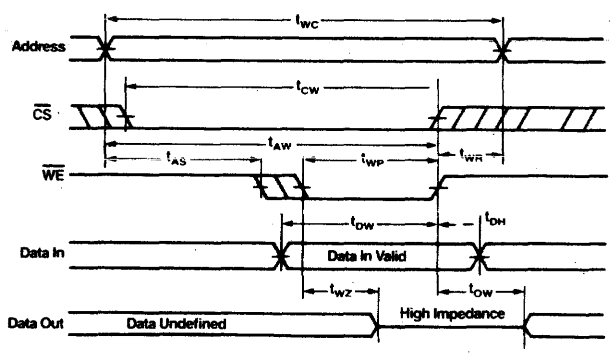


Read Cycle No. 2 ⑤⑦

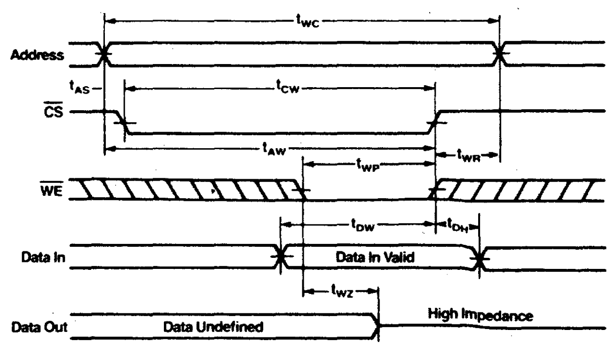


Notes:
1. All Read Cycle timings are referenced from the last valid address to the first transitioning address.
2. At any given temperature and voltage condition, t_{HZ} max is less than t_{LZ} min, both for a given device and from device to device.
3. Transition is measured · 200mV from steady state voltage with specified loading in Figure 2.
4. Transition is measured at V_{OL} · 200mV and V_{OH} 200mV with specified loading in Figure 2.
5. $\overline{WE}$ is high for Read Cycles.
6. Device is continuously selected, $\overline{CS}$ V_{IL}.
7. Addresses valid prior to or coincident with $\overline{CS}$ transition low.

Write Cycle No. 1 ($\overline{WE}$ Controlled) ⑤



Write Cycle No. 2 ($\overline{CS}$ Controlled) ⑤



Notes:
1. If $\overline{CS}$ goes high simultaneously with $\overline{WE}$ high, the output remains in a high impedance state.
2. All Write Cycle timings are referenced from the last valid address to the first transitioning address.
3. Transition is measured at V_{OL} · 200mV and V_{OH} 200mV with specified loading in Figure 2.
4. Transition is measured · 200mV from steady state voltage with specified loading in Figure 2.
5. $\overline{CS}$ or $\overline{WE}$ must be high during address transitions.

NEC Electronics

MEMORY

4096 (1024x4) BIT STATIC RAM

DESCRIPTION

The μPD2149 is a 4096-bit static Random Access Memory organized as 1024 words by 4-bits. Using a scaled NMOS technology, it incorporates an innovative design approach which provides the ease-of-use features associated with non-clocked static memories.

The μPD2149 is encapsulated in an 18-pin ceramic package configured with the industry standard pinout. It is directly TTL compatible in all respects: inputs, outputs, and a single +5V supply. The data is read out non-destructively and has the same polarity as the input data.

FEATURES

- Completely Static Memory — No Clock or Timing Strobe Required
- Equal Access and Cycle Times, Faster Chip Select Access
- Single +5V Supply
- High Density 18-Pin Package
- Directly TTL Compatible — All Inputs and Outputs
- Common Input and Output
- Three-State Output
- Access Time: 35-55 ns MAX (From Address)
  15-25 ns MAX (From Chip Select)
- Power Dissipation: 180 mA MAX

μPD2167-2/-3
16,384 x 1-BIT STATIC RAM

Description

The μPD2167 is a 16,384-word by 1-bit static MOS RAM. Using a scaled-NMOS technology, its design provides the easy-to-use features associated with non-clocked static memories.

The μPD2167 has a three-state output and offers a standby mode that features an 83% savings in power consumption. The μPD2167 requires a single +5 volt supply and is fully TTL-compatible. It features equal access and cycle times and, because of its fully static operation, it requires no external clocks or timing strobes. It is packaged in a standard 20-pin, 300 mil DIP.

Features

- ☐ 16384 x 1 organization
- ☐ Fully static memory — no clock or timing strobe required
- ☐ Equal access and cycle times
- ☐ Single +5v supply
- ☐ Automatic power-down
- ☐ Standard 20-pin DIP, 300 mil
- ☐ All inputs and output directly TTL-compatible
- ☐ Separate data input and output
- ☐ Three-state output
- ☐ Power dissipation: 180 mA max (active)
  30 mA max (standby)

μPD4016-1/-2/-3
2048 x 8-BIT STATIC RAM

Description

The μPD4016 is a 16384-bit static Random Access Memory device organized as 2048 words by 8 bits. Using a scaled NMOS technology, its design provides the ease-of-use features associated with nonclocked static memories. The μPD4016 has a three-state output and offers a standby mode with an attendant 75% to 90% savings in power consumption. It features equal access and cycle times and provides an output enable function that eliminates the need for external bus buffers. The μPD4016 is packaged in 600 mil and 300 mil 24-pin dual-in-line packages and is plug-compatible with 2716 EPROMS.

Features

- □ Scaled NMOS technology
- □ Completely static memory: no clock, no refresh
- □ Equal access and cycle times
- □ Single +5V supply
- □ Automatic power-down
- □ All inputs and outputs directly TTL-compatible
- □ Common I/O capability
- □ OE eliminates need for external bus buffers
- □ Three-state outputs
- □ Plug-compatible with 2716 EPROMS
- □ Standby current 15mA standard, selectable to 5mA
- □ Available in 600 mil and 300 mil DIP (Skinnydip)

	Access Time	R/W Cycle	I_{cc} (max)
μPD4016-1	250 ns	250 ns	60 mA
μPD4016-2	200 ns	200 ns	60 mA
μPD4016-3	150 ns	150 ns	60 mA

NEC Electronics

MEMORY

μPD446/-1/-2/-3
2048 x 8-BIT STATIC CMOS RAM

DESCRIPTION

The μPD446 is a high speed, low power, 2048 word by 8 bit static CMOS RAM fabricated using an advanced silicon gate CMOS technology. A unique circuitry technique makes the μPD446 a very low operating power device which requires no clock or refreshing to operate. Minimum standby power current is drawn by this device when $\overline{CS}$ equals V_{CC} independently of the other input levels.

Data retention is guaranteed at a power supply voltage as low as 2V.

The μPD446 is packaged in a standard 24-pin dual-in-line package and is plug-in compatible with 16K EPROMs. The μPD446 is also available in the 24-pin mini-flat (SOP) package.

FEATURES

- Single +5V Supply
- Fully Static Operation – No Clock or Refreshing required
- TTL Compatible – All Inputs and Outputs
- Common I/O Using Three-State Output
- $\overline{OE}$ Eliminates Need for External Bus Buffers
- Max Access/Min Cycle Times Down to 150 ns
- Low power Dissipation, 18 mA Max Active/10 μA Max Standby/ 10 μA Max Data Retention
- Data Retention Voltage – 2V Min
- Standard 24-Pin Plastic, DIP, and Mini-flat (SOP) Packages
- Plug-in Compatible with 16K EPROMs
- Operating Temperature Range – –40°C to +85°C
- For operation at less than 4.5V power supply, contact the NEC Sales Office

2048 × 8-BIT STATIC CMOS RAM

DESCRIPTION

The μPD449 is a high speed, low power, 2048 word by 8-bit static CMOS RAM fabricated using an advanced silicon gate CMOS technology. A unique circuitry technique makes the μPD449 a very low operating power device which requires no clock or refreshing to operate.

Since the device has two chip enable inputs, it is suited for battery backup applications. Minimum standby power current is drawn by this device when $\overline{CE}1$ or $\overline{CE}2$ equals V_{CC} independently of the other input levels.

Data Retention is guaranteed at a power supply voltage as low as 2V.

The μPD449 is packaged in a standard 24-pin dual-in-line package and is plug-in compatible with 16K EPROMs. The μPD449 is also available in the 24-pin mini-flat (SOP) package.

FEATURES

- Single +5V Supply
- Fully Static Operation — No Clock or Refreshing required
- TTL Compatible — All Inputs and Outputs
- Common Data Input and Output Using Three-State Output
- Two Chip Enable Inputs eliminates need for External Bus Buffers
- Max Access/Min Cycle Times Down to 150 ns
- Low Power Dissipation; 18 mA Max Active/10 μA Max Standby/ 10 μA Max Data Retention
- Data Retention Voltage — 2V Min
- Standard 24-Pin Plastic, DIP and Mini-flat (SOP) Packages
- Plug-in Compatible with 16K EPROMs
- Operating Temperature Range −40°C to +85°C
- For operation at less than 4.5V power supply, contact the NEC Sales Office

μPD2308A
NMOS READ ONLY MEMORY
1,024 WORDS, 8 BITS/WORD

FEATURES:

- **Two Fast Access Times:**
  —450nsec
  —350nsec
- **All Inputs TTL Compatible**
- **All Outputs Drive 2 TTL Load Directly**
- **Single +5 Volt Supply with ± 10% Tolerance**
- **Three-State Outputs for Direct Bus Compatibility**
- **Pin Compatible to 2708 EPROM**
- **Fully Static Operation**
- **All Inputs Protected Against Static Charge**
- **100% Burned-In**

GENERAL DESCRIPTION:

The μPD2308A is a 8,192 bit Read Only Memory, utilizing MOS N-Channel silicon gate technology. The device is completely static in operation and is organized as 1024 words by 8 bits and operates from a single +5 volt power supply. All inputs and outputs are fully TTL compatible. It has two programmable chip selects, and Pins 21 and 19 have no connection (NC) to allow full plug-in compatibility with 2708 EPROMs. Programming of the device is done through a custom mask during fabrication.

CUSTOM PROGRAMMING INSTRUCTIONS

BIT PATTERN SUBMITTAL OPTIONS:

The customer's unique bit pattern can be submitted in a convenient method that is easy for the ROM customer, and readily verifiable for accuracy. The bit pattern can be delivered to NEC contained within:

1. One programmed 2708 EPROM

BIT PATTERN VERIFICATION:

For customer verification of the submitted bit patterns, several alternatives are also available. The following is found to be most expeditious.

CUSTOM PATTERN SUBMITTED VIA:	VERIFICATION ROUTINE
1. One programmed 2708 EPROM	Customer sends NEC one additional erased 2708. NEC programs the spare 2708 with the data from the programmed 2708, and returns to customer for verification.

MEMORY

μPD2316E
NMOS READ ONLY MEMORY
2,048 WORDS, 8 BITS/WORD

FEATURES:

- **Two Fast Access Times:**
  —450nsec
  —350nsec
- **All Inputs TTL Compatible**
- **Single +5 V ± 10% Supply**
- **Three-State Outputs for Direct Bus Compatibility**
- **Pin Compatible to 2708 and 2716 EPROMs**
- **Fully Static Operation**
- **Inputs Static Charge Protected**
- **100% Burned-In**

GENERAL DESCRIPTION:

The μPD2316E is a 16,384 bit Read Only Memory utilizing MOS N-Channel silicon gate technology. The device is completely static in operation and is organized as 2048 words by 8 bits and operates from a single +5 volt power supply. All inputs and outputs are fully TTL compatible. It has three programmable chip select inputs and three state outputs that allow memory expansion to 16,384 words by 8 bits without the use of external logic. Programming of the device is accomplished by a custom mask during fabrication. Pinout is compatible with 2708 and 2716 EPROMs.

CUSTOM PROGRAMMING INSTRUCTIONS

BIT PATTERN SUBMITTAL OPTIONS:

The customer's unique bit pattern can be submitted in several convenient methods that are easy for the ROM customer, and readily verifiable for accuracy. The bit pattern can be delivered to NEC contained within:

1. One programmed 2732 EPROM
2. Two programmed 2716 EPROMs

BIT PATTERN VERIFICATIONS:

For customer verification of the submitted bit patterns, several alternatives are also available. The following are those found to be most expeditious.

CUSTOM PATTERN SUBMITTED VIA:	VERIFICATION ROUTINE
1. One programmed 2732 EPROM	Customer sends NEC one additional erased 2732. NEC programs the spare 2732 with the data from the programmed 2732, and returns to customer for verification.
2. Two programmed 2716 EPROMs	Customer sends NEC two additional erased 2716's. NEC programs the spare 2716's with the data from the programmed EPROMs and returns to customer for verification.

μPD2364
NMOS READ ONLY MEMORY
8192 WORDS, 8 BITS/WORD

FEATURES:

- **Three Fast Access Times**
  -450nsec
  -350nsec
  -300nsec
- **All Inputs and Outputs TTL Compatible**
- **Single +5V ± 10% Power Supply**
- **One Programmable Chip Select**
- **Three-State Outputs for Direct Bus Compatibility**
- **Pin Compatible to 2716, 2732, and 2564 EPROMS**
- **Fully Static Operation**
- **All Inputs Protected Against Static Charge**
- **100% Burned-In**

GENERAL DESCRIPTION:

The μPD2364 is a 65,536 bit Read Only Memory utilizing MOS N-Channel silicon gate technology. The device is completely static in operation, organized as 8192 words by 8 bits and operates from a single +5V power supply. All inputs and outputs are fully TTL compatible. It has one programmable chip select input and three-state outputs that allow memory expansion to 16,384 words by 8 bits without the use of external logic. Programming of the device is accomplished by a custom mask during fabrication. Pinout is compatible with 2716, 2732, and 2564 EPROMs.

CUSTOM PROGRAMMING INSTRUCTIONS

BIT PATTERN SUBMITTAL OPTIONS:

The customer's unique bit pattern can be submitted in several convenient methods that are easy for the ROM customer, and readily verifiable for accuracy. The bit pattern can be delivered to NEC contained within:

1. One programmed 27128 EPROM
2. Two programmed 2764 EPROMs
3. Four programmed 2732 EPROMs

BIT PATTERN VERIFICATION:

For customer verification of the submitted bit patterns, several alternatives are also available. The following are those found to be most expeditious.

CUSTOM PATTERN SUBMITTED VIA:	VERIFICATION ROUTINE
1. One programmed 27128 EPROM	Customer sends NEC one additional erased 27128. NEC programs the spare 27128 with the data from the programmed 27212 and returns to customer for verification.
2. Two programmed 2764 EPROMs	Customer sends NEC two additional erased 2764's. NEC programs the spare 2764's with the data from the programmed 2764's and returns to the customer for verification.
3. Four programmed 2732 EPROMs	Customer sends NEC four additional erased 2732's. NEC programs the spare 2732's with the data from the programmed 2732's and returns to the customer for verification.

μPD73128G CMOS READ ONLY MEMORY 16,384 WORDS, 8 BITS/WORD

FEATURES:

- **16,384 Words by 8 Bits**
- **Access Time: 5μsec VCC " 5V ± 10%**
- **Low Power Consumption—CMOS Technology**
- **Four Mask Programmable Chip Selects**
- **Three State Output for Direct Bus Interface**
- **Built for Direct Interface with 8048/8748 μproc.**
- **Single Power Supply (3.5-5.5V)**
- **52 Pin Plastic Flat Package**

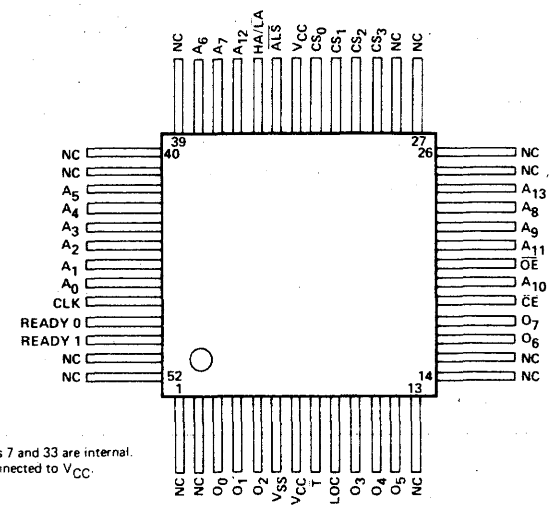
ORDERING INFORMATION

PART NUMBER	ACCESS TIME	PACKAGE
μPD 73128G	5μsec	52 Pin Plastic Flat Package

GENERAL DESCRIPTION:

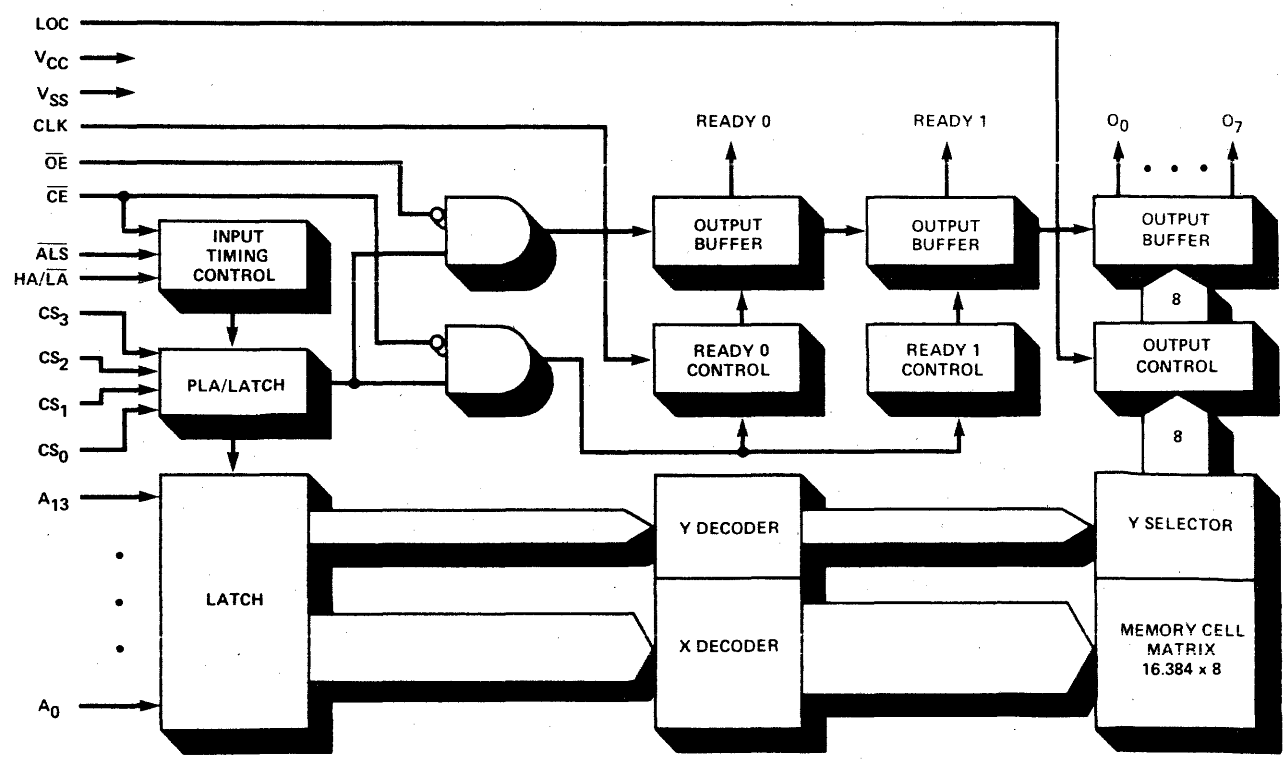
The μPD73128G is a 131,072 bit Read Only Memory utilizing low power CMOS technology. The device is mask programmable and is organized 16,384 words, by 8 bits/word and operates from a single 3.5-5.5 volt supply. The device has four mask programmable chip select inputs for simple memory expansion and has three-state output for direct bus interface.

PIN CONFIGURATION (TOP VIEW)



NOTE: Pins 7 and 33 are internal. Connected to V_{CC}.

BLOCK DIAGRAM



ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Ratings	Unit
V_{CC}	Supply Voltage	−0.3 ~ +7	V
V_I	Input Voltage	−0.3 ~ V_{CC} +0.3	V
V_O	Output Voltage	−0.3 ~ V_{CC} +0.3	V
T_{opt}	Operating Temperature	−10 ~ +70	°C
T_{stg}	Storage Temperature	−40 ~ +125	°C

Stresses more severe than those listed here may cause permanent damage to the device. This is a stress rating only, and operation of the device at any condition above those indicated in the operational sections of this specification is not implied.

MN4164, N MOS 65K Bit Dynamic Ram

Description

System oriented features include: operation from a single +5V ±10% tolerance power supply, direct TTL interfacing capability, on-chip addresses and data registers which eliminate the need for interface registers, and two chip select methods to allow the user to determine the appropriate speed/power characteristics of his memory system.

The RAM module also incorporates several flexible operating modes: "Read," "Write," "Read-Modify-Write" cycles, "Page-Mode" operation and "RAS-Only" refresh. Proper control of the clock inputs (RAS, CAS and WRITE) allows common I/O capability, two dimensional chip selection, and extended page boundaries (for operating in page mode).

Features

- 65,536 x 1 RAM, 16-pin package
- Row access time:
  150 ns Max. (MN4164-15/MN4164P-15)
  200 ns Max. (MN4164-20/MN4164P-20)
  250 ns Max. (MN4164-25/MN4164P-25)
- Cycle time:
  270 ns Max. (MN4164-15/MN4164P-15)
  330 ns Max. (MN4164-20/MN4164P-20)
  410 ns Max. (MN4164-25/MN4164P-25)
- Low power dissipation:
  275 mW Max. (active)
  27.5 mW Max. (standby)
- Single 5V supply, ±10% tolerance
- 128 refresh cycles/2ms

MN4164, N MOS 65K Bit Dynamic Ram

Note:

1) Several cycles are required after power up or prolonged periods of RAS inactivity (2 ms) before proper device operation is achieved. Any 8 cycles which perform refresh are adequate for this purpose.
2) AC measurements assume $t_T = 5.0$ ns.
3) V_{IH} and V_{IL} are reference levels for measuring signal timings and transition times.
4) Assumes that $t_{RCD} \leqq t_{RCD}$ (Max).
5) Assumes that $t_{RCD} \geqq t_{RCD}$ (Max).
6) Measure with load equivalent to 2 TTL loads and 100 pF.
7) t_{OFF} defines the time at which the output enters high impedance state. It is not referenced to levels of V_{IH} and V_{IL}.
8) Operation within the t_{RCD} (Max) limit ensures that t_{RAC} (Max) can be met. t_{RCD} is specified as a reference point only; if t_{RCD} is greater than the specified t_{RCD} limit, then row access time is $t_{RCD} + t_{CAC}$.
9) These parameters are referenced to leading edge of CAS (Early-Write) or WRITE (Delayed-Write or Read-Modify-Write) whichever occurs last.
10) t_{WCS}, t_{CWD} and t_{RWD} are not restrictive operating parameters. They are included under AC Characteristics as electrical characteristics only. If $t_{WCS} \leqq t_{WCS}$ (Min), the cycle is an Early-Write cycle and the data out pins will remain open circuit (high impedance) throughout the entire cycle. If $t_{CWD} \geqq t_{CWD}$ (Min) and $t_{RWD} \geqq t_{RWD}$ (Min), the cycle is a Read-Modify-Write cycle and the data out will contain data read from the selected cell. If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.

MN4164, N MOS 65K Bit Dynamic Ram

Functional Description

Address Input

The 16 address bits required to decode 1 of the 65,536-cell locations within the RAM module are multiplexed onto the 8 address inputs and latched into the on-chip address latches by externally applying two negative going TTL level clocks. The first clock, Row Address Strobe (RAS), latches the 8 row addresses bits into the chip. The second clock, the Column Address Strobe (CAS), subsequently latches the 8 column address bits into the chip. ($A_0 \sim A_7$ are row and column address input.) Each of these signals, RAS and CAS, triggers a sequence of events which are controlled by different delayed internal clocks. The two clock chains are linked together logically in such a way that the address multiplexing operation is done outside of the critical path timing sequence for read data access. The later events in the CAS clock sequence are inhibited until the occurrence of a delayed signal derived from the RAS clock chain. This "gated CAS" feature allows the CAS clock to be externally activated as soon as the Row Address Hold Time (t_{RAH}) has been satisfied and the address inputs have been changed from row address to column address information.

Note that CAS can be activated at any time after t_{RAH} and it will have no effect on the worst case data access time (t_{RAC}) up to the point in time when the delayed row clock no longer inhibits the remaining sequence of column clocks. Two timing specifications result from the internal gating of CAS; they are t_{RCD} (min) and t_{RCD} (max). No data storage or reading errors will result if CAS is applied to the RAM module at a point in time beyond the t_{RCD} (max) limit. However, access time will then be determined exclusively by the access time from CAS (t_{CAC}) rather than from RAS (t_{RAC}), and access time from RAS will be increased by the amount that t_{RCD} exceeds the t_{RCD} (max) limit.

Data Input/Output

Data is retrieved from memory in a read cycle by maintaining WRITE in the inactive or high state throughout the portion of the memory cycle in which CAS is active (low). Data read from the selected cell will be available at the output within the specified access time.

Data to be written into a selected cell is latched into an on chip register by a combination of WRITE and CAS while RAS is active. The later of the signals (WRITE or CAS) to make its negative transition is the strobe for the Data in register. This permits several options in the write cycle timing. In a write cycle, if the WRITE input is brought low (active) prior to CAS, the D_{IN} is strobed by CAS and the set up and hold times are referenced to CAS.

If the input data is not available at CAS time or if it is desired that the cycle be a Read-Modify-Write cycle, the WRITE signal will be delayed until after CAS has made its negative transition. In this delayed write cycle, the data input set up and hold times are referenced to the negative edge of WRITE rather than CAS. (To illustrate this feature, D_{IN} is referenced to WRITE in the timing diagrams depicting the "Read-Modify-Write" cycle while the "WRITE" and "Page-Mode-Write" cycle diagrams show D_{IN} referenced to CAS.)

Data Output

The normal condition of the data output (D_{OUT}) of the RAM module is a high impedance state. That is to say, any time CAS is at a high level, the D_{OUT} pin will be floating. The only time the outputs will turn on and contain either a logic 0 or logic 1 is at access time during a read cycle. D_{OUT} will remain valid from access time until CAS is taken back to the inactive (high) conditions.

If the memory cycle in progress is "Read" or "Read-Modify-Write" cycle, then the data output will go from the high impedance state to the active condition and at access time will contain the data read from the selected cell. This output data is the same polarity (not inverted) as the input data. Once having gone active the output will remain valid until CAS is taken to the precharge state, whether or not RAS goes into precharge.

If the cycle in progress is a "Write" cycle (Write active before CAS goes active), then the output pins will maintain the high impedance throughout the entire cycle.

Note that with this type of output configuration, the user is given full control of the D_{OUT} pin simply by controlling the placement of WRITE command during write operations, and the pulse width of CAS during read operations. Note also that even though data is not latched at the output, data can remain valid from access time until the beginning of a subsequent cycle without paying any penalty in overall memory cycle time (stretching cycle). This type of output operation results in some very significant system implications.

Common I/O

If all write operations are handled in the "Write" cycle mode (WRITE active before CAS goes active), then D_{IN} can be connected directly to D_{OUT} respectively for common I/O data bus.

RAS and CAS Chip Selection

Only those devices which receive both RAS and CAS signals will execute a read or write cycle. Since D_{OUT} is not latched, CAS is not required to turn off the outputs of unselected memory device in a matrix. This means that both CAS and/or RAS can be decoded for chip selection. If a common CAS scheme is used where RAS is decoded for module selection, then total memory power can be conserved. If both RAS and CAS are decoded, then a two dimensional (X, Y) chip select array can be realized.

Page Mode

The "Page-Mode" feature of the RAM allows for successive memory operations at multiple column locations of the same row address with increased speed without an increase in power. This is done by strobing row address into the chip and maintaining the RAS signal at a logic 0 throughout all successive memory cycle in which the row address is common. This "Page-Mode" of operation will not dissipate the power associated with the negative going edge of RAS. Also, the time required for strobing in a new row address is eliminated, thereby decreasing the access and cycle times.

The successive memory operations in "Page-Mode" may be any sequence of read, write, or read-modify-write operations.

The page boundary of a single RAM module is limited to the 256 column locations determined by all combinations of the 8 column address bits. However, in system applications which utilize more than 65,536 data words (more than one 64K memory block), the page boundary can be extended by using CAS rather than RAS as the chip select signal. RAS is applied to all devices to latch the row address into each device and then CAS is decoded and serves as a page cycle select signal. Only those devices which receive both RAS and CAS signals will execute a read or write cycle.

Refresh

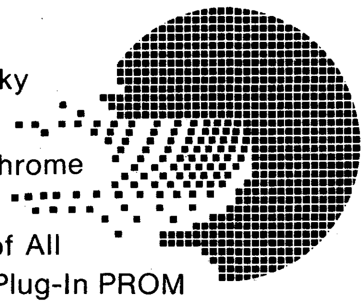
Refresh of the dynamic cell matrix is accomplished by performing a memory cycle at each of the 128 row addresses within each 2 ms time interval. Although any normal memory cycle will perform the refresh operation, this function is most easily accomplished with "RAS-Only" cycles. RAS-Only refresh results in a substantial reduction in operating power. This reduction in power is reflected in the I_{CC3} specification.

RAYTHEON

Field Programmable Read-Only Memories

29000 Series

Features



- Low Power Schottky Technology
- Highly Reliable Nichrome Fuses
- SPROM Versions of All Configurations as Plug-In PROM Replacements
- Typical SPROM "OFF" Power is 25% of Standard Power.
- SPROMs Feature Guaranteed Access Times and Full V_{CC} Tolerance Under Power-Switched Conditions.
- All Devices Use Same Programming Techniques (Generic)
- All Devices Available in both Commercial (0°C to 75°C) and Military (-55°C to +125°C) Versions.
- Packages Available
  - Flat
  - 0.3 Wide DIP
  - 0.6 Wide DIP
  - 28 Pin LCC

Absolute Maximum Ratings

(Above which the useful life may be impaired).

Junction Temperature	-65°C to +175°C
Storage Temperature	-65°C to +150°C
Temperature Under Bias	-55°C to +125°C
Supply Voltage to Ground Potential (Continuous)	-0.5V to +7.0V
DC Voltage Applied to Outputs (Except During Programming)	-0.5V to $+V_{CC}$ Max
DC Input Voltage (Address Inputs)	-0.5V to +5.5V
DC Voltage Applied to Outputs During Programming	26V
Output Current into Outputs During Programming	250mA
DC Input Voltage (Chip Select Input-Pin)	-0.5V to +33V
DC Input Current	-30mA to +5.0mA

Common Electrical Characteristics Over Operating Range (unless otherwise noted)

Parameter	Description	Test Conditions	Min	Typ[1]	Max	Units
V_{OH}	Output High Voltage	V_{CC} = Min, I_{OH} = −2.0mA V_{IN} = V_{IH} or V_{IL}	2.4	3.6		V
V_{OL}[3]	Output Low Voltage	V_{CC} = Min I_{OL} = 8.0mA V_{IN} = V_{IH} or V_{IL} I_{OL} = 16mA		0.30 0.35	0.4 0.5	V
V_{IH}	Input High Level	Guaranteed Input Logical High Voltage for All Inputs	2.0		5.5	V
V_{IL}	Input Low Level	Guaranteed Input Logical Low Voltage for All Inputs	0.0		0.8	V
I_{IL}	Input Low Current	V_{CC} = Max, V_{IN} = 0.4V		−10	−250	μA
I_{IH}	Input High Current	V_{CC} = Max, V_{IN} = 2.7V			10	μA
		V_{CC} = Max, V_{IN} = 5.5V			0.1	mA
I_{SC}	Output Short Circuit Current	V_{CC} = Max, V_{OUT} = 0.2V (Note 2)	−12	−35	−85	mA
V_I	Input Clamp Voltage	V_{CC} = Min, I_{IN} = −18mA			−1.5	V
I_{CEX}	Output Leakage Current	V_{CC} = Max V_O = 4.5V Chip Disabled V_O = 0.45V			+100 −100	μA

Notes: 1. Typical limits are at V_{CC} = 5.0V and T_A = +25°C.
2. Not more than one output should be selected at a time. Duration of the short circuit should not be more than one second.
3. This characteristic cannot be tested prior to programming; it is guaranteed by factory testing.

Electrically Erasable ROM

PRELIMINARY DATA SHEET

March 1983

Features

- **Input Latches**
- **Single 5V Supply**
- **Specified over V_{CC} ±10% Range**
- **TTL Byte Erase/Byte Write/Chip Clear**
- **1 ms or 10 ms Byte Erase/Byte Write**
- **10,000 Erase/Write Cycles per Byte**
- **Silicon Signature™ and DiTrace™**
- **Fast Read Access Time — 250 ns**
- **JEDEC Approved Byte Wide Memory Pinout**

Description

SEEQ's family of 5 volt, electrically erasable read only memories, E²ROMs, include three densities. The 52B13 and 52B13H are 2048 x 8 bit, the 52B23 and 52B23H are 4096 x 8 bit, and the 52B33 and 52B33H are 8192 x 8 bit E²ROM. Each device operates on 5 volt TTL levels in the read, write and erase modes. In addition, high voltage (14-22 volts) may be used with the 52B13 for erase and write. All devices have a chip clear mode in which the entire memory is erased in a single erase cycle. The 52B13 performs chip clear with a high voltage signal while the other devices in the family require only a TTL level signal on $\overline{OE}$. The erasure time for both chip clear and byte erase is under 10 ms for all device types. Where faster erase/write times are required, the "H" product may be used to achieve erase or write in under 1 ms.

Data, addresses, $\overline{CE}$, $\overline{CC}$ and $\overline{OE}$ are latched on the leading edge of $\overline{WE}$. The system controller needs only to maintain the $\overline{WE}$ signal during the erase/write cycle after the latches are activated. Once written, which requires under 10 ms, there is no limit to the number of times that the data may be read. Each byte may be erased and written at least 10,000 times.

This family of E²ROMs include Silicon Signature™ and DiTrace™, SEEQ's on-chip traceability feature. This feature provides the ability to trace the history of any packaged device back to the wafer level. Silicon Signature™ contains device revisions and programming information. The process lot numbers and data is written into DiTrace™.

The members of SEEQ's family of latched E²ROMs are each available in the military (-55°C to +125°C) and the extended (-40°C to +85°C) temperature ranges.

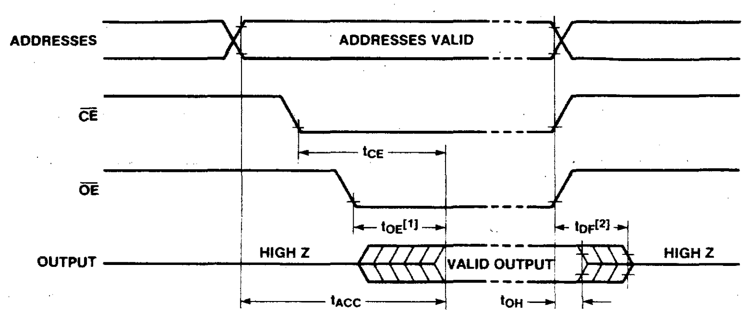
		Byte Modes — 52BXXH	1		ms
t_{WR}[6]	$\overline{WE}$ to Mode Change		50		ns

READ TIMING



Notes:
1. $\overline{OE}$ may be delayed up to t_{ACC} — t_{OE} after the falling edge of $\overline{CE}$ without impact on t_{ACC}.
2. t_{DF} is specified from $\overline{OE}$ or $\overline{CE}$, whichever occurs first.
3. This parameter is periodically sampled.
4. Maximum endurance, Q, is the number of write and erase cycles/byte.
5. After t_H, hold time, from $\overline{WE}$, the inputs $\overline{CE}$, $\overline{OE}$, $\overline{CC}$, Address and Data are latched and are "Don't Cares" until t_{WR}, Write Recovery Time, after the trailing edge of $\overline{WE}$.
6. The Write Recovery Time, t_{WR}, is the time after the trailing edge of $\overline{WE}$ that the latches are open and able to accept the next mode set-up conditions. Reference Table 1 (page 2) for mode control conditions.

5133/5143
64K/128K UV EPROM

PRODUCT DESCRIPTION

September 1983

Features

- **200 ns Access Times at 0 to 70° C**
- **Programmed Using Intelligent Algorithm**
  - **— Typically 5 ms/byte Programming Time**
  - **— 2 Minutes for 5143 (27128)**
  - **— 1 Minute for 5133 (2764)**
- **JEDEC Approved Bytewide Pin Configuration**
  - **— 5133 8K x 8 Organization**
  - **— 5143 16K x 8 Organization**
- **Low Power Dissipation**
  - **— 100 mA Active Current**
  - **— 30 mA Standby Current**
- **Extended Temperature Range Available**
- **Silicon Signature™**

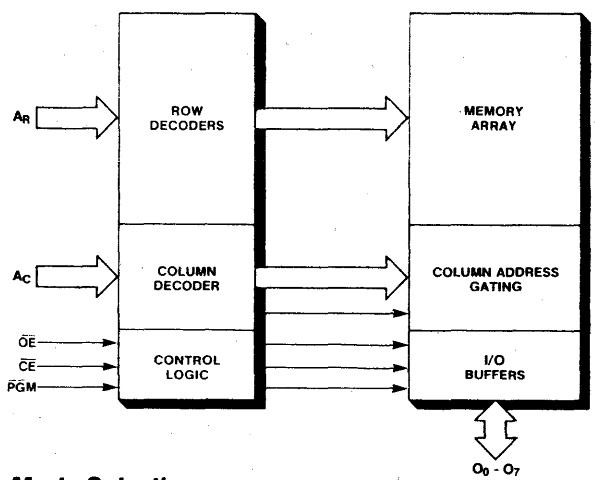
Description

SEEQ's 5133 and 5143 are ultraviolet light erasable EPROMs which are organized 8K x 8 and 16K x 8 respectively. They are pin for pin compatible to 64K and 128K EPROMs, such as the 2764 and 27128 respectively, in all operational/programming modes. Both devices have access times as fast as 200 ns over the 0 to 70° C temperature and V_{CC} tolerance range. The access time is achieved without sacrificing power since the maximum active and standby currents are 100 mA and 30 mA respectively. The 200 ns allows higher system efficiency by eliminating the need for wait states in today's 8- or 16-bit microcomputers.

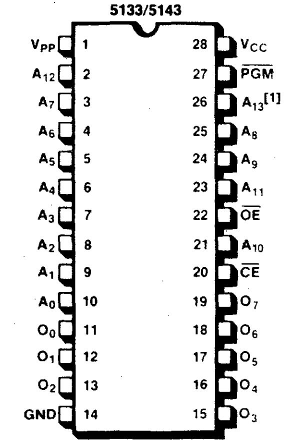
Initially, and after erasure, all bits are in the "1" state. Data is programmed by applying 21 V to V_{PP} and a TTL "0" to pin 27 (program pin). The 5133 and 5143 may be programmed with an intelligent algorithm

(continued on page 2)

Block Diagram



Pin Configuration



NOTE 1: PIN 26 IS A NO CONNECT ON THE 5133.

Mode Selection

MODE \ PINS	$\overline{CE}$ (20)	$\overline{OE}$ (22)	$\overline{PGM}$ (27)	V_{PP} (1)	V_{CC} (28)	Outputs (11-13, 15-19)
Read	V_{IL}	V_{IL}	V_{IH}	V_{CC}	V_{CC}	D_{OUT}
Standby	V_{IH}	X	X	V_{CC}	V_{CC}	High Z
Program	V_{IL}	V_{IH}	V_{IL}	V_{PP}	V_{CC}	D_{IN}

$\overline{PGM}$	PROGRAM

seeq Technology, Incorporated 1849 Fortune Drive, San Jose, California 95131 • (408) 942-1990

that is now available on commercial programmers. The programming time is typically 5 ms/byte or 2 minutes for all 16K bytes of the 5143. The 5133 requires only half of this time, about a minute for 8K bytes. This faster time improves manufacturing throughput time by hours over conventional 50 ms algorithms. Commercial programmers (e.g. Data I/O, Pro-log, Digelec, Kontron, and Stag) have implemented this fast algorithm for SEEQ's EPROMs. If desired, the 5143 and the 5133 may be programmed using the conventional 50 ms programming specification of older generation EPROMs.

Incorporated on the 5143 and 5133 is Silicon Signature™. Silicon Signature contains encoded data which identifies SEEQ as the EPROM manufacturer, the product's fab location, and programming information. This data is encoded in ROM to prevent erasure by ultraviolet light.

Absolute Maximum Stress Ratings

Temperature
- Storage .... -65° C to +150° C
- Under Bias .... -10° C to +80° C

All Inputs or Outputs with
- Respect to Ground .... +7V to -0.6V

V_{PP} During Programming with
- Respect to Ground .... +22V to -0.6V

Voltage on A_9 with
- Respect to Ground .... +15.5V to -0.6V

COMMENT: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Recommended Operating Conditions (51XX = 5133 and 5143)

	51XX-200, 51XX-250 51XX-300, 51XX-450	51XX-2, 51XX-3, 51XX-4
V_{CC} Supply Voltage(1)	5 V ± 10%	5 V ± 5%
Temperature Range (Read Mode)	0 to 70° C	0 to 70° C
V_{PP} During Programming	21 ± 0.5 V	21 ± 0.5 V

DC Operating Characteristics During Read or Programming

Symbol	Parameter		Limits Min.	Limits Max.	Unit	Test Conditions

FIELD PROGRAMMABLE GATE ARRAY (18×15×12) — 82S151

INTEGRATED FUSE LOGIC
SERIES 20

DESCRIPTION

The 82S151 is a single level logic element, consisting of 12 AND gates with fusible link connections for programming I/O polarity, I/O direction and output enable control.

All gates are linked to 6 inputs (I) and 12 bidirectional I/O lines (B). These yield variable I/O gate configurations via 3 direction control gates (D), ranging from 18 inputs to 12 outputs.

On chip T/C buffers couple either True (I, B) or Complement ($\overline{I}$, $\overline{B}$) input polarities to each AND gate. The polarity of all gate outputs is individually programmable through a set of EX-OR gates for implementing AND/NAND logic functions. Alternately, if desired, OR/NOR logic functions can also be realized by programming for each gate the complement of its inputs and output (DeMorgan's Theorem).

The 82S151 is field programmable, enabling the user to quickly generate custom patterns using standard programming equipment.

This device is available in a 20-pin slimline package. For the commercial temperature range (0°C to +75°C) specify N82S151 N or F. For the military temperature range (−55°C to +125°C) specify S82S151 F only.

FEATURES

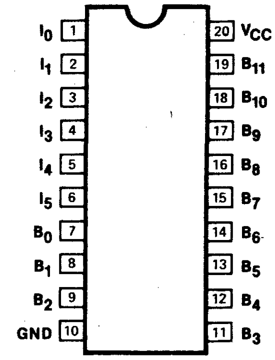
- **Field Programmable (Ni-Cr link)**
- **6 inputs**
- **15 Product Terms:**
  - **12 Logic Terms**
  - **3 Control Terms**
- **12 bidirectional I/O lines**
- **Active high or low outputs**
- **Programmable output enable**
- **Power dissipation: 650mW (typ)**
- **I/O propagation delay: 25ns (max)**
- **Input loading**
  - **N82S151: −100μA (max)**
  - **S82S151: −150μA (max)**
- **Output: three-state**
- **TTL compatible**

APPLICATIONS

- **Random gating functions**
- **Address decoding**
- **Code detectors**
- **Memory mapped I/O**
- **Fault monitors**
- **I/O port decoders**

PIN CONFIGURATION

F,N PACKAGES



F = Cerdip
N = Plastic

LOGIC FUNCTIONS

Typical Output Functions:

Active-High

$X = A \cdot \overline{B} \cdot C \cdot \ldots\ldots$

Active-Low

$\overline{X} = \overline{A \cdot \overline{B} \cdot C \cdot \ldots\ldots}$

$\overline{X} = \overline{A} + B + \overline{C} + \ldots\ldots$

NOTES:
1. For each of the 12 outputs, either function X (active-high) or $\overline{X}$ (active-low) is available, but not both. The desired output polarity is programmed via the EX-OR gates.
2. X, A, B, C, etc. are user defined connections to fixed inputs (I) and bidirectional pins (B).

NOTES
1. Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device of these or any other condition above those indicated in the operation of the device specifications is not implied.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. All voltage values are with respect to network ground terminal.
4. Test one at a time.
5. Duration of short circuit should not exceed 1 second.
6. Measured at $V_T = V_{OL} + 0.5V$.
7. I_O (OFF) at V_{OUT} = 0.45V includes I_{IL} max value and at V_{OUT} = 5.5V includes I_{IH} max value.

FIELD PROGRAMMABLE LOGIC ARRAY (18×42×10) 82S153/82S153A (T.S.)

INTEGRATED FUSE LOGIC
SERIES 20

DESCRIPTION

The 82S153 and 82S153A are two-level logic elements, consisting of 32 AND gates and 10 OR gates with fusible link connections for programming I/O polarity and direction.

All AND gates are linked to 8 inputs (I) and 10 bidirectional I/O lines (B). These yield variable I/O gate configurations via 10 direction control gates (D), ranging from 18 inputs to 10 outputs.

On chip T/C buffers couple either True (I, B) or Complement ($\overline{I}$, $\overline{B}$) input polarities to all AND gates, whose outputs can be optionally linked to all OR gates. Their output polarity, in turn, is individually programmable through a set of EX-OR gates for implementing AND/OR or AND/NOR logic functions.

The 82S153 and the 82S153A are field programmable, enabling the user to quickly generate custom patterns using standard programming equipment.

Both devices are available in a 20-pin slim line package. For the commercial temperature range (0°C to +75°C) specify N82S153 N or F and N82S153A N or F. For the military temperature range (−55°C to +125°C) specify S82S153 F only and S82S153A F only.

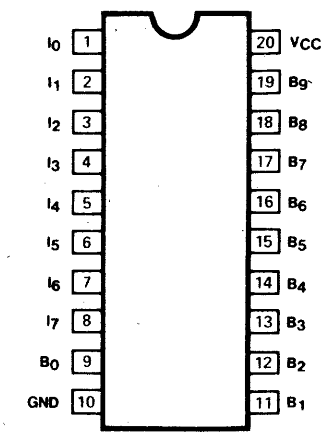
FEATURES

- **Field Programmable (Ni-Cr links)**
- **8 inputs**
- **32 AND gates**
- **10 OR gates**
- **10 bidirectional I/O lines**
- **Active high or low outputs**
- **42 Product Terms:**
  - **32 Logic Terms**
  - **10 Control Terms**
- **I/O propagation delay:**
  - **N82S153: 40ns (max)**
  - **N82S153A: 30ns (max)**
  - **S82S153: 60ns (max)**
  - **S82S153A: 45ns (max)**
- **Input loading**
  - **N82S153: −100μA (max)**
  - **S82S153: −150μA (max)**
- **Power dissipation:**
  - **650mW (typ)**
- **Output: three-state**
- **TTL compatible**

APPLICATIONS

- **Random logic**
- **Code converters**
- **Fault detectors**
- **Function generators**
- **Address mapping**
- **Multiplexing**

PIN CONFIGURATION



F = Cerdip
N = Plastic

LOGIC FUNCTION

Typical product term:
$Pn = A \cdot \overline{B} \cdot C \cdot D \cdot \ldots\ldots$
Typical logic function:
At Output Polarity = H
$Z = P0 + P1 + P2 \ldots.$

At Output Polarity = L
$\overline{Z} = \overline{P0 + P1 + P2 + \ldots.}$
$Z = \overline{P0} \cdot \overline{P1} \cdot \overline{P2} \ldots.$

NOTES:
1. For each of the 10 outputs, either function Z (active-high) or $\overline{Z}$ (active-low) is available, but not both. The desired output polarity is programmed via the EX-OR gates.
2. Z, A, B, C, etc. are user defined connections to fixed inputs (I) and bidirectional pins (B).

INTEGRATED FUSE LOGIC
SERIES 20

DESCRIPTION

The 82S159 is a three state output registered logic element combining AND/OR gate arrays with clocked J/K flip-flops, dynamically convertible to D-type via a "foldback" inverting buffer and control gate F_C. It features 8 registered I/O outputs (F), in conjunction with bidirectional I/O lines (B). These yield variable I/O gate and register configurations via control gates (D, L) ranging from 16 inputs to 12 outputs.

The AND/OR arrays consist of 32 logic AND gates, 13 control AND gates, and 21 OR gates with fusible link connections for programming I/O polarity and direction. All AND gates are linked to 4 inputs (I), bidirectional I/O lines (B), internal flip-flop outputs (Q), and Complement Array output ($\overline{C}$). The Complement Array consists of a NOR gate optionally linked to all AND gates for generating and propagating complementary AND terms.

On chip I/C buffers couple either True (I, B, Q) or Complement ($\overline{I}$, $\overline{B}$, $\overline{Q}$, $\overline{C}$) input polarities to all AND gates, whose outputs can be optionally linked to all OR gates. One group of OR gates drives bidirectional I/O lines (B), whose output polarity is individually programmable through a set of EX-OR gates for implementing AND-OR or AND-NOR logic functions. Another group drives the J-K inputs of all flip-flops, as well as asynchronous Preset and Reset lines (P, R), (except the 82S158/159, where AND functions are provided).

All flip-flops are positive edge trigger and can be used as input, output, or I/O (for interfacing with a bidirectional data bus) in conjunction with load control gates (L), steering inputs (I), (B), (Q) and programmable output select lines (E).

The 82S159 is field programmable, enabling the user to quickly generate custom patterns using standard programming equipment.

The 82S159 is available in a 20-pin, slim line package. For the commercial temperature range (0°C to +75°C) specify N82S159N or F. For the military range (−55°C to +125°C) specify S82S159F only.

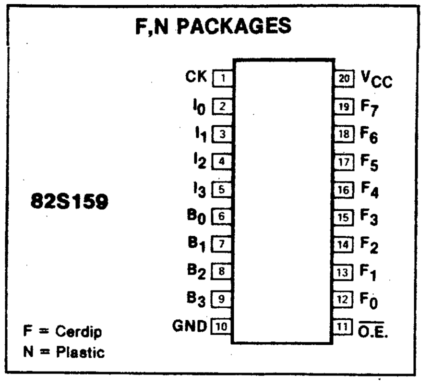
FEATURES

- Field programmable (Ni-Cr link)
- 4 dedicated inputs
- 13 control gates
- 32 AND gates
- 21 OR gates
- 45 product terms:
  32 logic terms
  13 control terms
- 4 bidirectional I/O lines
- 8 bidirectional registers
- J/K, T, or D-type flip-flops
- Asynchronous Preset/Reset
- Complement Array
- Active high or low outputs
- Programmable $\overline{O.E.}$ control
- Positive edge trigger clock
- Power-on reset on all flip-flops (F_n = "1")
- Clock frequency: N82S159: 15 MHz (max)
  S82S159: MHz (max)
- Input loading: N82S159: −100μA (max)
  S82S159: −150μA (max)
- Power dissipation: 650mW (typ)
- TTL Compatible

APPLICATIONS

- Random sequential logic
- Synchronous up/down counters
- Shift registers
- Bidirectional data buffers
- Timing function generators
- System controllers/synchronizers
- Priority encoder/registers

PIN CONFIGURATION



FLIP-FLOP TRUTH TABLE

V_{CC}	$\overline{O.E.}$	L	CK	P	R	J	K	Q	F
	H								H/HI-Z

	+10V	X	↑	X	X	L	H	L	H**
	+10V	X	↑	X	X	H	L	H	L**

NOTES

1. Positive Logic:
   $J/K = T_0 + T_1 + T_2 \ldots\ldots\ldots T_{47}$
   $T_n = \overline{C} \bullet (I_0 \bullet I_1 \bullet I_2 \ldots) \bullet (Q_0 \bullet Q_1 \ldots) \bullet (B_0 \bullet B_1 \bullet \ldots)$
2. ↑ denotes transition from Low to High level.
3. X = Don't Care
4. * = Forced at F_n pin for loading J/K flip-flop in I/O mode. L must be enabled, and other active T_n disabled via steering input(s) I, B, or Q.
5. At P = R = H, Q = H. The final state of Q depends on which is released first.
6. ** = Forced at F_n pin to load J/K flip-flop independent of program code (Diagnostic mode).

FIELD PROGRAMMABLE LOGIC SEQUENCER (14×48×6) 82S167 (T.S.)

INTEGRATED FUSE LOGIC
SERIES 24

DESCRIPTION

The 82S167 is a bipolar, programmable state machine of the Mealy type. It contains logic AND-OR gate arrays with user programmable connections which control the inputs of on-chip state and output registers. These consist respectively of 8 Q_p, and 4 Q_f edge-triggered, clocked S/R flip-flops, with an asynchronous preset option.

All flip-flops are unconditionally preset to "1" during power turn-on.

The AND array combines 14 external inputs, $I_{0\text{-}13}$, with 8 internal inputs, $P_{0\text{-}7}$, fed back from the State register to form up to 48 transition terms (AND terms). In addition, bit-0 and bit-1 of the internal state register are brought off-chip to allow extending the output register to 6 bits, if so desired.

All transition terms can include True, False, or Don't Care states of the controlling variables, and are merged in the OR array to issue next-state and next-output commands to their respective registers on the low to high transition of the Clock pulse.

Both True and Complement transition terms can be generated by optional use of the internal variable (C) from the complement array. Also, if desired, the Preset input can be converted to output-enable function, as an additional user programmable option.

The device is available in the commercial temperature range. For the commercial temperature range (0°C to +75°C) specify N82S167F or N.

FEATURES

- Field programmable (Ni-Cr link)
- 14 True/Complement buffered inputs
- 48 programmable AND gates
- 25 programmable OR gates
- 8-bit state register
- 2-bit shared state/output register
- 4-bit output register
- Transition complement array
- Programmable asynchronous preset/output enable
- Positive edge-trigger clock
- Power-on preset to logic "1" of all registers
- Automatic logic "HOLD" state via S/R flip-flops
- On-chip test array
- $f_{(max)}$: 13.9MHz (82S167)
- Power: 650mW (typ)
- TTL compatible
- Tri-state outputs
- Single +5V supply
- 300 mil wide 24-pin DIP

APPLICATIONS

- Interface protocols
- Sequence detectors
- Peripheral controllers
- Timing generators
- Sequential circuits
- Elevator controllers
- Security locking systems
- Counters
- Shift registers

FIELD PROGRAMMABLE LOGIC ARRAY (16×48×8) 82S100 (T.S.)/82S101 (O.C.)

INTEGRATED FUSE LOGIC
SERIES 28

DESCRIPTION

The 82S100 (tri-state) and 82S101 (open collector) are Bipolar, Fuse-Link Programmable Logic Arrays (FPLA). Each device utilizes the standard AND/OR/Invert architecture to directly implement custom sum of product logic equations.

Each device consists of 16 dedicated inputs and 8 dedicated outputs. Each output is capable of being actively controlled by any or all of the 48 product terms. The true, complement, or don't care condition of each of the 16 inputs ANDed together comprise one P-term. All 48 P-terms are then ORed to each output. The user must then only select which P-terms will activate an output by disconnecting terms which do not affect the output. In addition each output can be fused as active-high(H) or active-low(L).

The 82S100 and 82S101 are fully TTL compatible, and include chip-enable control for expansion of input variables, and output inhibit. They feature either open collector or tri-state outputs for ease of expansion of product terms and application in bus-organized systems.

Both devices are available in commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S100/101, F or N, and for the military temperature range (−55°C to +125°C specify S82S100/101, F, G or R.

FEATURES

- **Field programmable (Ni-Cr link)**
- **Input variables: 16**
- **Output functions: 8**
- **Product terms: 48**
- **Address access time:**
  - **S82S100/101 — 80ns max**
  - **N82S100/101 — 50ns max**
- **Power dissipation: 600mW typ**
- **Input loading:**
  - **S82S100/101: −150μA max**
  - **N82S100/101: −100μA max**
- **Chip enable input**
- **Output option:**
  - **82S100: Tri-state**
  - **82S101: Open collector**
- **Output disable function:**
  - **Tri-state — Hi-Z**
  - **Open collector — Hi**
- **Separate I/O architecture**

APPLICATIONS

- **CRT display systems**
- **Random logic**
- **Code conversion**
- **Peripheral controllers**
- **Function generators**
- **Look-up and decision tables**
- **Microprogramming**
- **Address mapping**
- **Character generators**
- **Data security encoders**
- **Fault detectors**
- **Frequency synthesizers**
- **16 bit-to-8 bit bus interface**
- **Random logic replacement**

NOTES:
1. Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and only functional operation of the device at these or any other conditions above those indicated in the operation of the device specifications is not implied.
2. All voltages are at V_{CC} = 5V, T_A = 25°C.
3. All voltage values are with respect to network ground terminal.
4. Test one at a time.
5. Measured with V_{IL} applied to $\overline{CE}$ and a logic high stored.
6. Measured with a programmed logic condition for which the output test is at a low logic level. Output sink current is applied through a resistor to V_{CC}.
7. Measured with V_{IH} applied to $\overline{CE}$.
8. Duration of short circuit should not exceed 1 second.
9. I_{CC} is measured with the chip enable input grounded, all other inputs at 4.5V and the outputs open.

FIELD PROGRAMMABLE GATE ARRAY (16×9×9) 82S102 (O.C.)/82S103 (T.S.)

INTEGRATED FUSE LOGIC
SERIES 28

DESCRIPTION

The 82S102 and 82S103 are Bipolar, fuse programmable, gate arrays. The device consists of 9 AND/NAND Gates which share 16 common inputs. The type of gate is selected by programming the output as active-high(H) or active-low(L). Each of the 16 inputs I_0–I_{15} can be programmed to provide the True (H), Complement (L), or Don't Care (—) state to each of the 9 AND/NAND gates. OR/NOR logic functions can also be implemented by complementing the inputs and outputs via on-chip inverting buffers.

Both devices are field-programmable, which means that custom patterns are immediately available.

The 82S102 and 82S103 include chip-enable control for output strobing and inhibit. They feature either open collector or tri-state outputs for ease of expansion of input variables and application in bus-organized systems.

Both devices are available in the commercial and military temperature ranges. For the commercial range (0°C to +75°C) specify N82S102/103, F or N, and for the military range (−55°C to +125°C) specify S82S102/103, F, G, and R.

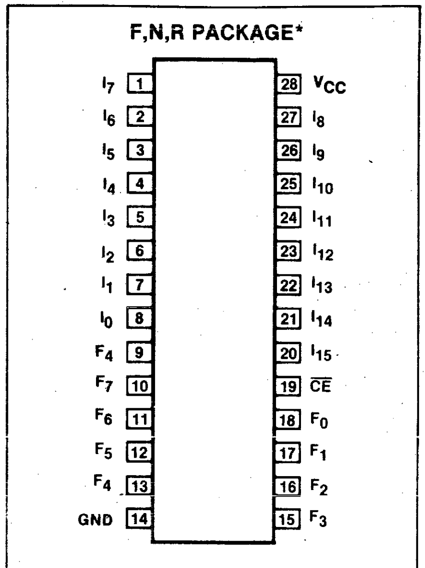
FEATURES

- **Field programmable (Ni-Cr link)**
- **16 input variables**
- **9 output functions**
- **Chip enable input**
- **I/O propagation delay:**
  - **N82S102/103: 35ns max**
  - **S82S102/103: 50ns max**
- **Power dissipation: 600mW typ**
- **Input loading:**
  - **N82S102/103: −100μA max**
  - **S82S102/103: −150μA max**
- **Output options:**
  - **82S102: Open collector**
  - **82S103: Tri-state**
- **Output disable function:**
  - **82S102: Hi**
  - **82S103: Hi-Z**
- **Fully TTL compatible**

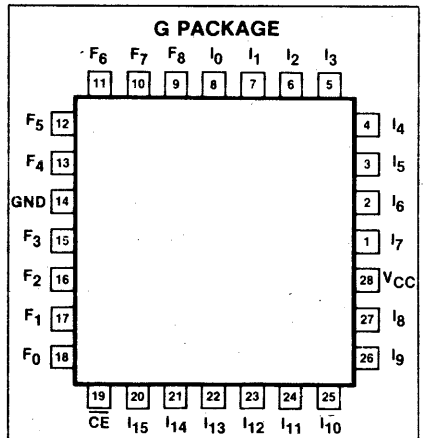
APPLICATIONS

- **Random logic**
- **Address decoders**
- **Code detectors**
- **Peripheral selectors**
- **Fault monitors**
- **Machine state decoders**

PIN CONFIGURATION



*F = Cerdip N = Plastic R = Flat Pack



G = Leadless

NOTES

1. All voltage values are with respect to network ground terminal.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. Test each output one at a time.
4. Measured with a programmed logic condition for which the output under test is at a low logic level. Output sink current is supplied through a resistor to V_{CC}.
5. Measured with V_{IL} applied to $\overline{CE}$ and a logic high at the output.
6. Measured with V_{IH} applied to $\overline{CE}$.
7. Duration of short circuit should not exceed 1 second.
8. I_{CC} is measured with the chip enable input grounded, all other inputs at 4.5V and the outputs open.

INTEGRATED FUSE LOGIC
SERIES 28

DESCRIPTION

The 82S105A is a bipolar programmable state machine of the Mealy type. It contains logic AND-OR gate arrays with user programmable connections which control the inputs of on-chip State and Output registers. These consist respectively of 6 Q_P, and 8 Q_F edge triggered, clocked S/R flip-flops, with an asynchronous Preset option. All flip-flops are unconditionally preset to "1" during power turn on.

The AND array combines 16 external inputs $I_{0\text{-}15}$ with 6 internal inputs $P_{0\text{-}5}$ fed back from the State register to form up to 48 Transition terms (AND terms). All Transition terms can include True, False, or Don't Care states of the controlling variables, and are merged in the OR array to issue next-state and next-output commands to their respective registers on the Low to High transition of the Clock pulse. Both True and Complement Transition terms can be generated by optional use of the internal input variable (C) from the Complement array. Also, if desired, the Preset input can be converted to Output-Enable function, as an additional user programmable option.

The device is available in commercial temperature range. For the commercial temperature range (0°C to +75°) specify N82S105A, F or N.

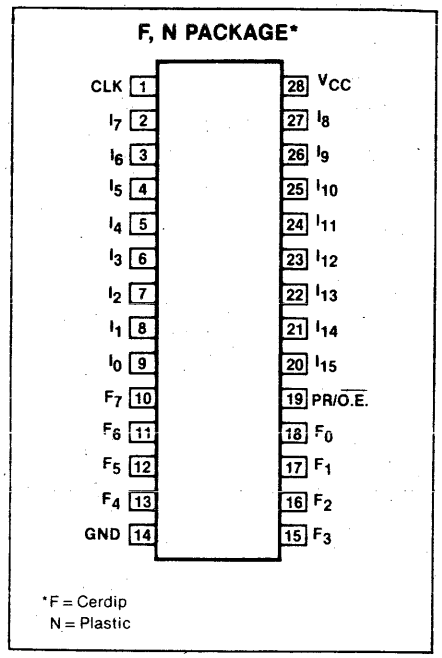
FEATURES

- **Field programmable (Ni-Cr link)**
- **16 input variables**
- **8 output functions**
- **48 transition terms**
- **6-bit state register**
- **8-bit output register**
- **Transition complement array**
- **Positive edge trigger clock**
- **Programmable asynchronous preset or output enable**
- **Power-on preset to all "1" of internal registers**
- **f(max) = 20MHz**
- **650mW power dissipation (typical)**
- **TTL compatible**
- **Single +5V supply**
- **Open collector and tri-state versions**
- **TRI-STATE outputs**

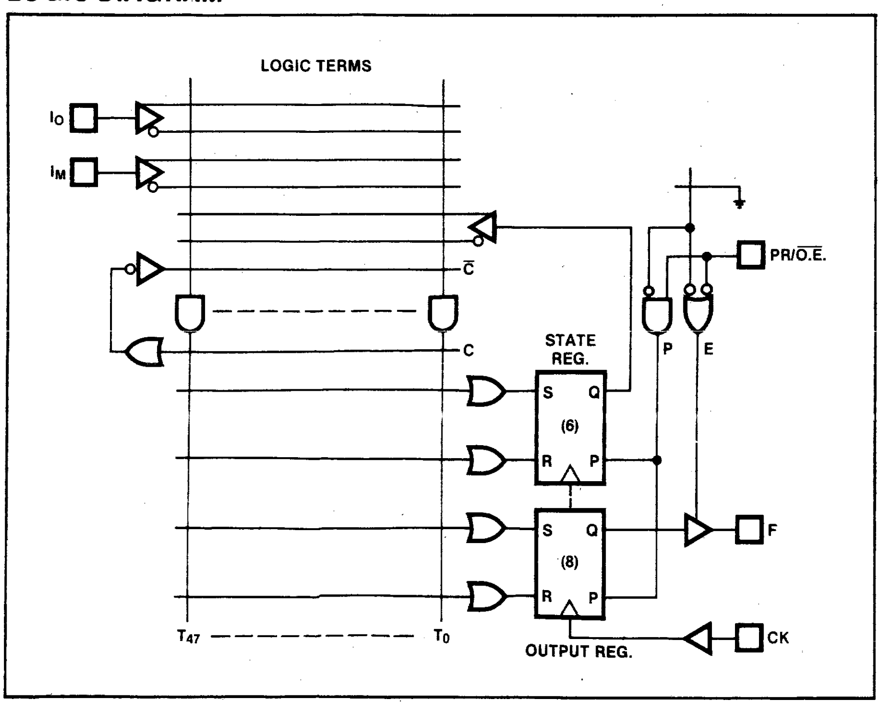
APPLICATIONS

- **Interface protocols**
- **Sequence detectors**
- **Peripheral controllers**
- **Timing generators**
- **Sequential circuits**
- **Elevator controllers**
- **Security locking systems**
- **Counters**
- **Shift registers**

PIN CONFIGURATION

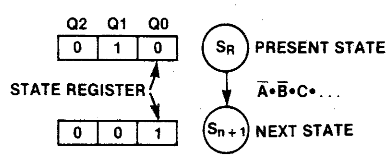


LOGIC DIAGRAM



LOGIC FUNCTION

Typical State Transition:



SET Q_0: $S_0 = (\bar{Q}_2 \cdot Q_1 \cdot \bar{Q}_0) \cdot \bar{A} \cdot \bar{B} \cdot C \ldots$
$R_0 = 0$

RESET Q_1: $S_1 = 0$
$R_1 = (\bar{Q}_2 \cdot Q_1 \cdot \bar{Q}_0) \cdot \bar{A} \cdot \bar{B} \cdot C \ldots$

HOLD Q_2: $S_2 = 0$
$R_2 = 0$

MEMORY

256-BIT BIPOLAR RAM (256×1) 82LS16 (T.S.)/82LS17 (O.C.)

DESCRIPTION

The 82LS16 and 82LS17 are Read/Write memory arrays which feature either open collector or 3-state output options for optimization of word expansion in bused organizations. Memory expansion is further enhanced by full on-chip address decoding, 3 chip enable inputs and PNP input transistors which reduce input loading.

During Write operation, the logical state of the output of both devices follows the complement of the data input being written. This feature allows faster execution of Write/Read cycles, enhancing the performance of systems utilizing indirect addressing modes, and/or requiring immediate verification following a Write cycle.

Both devices have fast Read access and Write cycle times, as well as low power requirements and thus are ideally suited in high-speed memory applications such as cache, buffers, scratch pads, writable control stores, where power limitations are of major concern.

Both devices are available in the commercial temperature range (0°C to +75°C) and the military temperature range (−55°C to +125°C). They are specified as: N82LS16F or N or N82LS17F or N for the commercial temperature range, and S82LS16F, G, or W or S82LS17F, G, or W for the military temperature range. Military products are available as fully processed to Mil-Std 883 Level B or Level C; specify either 883B or 883C.

See page 4-9 for Truth Table, Timing Diagrams, Test Circuit and Waveform.

FEATURES

- **Address access time:**
  N82LS16/17: 40ns max
  S82LS16/17: 60ns max
- **Write cycle time:**
  N82LS16/17: 40ns max
  S82LS16/17: 65ns max
- **Power dissipation: 0.98mW/bit typ**
- **Input loading:**
  N82LS16/17: −100μA max
  S82LS16/17: −250μA max
- **Output follows complement of data input during Write**
- **On-chip address decoding**
- **Output option:**
  82LS16 3-state
  82LS17 Open collector
- **Schottky clamped**
- **TTL compatible**

APPLICATIONS

- **Buffer memory**
- **Writable control store**
- **Memory mapping**
- **Push down stack**
- **Scratch pad**

NOTES

1. All typical values are at V_{CC} = 5V, T_A + 25°C.
2. All voltage values are with respect to network ground terminal.
3. Test each input one at a time.
4. Measured with a logic low stored and V_{IL} applied to $\overline{CE1}$, $\overline{CE2}$ and $\overline{CE3}$.
5. Measured with a logic high stored. Output sink current is supplied through a resistor to V_{CC}.
6. Measured with V_{IH} applied to $\overline{CE1}$, $\overline{CE2}$ and $\overline{CE3}$.
7. Duration of the short-circuit should not exceed 1 second.
8. I_{CC} is measured with the Write enable and memory enable inputs grounded, all other inputs at 4.5V, and the output open.
9. Minimum required to guarantee a Write into the slowest bit.

2304-BIT BIPOLAR RAM (256×9) 82S212A (T.S.)

DESCRIPTION

The organization of the 82S212A allows byte wide storage of data, including parity. Where parity is not required, the ninth bit can be used as a tag for each word stored. The 82S212A is ideal for scratch-pad, push-down stacks, buffer memories, and other internal memory applications in which space and performance requirements dictate a wide data path in favor of word depth.

The 82S212A data inputs and outputs are common (common I/O) with separate output disable (OD) line that allows ease of read/write operations using a common bus.

The 82S212A is available in the commercial temperature range. For the commercial temperature range (0°C to 75°C) specify N82S212AF or N.

FEATURES

- **Address access time:**
  N82S212A: 35ns max
- **Power dissipation: 0.3mW/bit**
- **Tri-state outputs**
- **Schottky clamped TTL**

APPLICATIONS

- **Cache memory**
- **Buffer storage**
- **Writable control store**

1. The operating embient temperature ranges are guaranteed with transverse air flow exceeding 400 linear feet per minute and a 2 minute warmup.
2. All voltages are with respect to network ground terminal.
3. All typical values are at V_{CC} = 5V, T_A = 25°C.
4. Measured on one pin at a time.
5. Duration of I_{OS} test should not exceed one second.
6. Measured at a delta of 0.5V from Logic Level with R_1 = 750Ω, R_2 = 750Ω and C_L = 5pF.

Signetics

MEMORY

256-BIT BIPOLAR PROM (32×8) 82S23A (O.C.)/82S123A (T.S.)

DESCRIPTION

The 82S23A and 82S123A are field programmable, which means that customer patterns are immediately available by following the fusing procedure given in this data manual. The 82S23A and 82S123A devices are supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

These devices include on-chip decoding and 1 chip enable input for memory expansion. They feature either open collector or tri-state outputs for optimization of word expansion in bused organizations.

Both 82S23A and 82S123A devices are available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S23A/123A, N or F, and for the military temperature range (−55°C to +125°C) specify S82S23A/123A, F or W.

FEATURES

- **Address access time:**
  - **N82S23A/123A: 25ns max**
  - **S82S23A/123A: 35ns max**
- **Power dissipation: 1.3mW/bit typ**
- **Input loading:**
  - **N82S23A/123A: −100μA max**
  - **S82S23A/123A: −150μA max**
- **On-chip address decoding**
- **Output options:**
  - **82S23A: Open collector**
  - **82S123A: Tri-state**
- **No separate fusing pins**
- **Unprogrammed outputs are low level**
- **Fully TTL compatible**

APPLICATIONS

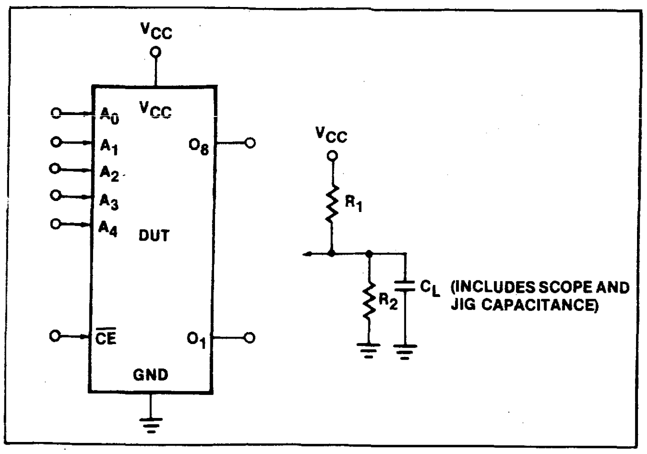
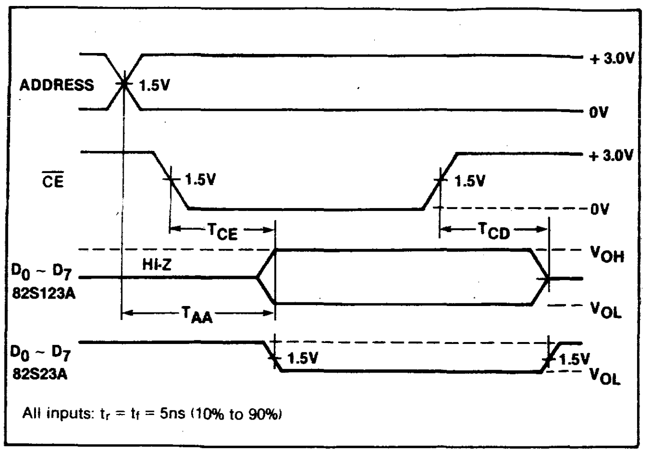
NOTES
1. Positive current is defined as into the terminal referenced.
2. All voltages with respect to network ground.
3. Duration of short circuit should not exceed 1 second.
4. Tested at an address cycle time of 1μsec.
5. Typical values are at V_{CC} = 5V, T_A = 25°C.

TEST LOAD CIRCUIT



VOLTAGE WAVEFORM



1024-BIT BIPOLAR PROM (256×4)

82S126A (O.C.)/82S129A (T.S.)

DESCRIPTION

The 82S126A and 82S129A are field programmable, which means that customer patterns are immediately available by following the fusing procedure given in this data manual. The 82S126A and 82S129A devices are supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

These devices include on-chip decoding and 2 chip enable input for ease of memory expansion. They feature either open collector or tri-state outputs for optimization of word expansion in bused organizations.

Both 82S126A and 82S129A devices are available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S126A/129A, F or N, and for the military temperature range (−55°C to +125°C) specify S82S126A/129A, F or R.

FEATURES

- **Address access time:**
  - **N82S126A: 30ns max**
  - **N82S129A: 27ns max**
  - **S82S126A/129A: 35ns max**
- **Power dissipation: 0.5mW/bit typ**
- **Input loading:**
  - **N82S126A/129A: −100μA max**
  - **S82S126A/129A: −150μA max**
- **On-chip address decoding**
- **Output options:**
  - **82S126A: Open collector**
  - **82S129A: Tri-state**
- **No separate fusing pins**
- **Unprogrammed outputs are low level**
- **Fully TTL compatible**

APPLICATIONS

- **Prototyping/volume production**
- **Sequential controllers**
- **Microprogramming**
- **Hardwired algorithms**
- **Control store**
- **Random logic**
- **Code conversion**

MEMORY

2048-BIT BIPOLAR PROM (256×8) 82LS135 (T.S.)

DESCRIPTION

The 82LS135 is field-programmable, which means that custom patterns are immediately available by following the fusing procedure given in this data manual. The standard devices are supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

The 82LS135 includes on-chip decoding and two chip enable inputs for ease of memory expansion, and features tri-state outputs for optimization of word expansion in bused organizations.

The 82LS135 device is available in the commercial temperature range (0°C to 75°C), and is specified as N82LS135F or N.

FEATURES

- **Address access time: 100ns max.**
- **Power dissipation: 200μW/bit typ**
- **Input loading: -100μA max**
- **Two chip enable inputs**
- **On chip address decoding**
- **No separate fusing pins**
- **Fully TTL compatible**

APPLICATIONS

2. All voltages with respect to network ground.
3. Duration of short circuit should not exceed 1 second.
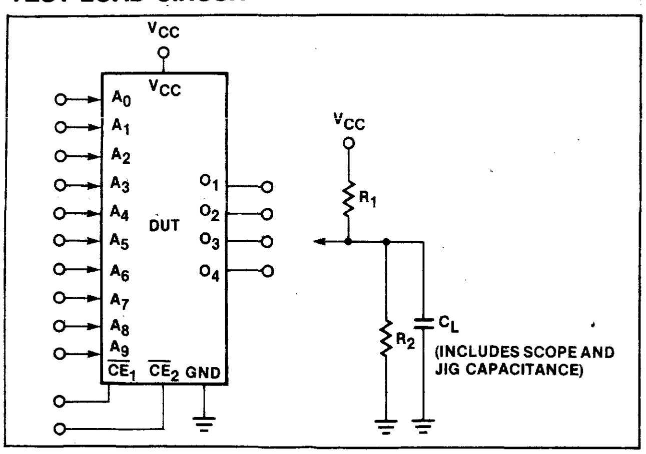
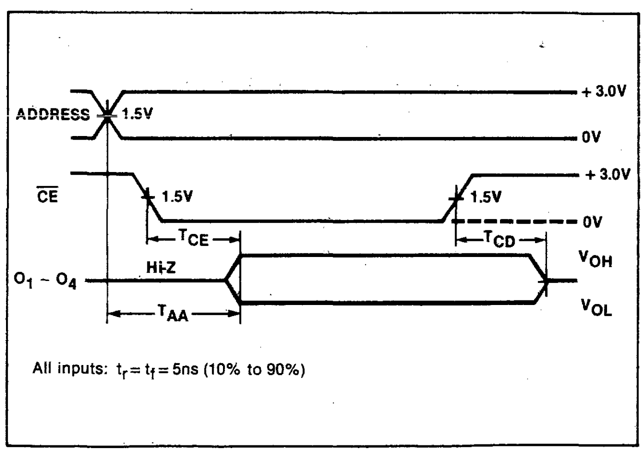
4. Tested at an address cycle time of 1μsec.
5. Typical values are at V_{CC} = 5V, T_A = 25°C.

TEST LOAD CIRCUIT



VOLTAGE WAVEFORM



4096-BIT BIPOLAR PROM (512×8)

82S147A (T.S.)

DESCRIPTION

The 82S147A is field-programmable, which means that custom patterns are immediately available by following the fusing procedure given in this data manual. The standard devices are supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

The 82S147A includes on-chip decoding and one chip enable input for ease of memory expansion, and features tri-state outputs for optimization of word expansion in bused organizations.

The 82S147A device is available in the commercial temperature range (0°C to +75°C), and is specified as N82S147A, F or N.

FEATURES

- **Address access time: 45ns max**
- **Power dissipation: 853mW max**
- **Input loading: −100µA max**
- **One chip enable input**
- **On chip address decoding**
- **No separate fusing pins**
- **Fully TTL compatible**

APPLICATIONS

- **Prototyping/volume production**
- **Sequential controllers**
- **Microprogramming**
- **Hardwired algorithms**
- **Control store**
- **Random logic**
- **Code conversion**

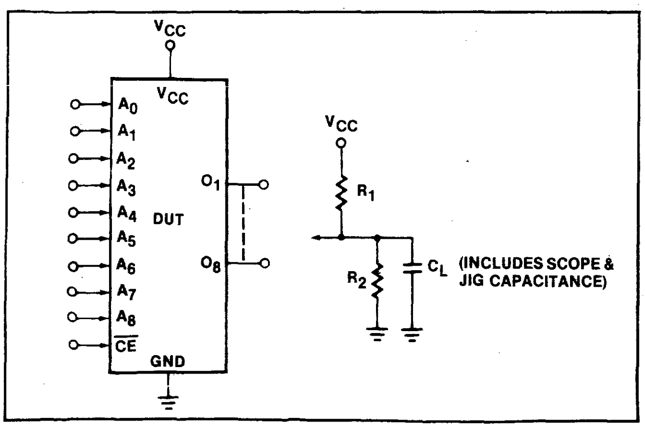
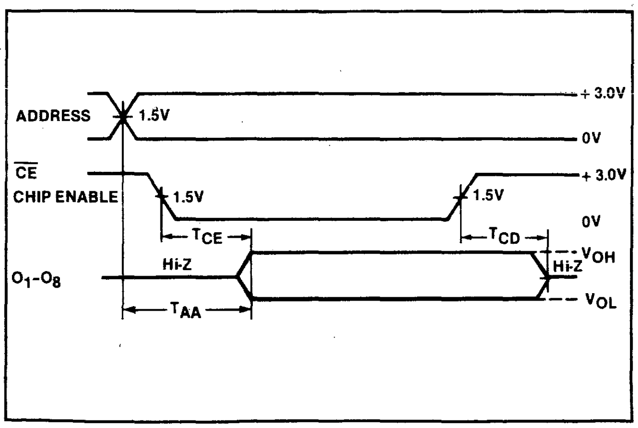
TEST LOAD CIRCUIT



VOLTAGE WAVEFORM



8192-BIT BIPOLAR PROM (1024×8)

82S181A/82S181B (T.S.)

DESCRIPTION

The 82S181 is field-programmable, which means that custom patterns are immediately available by following the fusing procedure given in this data manual. The 82S181 is supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

This device includes on-chip decoding and 4 chip enable inputs for ease of memory expansion. It features 2 tri-state outputs for optimization of word expansion in bused organizations.

The 82S181 is available in both the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S181AF or N or N82S181BF or N, and for the military temperature range (−55°C to +125°C) specify S82S181A, R, F, G.

FEATURES

- **Address access time:**
  N82S181A: 55ns max
  N82S181B: 45ns max
  S82S181A: 80ns max
- **Power dissipation: 76μW/bit typ**
- **Input loading:**
  N82S181: −100μA max
  S82S181: −150μA max
- **On-chip address decoding**
- **Output:**
  82S181: tri-state
- **No separate fusing pins**
- **Unprogrammed outputs are low level**
- **Fully TTL compatible**

APPLICATIONS

- **Prototyping/volume production**
- **Sequential controllers**
- **Microprogramming**
- **Hardwired algorithms**
- **Control store**
- **Random logic**
- **Code conversion**

16,384-BIT BIPOLAR PROM (4096×4)

82HS195(T.S.)

Advance Information

DESCRIPTION

The 82HS195 is field programmable, which means that custom patterns are immediately available by following the Generic II fusing procedure. The standard 82HS195 is supplied with all outputs at logical high. Outputs are programmed to a logic low level at any specified address by fusing a programmable matrix.

This device includes on-chip decoding and 2 chip enable inputs for memory expansion. It features tri-state outputs for optimization of word expansion in bused organizations.

The 82HS195 device is available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S195, F or N, and for the military temperature range (−55°C to +125°C) specify S82S195, F.

FEATURES

- **Low power dissipation: 35μW/bit typ**
- **Address access time:**
  - **N82HS195: 30ns max**
  - **S82HS195: 40 ns max**
- **Input loading:**
  - **N82HS195: −100μA max**
  - **S82HS195: −150μA max**
- **On-chip address decoding**
- **No separate fusing pins**
- **Unprogrammed outputs are high level**
- **Fully TTL compatible**

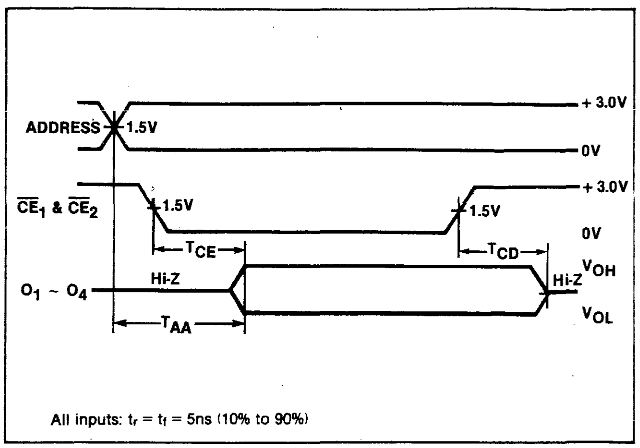
VOLTAGE WAVEFORM



Signetics

MEMORY

32,768-BIT BIPOLAR PROM (4096×8) 82HS321(T.S.)

Preliminary

DESCRIPTION

The 82HS321 is field programmable, which means that custom patterns are immediately available by following the Generic II fusing procedure. The 82HS321 is supplied with all outputs at a logical high. Outputs are programmed to a logic low level at any specified address by fusing a programmable matrix.

This device includes on-chip decoding and 2 chip enable inputs for ease of memory expansion. It features tri-state outputs for optimization of word expansion in bused organizations.

The 82HS321 device is available in the commercial and military ranges. For the commercial temperature range (0°C to +75°C) specify N82HS321, F, N, and for the military temperature range (−55°C to +125°C) specify S82HS321, F, R or G.

FEATURES

- Address access time:
  - N82HS321: 45ns max
  - S82HS321: 60ns max
- Power dissipation: 20μW/bit typ
- Input loading:
  - N82HS321: −100μA max
  - S82HS321: −150μA max
- 2 chip enable inputs
- On-chip address decoding
- No separate fusing pins
- Unprogrammed outputs are high level
- Fully TTL compatible

APPLICATIONS

- Prototyping/volume production
- Sequential controllers
- Microprogramming
- Hardwired algorithms
- Control store
- Random logic
- Code conversion

65,536-BIT CMOS EPROM (8192×8) — 27C64

Advance Information

DESCRIPTION

The Signetics 27C64 EPROM is a static complementary MOS (CMOS) 5V only, 65,536-bit electrically programmable and ultraviolet light erasable read only memory, organized as 8192 words by 8 bits.

The 27C64 has a separate Output Enable control ($\overline{G}$) from the Chip Enable Control ($\overline{E}$), in order to eliminate bus contention in multiple bus systems.

The 27C64 typically consumes only 5μW power either in standby mode ($\overline{E} = V_{CC}$) or in quiescent active mode ($\overline{E} = V_{SS}$ pausing on one address location with $V_{IN} = V_{CC}$ or V_{SS}).

FEATURES

- **Low CMOS power consumption — 5μW typ. (standby or quiescent active) 25mW typ. (active)**
- **200ns access time**
- **TTL compatible**
- **Single +5V power supply**
- **Industry standard pinout**
- **Three-state outputs**
- **Two line controls**
- **Fast programming**

131,072-BIT NMOS EPROM (16,384×8) 27128

Preview

DESCRIPTION

The Signetics 27128 EPROM is an NMOS, 5V only, 131,072-bit electrically programmable and ultraviolet light erasable read only memory, organized as 16,384 words by 8 bits. The 27128 has a separate Output Enable control ($\overline{G}$) from the Chip Enable control ($\overline{E}$), in order to eliminate bus contention in multiple bus systems.

The 27128 has a standby mode to reduce the power dissipation with no increase in access time. The maximum active current is 100mA while the standby current is 40mA from the power supply. This mode is initiated by placing a TTL-high signal on the $\overline{E}$ input.

FEATURES

- **250ns access time**
- **TTL compatible**
- **Single +5V power supply ±10%**
- **Industry standard pinout**
- **Power down mode with 30mA maximum power supply current**
- **Three-state outputs**
- **Two line controls**

Preview

AC ELECTRICAL CHARACTERISTICS DURING READ (Note 2) $T_A = 0°$ to $+70°C$, $V_{CC} = 5V \pm 10\%$, unless otherwise specified, $V_{PP} = V_{CC}$

STANDARD SYMBOL	COMMON SYMBOL	PARAMETER	TEST CONDITIONS (Note 2)	LIMITS 27128-20 Min	Max	27128-25 Min	Max	27128-30 Min	Max	UNIT
t_{AVQV}	t_{ACC}	Address Access Time	$\overline{E} = \overline{G} = V_{IL}$		200		250		300	ns
t_{ELQV}	t_{CE}	Chip Select Delay	$\overline{G} = V_{IL}$		200		250		300	ns
t_{GLQV}	t_{OE}	Output Enable Delay	$\overline{E} = V_{IL}$ (Note 3)	10	70	10	100	10	150	ns
t_{EHQX} t_{GHQX}	t_{DF}	Chip Deselect Delay (Note 4)	$\overline{E} = V_{IL}$ t_{DF} is measured at $V_{OL} = 0.5$ to tri-state (High-Z) transition	0	60	0	90	0	130	ns
t_{AXQX}	t_{OH}	Previous Output Data Holding Time	From Addresses, $\overline{E}$ or $\overline{G}$ whichever occurred first $\overline{E} = \overline{G} = V_{IL}$	0		0		0		ns

NOTES
2. AC TEST CONDITIONS:
Output load 2 TTL gates and $C_L = 100pF$
Input rise and fall times: $\leq 20ns$
Input pulse levels: 0.8V to 2.2V
Timing measurement reference levels:
Inputs 1.5V
Outputs 0.6V and 2.2V
3. G may be delayed up to $t_{AVQV} - t_{GLQV}$ after $\overline{E}$ without impact on t_{AVQV}.
4. t_{EHQX} is specified from $\overline{G}$ or $\overline{E}$, whichever occurs first.

DC ELECTRICAL CHARACTERISTICS DURING PROGRAMMING (Note 5) $T_A = 25 \pm 5°C$, $V_{CC} = 5V \pm 5\%$, $V_{PP} = 21V \pm 0.5V$

SYMBOL	PARAMETER	TEST CONDITIONS	LIMITS Min	Typ	Max	UNIT
V_{IL}	Input Voltage — Low		−0.1		0.8	V
V_{IH}	Input Voltage — High		2.0		$V_{CC}+1$	
V_{OL}	Output Voltage During Verify — Low	$I_{OL} = 3.2mA$			0.45	V
V_{OH}	Output Voltage During Verify — High	$I_{OH} = 400\mu A$	2.4			
I_{LI}	Input Load Current	$V_{IN} = 5.25V$ or V_{IL}			10	µA
I_{CC2}	V_{CC} Supply Current — Active				100	mA
I_{PP2}	V_{PP} Supply Current During Programming Pulse	$\overline{E} = \overline{PGM} = V_{IL}$ $V_{PP} = 21.5V$, DQ_0-$DQ_7 = V_{IL}$			30	mA

NOTE
5. V_{CC} must be applied before and removed after V_{PP}. V_{PP} should never exceed 21.5V (including transients). If $\overline{PGM} = V_{IL}$, V_{PP} should not be switched.

AC ELECTRICAL CHARACTERISTICS DURING PROGRAMMING (Note 7) $T_A = 25 \pm 5°C$, $V_{CC} = 5V \pm 5\%$, $V_{PP} = 21V \pm 0.5V$

STANDARD SYMBOL	COMMON SYMBOL	PARAMETER	TEST CONDITIONS (Note 2)	LIMITS Min	Typ	Max	UNIT
t_{AVPL}	t_{AS}	Address Set-up Time		2			µS
t_{DVPL}	t_{DS}	Data Set-up Time		2			µS
t_{PHDX}	t_{DH}	Data Hold Time		2			µS
t_{VHPL}	t_{VPPS}	V_{PP} Set-up Time		2			µS
t_{ELPL}	t_{CES}	$\overline{E}$ Set-up Time		2			µS
t_{PLPH}	t_{PW}	$\overline{PGM}$ Pulse Width During Programming		45	50	55	mS
t_{GHPL}	t_{OES}	$\overline{G}$ Set-up Time		2			µS
t_{GHQX} t_{EHQZ}	t_{DF}	Chip Deselect Delay (Note 6)	$\overline{E} = V_{IL}$	0		130	ns
t_{PHAX}	t_{AH}	Address Hold Time			0		ns

NOTES
6. t_{GHQX} is specified from $\overline{G}$ or $\overline{E}$, whichever occurs first.
7. The input reference level is 1V for V_{IL} and 2V for V_{IH}.

65,536-BIT STATIC MOS ROM (8192×8)

2364-15/20

DESCRIPTION

This ROM is designed for memory applications where high performance, large bit storage, and simple interfacing are important design objectives.

The four Chip Select inputs are programmable. Active-high or active-low level Chip Select input can can be defined by the designer and the desired chip select logic level is fixed during the masking process. The programmable Chip Select input, as well as OR-tie compatibility on the outputs, facilitates easy memory expansion.

The 2364 Read-Only Memory is fabricated with n-channel silicon gate technology. This technology provides the designer with high performance, easy-to-use MOS circuits.

FEATURES

- **Fast access time**
- **Industry standard pinout — JEDEC approved**
- **Completely TTL compatible**
- **One +5V ±10% power supply**
- **Low power dissipation**
- **Three-state output — OR-tie capability**
- **Four programmable Chip Select inputs for easy memory expansion or no connection option**
- **Inputs protected — all inputs have protection against static charge**
- **2764 EPROM compatible**

ABSOLUTE MAXIMUM RATINGS (Note 1)

PARAMETER	RATING	UNIT
Operating Temperature 2364-XX	0 to +70	°C
2364E-XX	−40 to +85	°C
Storage Temperature	−65 to +150	°C
Voltage on Any Pin Relative to Ground	−2 to +7	V
Power Dissipation	1	Watt
Electrostatic Discharge Rating Relative to Ground (Note 2)	±2000	V

NOTES

1. Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only. Functional operation of this device at these any any other conditions above those indicated in the operational sections of this specification is not implied and exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Test condition. Discharge 100pF through 1500 ohms, MIL-STD 883, method 3015.1.

131,072-BIT STATIC MOS ROM (16,384×8) 23128-15/20

DESCRIPTION

This ROM is designed for memory applications where high performance, large bit storage, and simple interfacing are important design objectives.

The three Chip Select inputs are programmable. Active-high or active-low level Chip Select input can can be defined by the designer and the desired chip select logic level is fixed during the masking process. The programmable Chip Select input, as well as OR-tie compatibility on the outputs, facilitates easy memory expansion.

The 23128 Read-Only Memory is fabricated with n-channel silicon gate technology. This technology provides the designer with high performance, easy-to-use MOS circuits.

FEATURES

- **Fast access time**
- **Industry standard pinout — JEDEC approved**
- **Completely TTL compatible**
- **One +5V ±10% power supply**
- **Low power dissipation**
- **Three-state output — OR-tie capability**
- **Four programmable Chip Select inputs for easy memory expansion or no connection option**
- **Inputs protected — all inputs have protection against static charge**

131,072-BIT STATIC MOS ROM (16,384×8) 23128/23128E/23128M

DESCRIPTION

This ROM is designed for memory applications where high performance, large bit storage, simple interfacing and wide operating temperature range are important design objectives.

The Chip Select inputs are programmable. Active-high or active-low level Chip Select input can be defined by the designer and the desired chip select logic level is fixed during the masking process. The programmable Chip Select input, as well as OR-tie compatibility on the outputs, facilitates easy memory expansion.

The 23128 Read-Only Memory is fabricated with n-channel silicon gate technology. This technology provides the designer with high performance, easy-to-use MOS circuits.

FEATURES

- **Fast access time**
  - **— 250ns max. 23128-25**
  - **— 300ns max. 23128M**
- **Industry standard pinout — JEDEC approved**
- **Completely TTL compatible**
- **Single +5V ±10% power supply**
- **Low power dissipation**
- **Three-state output — OR-tie capability**
- **Three programmable Chip Select inputs for easy memory expansion**
- **Inputs protected — all inputs have protection against static charge**
- **27128 compatible**

MEMORY

262,144-BIT STATIC MOS ROM (32,768×8) — 23256A

Preliminary

DESCRIPTION

The 23256A is a 262,144-bit read-only memory organized as 32,768 words by 8 bits. The pinout conforms to JEDEC standards for byte-wide memories.

The 23256A is a fully static device; it goes into low power, standby mode when pin 20 ($\overline{E}$), is held high. Either $\overline{G}$ or $\overline{E}$ may be used for output control to eliminate bus contention.

The 23256A is fabricated using high performance n-channel silicon gate MOS technology.

FEATURES

- **Completely TTL compatible, 2 TTL loads**
- **Single +5V ±10% power supply**
- **Three-state outputs**
- **Fast access time — 200ns**
- **Fully static**
- **Low standby power**
- **JEDEC approved byte-wide pinout**
- **Inputs and outputs protected against static charge**

ABSOLUTE MAXIMUM RATINGS (Note 1)

PARAMETER	RATING	UNIT
Operating Temperature	0 to +70	°C
Storage Temperature	−65 to +150	°C
Voltage on Any Pin Relative to Ground	−2 to +7	V
Power Dissipation	1	Watt
Electrostatic Discharge Rating Relative to Ground (Note 2)	±2000	V

NOTES
1. Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied and exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Test condition. Discharge 100pF through 1500 ohms, MIL-STD 883, method 3015.1.

PIN NAMES

A_0-A_{14}	Address Inputs
$\overline{E}$	Chip Enable
$\overline{G}$	Output Enable

65,536-BIT STATIC MOS ROM (TWO 4096×8 BANKS) — 26S64-30/45

DESCRIPTION

The 26S64 is a mask-programmable, 8192 words by 8 bits Read-Only Memory, partitioned into two banks of 4096 words by 8 bits. Each half can be accessed by a 12-bit address, A_0 through A_{11}, and switching from one bank to the other is effected by a pair of bank-select addresses, FF8 and FF9. The address FF8 accesses the bank containing locations 0000 through 0FFF, and FF9 accesses the bank containing locations 1000 through 1FFF. The bank-select locations, 1FF8 and 0FF9, must be programmed with a no-operation (NOP) instruction.

The 26S64 has two user-programmable chip selects, along with three-state outputs, allowing easy memory expansion. It is suitable for applications where 12 address lines must be used to access 8192 words of memory, the 13th address bit is internally generated and latched, in response to bank select address FF8 or FF9.

The 26S64 is manufactured with n-channel silicon gate MOS technology, and all inputs and outputs are TTL compatible.

FEATURES

- **Fast access time**
- **Organized as two 4K × 8 banks**
- **Access 8K bytes with 4K system address capability**
- **Industry standard pinout**
- **Low power dissipation**
- **TTL compatible inputs and outputs**
- **Single +5V ±10% power supply**
- **Three-state outputs — OR-tie capability**
- **Electrostatic discharge protection**

NOTES
3. Input levels that swing more negative than −2.0V may alter AC electrical characteristics.
4. This parameter is periodically sampled and is not 100% tested.

AC ELECTRICAL CHARACTERISTICS $V_{CC} = 5.0V \pm 10\%$

PARAMETER		26S64-30 Min	26S64-30 Max	26S64-45 Min	26S64-45 Max	UNIT
t_{AVQV}	Address access time (Note 5)		300		450	ns
t_{SVQV}	Chip select delay (Note 6)		120		150	ns
t_{SXQZ}	Chip deselect delay (Note 7)		100		100	ns
t_{AXQX}	Previous data valid after address change delay	0		0		ns

NOTES
5. Following a change of banks, at least two times t_{AVQV} must elapse before a valid access may be exercised.
6. t_{SVQV} is at value indicated, provided the valid address leads the chip select by (t_{AVQV}-t_{SVQV}) ns or more.
7. t_{SXQZ} is measured at $V_{OL} = 0.5V$ on the "0" to High-Z state transition, with AC test load connected to the output.
8. Bank select can be effected only while chip is selected, and bank switch address is held valid for at least 100ns.
9. At power-up the 26S64 may come up in either bank; proper initialization is required.

Rotating Memory Integrated Circuit Capabilities

Silicon Systems is a semiconductor company dedicated primarily to the design and production of "application specific" integrated circuits. SSi sometimes works closely with a group of equipment manufacturers to develop an IC. Often these IC's become the "standard products" of the industry. Such is the case with Silicon Systems' family of read/write IC's for the rotating memory market.

SSi's first read/write Winchester IC developed in 1976

In 1976 Silicon Systems developed its first read/write monolithic bipolar integrated circuit for the IBM 3350 Winchester disk drive PCM (plug-compatible memory) market. Called the SSi 104, it integrated all of the required read, write, control, and data protection functions on one chip. Assembled in a flat pack, the device could be mounted directly on the head-arm assembly. The SSi 104 soon became the industry standard.

A broad line of Rotating Memory IC's

SSi now has several varieties of read/write products including the SSi 115 with 2, 4, or 5 channels, the SSi 117 with 4 to 6 channels, and the SSi 501 with 8 channels. For thin-film-head applications, SSi has the 4-channel SSi 114. SSi also has servo preamps including the SSi 101 for ferrite-head drives and the SSi 116 for thin-film-head drives. SSi has defined a floppy-disk read/write IC, the soon-to-be released SSi 570.

IC's for streamers, tape drives, and controllers, too

If you don't see the product you need, it may be on our standard product list soon. We serve the disk drive market more completely than anyone else with our standard line of circuits, and we have also developed a score of custom IC's of various designs and functions for the rotating memory market: IC's for spindle control, data paths, IC's for data separation and controllers too. So, if the exact circuit you need isn't already in our line — we have the technology and experience to make a custom chip for you.

- Hidden Refresh Mode

description

The '4256 and '4257 are high-speed, 262,144-bit dynamic random-access memories, organized as 262,144 words of one bit each. They employ state-of-the-art SMOS (scaled MOS) N-channel double-level polysilicon gate technology for very high performance combined with low cost and improved reliability.

These devices feature maximum $\overline{\text{RAS}}$ access times of 100 ns, 120 ns, 150 ns, or 200 ns. Typical power dissipation is 200 mW operating and 16.5 mW standby.

New SMOS technology permits operation from a single +5-V supply, reducing system power supply and decoupling requirements, and easing board layout. I_{DD} peaks are 150 mA typical, and a −1-V input voltage undershoot can be tolerated, minimizing system noise considerations.

All inputs and outputs, including clocks, are compatible with Series 74 TTL. All address and data-in lines are latched on chip to simplify system design. Data-out is unlatched to allow greater system flexibility.

description

The TMS4464 is a high-speed, 262,144-bit dynamic random-access memory, organized as 65,536 words of four bits each. It employs state-of-the-art SMOS (scaled MOS) N-channel double-level polysilicon gate technology for very high performance combined with low cost and improved reliability.

This device features maximum $\overline{RAS}$ access times of 100 ns, 120 ns, 150 ns, or 200 ns. Typical power dissipation is 350 mW operating and 16.5 mW standby.

New SMOS technology permits operation from a single +5-V supply, reducing system power supply and decoupling requirements, and easing board layout. I_{DD} peaks are 150 mA typical, and a −1-V input voltage undershoot can be tolerated, minimizing system noise considerations.

All inputs and outputs, including clocks, are compatible with Series 74 TTL. All address and data-in lines are latched on chip to simplify system design. Data-out is unlatched to allow greater system flexibility.

The TMS4464 is offered in an 18-pin dual-in-line ceramic or plastic package and is guaranteed for operation from 0°C to 70°C. These packages are designed for insertion in mounting-hole rows on 300-mil (7,62 mm) centers.

TMS4161
65,536-BIT MULTIPORT MEMORY

JULY 1983

- Dual Accessability – One Port Sequential Access, One Port Random Access
- Four Cascaded 64-Bit Serial Shift Registers for Sequential Access Applications
- Shift Register Loaded Once Every 64, 128, 192, or 256 Shift Cycles as Desired by User
- Fast Serial Port . . . 25 MHz Shift Rate
- $\overline{TR}/\overline{QE}$ as Output Enable Allows Direct Connection of D, Q and Address Lines to Simplify System Design
- Random Access Port Looks Exactly Like a TMS4164
- Separate Serial In and Serial Out to Allow Simultaneous Shift In and Out
- 65,536 × 1 Organization
- Maximum Access Time from $\overline{RAS}$ Less Than 150 ns
- Minimum Cycle Time (Read or Write) Less Than 260 ns
- Long Refresh Period . . . 4 Milliseconds
- Low Refresh Overhead Time . . . As Low As 1.6% of Total Refresh Period
- All Inputs, Outputs, Clocks Fully TTL Compatible
- 3-State Unlatched Outputs for Both Random and Serial Access
- Common I/O Capability with "Early Write" Feature
- Page-Mode Operation for Faster Access
- Low Power Dissipation
  - Operating . . . 200 mW (Typical)
  - Standby . . . 35 mW (Typical)
- New SMOS (Scaled-MOS) N-Channel Technology
- $\overline{SOE}$ Simplifies Multiplexing of Video Data Streams

description

The TMS4161 is a high-speed, dual-access 65,536-bit dynamic random-access memory. The random-access port makes the memory look like it is organized as 65,536 words of one bit each like the TMS4164. The sequential access port is interfaced to an internal 256-bit dynamic shift register organized as four 64-bit shift registers which makes the memory look like it is organized as up to 256 words of up to 256 bits each which are accessed serially. One,

PRODUCT PREVIEW

TEXAS INSTRUMENTS
POST OFFICE BOX 225012 • DALLAS, TEXAS 75265

two, three, or four 64-bit shift registers can be sequentially read out depending on a two-bit code applied to the two most significant column address inputs. The TMS4161 employs state-of-the-art SMOS (Scaled-MOS) N-channel double level polysilicon gate technology for very high performance combined with low cost and improved reliability.

The TMS4161 features full asynchronous dual access capability except when transferring data between the shift register and the memory array.

Refresh period is extended to 4 milliseconds, and during this period each of the 256 rows must be strobed with $\overline{RAS}$ in order to retain data. $\overline{CAS}$ can remain high during the refresh sequence to conserve power. Note that the transfer of a row of data from the memory array to the shift register also refreshes that row.

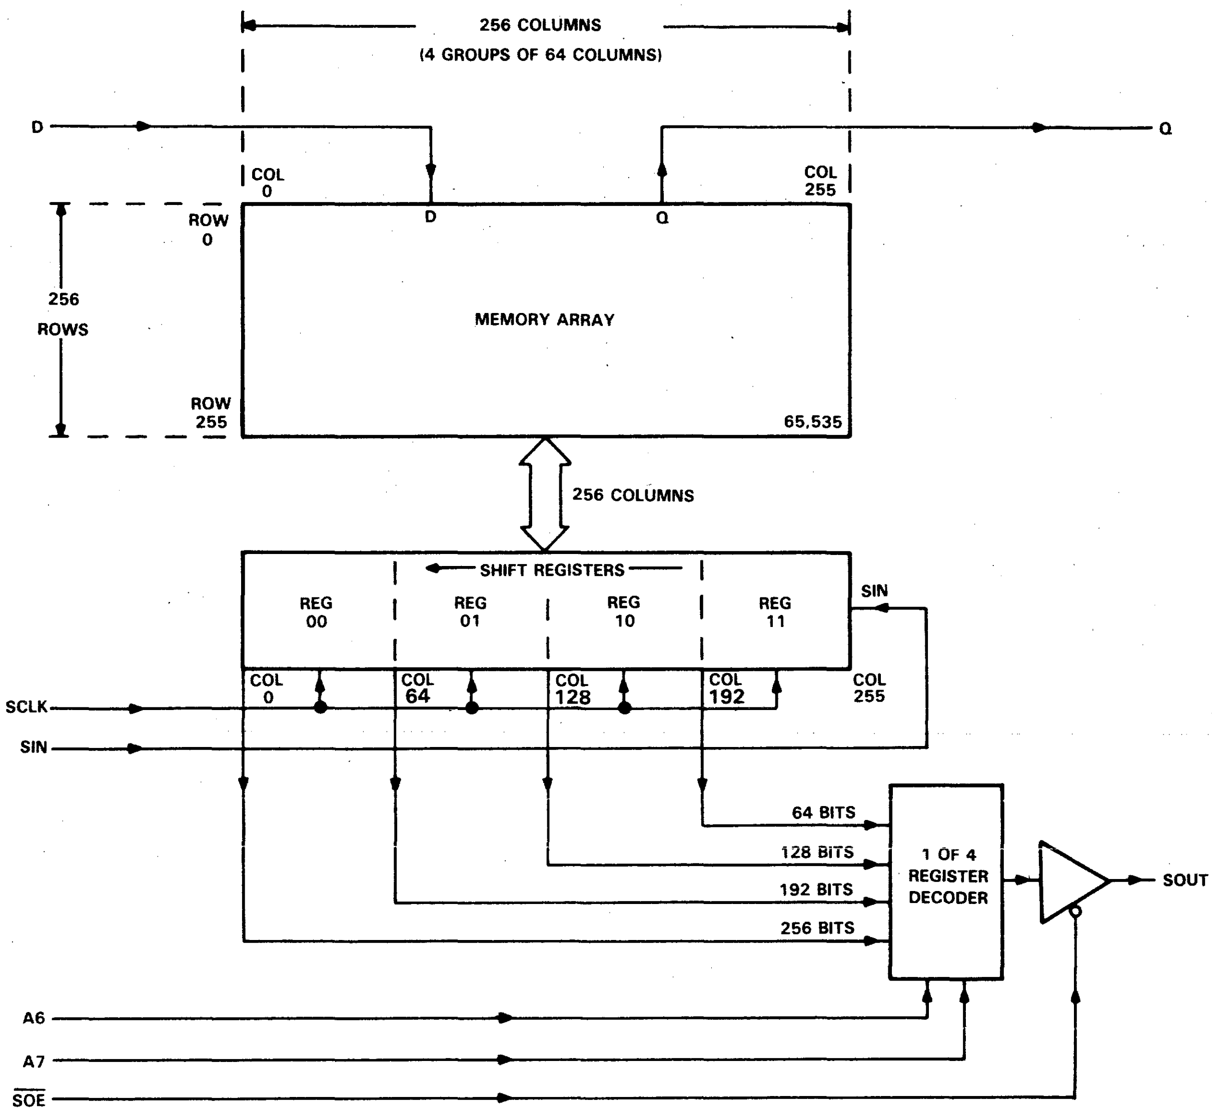
All inputs and outputs, including clocks, are compatible with Series 74 TTL. All address lines and data-in are latched on chip to simplify system design. Data-out is unlatched to allow greater system flexibility.

The TMS4161 is offered in a 20-pin dual-in-line-plastic package and is guaranteed for operation from 0°C to 70°C. Packages are designed for insertion in mounting-hole rows on 300-mil (7.62 mm) centers.

random access address space to sequential address space mapping

The TMS4161 is designed with each row divided into four, 64-column sections. The first column section to be shifted out is selected by the two most significant column address bits. If the two bits represent binary 00, then one to four registers can be shifted out in order. If the two bits represent binary 01, then only 1 to 3 (the most significant) registers can be shifted out in order. If the two bits represent 10, then one to two of the most significant registers can be shifted out in order. Finally, if the two bits represent 11 only the most significant register can be shifted out. All registers are shifted out with the least significant bit (bit 0) first and the most significant bit (bit 63) last. Note that if the two column address bits equal 00 during the last register transfer cycle ($\overline{TR}/\overline{QE}$ equal to 0) a total of 256 bits can be sequentially read out.

functional block diagram



random access operation

TR/QE

The TR/QE pin has two functions. First, it selects either register transfer or random-access operation as RAS falls, and second, if this is a random-access operation, it functions as an output enable after CAS falls.

To use the TMS4161 in the random-access mode, TR/QE must be high as RAS falls. Holding TR/QE high disconnects the 256 elements of the shift registers from the corresponding 256 bit lines of the memory array. If data is to be shifted, the shift registers must be disconnected from the bit lines. Holding TR/QE low enables the 256 switches that connect the shift registers to the bit lines and indicates that a transfer will occur between the shift registers and one of the memory rows.

Once CAS has been pulled low, TR/QE controls when the data will appear at the Q output (if this is a read cycle). Whenever TR/QE is held high, the Q output will be in the high-impedance state. This feature removes the possibility of an overlap between data on the address lines and data appearing on the Q output making it possible to connect the address lines to the Q and D lines (Use of this organization prohibits the use of the early write cycle.).

address (A0 through A7)

Sixteen address bits are required to decode 1 of 65,536 storage cell locations. Eight row-address bits are set up on pins A0 through A7 and latched onto the chip by the row-address strobe ($\overline{RAS}$). Then the eight column-address bits are set up on pins A0 through A7 and latched onto the chip by the column-address strobe ($\overline{CAS}$). All addresses must be stable on or before the falling edges of $\overline{RAS}$ and $\overline{CAS}$. $\overline{RAS}$ is similar to a chip enable in that it activates the sense amplifiers as well as the row decoder. $\overline{CAS}$ is used as a chip select activating the column decoder and the input and output buffers.

write enable ($\overline{W}$)

The read or write mode is selected through the write enable ($\overline{W}$) input. A logic high on the $\overline{W}$ input selects the read mode and a logic low selects the write mode. The write enable terminal can be driven from standard TTL circuits without a pull-up resistor. The data input is disabled when the read mode is selected. When $\overline{W}$ goes low prior to $\overline{CAS}$, data-out will remain in the high-impedance state for the entire cycle permitting common I/O operation.

data-in (D)

Data is written during a write or read-modify-write cycle. The falling edge of $\overline{CAS}$ or $\overline{W}$ strobes data into the on-chip data latch. This latch can be driven from standard TTL circuits without a pull-up resistor. In an early write cycle, $\overline{W}$ is brought low prior to $\overline{CAS}$ and the data is strobed in by $\overline{CAS}$ with setup and hold times referenced to this signal. In a delayed write or read-modify-write cycle, $\overline{CAS}$ will already be low, thus the data will be strobed in by $\overline{W}$ with setup and hold times referenced to this signal.

data-out (Q)

The three-state output buffer provides direct TTL compatibility (no pull-up resistor required) with a fan-out of two Series 74 TTL loads. Data-out is the same polarity as data-in. The output is in the high-impedance (floating) state as long as $\overline{CAS}$ or $\overline{TR}/\overline{QE}$ is held high. Data will not appear on the output until after both $\overline{CAS}$ and $\overline{TR}/\overline{QE}$ have been brought low. In a read cycle, the guaranteed maximum output enable access time is valid only if t_{CQE} is greater than t_{CQE} MAX, and t_{RLCL} is greater than t_{RLCL} MAX. Likewise, $t_{a(C)}$ MAX is valid only if t_{RLCL} is greater than t_{RLCL} MAX. Once the output is valid, it will remain valid while $\overline{CAS}$ and $\overline{TR}/\overline{QE}$ are both low; $\overline{CAS}$ or $\overline{TR}/\overline{QE}$ going high will return the output to a high-impedance state. In an early write cycle, the output is always in a high-impedance state. In a delayed write or read-modify-write cycle, the output will follow the sequence for the read cycle. In a register transfer cycle, the output will always be in a high-impedance state.

refresh

A refresh operation must be performed at least every four milliseconds to retain data. Since the output buffer is in high-impedance state unless $\overline{CAS}$ is applied, the $\overline{RAS}$ only refresh sequence avoids any output during refresh. Strobing each of the 256 row addresses (A0 through A7) with $\overline{RAS}$ causes all bits in each row to be refreshed. $\overline{CAS}$ can remain high (inactive) for this refresh sequence to conserve power. Note that the shift registers are also dynamic storage elements and that the data held in the registers will be lost unless SCLK goes high to shift the data one bit position or else the data is reloaded from the memory array. See specifications for maximum register data retention times.

page-mode

Page-mode operation allows effectively faster memory access by keeping the same row address and strobing successive column addresses onto the chip. Thus, the time required to setup and strobe sequential row addresses for the same page is eliminated. To extend beyond the 256 column locations on a single RAM, the row address and $\overline{RAS}$ are applied to multiple 64K RAMs. $\overline{CAS}$ is then decoded to select the proper RAM.

sequential access operation

$\overline{\mathrm{TR}}/\overline{\mathrm{QE}}$

Memory operations involving parallel use of the shift register are first indicated by bringing $\overline{\mathrm{TR}}/\overline{\mathrm{QE}}$ low before $\overline{\mathrm{RAS}}$ falls low. This enables the switches connecting the 256 elements of the shift register to the 256 bit lines of the memory array. The $\overline{\mathrm{W}}$ line determines whether the data will be transferred from or to the shift registers.

write enable ($\overline{\mathrm{W}}$)

In the sequential access mode, $\overline{\mathrm{W}}$ determines whether a transfer will occur from the shift registers to the memory array, or from the memory array to the shift registers. To transfer from the shift registers to the memory array, $\overline{\mathrm{W}}$ is held low as $\overline{\mathrm{RAS}}$ falls, and, to transfer from the memory array to the shift registers, $\overline{\mathrm{W}}$ is held high as $\overline{\mathrm{RAS}}$ falls. Thus, reads and writes are always with respect to the memory array. The write setup and hold times are referenced to the falling edge of $\overline{\mathrm{RAS}}$ for this mode of operation.

row address (A0 through A7)

Eight address bits are required to select one of the 256 possible rows involved in the transfer of data to or from the shift registers. The A0-A7, $\overline{\mathrm{W}}$, and the $\overline{\mathrm{TR}}/\overline{\mathrm{QE}}$ line are latched on the falling edge of $\overline{\mathrm{RAS}}$.

register column address (A7, A6)

To select one of the four shift registers (transfer from memory to register only), the appropriate 2-bit column address (A7, A6) must be valid when $\overline{\mathrm{CAS}}$ falls. However, the $\overline{\mathrm{CAS}}$ and register address signals need not be supplied every cycle, only when it is desired to change or select a new register.

SCLK

Data is shifted in and out on the rising edge of SCLK. This makes it possible to view the shift registers as though it were made of 256 rising edge D flip-flops connected D to Q. The TMS4161 is designed to work with a wide range duty cycle clock to simplify system design. Note that data will appear at the SOUT pin not only on the rising edge of SCLK but also after an access time of $t_{a(RSO)}$ from $\overline{\mathrm{RAS}}$ high during a parallel load of the shift registers.

SIN and SOUT

Data is shifted in through the SIN pin and is shifted out through the SOUT pin. The TMS4161 is designed such that it requires 0 ns hold time on SIN as SCLK rises. SOUT is guaranteed not to change for at least 8 ns after SLCK rises. These features make it possible to easily connect TMS4161s together, to allow SOUT to be connected to SIN, and to give external circuitry a full SLCK cycle time to allow manipulation of the serial data. To guarantee proper serial clock sequence after power up, a transfer cycle must be initiated before serial data is applied at SIN.

$\overline{\mathrm{SOE}}$

The serial output enable pin controls the impedance of the serial output allowing multiplexing of more than one bank of TMS4161 memories into the same external video circuitry. When $\overline{\mathrm{SOE}}$ is at a low logic level, SOUT will be enabled and the proper data read out. When $\overline{\mathrm{SOE}}$ is at a high logic level, SOUT will be disabled and be in the high-impedance state.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Voltage on any pin except V_{DD} and data out (see Note 1)	−1.5 V to 10 V
Voltage on V_{DD} supply and data out with respect to V_{SS}	−1 V to 6 V
Short circuit output current	50 mA
Power dissipation	1 W
Operating free-air temperature range	0 °C to 70 °C
Storage temperature range	−65 °C to 150 °C

† Stress beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the "Recommended Operating Conditions" section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values in this data sheet are with respect to V_{SS}.

TMS4164, SMJ4164
65,536-BIT DYNAMIC RANDOM-ACCESS MEMORY

JULY 1980 – REVISED OCTOBER 1983

- 65,536 X 1 Organization
- Single +5-V Supply (10% Tolerance)
- JEDEC Standardized Pin-Out in Dual-In-Line Packages
- Upward Pin Compatible with TMS4116 (16K Dynamic RAM)
- First Military Version of 64K DRAM
- Available Temperature Ranges:
  - M . . . −55°C to 125°C
  - S . . . −55°C to 100°C
  - E . . . −40°C to 85°C
  - L . . . 0°C to 70°C
- Long Refresh Period . . . 4 milliseconds
- Low Refresh Overhead Time . . . As Low As 1.8% of Total Refresh Period
- All Inputs, Outputs, Clocks Fully TTL Compatible
- 3-State Unlatched Output
- Common I/O Capability with "Early Write" Feature
- Page-Mode Operation for Faster Access
- Low Power Dissipation
  - Operating . . . 125 mW (TYP)
  - Standby . . . 17.5 mW (TYP)
- Performance Ranges:

	ACCESS TIME ROW ADDRESS (MAX)	ACCESS TIME COLUMN ADDRESS (MAX)	READ OR WRITE CYCLE (MIN)	READ-MODIFY-WRITE CYCLE (MIN)
'4164-12	120 ns	70 ns	230 ns	260 ns
'4164-15	150 ns	85 ns	260 ns	285 ns
'4164-20	200 ns	135 ns	330 ns	345 ns

$\overline{\text{G}}$	Output Enable
$\overline{\text{RAS}}$	Row Address Strobe
V_{DD}	+5-V Supply
V_{SS}	Ground
$\overline{\text{W}}$	Write Enable

description

The '4416 is a high-speed, 65,536-bit, dynamic, random-access memory, organized as 16,384 words of 4 bits each. It employs state-of-the-art SMOS (scaled MOS) N-channel double-level polysilicon gate technology for very high performance combined with low cost and improved reliability.

The '4416 features $\overline{\text{RAS}}$ access times to 150 ns maximum. Power dissipation is 130 mW typical operating, 17.5 mW typical standby.

New SMOS technology permits operation from a single +5-V supply, reducing system power supply and decoupling requirements, and easing board layout. I_{DD} peaks have been reduced to 60 mA typical, and a −1-V input voltage undershoot can be tolerated, minimizing system noise considerations. Input clamp diodes are used to ease system design.

Refresh period is extended to 4 milliseconds, and during this period each of the 256 rows must be strobed with $\overline{\text{RAS}}$ in order to retain data. $\overline{\text{CAS}}$ can remain high during the refresh sequence to conserve power.

All inputs and outputs, including clocks, are compatible with Series 54/74 TTL. All address lines and data-in are latched on chip to simplify system design. Data-out is unlatched to allow greater system flexibility.

* M temperature range (−55°C to 125°C) to be available in future.

TMS4500A DYNAMIC RAM CONTROLLER

JANUARY 1982 – REVISED APRIL 1983

- Controls Operation of 8K/16K/32K/64K Dynamic RAMs
- Creates Static RAM Appearance
- One Package Contains Address Multiplexer, Refresh Control, and Timing Control
- Directly Addresses and Drives Up to 256K Bytes of Memory Without External Drivers
- Operates from Microprocessor Clock
  - No Crystals, Delay Lines, or RC Networks
  - Eliminates Arbitration Delays
- Refresh May Be Internally or Externally Initiated
- Versatile
  - Strap-Selected Refresh Rate
  - Synchronous, Predictable Refresh
  - Selection of Distributed, Transparent, and Cycle-Steal Refresh Modes
  - Interfaces Easily to Popular Microprocessors
- Strap-Selected Wait State Generation for Microprocessor/Memory Speed Matching
- Ability to Synchronize or Interleave Controller with the Microprocessor System (Including Multiple Controllers)
- Three-State Outputs Allow Multiport Memory Configuration
- Performance Ranges of 150 ns/200 ns/250 ns

description

The TMS4500A is a monolithic DRAM system controller designed to provide address multiplexing, timing, control and refresh/access arbitration functions to simplify the interface of dynamic RAMs to microprocessor systems.

The controller contains a 16-bit multiplexer that generates the address lines for the memory device from the 16 system address bits and provides the strobe signals required by the memory to decode the address. An 8-bit refresh counter generates the 256-row addresses required for refresh.

A refresh timer is provided that generates the necessary timing to refresh the dynamic memories and assure data retention.

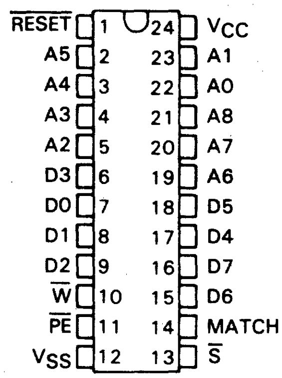
The TMS4500A also contains refresh/access arbitration circuitry to resolve conflicts between memory access requests and memory refresh cycles. The TMS4500A is offered in a 40-pin, 600-mil dual-in-line plastic package and is guaranteed for operation from 0°C to 70°C.

TMS2150
CACHE ADDRESS COMPARATOR

MARCH 1982 – REVISED SEPTEMBER 1983

- Fast Address to Match Valid Delay – Two Speed Ranges: 45 ns, 55 ns
- 512 X 9 Internal RAM
- 300-Mil 24-Pin Ceramic Side Brazed Package
- Max Power Dissipation: 660 mW
- On-Chip Parity Generation and Checking
- Parity Error Output/Force Parity Error Input
- On-Chip Address/Data Comparator
- Asynchronous, Single-Cycle Reset
- Easily Expandable
- Fully Static, TTL Compatible
- Reliable SMOS (Scaled NMOS) Technology

TMS2150 . . . JDL PACKAGE
(TOP VIEW)



description

The 8-bit-slice cache address comparator consists of a high-speed 512 X 9 static RAM array, parity generator, and parity checker, and 9-bit high-speed comparator. It is fabricated using N-channel silicon gate technology for high speed and simple interface with MOS and bipolar TTL circuits. The cache address comparator is easily cascadable for wider tag addresses or deeper tag memories. Significant reductions in cache memory component count, board area, and power dissipation can be achieved with this device.

When $\overline{\text{S}}$ is low and $\overline{\text{W}}$ is high, the cache address comparator compares the contents of the memory location addressed by A0-A8 with the data on D0-D7 plus generated parity. An equality is indicated by a high level on the MATCH output. A low-level output from $\overline{\text{PE}}$ signifies a parity error in the internal RAM data. $\overline{\text{PE}}$ is an N-channel open-drain output for easy OR-tieing. During a write cycle ($\overline{\text{S}}$ and $\overline{\text{W}}$ low), data on D0-D7 plus generated even parity are written in the 9-bit memory location addressed by A0-A8. Also during write, a parity error may be forced by holding $\overline{\text{PE}}$ low.

A $\overline{\text{RESET}}$ input is provided for initialization. When $\overline{\text{RESET}}$ goes low, all 512 X 9 RAM locations will be cleared and the MATCH output will be forced high.

The cache address comparator operates from a single +5 V supply and is offered in a 24-pin 300-mil side brazed package. The device is fully TTL compatible and is guaranteed to operate from 0°C to 70°C.

MATCH OUTPUT DESCRIPTION

MATCH = V_{OH} if: [A0-A8] = D0-D7 + parity,
or: $\overline{\text{RESET}} = V_{IL}$,
or: $\overline{\text{S}} = V_{IH}$,
or: $\overline{\text{W}} = V_{IL}$

MATCH = V_{OL} if: [A0-A8] $\neq$ D0-D7 + parity,
with $\overline{\text{RESET}} = V_{IH}$,
$\overline{\text{S}} = V_{IL}$, and $\overline{\text{W}} = V_{IH}$

FUNCTION TABLE

V_{CC}	+5-V Supply
V_{SS}	Ground

description

The TMS4764 is a 65,536-bit read-only memory organized as 8192 words of 8-bit length. This makes the TMS4764 ideal for microprocessor based systems. The device is fabricated using N-channel silicon-gate technology for high speed and simple interface with bipolar circuits.

All inputs can be driven directly by Series 74 TTL circuits without the use of any internal pull-up resistor. Each output can drive two Series 74 or 74S loads without external resistors. The data outputs are three-state for OR-tieing multiple devices on a common bus. Pin 20 is programmable, providing additional system flexibility. The data is always available, it is not dependent on external clocking of pin 20.

The TMS4764 is designed for high-density fixed-memory applications such as logic function generation and microprogramming. It is pin compatible with TI's full line of ROMs and EPROMs.

This ROM is supplied in 24-pin dual-in-line-plastic (NL suffix) or ceramic (JL suffix) packages designed for insertion in mounting-hole rows on 600-mil centers or chip on board. The device is designed for operation from 0°C to 70°C.

operation

address (A0 – A12)

The address-valid interval determines the device cycle time. The 13-bit positive-logic address is decoded on-chip to select one of 8192 words of 8-bit length in the memory array. A0 is the least-significant bit and A12 the most-significant bit of the word address.

chip select (S or S̄)

Pin 20 can be programmed during mask fabrication to be active with either a high- or a low-level input. When the signal is active, all eight outputs are enabled and the eight-bit addressed word can be read. When the signal is not active, all eight outputs are in a high-impedance state.

description

The TMS4732 is a 32,768-bit read-only memory organized as 4096 words of 8-bit length. This makes the TMS4732 ideal for microprocessor based systems. The device is fabricated using N-channel silicon-gate technology for high speed and simple interface with bipolar circuits.

All inputs can be driven directly by Series 74 TTL circuits without the use of any internal pull-up resistor. Each output can drive one Series 74 or 74S load without external resistors. The data outputs are three-state for OR-tieing multiple devices on a common bus. Two chip-select controls allow data to be read. These controls are programmable, providing additional system decode flexibility. The data is always available, it is not dependent on external clocking of the control pins.

The TMS4732 is designed for high-density fixed-memory applications such as logic function generation and microprogramming. The part is pin compatible with the TMS2532 4096 × 8 EPROM, which aids in prototyping and code verification.

This ROM is supplied in 24-pin dual-in-line-plastic (NL suffix) or ceramic (JL suffix) packages designed for insertion in mounting-hole rows on 600-mil centers or chip on board. The device is designed for operation from 0°C to 70°C.

operation

address (A0 – A11)

The address-valid interval determines the device cycle time. The 12-bit positive-logic address is decoded on-chip to select one of 4096 words of 8-bit length in the memory array. A0 is the least-significant bit and A11 the most-significant bit of the word address.

chip select/output enable (pins 20 and 21)

Each of these pins can be programmed during mask fabrication to be active with either a high- or a low-level input. When both signals are active, all eight outputs are enabled and the eight-bit addressed word can be read. When either signal is not active, all eight outputs are in a high-impedance state.

TMS27128
131,072-BIT ERASABLE PROGRAMMABLE READ-ONLY MEMORY

OCTOBER 1983

- 16,384 X 8 Organization
- Single +5-V Power Supply
- Pin Compatible with TMS2764 EPROM
- All Inputs Are TTL Compatible
- Max Access/Min Cycle Time:

TMS27128-20	200 ns
TMS27128-25	250 ns
TMS27128-30	300 ns
TMS27128-45	450 ns

- Low Power Dissipation
  – 500 mW (Typical)
- JEDEC Approved Pinout

description

The TMS27128 is an ultraviolet light-erasable, electrically programmable read-only memory. It has 131,072 bits organized as 16,384 words of 8-bit length. The TMS27128 only requires a single 5-volt power supply with a tolerance of ±5%. The TMS27128-20 provides an access time of 200 ns, which is compatible with high-speed microprocessors.

The TMS27128 provides dual output control lines: Output Enable ($\overline{G}$) and Chip Enable/Power Down ($\overline{E}$). This feature allows the $\overline{G}$ control line to eliminate bus contention in multibus microprocessor systems. The TMS27128 has a standby mode that reduces the maximum power dissipation from 750 mW to 225 mW when the device is placed on standby.

This EPROM is supplied in a 28-pin dual-in-line ceramic package (JL suffix). It is pin compatible with the TMS2764 EPROM and is designed for operation from 0°C to 70°C.

operation

The five modes of operation for the TMS27128 are listed in the following table.

FUNCTION (PINS)	MODE				
	Read	Power Down (Standby)	Program	Program Verification	Inhibit Programming
$\overline{PGM}$ (27)	V_{IH}	X	V_{IL}	V_{IH}	X
V_{PP} (1)	5 V	5 V	21 V	21 V	21 V
V_{CC} (28)	V_{CC}	V_{CC}	5 V	5 V	5 V
$\overline{E}$ (20)	V_{IL}	V_{IH}	V_{IL}	V_{IL}	V_{IH}
$\overline{G}$ 22	V_{IL}	X	V_{IH}	V_{IL}	X
Q1-Q8 (11 to 13, 15 to 19)	Q	HI-Z	D	Q	HI-Z

X = V_{IL} or V_{IH}

description

The '2564 is a 65,536-bit ultraviolet-light-erasable, electrically-programmable read-only memory. This device is fabricated using N-channel silicon-gate technology for high-speed and simple interface with MOS and bipolar circuits. All inputs (including program data inputs) can be driven by Series 54/74 TTL circuits without the use of external resistors. The data outputs are three-state for connecting multiple devices to a common bus.

The TMS2564 is offered in a dual-in-line ceramic package (JL or JDL suffix) rated for operation from 0°C to 70°C. The SMJ2564 is offered in a 28-pin dual-in-line ceramic package (J) and a leadless ceramic chip carrier (FE), rated for operation from −55°C to 125°C. The J package is designed for insertion in mounting-hole rows on 600-mil (15,2 mm) centers, whereas the FE package is intended for surface mounting on solder pads on 0.050-inch (1,27 mm) centers. The FE package offers a three-layer rectangular chip carrier with dimensions 0.450×0.550×0.100 (11,43×13,97×2,54 mm).

description

The TMS2716 is an ultra-violet light-erasable, electrically programmable read-only memory. It has 16,384 bits organized as 2048 words of 8-bit length. The device is fabricated using N-channel silicon-gate technology for high-speed and simple interface with MOS and bipolar circuits. All inputs (including program data inputs) can be driven by Series 74 circuits without the use of external pull-up resistors and each output can drive one Series 74 or 74LS TTL circuit without external resistors. The TMS2716 guarantees 250 mV dc noise immunity in the low state. Data outputs are three-state for OR-tying multiple devices on a common bus. The TMS2716 is plug-in compatible with the TMS2708 and the TMS27L08. Pin compatible mask programmed ROMs are available for large volume requirements.

This EPROM is designed for high-density fixed-memory applications where fast turn arounds and/or program changes are required. It is supplied in a 24-pin dual-in-line cerpak (JL suffix) package designed for insertion in mounting-hole rows on 600-mil (15,2 mm) centers. It is designed for operation from 0°C to 70°C.

operation (read mode)

address (A0-A10)

The address-valid interval determines the device cycle time. The 11-bit positive-logic address is decoded on-chip to select one of 2048 words of 8-bit length in the memory array. A0 is the least-significant bit and A10 most-significant bit of the word address.

chip select, program [S̄ (PGM)]

When the chip select is low, all eight outputs are enabled and the eight-bit addressed word can be read. When the chip select is high, all eight outputs are in a high-impedance state.

program

In the program mode, the chip select feature does not function as pin 18 inputs only the program pulse. The program mode is selected by the V_{CC}(PE) pin. Either 0 V or +12 V on this pin will cause the TMS2716 to assume program cycle.

data out (Q1-Q8)

The chip must be selected before the eight-bit output word can be read. Data will remain valid until the address is changed or the chip is deselected. When deselected, the three-state outputs are in a high-impedance state. The outputs will drive TTL circuits without external components.

DECEMBER 1979 – REVISED AUGUST 1983

VT2332/33

4096 x 8 STATIC READ ONLY MEMORY

FEATURES

- 4096 x 8-bit organization
- Single +5 V supply
- Access Time—250 ns (max)
- Totally static operation
- Completely TTL compatible
- VT2332 pin compatible with 2532
- VT2333 pin compatible with 2732
- 3-State Outputs for wired-OR expansion
- Two programmable Chip Selects
- 2708/2716/2532/2732 EPROMs accepted as program data inputs

DESCRIPTION

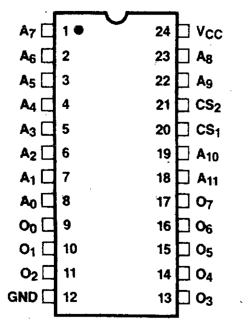
The VT2332/3 high-performance Read Only Memory is organized 4096 words by eight bits with access times of less than 250 ns. This ROM is designed to be compatible with all microprocessor and similar applications where high performance, large bit storage and simple interfacing are important design considerations. This device offers TTL input and output levels with a minimum of 0.4 V noise immunity in conjunction with a +5 V power supply.

The VT2332/3 operates totally asynchronously. No clock input is required. The two programmable Chip Selects allow up to four 32K ROMs to be wired-OR without external decoding. Both devices offer 3-state output buffers for memory expansion.

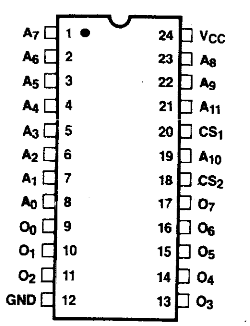
Designed to replace either the 2732 or 2532 32K EPROMs, the VT2332/3 can eliminate the need to redesign printed circuit boards for volume mask programmed ROMs after prototyping with EPROMs.

PIN CONFIGURATIONS

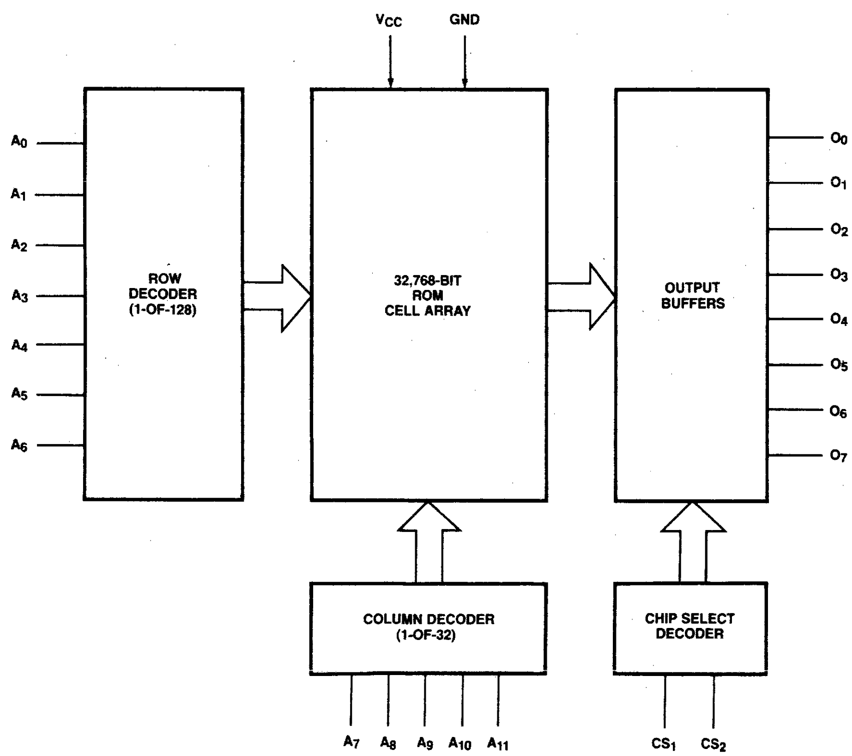
VT2332



VT2333



BLOCK DIAGRAM



VLSI Technology

MEMORY

VT2364

8192 x 8 STATIC READ ONLY MEMORY

FEATURES

- 2732 EPROM pin compatible
- 8192 x 8-bit organization
- Single +5 V supply
- Access time—250 ns max
- Totally static operation
- Completely TTL compatible
- Operating Power: 45 mA (max)
- 24-Pin JEDEC approved pin-out
- Programmable Chip Select
- 3-state outputs for wired-OR expansion
- EPROMS accepted as program data input

DESCRIPTION

The VT2364 high-performance Read Only Memory is organized as 8,192 words by eight bits with an access time of 250 ns. The ROM is designed to be compatible with all microprocessors and similar applications where high-performance large-bit storage and simple interfacing are important design considerations. It conforms to the JEDEC approved pinouts for 24-pin 64K ROMs.

The VT2364 offers very simple operation with no power down. The programmable Chip Select allows two 64K ROMs to be Wired-OR without external decoding. It is pin compatible with the 2732 EPROM thus eliminating the need to redesign printed circuit boards for volume mask programmed ROMs after prototyping with EPROMS.

VT 2365/66

8,192 x 8 STATIC READ ONLY MEMORY

FEATURES

- 2764/2564 EPROM pin compatible
- 8,192 x 8-bit organization
- Single +5 V supply
- Access time—200 ns (max)
- Totally static operation
- Completely TTL compatible
- Power
  Operating: 45 mA (max)
  Standby: 10 mA (max)
- 28-Pin JEDEC approved pinout
- Automatic power down ($\overline{CE}$)
- Output Enable function ($\overline{OE}$)
- Programmable Chip Select
- 3-state outputs for wired-OR expansion
- EPROMs accepted as program data input

DESCRIPTION

The VT2365/66 high-performance Read Only Memory is organized 8,192 words by eight bits with an access time of 200 ns. The ROM is designed to be compatible with all microprocessors and similar applications where high-performance large-bit storage and simple interfacing are important design considerations. It conforms to the JEDEC approved pinout for 28-pin 64K ROMs.

The VT2365/66 offers an automatic power down feature with power down controlled by the Chip Enable. ($\overline{CE}$) input. When $\overline{CE}$ goes HIGH, the device will automatically power down and remain in a low-power standby mode as long as $\overline{CE}$ remains HIGH.

This unique feature provides system level power savings of as much as 90%. The programmable Chip Selects allow up to four 64K ROMs to be wired-OR without external decoding. An additional feature of the VT2365 is the Output Enable ($\overline{OE}$) function which eliminates bus contention in multiple-bus microprocessor systems.

The VT2365 is pin compatible with the 2764 EPROM and the VT2366 is pin compatible with the 2564 EPROM, thus eliminating the need to redesign printed circuit boards for volume mask programmable ROMs after prototyping with EPROMs.

VT23128/29

16,384 x 8 STATIC READ ONLY MEMORY

FEATURES

- 16,384 x 8-bit organization
- Single +5 V supply
- Access time 170 ns max
- Totally static operation
- Completely TTL compatible
- Operating power 45 mA max
- Standby power 10 mA max
- Automatic power down (C̅E̅)
- Output enable function (O̅E̅)
- Programmable Chip Select
- 3-state outputs for wired-OR expansion
- 28-pin JEDEC approved pinouts
- VT23128 pin compatible with the 2764 EPROM
- VT23129 pin compatible with the 2564 EPROM
- EPROMs accepted as program data input

DESCRIPTION

The VT23128/29 high-performance Read Only Memory is organized 16,384 words by eight bits with an access time of 170 ns. It is designed to be compatible with all microprocessors and similar applications where high-performance large-bit storage and simple interfacing are important design considerations.

The VT23128/29 offers automatic power down with power down controlled by the Chip Enable (C̅E̅) input. When C̅E̅ goes HIGH, the device will automatically power down and remain in a low-power standby mode as long as C̅E̅ remains HIGH. This unique feature provides system level power savings of as much as 90%. The VT23128 also has an Output Enable (O̅E̅) function to eliminate bus contention in multiple-bus microprocessor systems. The programmable Chip Select allows up to eight 128K ROMs to be wired-OR without external decoding.

The VT23128 is pin compatible with the 2764 EPROM and the VT23129 is pin compatible with the 2564 EPROM, thus eliminating the need to redesign printed circuit boards for volume mask programmable ROMs after prototyping with EPROMS.

VT23256/57 PRELIMINARY

32,768 x 8 STATIC READ ONLY MEMORY

FEATURES

- 32,768 x 8-bit organization
- Single +5 V supply
- Access time 200 ns max
- Totally static operation
- Completely TTL compatible
- Operating power 60 mA max
- Standby power 10 mA max
- Automatic power down ($\overline{CE}$)
- Output Enable function ($\overline{OE}$)
- Programmable Chip Select
- 3-state outputs for wired-OR expansion
- 28-pin JEDEC approved pinouts
- VT23256 pin compatible with the 2764 EPROM
- VT23257 pin compatible with the 2564 EPROM
- EPROMs accepted as program data input

DESCRIPTION

The VT23256/57 high-performance Read Only Memory is organized words by eight bits with an access time of 200 ns. It is designed to be compatible with all microprocessors and similar applications where high-performance large-bit storage and simple interfacing are important design considerations.

The VT23256/57 offers automatic power down with power down controlled by the Chip Enable ($\overline{CE}$) input. When $\overline{CE}$ goes HIGH, the device will automatically power down and remain in a low power standby mode as long as $\overline{CE}$ remains HIGH. This unique feature provides system level power savings of as much as 90%. The VT23256/57 also has an Output Enable ($\overline{OE}$) function to eliminate bus contention in multiple-bus microprocessor systems. The programmable Chip Select allows up to four 256K ROMs to be wired-OR without external decoding.

The VT23256 is pin compatible with the 2764 EPROM and the VT23257 is pin compatible with the 2564 EPROM, thus eliminating the need to redesign printed circuit boards for volume mask programmable ROMs after prototyping with EPROMS.

VL4500A

DYNAMIC RAM CONTROLLER

FEATURES

- Controls operation of 8K/16K/32K/64K dynamic RAMs
- Creates static RAM appearance
- One package contains address multiplexer, refresh control and timing control
- Directly addresses and drives up to 256K bytes of memory without external drivers
- Operates from microprocessor clock
  - No crystals, delay lines, or RC networks
  - Eliminates arbitration delays
- Refresh may be internally or externally initiated
- Versatile
  - Strap-selected refresh rate
  - Synchronous, predictable refresh
  - Selection of distributed, transparent, and cycle-steal refresh modes
  - Interfaces easily to popular microprocessors
- Strap-selected wait state generation for microprocessor/memory speed matching
- Ability to synchronize or interleave controller with the microprocessor system (including multiple controllers)
- Three-state outputs allow multiport memory configuration
- Performance ranges of 150 ns/200 ns/250 ns
- Compatible with TI TMS 4500A

DESCRIPTION

The VL4500A is a monolithic DRAM system controller designed to provide address multiplexing, timing, control and refresh/access arbitration functions to simplify the interface of dynamic RAMs to microprocessor systems.

The controller contains a 16-bit multiplexer that generates the address lines for the memory device from the 16 system address bits and provides the strobe signals required by the memory to decode the address. An 8-bit refresh counter generates the 256-row addresses required to refresh.

A refresh timer is provided that generates the necessary timing to refresh the dynamic memories and assure data retention.

The VL4500A also contains refresh/access arbitration circuitry to resolve conflicts between memory access requests and memory refresh cycles. The VL4500A is offered in a 40-pin, 600-mil dual in-line plastic package and is guaranteed for operation from 0°C to 70°C.

ABSOLUTE MAXIMUM RATINGS

Operating Ambient Temperature Range	0°C to 70°C
Storage Temperature Range	−65°C to 150°C
Supply Voltage Range, V_{CC}[1]	−1.5 to 7 V
Input Voltage Range (any input)[1]	−1.5 to 7 V
Continuous Power Dissipation	1.2 W

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated on the operational sections of this specification is not implied and exposure to absolute maximum rating conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS: T_A = 0°C to +70°C

Symbol	Parameter	Min	Nom	Max	Unit
V_{CC}	Supply Voltage	4.5	5.0	5.5	V
V_{IH} (except $\overline{\text{REFREQ}}$)	High-Level Input Voltage	2.0		6.0	V
V_{IH} ($\overline{\text{REFREQ}}$)	High-Level Input Voltage	2.4		6.0	V
V_{IL} (except $\overline{\text{REFREQ}}$)	Low-Level Input Voltage	−1.0[2]		0.8	V
V_{IL} ($\overline{\text{REFREQ}}$)	Low-Level Input Voltage	−1.0[2]		1.2	V

DC CHARACTERISTICS: T_A = 0°C to +70°C, V_{CC} = 5 V ± 10%

Symbol	Parameter		Test Conditions		Min	Typ[3]	Max	Unit
V_{OH}	High-Level Output Voltage	MA0-MA7, RDY	I_{OH} = −1 mA	V_{CC} = 4.5 V	2.4			V
		$\overline{\text{RAS0}}$, $\overline{\text{RAS1}}$, $\overline{\text{CAS}}$			2.7			
		$\overline{\text{REFREQ}}$	I_{OH} = 100 μA	V_{CC} = 4.5 V	2.4			
V_{OL}	Low-Level Output Voltage		I_{OL} = 4 mA	V_{CC} = 4.5 V			0.4	V
I_{IH}	High-Level Input Current	$\overline{\text{REFREQ}}$	V_I = 5.5 V				100	μA
		All others					10	
I_{IL}	Low-Level Input Current	$\overline{\text{REFREQ}}$	V_I = 0 V				−1.25	mA
		All others					−10	μA
I_{OZ}	Off-State Output Current		V_O = 0 to 4.5 V	V_{CC} = 5.5 V			±50	μA
I_{CC}	Operating Supply Current		T_A = 0°C	V_{CC} = 5.5 V		100	140	mA
C_I	Input Capacitance		V_I = 0 V	f = 1 MHz		5		pF
C_O	Output Capacitance		V_O = 0 V	f = 1 MHz		6		pF

Notes:

1. Voltage values are with respect to the ground terminal.
2. The algebraic convention, where the more negative limit is designated as minimum, is used in this data sheet for logic voltage levels only.
3. All typical values are at V_{CC} = 5 V, T_A = 25°C except where otherwise noted.

AC CHARACTERISTICS: $T_A = 0°C$ to $+70°C$, $V_{CC} = 5\ V \pm 10\%$

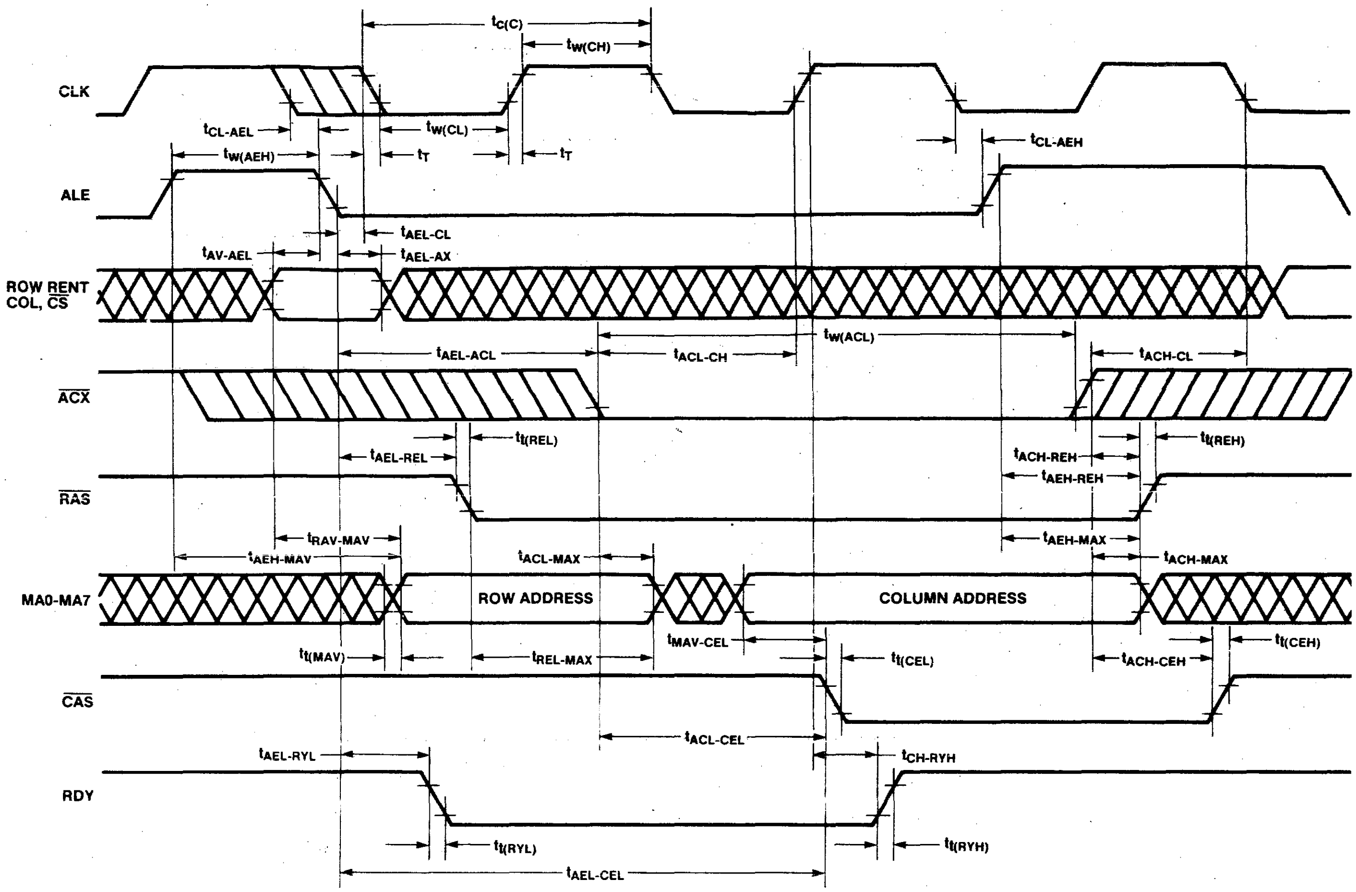
Symbol	Parameter	VL4500A-15PC Min	VL4500A-15PC Max	VL4500A-20PC Min	VL4500A-20PC Max	VL4500A-25PC Min	VL4500A-25PC Max	Unit
$t_{C(C)}$	CLK Cycle Time	100		100		140		
$t_{W(CH)}$	CLK High Pulse Width	20		20		20		
$t_{W(CL)}$	CLK Low Pulse Width	35		35		35		
t_t	Transition Time, All Inputs		50		50		50	
$t_{AEL\text{-}CL}$	Time Delay, ALE Low to CLK Starting Low(1)	10		10		15		
$t_{CL\text{-}AEL}$	Time Delay, CLK Low to ALE Starting Low(1)	10		10		15		
$t_{CL\text{-}AEH}$	Time Delay, CLK Low to ALE Starting High(2)	15		20		20		
$t_{W(AEH)}$	Pulse Width ALE High	50		60		60		ns
$t_{AV\text{-}AEL}$	Time Delay, Address, REN1, $\overline{CS}$ Valid to ALE Low	5		10		15		
$t_{AEL\text{-}AX}$	Time Delay, ALE Low to Address Not Valid	10		10		10		
$t_{AEL\text{-}ACL}$	Time Delay, ALE Low to $\overline{ACX}$ Low(3, 4, 5, 6)	$t_{h(RA)} + 30$		$t_{h(RA)} + 40$		$t_{h(RA)} + 50$		
$t_{ACH\text{-}CL}$	Time Delay, $\overline{ACX}$ High to CLK Low(3, 7)	20		20		20		
$t_{ACL\text{-}CH}$	Time Delay, $\overline{ACX}$ Low to CLK Starting High (to remove RDY)	30		30		30		
$t_{RQL\text{-}CL}$	Time Delay, $\overline{REFREQ}$ Low to CLK Starting Low(8)	20		20		20		
$t_{W(RQL)}$	Pulse Width, $\overline{REFREQ}$ Low	20		20		20		

Notes:

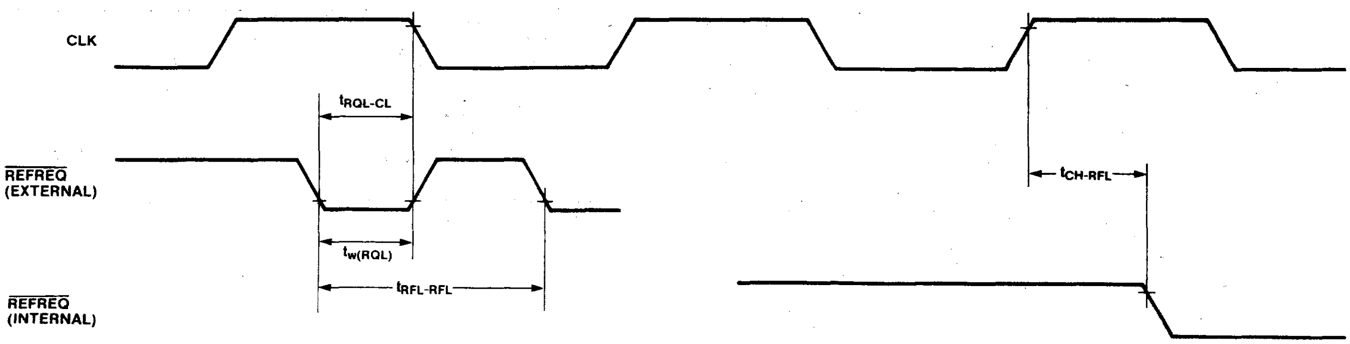
1. Coincidence of the trailing edge of CLK and the trailing edge of ALE should be avoided, as the refresh/access occurs on the trailing CLK edge. A trailing edge of CLK should occur during the interval from $\overline{ACX}$ high to ALE low.
2. If ALE rises before $\overline{ACX}$ and a refresh request is present, the falling edge of CLK after $t_{CL\text{-}AEH}$ will output the refresh address to MA0-MA7 and initiate a refresh cycle.
3. These specifications relate to system timing and do not directly reflect device performance.
4. On the access grant cycle following refresh, the occurrence of $\overline{CAS}$ low depends on the relative occurrence of ALE low to $\overline{ACX}$ low. If $\overline{ACX}$ occurs prior to or coincident with ALE then $\overline{CAS}$ is timed from the CLK high transition that causes RAS low. If $\overline{ACX}$ occurs 20 ns or more after ALE then $\overline{CAS}$ is timed from the CLK low transition following the CLK high transition causing RAS low.
5. For maximum speed access (internal delays on both access and access grant cycles), $\overline{ACX}$ should occur prior to or coincident with ALE.
6. $t_{h(RA)}$ is the dynamic memory row address hold time. $\overline{ACX}$ should follow ALE by $t_{AEL\text{-}CEL}$ in systems where the required $t_{h(RA)}$ is greater than $t_{REL\text{-}MAX}$ minimum.
7. Minimum of 20 ns is specified to ensure arbitration will occur on falling CLK edge. $t_{ACH\text{-}CL}$ also affects precharge time such that the minimum $t_{ACH\text{-}CL}$ should be equal or greater than: $t_{W(RH)}\text{-}t_{W(CL)}$ + 30 ns (for cycle where $\overline{ACX}$ high occurs prior to ALE high) where $t_{W(RH)}$ is the DRAM $\overline{RAS}$ precharge time.
8. This parameter is necessary only if refresh arbitration is to occur on this low-going CLK edge (in systems where refresh is synchronized to external events).

TIMING DIAGRAMS

ACCESS CYCLE TIMING



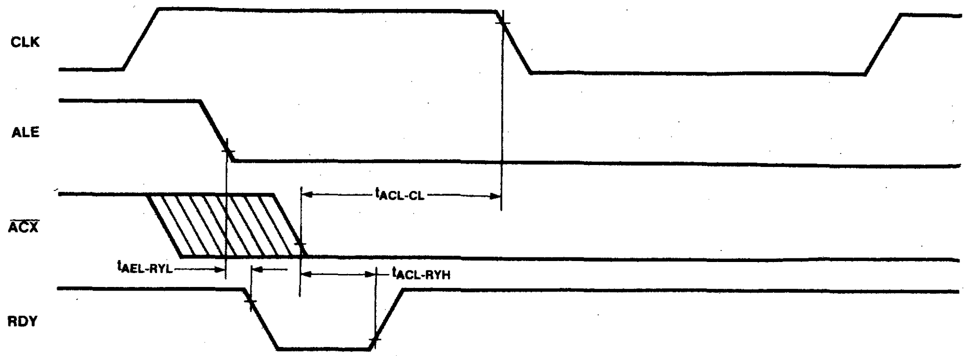
REFRESH REQUEST TIMING



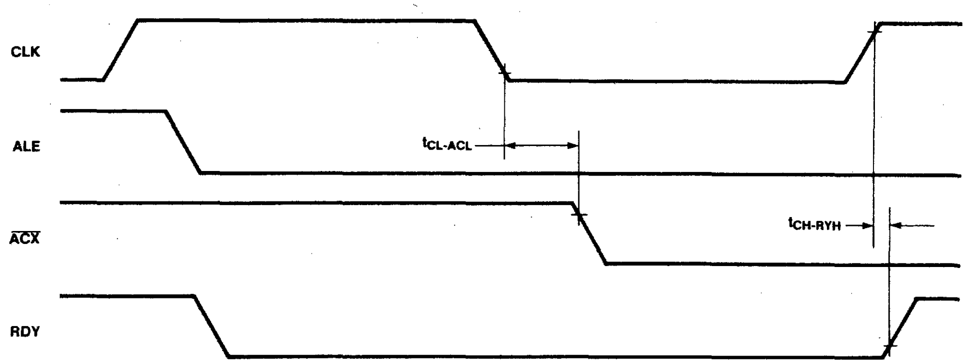
VLSI Technology

MEMORY

READY (RDY) SIGNAL TIMING (WAIT STATE OPERATION, TWST = 1)



RDY starting high is timed from $\overline{ACX}$ low ($t_{ACL\text{-}RYH}$) for the condition $\overline{ACX}$ going low while CLK high.



RDY starting high is timed from CLK high ($t_{CH\text{-}RYH}$) for the condition $\overline{ACX}$ going low while CLK low.

NEW PRODUCT BULLETIN

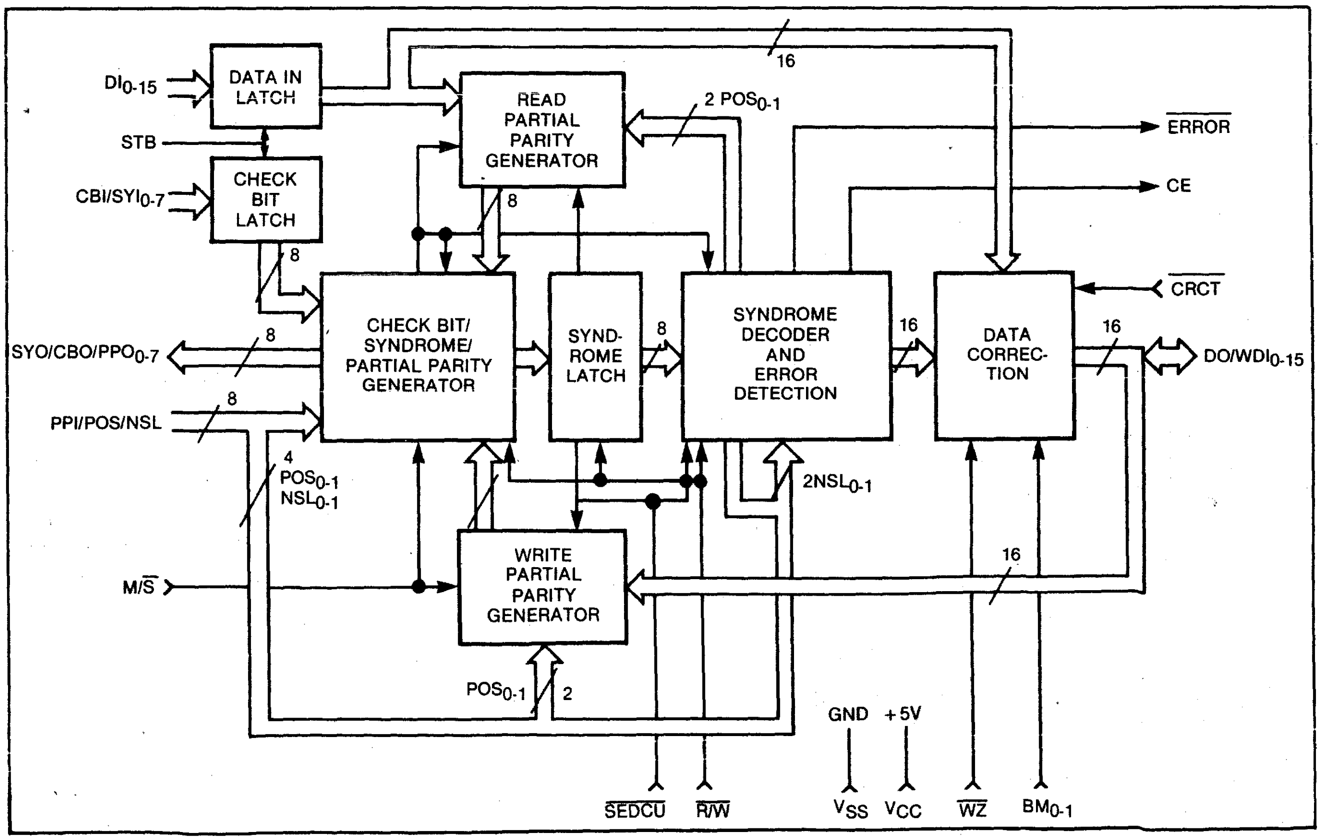
Error Detection and Correction Unit WD8206

FEATURES

- DETECTS AND CORRECTS ALL SINGLE BIT ERRORS
- DETECTS ALL DOUBLE BIT AND MOST MULTIPLE BIT ERRORS
- 52 NS MAXIMUM FOR DETECTION; 67 NS MAXIMUM FOR CORRECTION (16 BIT SYSTEM)
- EXPANDABLE TO HANDLE 80 BIT MEMORIES
- SYNDROME OUTPUTS FOR ERROR LOGGING
- SEPARATE INPUT AND OUTPUT BUSSES — NO TIMING STROBES REQUIRED
- SUPPORTS READS WITH AND WITHOUT CORRECTION, WRITES, PARTIAL (BYTE) WRITES, AND READ-MODIFY-WRITES
- NMOS TECHNOLOGY FOR LOW POWER
- COMPATIBLE WITH INTEL 8206 DEVICE
- 68 PIN LEADLESS JEDEC PACKAGE
- SINGLE +5V SUPPLY

DESCRIPTION

The NMOS 8206 Error Detection and Correction Unit is a high-speed device that provides error detection and correction for memory systems (static and dynamic) requiring high reliability and performance. Each WD8206 handles 8 or 16 data bits and up to 8 check bits. WD8206's can be cascaded to provide correction and detection for up to 80 bits of data. Other WD8206 features include the ability to handle byte writes, memory initialization, and error logging.



WD8206 BLOCK DIAGRAM

PROPOSED APPLICATIONS

The WD8206 interface to a typical 32 bit memory system is illustrated below. For larger systems, the partial parity bits from slaves two to four must be XOR'ed externally, which calls for one level of XOR gating for three WD8206's and two levels for four or five WD8206's.

NEW PRODUCT BULLETIN

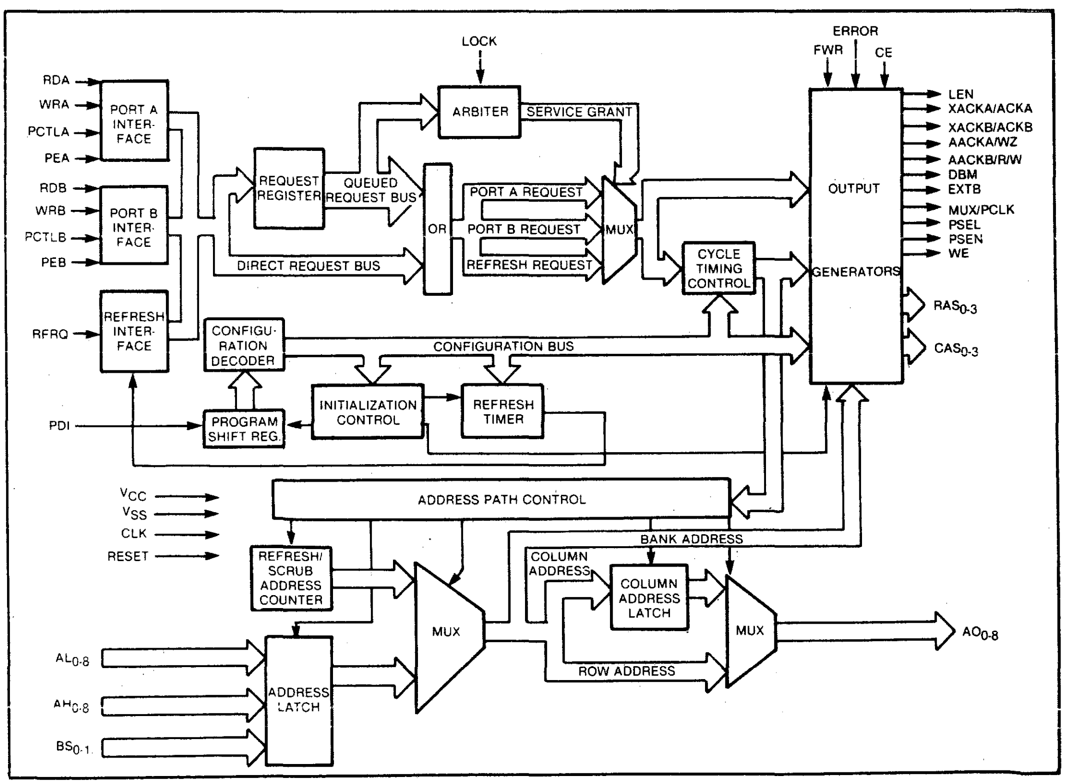
Advanced Dynamic RAM Controller WD8207

FEATURES

- PROVIDES ALL SIGNALS NECESSARY TO CONTROL 16K, 64K AND 256K DYNAMIC RAMS
- DIRECTLY ADDRESSES AND DRIVES UP TO 2 MEGABYTES WITHOUT EXTERNAL DRIVERS
- SUPPORTS SINGLE AND DUAL-PORT CONFIGURATIONS
- AUTOMATIC RAM INITIALIZATION IN ALL MODES
- FIVE PROGRAMMABLE REFRESH MODES
- TRANSPARENT MEMORY SCRUBBING IN ECC MODE
- DATA TRANSFER ACKNOWLEDGE SIGNALS FOR EACH PORT
- PROVIDES SIGNALS TO DIRECTLY CONTROL THE WD8206 ERROR DETECTION AND CORRECTION UNIT
- SUPPORTS SYNCHRONOUS OR ASYNCHRONOUS OPERATION ON EITHER PORT
- SINGLE +5V SUPPLY

DESCRIPTION

The WD8207 is a 68-pin leadless JEDEC type A hermetic chip carrier. The WD8207 Advanced Dynamic RAM Controller (ADRC) is a high-performance, systems-oriented, Dynamic RAM controller that is designed to easily interface 16K, 64K and 256K Dynamic RAMs microprocessor Systems. A dual-port interface allows two different busses to independently access memory. When configured with a WD8206 Error Detection and Correction Unit the WD8207 supplies the necessary logic for designing large error-corrected memory arrays. This combination provides automatic memory initialization and transparent memory error scrubbing.



WD8207 BLOCK DIAGRAM

PROPOSED APPLICATIONS

The ADRC supports several microprocessor interface options including synchronous and asynchronous connection.

PRELIMINARY DATA SHEET

X2444 / X2444I — 256 Bit Serial Nonvolatile Static RAM

16x16 Bit Serial NOVRAM*

- **Ideal for use with Single Chip Microcomputers**
  - **Static Timing 1 MHz Operation**
  - **Minimum I/O Interface**
  - **Serial Port Compatible (COPS™, 8051)**
  - **Minimum Support Circuits**
- **Software and Hardware Control of Nonvolatile Functions**
  - **Maximum Store Protection**
- **TTL Compatible**
- **16x16 Organization**
- **X2444 Emulator Available—X2444E**
- **Reliable N-Channel Floating Gate Technology**
- **Single 5V Supply**
- **Low Power Dissipation**
  - **Active Current: 15mA Typ.**
  - **Store Current: 8mA Typ.**
  - **Standby Current: 6mA Typ.**
  - **Sleep Current: 5mA Typ.**
- **8-Pin Mini-Dip**
  - **Low Cost**
  - **Compact**

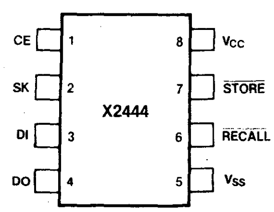
The X2444 is a 256-bit Xicor NOVRAM memory fabricated in Xicor's proven NMOS technology. The device is organized as 16 words of 16 bits each. Serial access allows the use of a cost-effective 8-pin package, making the X2444 ideal for cost sensitive and compact design applications. Each bit of the static RAM is overlayed with a bit of nonvolatile electrically erasable PROM (E^2PROM). Data can be transferred back and forth between the two memories either by instructions sent from the processor over the serial interface, or by toggling the external $\overline{STORE}$ and $\overline{RECALL}$ inputs. Nonvolatile data is retained in the E^2PROM, while independent data can be accessed and updated in the RAM.

High voltage pulses and supplies are not required. A single 5V supply is the only power source needed, and all signals are TTL compatible.

The X2444 offers many modes of operation in order to minimize the power consumption of the chip. The chip is placed in the STANDBY mode whenever it is deselected, and is placed in the SLEEP mode whenever the sleep instruction is executed. The chip will automatically return active from STANDBY when selected by CE, and will exit the SLEEP mode when the next RECALL operation is performed, either by the RCL instruction or by taking the $\overline{RECALL}$ input low.

PIN CONFIGURATION

8-PIN DIP .300″



PIN NAMES

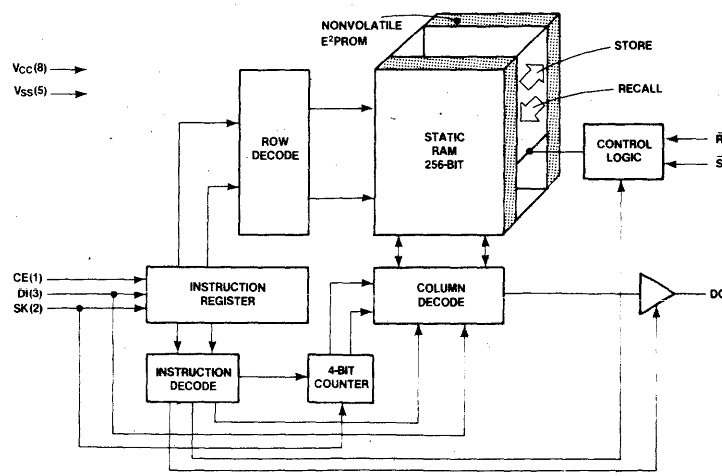
FUNCTIONAL DIAGRAM X2444 (16x16)



*NOVRAM is Xicor's nonvolatile static random access memory device.
COPS™ is a trademark of National Semiconductor, Inc.

Characteristics Subject to Change Without Notice
June 1983, Stock No. 200-019

Xicor NOVRAM* Memories
Nonvolatile Static RAMS

5V-Programmable	X2212	256 x 4 Bit Nonvolatile Static RAM
10% Power Supply Margin	X2210	64 x 4 Bit Nonvolatile Static RAM
V_{CC} = 5V ±10%	X2201A	1024 x 1 Bit Nonvolatile Static RAM

- **NONVOLATILE STATIC RAM:** The **X2201A, X2210,** and **X2212** are organized as conventional static RAMs overlaid bit-for-bit with a nonvolatile Electrically Erasable PROM (E^2PROM). Nonvolatile data can be stored in the E^2PROM and at the same time independent data can be accessed in the RAM memory. At any time, data can be transferred back-and-forth between the RAM and E^2PROM by simple store and array recall signals.
- **5V ONLY:** High-voltage pulses or supplies are never required. A single 5V supply is the *only power source* ever required for any function.
- **EASE-OF-USE:** Unprecedented simplicity, all inputs and outputs are directly TTL compatible. Fully static timing. Three-state output. 18-pin package.
- **PERFORMANCE:** RAM cycle time is less than 300ns. During the lifetime of the device, data can be recalled from the E^2PROM an unlimited number of times.
- **POWER-FAILURE PROTECTION:** One simple TTL signal saves the entire RAM database. A snapshot nonvolatile copy of all RAM data is internally stored safely without power and can be recalled to the RAM when power returns. No battery backup required.
- **ORGANIZED FOR MICROCOMPUTER SYSTEMS:** The common data input and output is organized four bits wide on the X2210 and X2212. The X2201A is organized conveniently by one for larger memory applications.
- **Xicor's** products are fabricated with reliable n-channel floating gate MOS technology. For systems where RAM nonvolatility or *in-the-circuit* ROM changes by TTL signals are important, the **Xicor X2201A, X2210,** or **X2212** is the ideal choice.

- **Single 5-Volt Supply**
- **Byte Write Time: 10ms Max.**
- **Fast Access Time: 300ns Max.**
- **Low Power Dissipation**
  - **Active Current X2816A: 110mA Max.**
    X2804A: 80mA Max.
  - **Standby Current: 50mA Max.**

The Xicor X2816A (16,384 bits) and X2804A (4,096 bits) are electrically erasable programmable read-only memories (E²PROMs) with unprecedented ease-of-use features. Xicor E²PROM data can be modified using simple TTL level signals and a single 5-volt power supply. In addition, Xicor E²PROMs are operationally and pin compatible with existing 2K x 8 byte-programmable E²PROMs which require an additional high voltage power supply for programming. (See *optional* high voltage programming compatible mode.) Writing data in Xicor E²PROMs is analogous to writing data in a static RAM. A 200ns TTL low level signal to the $\overline{WE}$ pin initiates a byte write operation which is automatically timed out in a maximum of 10ms. Since addresses and data are internally latched, Xicor E²PROMs free the system for other tasks during the 10ms period, such as programming other Xicor E²PROMs. In addition to byte modification capability, a 10ms total chip erase feature is provided.

Xicor E²PROMs use a 2-line control architecture, $\overline{CE}$ and $\overline{OE}$, to eliminate bus contention in a system environment. A power down mode is featured. In the standby mode, power consumption is reduced by 55% without increasing access time. The standby mode is achieved by applying a $\overline{CE}$ high signal.

The X2816A and X2804A are fabricated with the same reliable n-channel floating gate MOS technology used in Xicor's popular 5-Volt programmable NOVRAM memories.

ADVANCED INFORMATION

64K X2864A 8K x 8 Bit Electrically Erasable PROM

5 Volt E^2PROM

FEATURES

- **Simple Byte and Page Write**
  - — Single TTL Level $\overline{WE}$ Signal
  - — Latched Address and Data
  - — Automatic Internal Erase
  - — Automatic Write Timing
  - — Automatic Page Write
  - — $\overline{DATA}$ Polling Verification
  - — Optional Chip Erase
- **Enhanced Write Protection**
- **Single 5 Volt Supply**
- **Byte or Page Write: 5 ms Typical**
  - — Effective 300 μsec/Byte Write
  - — Chip Rewrite—2.6 sec
- **Fast Access Time: 350 ns**
- **Power: 110 mA—Active Current**
  50 mA—Standby Current
- **JEDEC Approved Byte-Wide Pinout**

DESCRIPTION

The Xicor X2864A is an electrically erasable programmable read-only-memory (E^2PROM) with unprecedented ease-of-use features. Xicor E^2PROMs can be modified using simple TTL level signals and a single 5 volt power supply. In addition, the X2864A is operationally and pin compatible with existing 8K x 8 EPROMs which require high voltage programming and ultraviolet exposure erasing. Writing data in Xicor E^2PROMs is analogous to writing data in a static RAM. A 200 ns TTL low level signal to the $\overline{WE}$ pin initiates a byte write operation which is automatically timed out in 5 ms. Since addresses and data are internally latched, Xicor E^2PROMs free the system for other tasks during the 5 ms period, such as programming other Xicor E^2PROMs.

A 16-Byte Page Write allows data to be written at an effective rate of 300 μsec/byte or 2.6 seconds to rewrite the entire chip. An optional chip erase feature is also included.

The X2864A also features $\overline{DATA}$ Polling, which enables the E^2PROM to signal the processor that a write operation is complete without requiring the use of any external hardware.

The X2864A is fabricated with the same reliable N-Channel floating gate MOS technology used in the popular 5 volt programmable Xicor NOVRAMs.

INTRODUCTION TO PROM PROGRAMMERS

This section describes instruments used to enter assembly language code into programmable devices such as PROMs, EPROMs, EEPROMs, EAROMs, PALs, PLAs and MPUs. Equipment listed includes programmers designed for system development, production and field-service applications. Manufacturers are sequenced alphabetically, and each system is characterized by pertinent selection factors. These parameters include programmed device types, type of display, personality modules, edit functions, programming checks, self-test features and types of interface ports.

Some manufacturers assign different model numbers to units having capabilities beyond those listed for the model designated at the top of the Master Selection Guide. In these cases the units are covered under "Comments".

Detailed Product Information provided by:

The manufacturers listed above have provided detailed information on their latest and most significant products.

PROM PROGRAMMERS

Application	Capabilities	Programmed Devices	Display	Maximum PROM Array (bits)	Personality Modules	Maximum Gang Capacity (Sockets)	Edit Functions
Development	Program, copy, compare, read	EPROM	CRT, LED	16Kx8	Not Required		Insert, delete
Production	Copy	EPROM, EEPROM	LED	32Kx8	Software based	16	
Development, production, field service	Program, copy, compare, read, erase	EPROM	LED	32Kx8	Not required, software-based	1	Insert, move, delete, nibble swap, memory map
Production	Program, copy, compare	Bipolar PROM	Lamps	4Kx8	Dedicated	1	
Development, field service, Production	Program, copy, compare, read, erase	NMOS, CMOS, MPU, EEPROM, EPROM	7-Segment LED(4)	23Kx8 expandable	Software programmable	1	Via Host System
Development, field service	Program, read	Bipolar PROM	Lamps, digit switch	4Kx8	Dedicated		
Development, production, field service	Program, copy, compare, read, test	FPLA: Signetics 82S100, 82S101, 82S106, 82S107	LED		Dedicated		Insert, delete
Development, field service, production	Program, copy, compare, read	Bipolar PROM (8 x 32)	LED	32x8			Insert, delete
Development	Program, copy, compare, read, test	Seeq 72720 (T.I. 7000 with EEPROM)	User terminal	up to 8Kx8		1	Line editing or any word processor on host computer
Development	Program, copy, compare, read, test, erase	EPROM, EEPROM	CRT	32Kx8	Dedicated		
Development, Incoming Test	Program, copy, compare, read, test	8748, 8749	User terminal	1Kx8 8748, 2Kx8 8749		1	Line editing or any word processor on host computer
Development, incoming test	Program, copy, compare, read, test	8751, 8752	User terminal	2Kx8 8751, 4Kx8 8752		1	Line editing or any word processor on host computer
Development	Program, copy, compare, read	EPROM, EEPROM, MPU	LED	8Kx8	Dedicated (Universal NMOS and Intel single-chip microcomputers)	1	Insert, delete, write, fill
Development, field service	Program, copy (load), compare (verify), read, test, erase	Bipolar (fuse-link and vertical-fuse) PROM, CMOS, PROM, EPROM, EEPROM, EAROM, MPU	16-character fluorescent	256Kx8	24-pin skinny-wide and 40-pin MPU socket adapters; no modules required	1	Insert, move, delete, nibble swap, memory map, split, shuffle, clear, complement, fill RAM
Development, field service	Program, copy (load), compare (verify), read, test, erase	CMOS, PROM, EPROM, EEPROM, EAROM, MPU	16-character fluorescent	256Kx8		1	Insert, move, delete, nibble swap, memory map, split, shuffle, clear, complement, fill RAM

PROM PROGRAMMERS

Programming Checks	Self-Test	Prompting	Buffer Memory	I/O Interface	Comments	Model	Source
Blank, verify		Audible		RS232 Serial, selectable baud rate	Operates with Z80/8080 CP/M. Utility software supplied to partition long object or HEX files into required EPROM length and split 16-bit files into upper/lower 8-bit files.	UP8	Advent
Blank, checksum, illegal bit, verify	Keyboard, display, switches	Visual/ audible				CopyROM3716	Citel
Blank, checksum, illegal bit, verify	Keyboard, display, switches, buffer, memory	Visual/ audible	8Kx8 expandable	Parallel TTL, RS232 serial		System37	Citel
Illegal bit, Vcc sensitivity		Visual				PD2000S	Curtis
Blank, checksum, illegal bit, verify, on current	Status of programming levels	Visual/ audible	64	RS232 serial selectable Baud rates 110-9600	Programs 4K 3-supply through 25gK 1-5 supply and beyond. Stand-alone duplicator or complete remote control by host computer.	PD5000E	Curtis
Vcc sensitivity		Visual				PM3000S	Curtis
Verify		Visual				PR-100A	Curtis
Blank, checksum, illegal bit, verify	Diagnostic & calibration	Visual/ Audible	32 bytes	RS5332 110-9600 Baud	Handles Signetics, TI, NSC, Harris, AMD, MMI, Intersil.	PR5200B	Curtis
Checksum verify bytes		Visual	User system	300, 1200, 2400 baud RS 232 link to host computer	IBM PC cross assemblers with downloader available. Programmer board connects to any RS-232 port and utilizes user computer terminal and power supply.	CYP-7000	Cybernetic
Blank, checksum, verify		Visual/ Audible	16Kx8	RS232 Serial, Selectable Baud Rate		CYP275	Cybernetic
Checksum verify bytes		Visual	User system	300, 1200, 2400 baud RS 232 link to host computer	IBM PC cross assemblers with downloader available. Programmer board connects to any RS-232 port and utilizes user computer terminal and power supply.	CYP8048/9	Cybernetic
Checksum verify bytes		Visual	User system	300, 1200, 2400 baud RS 232 link to host computer	IBM PC cross assemblers with downloader available. Programmer board connects to any RS-232 port and utilizes user computer terminal and power supply.	CYP8051	Cybernetic
Blank, checksum, illegal bit, verify	Keyboard, display, switches, buffer memory, automatic power-up, program ROM, status of programming electronics	Visual	2kx8	RS232 serial, selectable baud rate (110-9600 baud)		20B Universal NMOS Memory Programmer	Data I/O
Blank, checksum, illegal bit, verify, overcurrent check, backward device, 2-pass verify with variable	Keyboard, display, switches, buffer memory, automatic power-up, program ROM, status readout of programming electronics	Visual	32Kx8	RS232 serial, current loop, selectable baud rate (50-19,200)	Portable programming system; includes UV erasing lamp and removable lid for storing accessory.	22A Personal Programmer	Data I/O
Blank, checksum, illegal bit, verify, overcurrent check, backward device, 2-pass verify with variable Vcc	Keyboard, display, switches, buffer memory, automatic power-up, program ROM, status of programming electronics	Visual	32Kx8	RS232 serial, current loop, selectable baud rate (50-19,200)	Portable MOS-only programming system; includes UV erasing lamp and removable lid for accessory storage.	22B Personal Programmer	Data I/O

Bold face indicates additional data is provided on the page noted.

PROM PROGRAMMERS

Application	Capabilities	Programmed Devices	Display	Maximum PROM Array (bits)	Personality Modules	Maximum Gang Capacity (Sockets)	Edit Functions
Development, field service	Program, copy (load), compare (verify), read, test	Bipolar PROM, CMOS, PROM, EPROM, EEPROM, EAROM, PAL, PLA, MPU, FPGA, FPLA, FPRP, FPLS, prog. I/O port, PMUX	16-character fluorescent	256Kx8 (UniPak2)	Software selectable Paks (UniPAK 2, MOSPak, LogicPak, Gang Pak, Handler UniPak)	8	Insert, move (block), delete, nibble swap, memory map, split, shuffle, clear, complement, fill RAM
Production	Program, copy (load), compare (verify), read, test, EEPROM cycling test, electronic device identification	MOS and CMOS PROM, EPROM, EEPROM, intelligent algorithms for EPROMs	16 character fluorescent	16Kx8, expandable	Software selectable	20	Complement RAM, fill RAM, 16-bit mode
Development, production	Program, Set program, copy (load), compare (verify), read, test, EEPROM cycling test, electronic device identification	MOS and CMOS, EPROM, EEPROM, intelligent algorithms for EPROMs	16 character fluorescent	16Kx8	Software selectable	20	Insert, delete, I/O offset, begin RAM, fill RAM, complement RAM, 16-bit mode
Development, production, field service	Program, copy, compare, read, test, stimulate	CMOS, PROM, EPROM, EEPROM	LED Hexadecimal	32Kx8	Dedicated, generic		Insert, move, search, split/shuffle, memory map
Production, field service	Program, copy, compare, read, test	CMOS, PROM, EPROM	LED	4Kx8	Gang, generic gang	16	
Production, field service	Program, copy, compare, read, test, erase	CMOS, PROM, EPROM, EEPROM	LED	16Kx8	Gang, generic gang	10	
Development, production, field service	Program, copy, compare, read, test, erase	Bipolar PROM, CMOS, PROM, EPROM, EEPROM, EAROM, IFL, PAL, PLA, MPU	CRT	63Kx8	Generic		Insert, move, delete, nibble swap, memory map, complement, byte, split, shuffle, search
Development, production	Program, copy, compare, read, test, erase	Bipolar PROM, CMOS, PROM, EPROM, EAROM, PAL, PMUX, MPU	LED, hexadecimal	50Kx8 (add field 64Kx8BMS)	Dedicated, generic		Move, nibble swap, memory map, complement
Development, production, field service	Program, copy, compare, read	Bipolar PROM, EPROM, MPU	LED	16Kx8	Dedicated, generic, gang	8	Insert, delete, nibble swap
Development, field service	Program, copy, compare, read, test, erase	CMOS, PROM, EPROM, EEPROM, EAROM	LED	32Kx8	Dedicated		Insert, move, delete, memory map
Development, field service	Program, copy, compare, read, test, erase, modify	Bipolar PROM, CMOS, PROM EEPROM			Not required		Move, compare, replace
Development, field service	Program, copy, compare, read, test, erase	Bipolar PROM, CMOS PROM, EPROM, EEPROM, EAROM, PAL	LED	32Kx8	Generic & software programmable		Insert, move, delete, nibble swap, memory map, search

PROM PROGRAMMERS

Programming Checks	Self-Test	Prompting	Buffer Memory	I/O Interface	Comments	Model	Source	Line
Blank, checksum, illegal bit, verify, overcurrent, backward device, 2-pass verify with variable Vcc	Keyboard, display, switches, buffer memory, automatic power-up, program ROM, status of programming electronics	Visual/ audible	16Kx8 (standard), 64Kx8, (optional)	RS232 serial, current loop, selectable baud rate (50-19,200 baud)	Edit in hexadecimal, octal or binary. English-language prompts, menus and error messages. Remote control and 26 development-system format translators are standard.	29A Universal Programmer	Data I/0	1
Blank, checksum, illegal bit, verify, overcurrent, backward device, mislocated device	Keyboard, display, switches, buffer memory, automatic power-up, program ROM, status of programming electronics	Visual/ audible	32Kx8	RS232 serial, selectable baud rate (110-9600 baud)	Remote control and 26 data translation formats are standard. M120A controls 200A Data Contriol Unit for program storage.	M120A Gang Programmer	Data I/0	
Blank, checksum, illegal bit, verify, overcurrent, backward device, miclocated device, variable Vcc on verification	Keyboard, display, switches, buffer memory, automatic power-up, program ROM, status of programming electronics	Visual/ audible	128Kx8, 256Kx8	RS232 serial (2), selectable baud rate (110-9600 baud)	Can segment programs and load each segment into different PROMs simultaneously. Remote control and 26 data translation formats are standard. M121A controls 200A Data Control Unit for program.	M121A Gang Programmer	Data I/0	
Blank, illegal bit, checksum, verify	Automatic with power-up	Visual/ audible	8Kx8 expanded to 32Kx8 data retention with power off	RS232 serial port, selectable baud rate to 19.2K	Interfacing formats: Intel Hex; Motorola exorciser; ACSII-Hex Space; ACSII-BNPF & manual format. EPROM/EEPROM simulation capability	EP-804	Digelec	
Blank, verify		Visual/ audible	4Kx8	RS232 serial, current loop, selectable baud rate	Can program two different patterns simultaneously.	GP-16 Gang Programmer	Digelec	5
Blank, checksum, illegal bit, verify, parametric test	Device Selection vs Pin Out	Visual/ audible				GP-810 Gang Programmer	Digelec	
Blank, checksum, illegal bit, verify, continuity, parametric check	Buffer memory, program voltages	Visual/ audible	64Kx8, espandable to 512Kx8 battery backup	Parallel TTL, RS232 serial, current loop, selectable baud rate	No calibration required. Software/Menu driven machine.	UP-803	Digelec	
Blank, verify, continuity, window check		Visual/ audible	4Kx8, 8Kx8, expandable, battery backup	Parallel TTL, RS232 serial, current loop, selectable baud rate	12 interfacing formats; 4 data entry keyboard formats	UPP-801	Digelec	
Blank, checksum, illegal bit, verify	Display, buffer memory	Visual/ audible	16Kx8	RS232 serial, current loop, selectable baud rate, 110 to 9600 baud	Unit is equipped with three fast programmable power supplies (100ns/V) for programming voltages	RP400-S	Elind	
Blank, checksum, illegal bit, verify	Buffer memory	Visual/ audible	64Kx8	RS232 seial, +TTL serial	The RP600 is a dedicated EPROM Programmer, the selection is made by software. The unit is particularly suited for field service. The unit can program all EPROMs available at the moment.	RP600	Elind	10
Verify						H3000	Hughes	
Blank, checksum, illegal bit, verify	Keyboard, display, buffer memory module	Visual	32Kx8	RS232 serial, current loop, selectable baud rate	PROM Emulation Module option allows user to test and debug programs before committing to PROMs.	IM1010 Universal Programmer	IMS	

Bold face indicates additional data is provided on the page noted.

PROM PROGRAMMERS

Application	Capabilities	Programmed Devices	Display	Maximum PROM Array (bits)	Personality Modules	Maximum Gang Capacity (Sockets)	Edit Functions
Production, development	Program, copy, compare, read, test, erase	EPROM, EEROM, CMOS, EPROM	LED	16Kx8, 32Kx8	Software programmable	16	Move, delete, memory map, I/O offset, fill RAM
Development, production	Program, copy, compare, read, erase (E2 only)	Bipolar PROM, EPROM, EEPROM, MPU	LED	32Kx8bits	Generic, gang, generic gang	8	Move*, nibble swap* n byte swap*, memory map*, enter
Development, production	Program, copy, compare, read, test, erase	Bipolar PROM, CMOS PROM, EPROM, EEPROM, EAROM, PAL, PLA, MPU, EPLA, FDRP, EPGA, FPLS, PMUX	Fluorescent	32Kx8	Dedicated, generic, gang, generic gang	8	Set, insert, move, delete, nibble swap, memory map, fill, invert, 16-bit split/shuffle, logical AND/OR/XOR, string search
Development, production, field service	Program, copy, compare, read, test, erase	Bipolar PROM, CMOS PROM, EPROM, EEPROM, EAROM, PAL, PLA, FPLA, FPRP, FPGA, FPLS, PMUX	LED	32Kx8	Dedicated, generic, gang, generic gang	8	Insert, move, delete, nibble swap, memory map, fill, invert
Development, production, field service	Program, copy, compare, read, test, erase	Bipolar PROM, CMOS PROM, EPROM, EEPROM, EAROM, PAL, PLA, MPU, FPLA, FPLS, PMUX	LED	32Kx8	Dedicated, generic, gang, generic gang	8	Set, insert, move, delete, nibble swap, memory map, fill, invert
Development, production, field service	Program, copy, verify, read, test, erase, help, odd/even	Bipolar PROM, CMOS PROM, EPROM, EEPROM, EAROM, PLA	CRT via terminal	8Kx8	Dedicated	1	Insert, move, delete, save, memory map, change
Development, production, field service	Program, copy, compare, read, test, erase	Bipolar PROM, CMOS PROM, EPROM, EEPROM, EAROM, PAL, PLA, MPU, All programmable devices	CRT Interfaces with Remote printer		None—(completely software based)!!	1	Insert, move, delete, nibble swap, memory map, on screen cursor-controlled editing
Production	Program, copy, compare, read, test	EPROM	LED	32Kx8	Generic gang	16 (32 with satellite)	None allowed
Production	Program, copy, compare, read, test, erase, dc parameters	EPROM, EEPROM, EAROM	LED, ASCII	256Kx8	Generic gang	18 (36 with satellite)	None allowed
Production	Program, copy, compare, read, test, erase, dc parameters	EPROM, EEPROM, EAROM	LED, ASCII	256Kx8	Generic gang	20 (40 with satellite)	None allowed
Development, production	Program, copy, compare, read	EPROM	LED	2764	Dedicated	1	Insert, move
Development, production, field service	Copy, compare	Bipolar PROM, CMOS PROM, EPROM, EEPROM, PLA	LED	64Kx8	Dedicated, generic, gang, generic gang	8	Insert, move, delete, nibble swap, memory map
Development, production, field service	Program, copy, compare, read	Bipolar PROM, CMOS PROM, EPROM, EEPROM	LED	64Kx16	Dedicated, generic, gang, generic gang	8	Insert, move, delete, nibble swap, memory map

PROM PROGRAMMERS

Programming Checks	Self-Test	Prompting	Buffer Memory	I/O Interface	Comments	Model	Source	Line
Blank, checksum, illegal bit, verify, misaligned or upside-down device, broken or bent pin, overcurrent	Keyboard, display, switches, buffer memory, automatic power reset, calibration, programming electronics	Visual/ audible	64Kx9 standard; 128Kx9, 256Kx9 and 512Kx9	RS232 serial, selectable baud rate	Simultaneous set programming ability, electrically isolated programming sockets. Computer control software automates EPROM programming, intelligent Fast algorithms supported.	IM3016 Multi-Master Programmer	IMS	1
Blank, checksum, illegal bit, verify, reverse socket detection	Buffer memory, motherboard, power supply, module	Visual/ audible*	16Kx8, expandable to 32K; virtual buffer*	RS232 serial, automatic baud rate selection	*iUPS software package feature. Host software driver also provides file manipulation, file mapping, held file, screen editing, data manipulation and other features.	UP-200/201	Intel	
Blank, checksum, illegal bit, verify at high and low Vcc limits	Keyboard, display, switches, buffer, firmware integrity	Visual/ audible	8Kx8, expandable to 32Kx8	Parallel TTL, RS232 serial, current loop, selectable baud rate (50 to 38400 baud), IEEE-488	Build-in uv EPROM eraser with keyboard programmable timer. Remote controllable via RA232 and IEEE-488 ports. Error-tolerant communications protocol for long distance telephone transfers. Compatible with MPP-80S modules.	EPP-80	Kontron	
Blank, checksum, illegal bit, verify at high and low Vcc limits	Keyboard, display switches, buffer memory	Visual/ audible	4Kx8, 8Kx8, 16Kx8, 32Kx8 plus mass storage	RS232 serial, selectable baud rate	Build-in uv source, IC handler interface. MPP 80SAM has acoustic coupler and modem.	MPP-80	Kontron	
Blank, checksum, illegal bit, verify at high and low Vcc limits	Keyboard, display switches, buffer memory, firmware integrity	Visual/ audible	8Kx8, expandable to 32Kx8	RS232 serial, current loop, selectable baud rate (50 to 38400 baud)	Build-in uv EPROM eraser. IC handler interface. Remote controllable via RS232 port from terminal or host computer. MPP-80SAM has build-in acoustic coupler, modem and error-tolerant communications protocol.	MPP80S	Kontron	5
Blank, illegal bit, verify		Visual/ audible	8Kx8, expandable	Proprietary		MG8PPS	Motorola	
Blank, checksum, illegal bit, verify, matrix test	Keyboard, buffer memory, leakage test on socket	Visual/ audible menu-driven	64Kx8 Std, expandable to 256Kx8	Dual RS-232	Five versions available, depending on programming capabilities needed. Fully expanded, Datatap uses 40 separate high-voltage drivers with a library of over 1000 programmable devices, programmed from one universal socket!!	Datatap®	Oliver	
Blank, illegal bit, verify, matrix test*	Keyboard, switches, leakage test on socket matrix	Visual/ audible			*Matrix test checks both data and address lines for ESD (electrostatic discharge) damage. Data lines are checked for min. sink and source current capability during both blank and verify tests. 100-240 Vac operation.	UPP-2700	Oliver	
Blank, checksum, illegal bit, verify, Vcc level tests, matrix test	Keyboard, switches, leakage test on socket matrix	Visual/ audible, including voice option	2 ports for label printer and voice enunciator	UL-Listed, short circuit protection, power-fail restart capability		**UPP-28000-ZIF**	**Oliver (4401)**	
Blank, checksum, illegal bit, verify, Vcc level tests, matrix test	Keyboard, switches, leakage test on socket matrix	Visual/ audible, including voice option		2 ports for label printer and voice enunciator		**UPP-28000 Scoop**	**Oliver (4401)**	10
Blank, illegal bit, verify		Visual	None	RS232 serial, selectable baud rate		Gangbuster	Onset	
Blank, verify, at high and low Vcc limits, checksum	Keyboard, display, switches, buffer memory	Visual/ audible	8Kx8, 16Kx8, expandable, battery backup CMOS	Parallel TTL, RS232 serial, selectable baud rate	Two year warranty. Separate master and copy sockets on personality modules (can duplicate directly from master to copy socket). Fixed Vpp power supplies do not require adjustment.	M910AControl Unit	Pro-Log	
Blank, checksum, illegal bit, verify at high and low Vcc limits	Keyboard, display, switches, buffer memory	Visual/ audible	8Kx8, 16Kx8, expandable, battery backup CMOS	Parallel TTL, RS232 serial, selectable baud rate	Two year warranty. Separate master and copy sockets on personality modules (can duplicate directly from master to copy socket). Fixed Vpp power supplies do not require adjustment.	M980Control Unit	Pro-Log

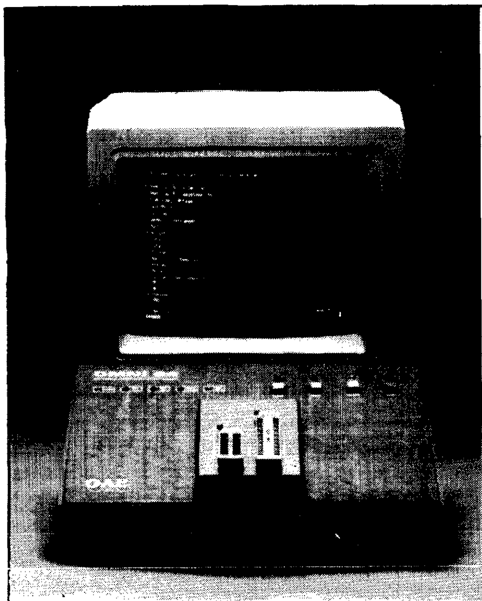
Digital Gate Arrays, Standard Cells, and Linear Arrays Are All Covered

Vol. II, page 4425

Oliver Advanced Engineering, Inc.

NEW



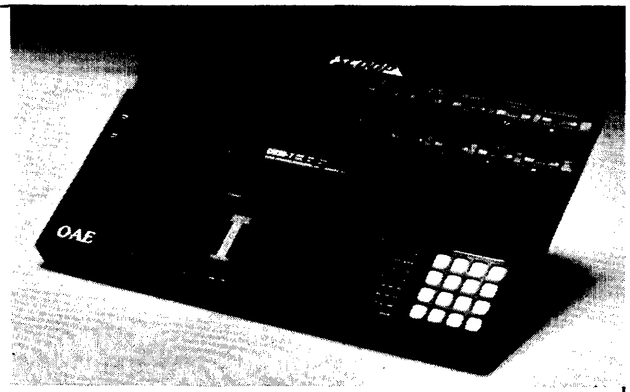
OMNI 64™
SOFTWARE CONFIGURED PROGRAMMER

- Practically every programmable device in production can be programmed on two universal sockets, including EPROMs, EEPROMs, bipolar PROMs, single chip microprocessors, PALs, FPLAs, FPLSs, FPGAs, and even diode arrays.
- No more personality modules, HEX keypads or cryptic one-line displays. The OMNI 64 has replaced them with programmable pin drivers, a large firmware data base and a cursor controlled full screen display format.
- Any 24×80 CRT with clear screen and addressable cursor will provide over 50 pre-formatted user interactive screens.
- 65,536 bytes of DATA RAM standard, 262,144 bytes optional.
- The OMNI 64 comes in five upgradable levels. No need to pay for programming hardware that you are not going to use.
- ATE version available. Combines DC and AC parametric testing with the extensive OMNI 64 programming data base.

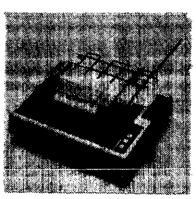
Patents pending.

Specifications are subject to change without notice.

NEW MODEL 28000 SCOOP
EPROM & E²PROM TESTER-DUPLICATOR



- OAE's exclusive SCOOP design allows all PROMs to be scooped from their sockets and into a tube in one operation!
- 20 Sockets for high throughput and lower labor costs.
- Full alpha-numeric display produces easy to understand operator prompts.
- TESTS and PROGRAMS both 24 & 28 pin NMOS, HMOS, and CMOS 5v single supply EPROMs and E²PROMs.
- Fourteen new tests check for shorts, opens, excessive leakage, and static damage on both data and address lines.



- Two stage Matrix Test™ locates defective or incorrectly inserted devices in Stage I. Static damaged or tri-stated parts are detected in Stage II.
- Sink and source current tests are performed every time a device is read.
- Label Printer produces professional custom labels for each device. Diagnostic error labels are automatically printed for marginal or defective EPROMs.
- 18 Zero Insertion Force Socket version also available.

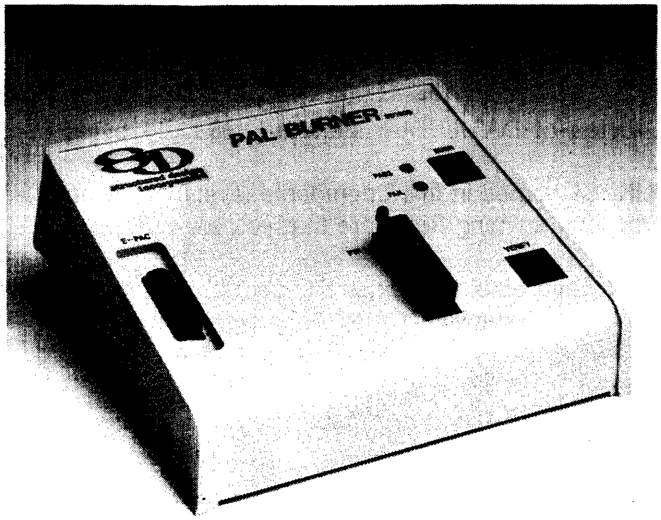
SIMPLIFIED METHODOLOGY

Structured Design Provides the Complete PAL® Development System

PAL BURNER

At Structured Design we believe in methods — *complete step-by-step methods* that free your creativity to design hardware that's practical, marketable and tested.



Simplify, Simplify, Simplify

Like all methods that work, ours includes all you need to do your job. The SD1000 PAL Burner is the most complete programmer available today, working without costly add-on equipment or awkward switching of modules.

New PAL Burner Offers Cost-Effective Design Power

PAL Burner combines power with simplicity. It's simple enough that your non-technical staff can easily use it; yet, it's powerful enough to capture and store complex designs. Since PAL Burner includes a structured, menu-driven, user-friendly PAL assembler that prompts you through each step, you virtually eliminate syntax errors saving many design hours and dollars.

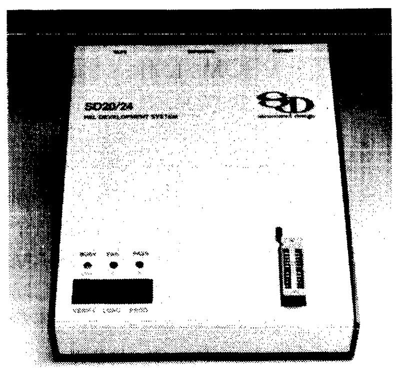
Compatible. Reliable. Easy-to-Use.

PAL Burner offers other benefits: programs all current PALs (Monolithic Memories, Texas Instruments, National Semiconductor, Advanced Micro Devices), built-in PALASM simulator and portability. Weighing only two pounds, PAL Burner is easy to pack in your briefcase to capture after-hours design inspirations.

In addition, PAL Burner is upward compatible. We can meet new firmware and software developments almost as they're introduced.

SD1000 PAL Burner

- **Assembles Boolean equations through new menu-driven PALASM**
- **Programs 20-pin and 24-pin PALs**
- **Programs MMI, National, TI, and AMD PALs**
- **Stores PAL design specification in E-PAC**
- **Verifies logic through Function Test**
- **Verifies Boolean equations through SIMULATE function**
- **Scores Function Test with Stuck-High/Stuck-Low FAULT Grading**
- **Verifies socket connection through Continuity Test**
- **Blows security fuse**



Also available is our original PAL Programmer, the SD 20/24 PAL Development System.

Call us first for a simple method — you won't need to call anyone else!

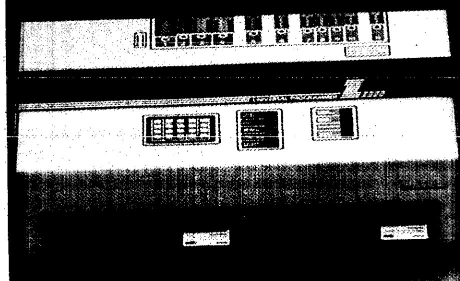
AMERICA'S BEST PROM PROGRAMMERS

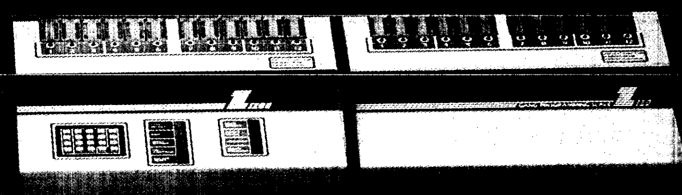
Two series of high tech instruments for EPROM/PROM/PAL/MPU programming.

Z SERIES programming units give you two independent RS-232 ports, 16 character alphanumeric displays, up to 128K x 8 of static RAM, full RAM editors, and prompted device selection. You can slave expand our universal or gang programmers for even greater production throughput of EPROMs, EEPROMs or Intel MPUs. These smart Z80A based units even calibrate themselves to save you time and ensure the best production lot yield.

For development applications or high volume programming, you can choose units with integral dual 8 inch DS/DD disk drives and CP/M* operating system.

ZAP SERIES of EPROM/MPU programmers are portable, easy to use and nicad battery operated. These compact, superbly engineered instruments give you many of the features of larger units plus PROM simulation. Use ZAP programmers for your engineering, low volume production and field service applications.



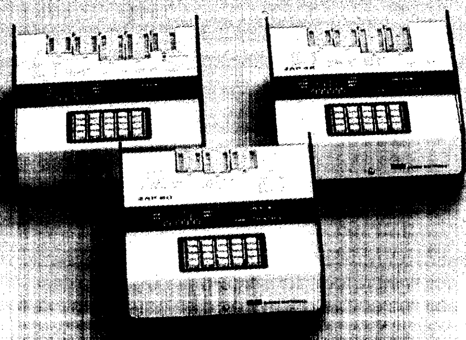


Z-2000B Disk Based Programmer

The Z-2000B universal programmer has all the features of the Z-1000B plus built-in dual 8 inch disk drives. Up to 2 megabytes of disk storage, 64K x 8 static RAM, CP/M* operating system, cross assemblers, two RS-232 ports and optional IEEE 488 interface makes this our premier programmer.

Z-1200/Z[illegible]

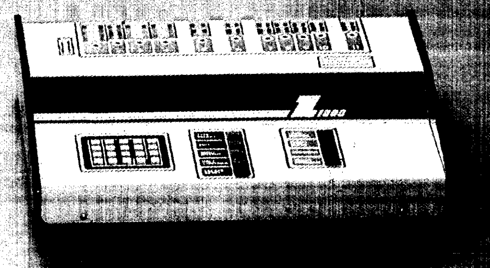
Z-1200s are design[illegible] EEPROMs simultaneously [illegible] You can add Z-120 gang [illegible] multiply your throughput and [illegible] gram Intel's 87XX family of microcom[illegible] Z-1248 programmer or Z-148 slave.



Zap Series EPROM/EEPROM/MPU Programmers

The ZAP SERIES of portable, battery operated programmers are designed for your development and field service needs.

These handy units program EPROMs and EEPROMs thru 27128, Intel and Motorola MPUs, use fast algorithms and have built-in PROM simulators. They also feature keystroke device selection, 16K x 8 DATA RAM, a sophisticated editor, 110 to 19.2K baud RS-232 ports and terminal control.



Z-1000/1000B Universal Programmers

The Z-1000 and 1000B program your EPROMs, bipolar PROMs, PALs, FPLAs and Intel microcomputers. Prompted device selection, fast algorithms and easily upgraded software let you program almost any device available now or in the future. These units are slave expandable for EPROM and MPU gang programming.

INTRODUCTION TO CUSTOM/SEMICUSTOM CIRCUITS

This section describes services and products of companies supplying digital, linear and combined ditigal/linear custom circuits. Listed alphabetically in the Master Selection Guide, the companies are characterized by descriptions of design services, production facilities, process technologies and testing capability. Options for user contribution to custom-circuit projects are outlined by listing the vendor's preferred level of user input which can range anywhere from system concept to a known good device.

Semicustom Gate Arrays, Linear and Linear/Digital Arrays, Standard Cells, and Programmable Logic are covered in detail appropriate for locating devices or suppliers. In the semicustom area, performance parameters are circuit dependent and definitions are not standardized; therefore some are more useful in comparisons within a manufacturer's line than in comparisons between manufacturers. Frequently the manufacturer's data provides additional capability information that will assist in source selection.

Detailed Product Information provided by:

The manufacturers listed above have provided detailed information on their latest and most significant products.

EINFÜHRUNG KUNDEN-SPEZIFISCHE ICs

Deiser neue Abschnitt beschreibt Dienstleistungen und produkte von Herstellern, die digitale, lineare und kombinierte digital/lineare kundenspezifische Schaltkreise anbieten. Die Firmen werden in alphabetischer Reihenfolge genannt und anhand ihrer Fähigkeit zum Schaltkreis- Entwurf, ihrer Produktionsanlagen, Prozeβtechniken und Testmöglichkeiten beschrieben. Die verschiedenen Möglichkeiten des Anwenders im Hinblick auf dessen Angaben sind durch eine Auflistung der vom Hersteller gewünschten technischen Details erläutert. Diese können von einer Gundkonzeption bis zu einem bekannten, funktionierenden Bauelement reichen.

Die enthaltenen halb-spezifischen (semicustom) Bauteile beschränken sich auf Gatter- und Zellen-Arrays, die durch die letzte Maske zum kundenspezifischen Schaltkreis werden. Feldprogrammierbare Bauteile sind in diesem Abschnitt nicht enthalten. PALs werden unter Speichern (Memory) aufgeführt und PLAs finden sich sowohl im Memory- als auch im Digitalteil.

INTRODUCTION AUX CIRCUITS FAITS SUR COMMANDE

Nouvelle cette année, cette Section décrit les services et produits fournis par des sociétés fabriquant sur mesure des circuits digitaux, linéaires, digitaux/linéaires. Le Guide Général de Sélection offre sur plusieurs pages un tableau indiquant par fabricant les services offerts, les équipements disponibles, les systèmes technologiques, et les procédés de test utilisés. Les possibilités de collaboration entre le fabricant et le client sont également indiquées dans ce même tableau.

Les produits partiellement faits sur mesure ont été limités aux "portes" et "cellules de mémoire" qui sont individualisées par un procédé final d'interconnexion. Les appareils programmables à l'extérieur ne sont pas considérés dans cette Section. Le PALs sont étudiés dans la Section "Mémoires", et les PLAs se trouvent dans les Sections "Mémoires" et "Systèmes Digitaux".

INTRODUCCIÓN A LOS CIRCUITOS POR PEDIDO

Esta sección, nueva para este año, describe servicios y productos de compañías que ofrecen circuitos por pedido, sea digital, lineal y digital/lineal combinado. Apareciendo en orden alfabético el la Guía Maestra de Selección, las compañías se caracterizan por descripciones de servicio de deseño, taller de producción, technologia de processos y capacidad de distintas pruebas. Opciones de contribución por el operador en los proyectos de circuitos por pedido, están delineados en la lista de nivel de asistencia del operador preferido por el fabricante que abarca de concepto de sistema a pieza comprobada buena.

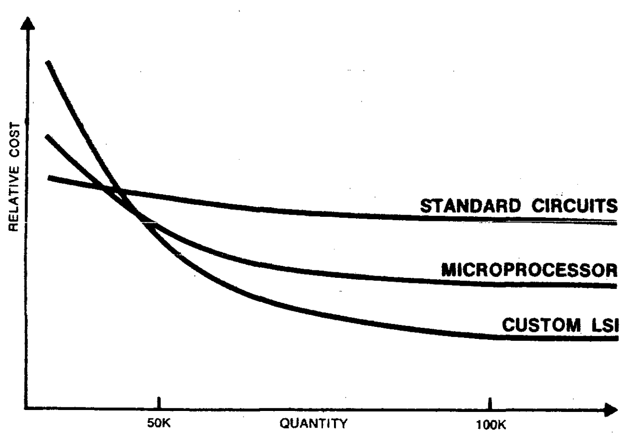
Componentes a pedido limitado están restringidos a redes de puertas y celdas electrónicas que son "a pedido" en el proceso final de interconección. Componentes programables en el campo no están incluidas en esta sección. Los PALs aparecen en las lista la sección de Memoria y los PLAs se encuentran en ambas secciones bajo Memoria y Digital.

カストムサーキットへの案内

本年新たに加わったこのセクションにはディジタル，リニア，双方兼ねたカストム回路を供給するメーカーのサーヴィスと製品を掲載しています。メーカー名はＡＢＣ順にマスターセレクションガイドにのっていますが，そのメーカー毎に，デザイン，製造設備，プロセス技術，テスト能力を示してあります。カストムサーキットに関するメーカー側のカストマー参加希望はシステムの概念から良く知られている製品の良品迄概略を記載しています。

セミカストム製品は最終の配線接続によりカストム化されるゲートアレイ，セルアレイに限定しています。フィールドプログラマブル製品はこのセクションにはのせていません。ＰＡＬはメモリーセクションに，ＰＬＡはメモリー，ディジタルセクションにあります。

Options for Going Custom



Standard circuits are recommended for production volumes below 1000 units. Intermediate-volume applications may benefit best from customizing through software, such as with microprocessors. Custom chips have the lowest cost at high-volume production. Source: National Semiconductor

For many applications, standard integrated circuits may be inappropriate from the standpoints of cost, size, power consumption or reliability. Moreover, unique features demanded by proprietary products often require entirely new circuit configurations. As a result, customized ICs are assuming an increasingly important role in system design.

Custom IC suppliers report that the chief benefits enjoyed by nearly all custom-circuit users are low-cost parts and cost savings resulting from reduced printed-circuit board space, parts handling, inventory, testing requirements and system maintenance. Obtaining these benefits requires careful consideration of the many options provided by both custom ICs and other approaches which ultimately effect economics.

For example, in addition to standard and custom parts, options for implementing new system designs include semicustom ICs, microcomputers, custom microcomputers, a mixture of microcomputers and custom ICs, or a mixture of all of these. The system development strategy used depends largely upon marketing objectives and may require staged system development, first with standard ICs, then with semicustom ICs and, finally, full custom units. Or, the strategy may dictate developing standard or semicustom prototype systems with concurrent verification of a full custom design.

Another option is to alter a standard microprocessor and other standard circuits, rather than using a full custom design. Customizing standard products can reduce the design costs, turnaround time and risks of a full custom design. In some cases, semicustom or custom circuits can replace microprocessors which have been used in dedicated, mostly controller-type applications. Or, a custom circuit may be a direct integration of several standard ICs, such as op-amps, comparators and resistor networks.

All approaches require up-front decisions involving design, prototype and production turnaround times, volume/cost trade-offs, alternate sourcing, circuit configuration and process technologies, and the user/supplier interface. The most critical factor, however, is cost.

The cost of a nonstandard IC includes expenses for design and tooling, wafer and chip processing, packaging and testing.

Design and Tooling: Until recently, IC users had just two options for implementing new designs: standard parts and full custom circuits. When standard parts were inadequate, a user had to commit to great production volumes to amortize high development costs. Additionally, development times often extended well over a year, and chances of initial success were relatively slim. However, custom suppliers have minimized these drawbacks by devising new customizing techniques to the extent that few custom circuits now are developed entirely from scratch.

Full Custom: In this approach the circuit designer draws from a collection of time-tested circuit modules and components to customize a chip. These elements of known performance are located on the chip with the assistance of CAD equipment to form optimized interconnect patterns, thereby minimizing chip area and thus cost. Full custom design gives the most efficient use of silicon chip area. Although design turnaround time has been longer than other options, advanced CAD techniques are closing the gap.

Semicustom: This approach produces custom circuits by interconnecting repetetive patterns of preprocessed circuit elements on a chip called a *masterslice*. Because a masterslice is processed just short of the final interconnect pattern, the same part is mass-produced for use by all customers, with customizing occuring at the final interconnect stage.

Gate arays are masterslices containing repetitive patterns of transistors connected as logic gates. *Device arrays* are patterns uncommitted transistors and resistors. The next level of customization uses an array of unconnected transistors and resistors called *cells*. Each cell can be interconnected internally to provide a specific logic function, and each cell on the chip interconnected into a customized system. The repertoire of allowable cell functions is called the *cell library*.

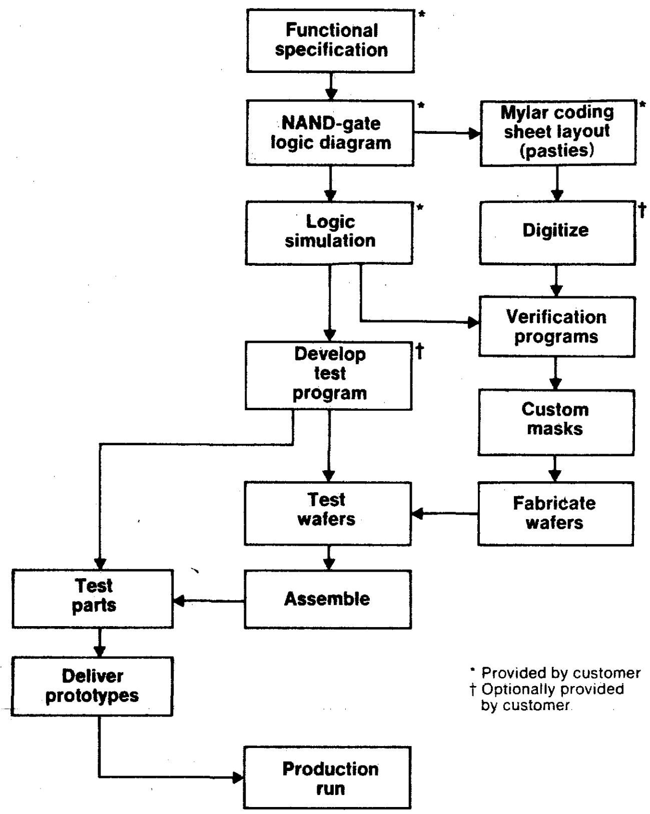
Interconnect design for masterslices can be manual or computer-aided. In all cases, the masterslice approach minimizes design turnaround time. Complex custom-cell library circuits can be obtained in about 18 weeks or less in prototype form; prototypes from gate arrays typically are available in about nine weeks.

One major disadvantage of masterslice circuits has been low circuit density. Circuit and device arrays require channels and alleys for routing interconnects. And because a single pattern must accommodate many different system designs, considerable interconnect routing space can be left unused after the chip is designed. Conversely, in a full custom design, unused space can be minimized. Consequently, a masterslice can be three times larger than an equivalent full-custom chip costing 20% to 60% less.

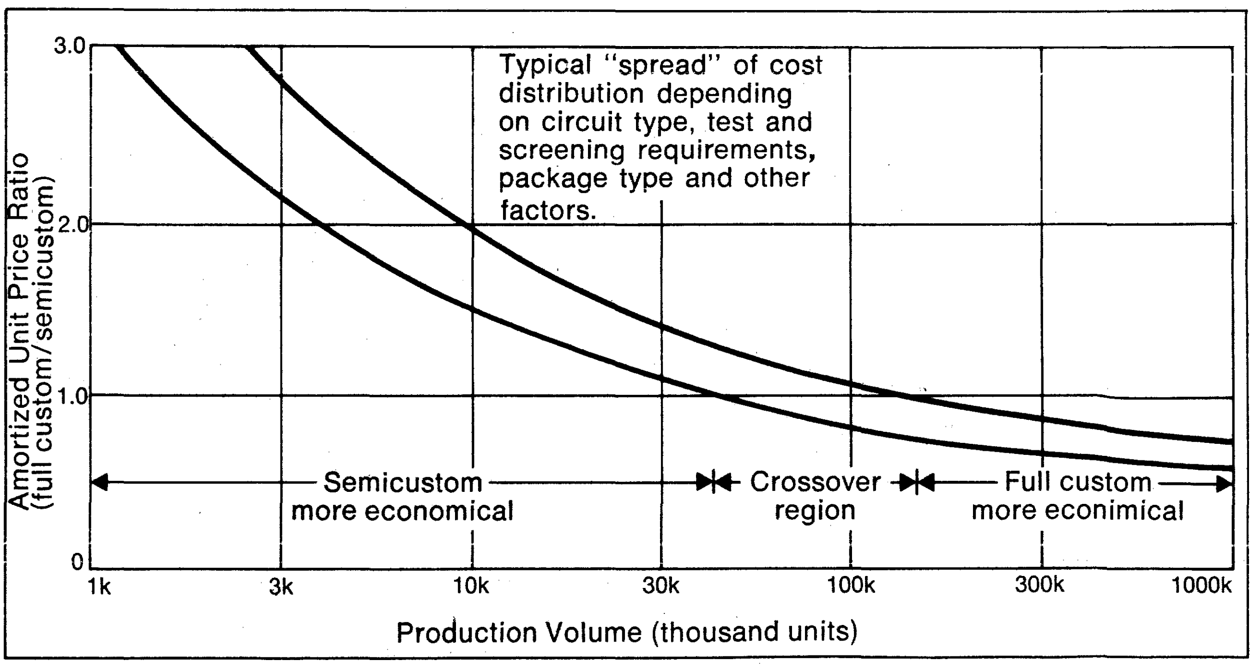
But masterslice manufacturers are increasing circuit densities to bring unit cost closer to that of full-custom circuits purchased in high volume. Circuits with two and three layers of interconnects are being developed to allow more efficient use of chip area. Triple interconnect-level masterslices are already used in a recent generation of IBM computers. So while full-custom designers are reducing design turnaround time, masterslice proponents are reducing unit cost.

Production: IC houses that process custom circuits basically sell a production service, not a design service. Most are concerned first with recovering design costs and then making profit on the volume production of parts. The general rule of thumb calls for total production volume representing at least ten times the supplier's design cost.

Some firms may accept a smaller production volume if engineering costs can be lowered. The customer may satisfy this requirement by using a design specialty firm or the in-house



Developing a custom IC is a multistage process. The degree of user involvement varies between companies. This diagram outlines the development of a custom chip designed from a cell library. Source: Signetics



Production volume influences the choice between full-custom and semicustom parts. However, other considerations (such as design turnaround time) may be overriding factors. Source: Exar engineering staff. Specialty firms provide services such as design, mask-making, assembly and testing. In many cases a design house controls the evolution of an IC through tooling, fabrication and final delivery.

Selecting a fabrication process based solely on chip cost is not entirely straightforward. For any given process, all wafers cost about the same regardless of circuit complexity. The cost of a chip is determined chiefly by yield, which tends to decrease with chip-area increase. Thus, chip cost varies directly with chip area.

Cost comparison between processes is more complex. Older processes do not necessarily produce higher yields than newer process techniques. And although processes involving more fabrication steps tend to have higher production cost per wafer, a more complex process may also allow circuit designs that produce smaller chips. Similarly, wafers fabricated by newer processes that involve expensive production equipment are usually costly. But, improved processes, although expensive, can produce high yields which tend to lower the die cost. The process must therefore be chosen to get the lowest chip cost consistent with meeting performance requirements.

Packaging: A standard package can cost from a few cents to several dollars. In many custom designs, package cost can be the largest part of unit cost, especially if a custom package is required.

Testing: This cost can be a large portion of the total unit cost. So care must be taken to design the chip for minimum testing requirements. Testing costs depend on the type of test equipment used and the amount of time required to test. Ideally the simplest and most widely available equipment should be used.

Testing cost can range from $50 per hour to several hundred dollars per hour. The manner in which tests are specified can vary test time per part from a few seconds to a minute. It is not economically feasible to test many complex digital circuits for every possible combination of inputs and outputs. And unless complex random logic is designed with testing in mind, it may not be possible to test the final product adequately.

Testing should be considered early in the design phase to minimize cost. Usually it is possible to select a process technology or circuit configuration that eliminates the need for some parametric tests. If timing requirements are critical, for example, using one of the faster process technologies or circuit configurations can eliminate testing speed parameters. Similarly, using a superior process for linear circuits could eliminate the need to test for offset voltages in op-amps.

Terminology

Assembly: Process of mounting a chip into a package and connecting the chip terminal pads to package terminals.

CAD: Computer-aided design. CAD includes computerized equipment that performs circuit simulation, logic simulation, automatic circuit and logic drawing, topological digitizing, topology construction on a CRT terminal, design rule checking and test generation.

Cell: Circuit performing a digital or linear function that is repeatedly used to design an LSI/VLSI chip.

Cell library: Collection of predesigned cell functions stored in a CAD data base. Custom LSI/VLSI devices can be designed by choosing appropriate cells from the library and locating them on a chip to minimize interconnects and maximize performance. The cells are computer characterized for performance much like SSI and MSI ICs with data sheets for each cell.

Custom circuit: In general, a component whose manufacture is under the exclusive control of a customer. The term can refer to full-custom, customized-standard or semicustom parts. In semicustom parts most of the mask layers are common to many customers, and only the final interconnect patterns are special. A customized part is a modification of a standard part to the requirements of a customer. Full-custom parts normally are fabricated from masks configured for the customer.

Design rules: Collection of rules that define minimum dimensions of device topological structures. Design rules also express process-parameter design limits such as gain factor, threshold level, oxide thickness and capacitance.

Die: Rectangular piece of semiconductor material into which electrical circuits have been fabricated. Also called a chip. Plural is dice.

Digitized data base: Recorded digital data representing a topological drawing of an SSI, MSI, LSI or VLSI device. The data include locations and dimensions of rectangles that make up individual circuit elements and interconnects.

Feature size: Dimensions of rectangles, lines and spacings in in an IC topological design.

Gate: Basic digital-logic element producing a binary output depending on the logic state of various inputs.

Gate array: Regular pattern of circuit components on a chip, connected to form regular patterns of gates. The gates are not interconnected until the customer specifies the chip function.

Gate equivalent: Basic unit of measure for digital circuit complexity based on the number of elementary logic gates needed to provide the same circuit function.

LSI: Large-scale integration. Device design integrating from 100 up to thousands of gate equivalents on a chip.

Macrocell array: Regular pattern of grouped, unconnected circuit components. Macrocells are formed into standard logic elements by interconnecting the components to provide specific circuit functions. Interconnects between the cells are specified to perform a specific chip function. The formation of the cell functions and cell interconnects are unique to the customer.

MSI: Medium-scale integration. Device design integrating from 10 to 100 gate equivalents on a chip.

Masterslice: In general, a partially processed chip containing circuit elements for customizing through final metal interconnect patterns. Can refer to gate, device or cell arrays.

Pastie: Scaled decal (usually transparent) representing both function and dimensions of an IC building block such as a gate, flip-flop or I/O buffer. Pasties are a commonly used tool for designing LSI/VLSI chips from a cell library. Each cell type has pastie equivalents.

SSI: Small-scale integration. ICs containing fewer than ten logic-gate equivalents.

Silicon gate: MOS design in which the gate is made of silicon instead of metal. Silicon-gate MOS is faster and more dense than metal-gate MOS.

VLSI: Very-large-scale integration. Device design integrating thousands of gate equivalents on a chip.

Cost: Intense activity in both gate arrays and associated development tools should make the gate-array concept extremely cost competitive with other design approaches. Typical costs for the development of a gate array and a full-custom IC are shown in the accompanying tables.

New gate arrays are currently in widespread development by IC manufacturers; CMOS products with up to 8,000 gates and emitter-coupled-logic (ECL) devices with 100-picosecond gate delays have already been developed. Although most of the attention has been concentrated on CMOS, many bipolar technologies are not being neglected.

Gate arrays are available in a number of bipolar technologies including ECL, Schottky TTL, integrated injection logic, integrated Schottky logic (ISL), and Schottky transistor logic (STL). Gate delays for these devices can be as low as 0.8 nanoseconds. Gate array chips are also available in NMOS and combination CMOS/NMOS versions.

Availability of computer-aided-design (CAD) tools and software support are helping both semicustom and custom products gain acceptance. In some cases, IC suppliers permit customers to use the supplier's in-house CAD facilities. Training courses, running three to five days, are also being offered by many IC manufacturers.

883B Environmental Screening			Extra	
TOTAL			$40K	$280K
* Depends on application				

Comparison. The relative ranking of risk factors for alternative design approaches is shown at the right. These ratings will vary depending on the selected suppliers for custom, cell library, gate array or non-LSI devices. Therefore, this chart should be used only as a guide. In the case of linear designs, risks are greater than for digital counterparts. Unless the various circuit blocks assembled from a cell library are compatible with each other from the standpoint of processing, the overall performance of the chip can be less than expected. For instance, the breakdown voltage, beta, sheet resistance, implant dosage, and epi thickness requirements, to say nothing of the starting material, may be mutually exclusive. Also, NPN and PNP transistor configurations cannot both be optimized for performance as is possible with discrete devices.

Comparisons of advantages of various design approaches. A rating of 1 indicates best. (Numbers in parenthesis apply to linear designs.)

	Full Custom	Cell Library	Gate Array	Non-LSI
Design Costs	4(3)	3(4)	2	1
Design Time	4(3)	2(4)	3(2)	1
Mask Costs	4	4	2	1
Redesign Flexibility	4	3	2	1
Test Program Costs	3	3	2	1
Circuit Purchase Price	1	2	3	4
System Power Required	1	2	2	4
Reliability	1	2	2	4
PC Board & Costs	1	2	2	4
Production Labor	1	2	2	4
Security	1	3	2	4
Added Features/ Board	1	3	3	4

CUSTOM CONSIDERATIONS

Benefits provided by custom, related to cost factors, are described in the following paragraphs:

Specification Documentation: Since a single custom IC can replace as many as 100 MSI circuits (plus assorted external active and passive components, such as decoupling capacitors, diodes, and transistors), paperwork needed is greatly reduced.

Purchasing: The purchasing function is not a "free" activity in any company. It costs money to issue purchase orders, and to track them through various delivery dates and procedures with phone calls and computer time. The lower parts count significantly reduce this paper load.

Purchase Price: Depending on the complexity of the chip, the price for a custom device can be lower, at, or above that of all the components to be replaced. It is important to count all of the passive peripheral components involved, such as sockets, resistors, capacitors, inductors, and perhaps even connector pins to the outside.

Cost of Capital: This cost varies with prevailing interest rate. If a company has to borrow development money, usually at about three or four percent over prime rate, then this interest is also an expense incurred by the project. But even if cash is available, there still may be an opportunity cost. This is the income that could have been earned if the cash had been used on short-term projects (such as buying more inventory — provided the sales to turn the inventory over exists).

Inventory: Once the material is in the plant, it has to be handled (including counting, sorting, and paperwork), and stored. Usually, storage space is predefined, and, since it already exists, it is not considered to be an additional expense. However, one has to remember that real estate value on a per-footage basis is substantial and that other departments might make a more cost effective use of any space available. Hence, an additional cost is incurred for each additional component that has to be stored and accounted for. Also, components may become obsolete before the inventory is used up. Custom ICs contribute to decreasing inventory expenses.

Incoming Inspection: Unless pre-aged and pre-screened components are bought to prevent early failures (infant mortality), it is advantageous to inspect active components as they come in. Again, a reduction in the number and variety of devices to be tested adds to profits.

Printed Circuit Board Space: Fewer components mean less space needed to mount them, less auxiliary components, less artwork for interconnect lines, fewer holes to be drilled, and less insertion time and effort — as well as a smaller board.

Power Consumption: The power consumption of the entire system is usually dramatically reduced, making savings possible with lowered power supply and cooling requirements.

CUSTOM/SEMICUSTOM

Manufacturer	Advanced Micro Devices	Alphatron	American Microsystems, Inc.
FOR DETAILED DATA SEE:	(Page 4600)		(Page 4614)
Customized Standard Circuits			Digital, Linear, Combined Digital/Linear
Gate Array	Programmable Array Logic		3μ and 5μ silicon-gate CMOS
Chip Density Range (equiv. gates)	200 to 800	Up to 4400 2-input gates	300 to 1200 2-input gates (5μ) 500 to 5000 2-input gates (3μ)
Cell Library		CMOS	Yes
Design Kit Available	Yes	Yes	Yes
Full Custom Circuits Digital		Silicon- or metal-gate PMOS, NMOS, CMOS	Silicon- or metal-gate PMOS, NMOS, CMOS with high-voltage output capability.
Linear		Silicon- or metal-gate PMOS, NMOS, CMOS	Silicon-gate NMOS, CMOS, filter, amplifier to rf
Combined Digital/Linear		Silicon- or metal-gate PMOS, NMOS, CMOS	Silicon-gate NMOS, CMOS, 14-bit resolution, VHF-rf
Provide Design Assistance	Yes	Yes	Yes - class instruction
Acceptable Customer Input (in order of preference)		Alphamap layout logic diagram functional description block diagram.	Logic diagram, functional specification, data-base tape, PG tape, masks, COT.
Design Aids	AMPALASM-20 software for Boolean equation generation. AMPLPL software provides similar capability for advanced products.	Logic simulation, breadboard assistance, design rule checks, decals.	Complete CAD assistance for logic circuit simulation design rule checks, breadboard assistance.
Production	In-house	Wafer production procured from outside foundries. Testing done in-house.	Masks, fabrication and assembly in-house.
Preferred Delivered Product	Ceramic and plastic DIPs, leadless chip carriers, dice; all available in commercial and military.	Any upon request	DIP, chip carriers, die-on-board packages, wafers, die to commercial or military specifications.
Test Program Generation		Yes	Yes, CAD supported
Production Test	100% dc, ac and functional testing. Burn-in, thermal shock, environmental, MIL.	Functional, parametric, burn-in, thermal shock, environmental, MIL.	Functional, parametric, burn-in, thermal shock, environmental, MIL.
Electrical Test Systems Available	Xincom, Accutest	In-house designed, customer-supplied, or outside service.	Sentry, Teradyne, Xincom, LTX, General Radio.
Comments	Commercial programmers available Software output JEDEC PLDTF. Most complex programmable logic parts available.	Multiple sourcing. Cell library and design rule handbook.	Complete custom capability including design, instruction, CAD and process licensing and technology sales. CAD also available through timesharing and at Design Centers.

Manufacturer FOR DETAILED DATA SEE:	Applied Micro Circuits	AWI	Barvon Research (Page 4626)
Customized Standard Circuits		Linear, Digital, Combined Digital/Linear	Digital Combined Digital/Linear
Gate Array	ECL	Bipolar, CMDS, silicon-gate MOS, hybrids	2-5μ silicon-gate CMOS, Bi-CMOS (Bipolar and CMOS)
Chip Density Range (equiv. gates)	250 to 1500 gates	10 to 10,000	100 to 10,000 2-input gates
Cell Library	ECL	Over 2600 type	CMOS, Bi-CMOS
Design Kit Available	Yes	Yes	Yes
Full Custom Circuits Digital	ECL	Yes	Silicon-gate CMOS, HCMOS, HMOS, Bi-CMOS
Linear		All processes	Silicon-gate CMOS, HCMOS, Bi-CMOS
Combined Digital/Linear		All processes	Silicon-gate CMOS, HCMOS, Bi-CMOS
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Functional specification, logic diagram, test vectors, PG Tape, Tegas Tape.	Functional schematic, circuit diagram	Logic diagram, circuit diagram, breadboard, functional specification, test vectors, COT, known good device.
Design Aids	Logic simulation, design rule checks.	Users manual	Circuit simulation, logic simulation, schematic entry, test program generation, design rule checks, breadboard assistance.
Production	In-house, procured	In-house robotics and automation	In-house, procured
Preferred Delivered Product	Packaged dice	Printed card mounted, packaged units	Packaged devices, others available
Test Program Generation		No	Yes
Production Test	Functional, parametric, burn-in, thermal shock environmental.	Functional	Functional, parametric, burn-in, thermal shock, environmental, MIL.
Electrical Test Systems Available		Customer supplied	Sentry, Teradyne
Comments			Complete custom capability including design, instruction, CAD and technology licensing. Standard cell library available.

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	California Devices	Cherry Semiconductor	Circuit Technology Inc.
Customized Standard Circuits	Digital	Digital, Linear, Combined Digital/Linear	Digital
Gate Array	Silicon- or metal-gate CMOS	I^2L, LSI^2L, ECL and other bipolar	Silicon gate CMOS
Chip Density Range (equiv. gates)	50 to 1780 2-input gates	64 to 150 gates/mm^2	560 to 1440 — 5 micron single metal 1120 to 3876 — 4 micron double metal
Cell Library	Silicon- or metal-gate CMOS	I^2L, LSI^2L, ECL and other bipolar	CMOS and LSTTL
Design Kit Available	Yes	Yes	Yes plus CAD
Full Custom Circuits Digital		I^2L, LSI^2L, ECL and other bipolar	Silicon gate CMOS
Linear	Bipolar linear arrays	I^2L, LSI^2L, ECL and other bipolar	
Combined Digital/Linear		I^2L, LSI^2L, ECL and other bipolar	
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Logic diagram with test vectors and PG tape; circuit diagram with data-base tape and composite drawing; breadboard.	Customer-owned tooling; circuit diagram; logic diagram; breadboard.	Logic diagram and test vectors. Customer-owned tooling. Functional specification.
Design Aids	Logic and circuit simulation; breadboard assistance; design rule checks.	Logic simulation; breadboard assistance; design rule checks.	Logis simulation, auto layout, rules checks, network comparison checks.
Production	In-house and procured	In-house	In-house plus second sourcing availability.
Preferred Delivered Product	Scribed dice, packaged dice, substrate-mounted device.	Packaged dice; flip chips	All options available
Test Program Generation	Yes	Yes	Yes
Production Test	Functional, parametric, burn-in, thermal shock, environmental, MIL.	All except military	Full capability including full MIL, class S and geothermal (200°C).
Electrical Test Systems Available	Sentry VII, Sentry Series 20	Teradyne 1259, A310, A311	Fairchild series 10
Comments	Si-gate isolated oxide CMOS has TTL/LSTTL interfacing capability, high-speed performance.	Dice can be solder-bump flip chips with nitride passivation; packaged dice can be delivered from COT for full custom.	No limit on package variety. In-house multichip hybrid capability.

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Circuit Technology Inc.	Citel (Page 4628)	Comlinear Corp.
Customized Standard Circuits	Digital	Digital	Yes
Gate Array	CMOS on Sapphire	3μ silicon-gate CMOS	
Chip Density Range (equiv. gates)	1120 to 3876-4 micron double metal	200 to 1200	
Cell Library	CMOS and LSTTL	Yes	
Design Kit Available	Yes plus CAD		
Full Custom Circuits Digital	CMOS on Sapphire	Silicon or metal-gate CMOS, silicon-gate NMOS, bipolar	
Linear		Bipolar	Bipolar-FET
Combined Digital/Linear		CMOS	
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Logic diagram and test vectors. Customer-owned tooling. Functional specification.	Logic diagram, circuit diagram, functional specification, bread-board, data-base tapes, PG tapes, mask sets, customer-owned tooling.	Functional specification
Design Aids	Logic simulation, auto layout, rules checks, network comparison checks.	Logic simulation, design-rule checks, net-list verification.	Computer simulation
Production	In-house	In-house	In-house or procured
Preferred Delivered Product	All options available	Packaged units; will supply wafers or dice.	Packaged circuit, printed card mounted units.
Test Program Generation	Yes	Yes	Yes
Production Test	Full capability including full MIL and class S.	Functional, parametric	Functional, burn-in, thermal shock, linear, MIL
Electrical Test Systems Available	Fairchild series 10	Sentry VII	Complete time domain and frequency domain testing from dc to 18 GHz.
Comments	No limit on package variety. In-house multichip hybrid capability.	Complete custom capability	Specialties include amplifiers with extremely wide bandwidth and fast settling time, fast sample-hold and A to D conversion products.

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Custom Integrated Circuits	Custom MOS Arrays (Page 4630)	Exar Integrated Systems (Page 3386)
Customized Standard Circuits	Digital, Linear, Combined Digital/Linear	CMOS	Digital, Linear, Combined Digital/Linear
Gate Array	I²L, Linear Master Slice, design on other companies' gate arrays		Metal-gate CMOS; I²L Si-gate CMOS
Chip Density Range (equiv. gates)	50 to 8000 (5-input gates)	448 to 1568 (2 inputs)	100 to 1250
Cell Library	I²L	Yes	Metal-gate CMOS; I²L Si-gate CMOS
Design Kit Available			Yes
Full Custom Circuits Digital	I²L, CMOS, TTL and other bipolar devices		Metal-gate CMOS; I²L Si-gate CMOS
Linear	Bipolar, CMOS		No
Combined Digital/Linear	I²L/Linear, TTL/Linear, CMOS/Linear		I²L, other bipolar
Provide Design Assistance	Yes		Yes
Acceptable Customer Input (in order of preference)	No preference		Complete layout, breadboard, circuit diagram, logic diagram, functional diagram.
Design Aids	Logic simulation, circuit simulation, design rule checks, breadboarding, complete Calma layout system, in-house CAD software, engineering assistance.		Logic simulation; breadboard assistance; design rule checks.
Production	Procured		In-house
Preferred Delivered Product	No preference		Probed wafers, scribed dice, packaged dice.
Test Program Generation	Yes		Yes
Production Test	All		Functional, parametric, environmental, burn-in
Electrical Test Systems Available	HP, MCC		Sentry; Fairchild 5000, Teradyne J273, A311; Amdahl
Comments	Total IC development from concept through product delivery. Any subset of the development cycle (design, layout, etc.)		

CUSTOM/SEMICUSTOM (cont)

Manufacturer	Fairchild	Ferranti	Fujitsu
FOR DETAILED DATA SEE:	(Page 4634)		(Page 4637)
Customized Standard Circuits	Digital	Linear, Digital, Combined Linear/Digital	Digital
Gate Array	Bipolar ECL	Collector Diffusion Isolation	Silicon-gate CMOS, LSTTL
Chip Density Range (equiv. gates)	20 to 1000 3-Input NAND	200 to 10,000 Gates/chip	200 to 8000 2-Input NAND
Cell Library		Collector Diffusion Isolation	Silicon-gate CMOS, LSTTL
Design Kit Available		Yes	Yes
Full Custom Circuits Digital		Collector Diffusion Isolation	Silicon-gate CMOS, LSTTL
Linear		Collector Diffusion Isolation	Silicon-gate CMOS, LSTTL
Combined Digital/Linear		Collector Diffusion Isolation	
Provide Design Assistance		Yes	Yes
Acceptable Customer Input (in order of preference)		Pattern-generator tape, composite drawing when done on Ferranti's supplied design station; functional specification, logic diagram, circuit diagram, breadboard, test vectors.	Logic data and test timing data (Fujitsu format).
Design Aids	Logic simulation, breadboard assistance, design rule checks.	Logic simulation, breadboard assistance, design rule checks, full design capability.	Logic simulation, design rule checks; complete CAD system.
Production	In-house	In-house	In-house
Preferred Delivered Product		Packaged dice	Substrate mounted dice
Test Program Generation		Yes	Automatic
Production Test		Functional, parametric, burn-in, thermal shock, environmental, MIL, linear.	Functional, ac and dc parametric.
Electrical Test Systems Available	FARCAD	LTX, Teradyne, Custom	In-house
Comments	Remote access to FARCAD via telephone link	Semi-custom from off-the-shelf selection of a range of standard wafers.	Dual-layer metal; CAD system verifies design; auto placement and routing from customer's inputs.

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	General Instrument	GTE Microcircuits	Harris Semiconductor (Page 4644)
Customized Standard Circuits			Digital, Linear, Combined Digital/Linear
Gate Array	Silicon-gate CMOS	ISO-CMOS	Silicon-gate CMOS, TTL-AS, TTL-ALS
Chip Density Range (equiv. gates)	560 to 2014	504 — 2500	Up to 10,000 (CMOS) Up to 2,500 (TTL-AS) 120, 312 and 918, (TTL-ALS) (Rad Hard)
Cell Library	Silicon-gate CMOS	ISO-CMOS	Silicon-gate CMOS, TTL-AS
Design Kit Available	Yes	Yes	Yes
Full Custom Circuits Digital	No	ISO-CMOS	Metal-gate CMOS and MOS; silicon-gate PMOS, LSTTL; ALSTTL; STTL; I²L.
Linear	No	ISO-CMOS	Bipolar (dielectric isolation) CMOS/bipolar (metal-gate/bipolar) and silicon.
Combined Digital/Linear	No	ISO-CMOS	Silicon-gate CMOS; bipolar
Provide Design Assistance	No	Yes	Yes
Acceptable Customer Input (in order of preference)	No	Calma tapes, PG tapes, masks	System specification, Logic diagram, JG, CALMA or Mebes Data Base.
Design Aids	No	Design rule checks, Logic simulation	Proven Cell Library MACROS, Logic Simulation, Layout Programs and Test Grading.
Production	No	In-house	In-house
Preferred Delivered Product	No	Packaged die, probed wafers, mapped wafers	Wafer, packaged dice, scribed dice, and packaged devices.
Test Program Generation	No	Yes	Yes
Production Test	No	Functional, parametric, burn-in	Up to and included equivalent Class "S" military flow. Also in-house total dose testing.
Electrical Test Systems Available	No	Sentry LTX, H.P., Mega, XINCOM	Sentry
Comments			Also offer low voltage CMOS. Radiation hardening for most process technologies. Also provides silicon foundry.

Master Selection Guide

CUSTOM/SEMICUSTOM

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Holt, Inc. (Page 4745)	Integrated Circuit Systems	Integrated Technology Corporation
Customized Standard Circuits	Linear, Digital, Combined Linear/Digital	Digital, Linear, Combined Digital/Linear	
Gate Array	Metal gate CMOS, linear bipolar	CMOS	
Chip Density Range (equiv. gates)	80 to 1098		
Cell Library	Metal gate CMOS	All MOS processes	
Design Kit Available	No		
Full Custom Circuits Digital	Silicon gate, metal gate CMOS	CMOS/SOS; CMOS, DMOS, NMOS, SI or Metal Gate; Double level metal; Double level poly.	Silicon- or metal-gate MOS; TTL, STTL, LSTTL, I²L, ECL, other bipoar
Linear	Bipolar	CMOS	Silicon- or metal-gate CMOS; bipolar
Combined Digital/Linear	Metal gate CMOS and bipolar	CMOS	Silicon- or metal-gate CMOS; bipolar
Provide Design Assistance	Yes	Yes	
Acceptable Customer Input (in order of preference)	Any	No minimum required	
Design Aids	Logic simulation, breadboard assistance, DRC.	DRC and ERC on VAX 11/780, Calma GDS II, sticks software, production test, systems.	Logic simulation; breadboard assistance; design rule checks; transient analysis.
Production	Procured	Small to medium quantity	Procured
Preferred Delivered Product	Packaged die, scribed die	Packaged parts	Mapped wafers; probed wafers; packaged dice; PC-mounted packaged units; design tooling; complete systems.
Test Program Generation	Yes	Yes	Yes
Production Test	Functional, parametric, burn-in, thermal shock, environmental, MIL, Linear SEM.	Yes	Functional; parametric
Electrical Test Systems Available	IT-200	Megatest	Siemens
Comments		Services: design, layout, chip/PCB artwork, test generation, product engineering, test and production.	Services: design, tooling for custom ICs; service industry used for photomasks, wafer fab, assembly, some testing. System design and production with custom IC's.

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Interdesign (Page 4747)	International Microcircuits (Page 4748)	International Microelectronic Products (Page 4749)
Customized Standard Circuits	Digital, Linear, Combined Digital/Linear	Digital	Digital, Combined Linear/Digital
Gate Array	CDI RTL and CML, metal-gate, CMOS, silicon-gate CMOS; bipolar	Silicon- or metal-gate CMOS	No
Chip Density Range (equiv. gates)	See comments	75 to 7500	200 to 10,000
Cell Library	Yes	Yes	Silicon-gate CMOS
Design Kit Available	Yes	Yes	Yes
Full Custom Circuits Digital	Silicon-gate CMOS; metal-gate CMOS; CDI bipolar; Linear bipolar; Linear CMOS.		Silicon-gate NMOS and CMOS
Linear	Bipolar		
Combined Digital/Linear	All linear functions		Silicon-gate NMOS and CMOS
Provide Design Assistance	Yes		Yes
Acceptable Customer Input (in order of preference)	Pencil-connected layout; logic diagram; specification; PG tapes; circuit diagram and breadboard (for linear bipolar).		Functional specification, logic diagram, circuit diagram, breadboard, test vectors, customer-owned tooling (pattern-generator tape, composite drawing), known good device.
Design Aids	Logic/circuit computer simulation; breadboard parts; layout sheets; functional overlays; evaluation parts.		Logic simulation, breadboard assistance, design rule checks, engineering assistance.
Production	Metallized wafers procured; other functions in-house.	In-house and procured	In-house
Preferred Delivered Product	Packaged dice, bare dice, probed wafers.	Scribed dice; packaged dice	Mapped wafers, probed wafers, scribed dice, packaged dice, or special packages.
Test Program Generation	Yes	Yes	Yes
Production Test	Functional; parametric; burn-in; MIL 883B; environmental.	Functional, parametric, burn-in, thermal shock, environmental, MIL.	Functional, parametric, burn-in
Electrical Test Systems Available	Teradyne J325; LTX CP/TS70; LOMAC LM325; Fairchild 5000; LTX DX90, Pragmatic Inspector 100.	GenRad, Sentry	Sentry 20, Kiethley
Comments	CDI RTL; 255 logic cells; CDI CML 450-2000 gates; metal-gate CMOS: 140-800 gates. Silicon-gate CMOS 150-2000 gates. Linear bipolar 100-150 components.		

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Intersil (Page 4751)	LSI Computer Systems (Page 4761)	LSI Logic (Page 4762)
Customized Standard Circuits	Digital, Linear/Digital		Digital
Gate Array	Silicon-gate CMOS, 2μ and 4μ		Silicon-gate CMOS, HCMOS and ECL
Chip Density Range (equiv. gates)	To 15,000		300 to 10,000
Cell Library	Yes		7400/4000 CMOS and HCMOS, ECL: 10K-SSI/MSI functions
Design Kit Available	Yes		Yes
Full Custom Circuits Digital	CMOS	Metal-gate PMOS, CMOS; Silicon-gate NMOS; Silicon-gate CMOS.	Implemented in gate array format Silicon gate oxide isolated CMOS/HCMOS; oxide isolated bipolar ECL.
Linear	CMOS	Metal-gate PMOS, CMOS; Silicon-gate CMOS	
Combined Digital/Linear	CMOS	Metal-gate PMOS, CMOS; Silicon-gate CMOS	
Provide Design Assistance	Yes	Yes	
Acceptable Customer Input (in order of preference)	Schematic, logic diagram, test vectors.	Logic diagram; customer-owned tooling (pattern-generation tape, composite drawing); circuit diagram; breadboard; functional specification.	Logic diagram to PG tape — Many input formats possible depending on customer interface required.
Design Aids	CAD assistance, training, manuals.	Design rule checks, computer-aided transient analysis, Applicon 760.	LSI design system (LDS), including design entry, circuit simulation, logic simulation, PG and test tape generation via remote terminal or factory based.
Production	In-house	Procured	In-house
Preferred Delivered Product	Packaged dice	Packaged dice, dice	Packaged dice
Test Program Generation	Yes	Yes	Yes
Production Test	Functional, parametric, burn-in, thermal shock, environmental, MIL.	Functional, parametric, burn-in; thermal shock, environmental; MIL.	Functional parametric to MIL 883B.
Electrical Test Systems Available	Sentry, Teradyne, Xincom, Tektronix	Macrodata 107 and customized equipment.	Industry standard tester
Comments	Specialize in linear and data-acquisition signal-conditioning circuits.	Multiple-sourced production	Multiple sourced

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Master Logic	MCE Semiconductor	Micrel Inc. (Page 4765)
Customized Standard Circuits	Digital	Linear, Digital, Combined Linear/Digital, Bipolar, CMOS	
Gate Array	Silicon- or metal-gate CMOS	CMOS, ECL, Dielectric Isolation, I²L, Linear	
Chip Density Range (equiv. gates)	50 to 1500, silicon-gate 50 to 600, metal-gate	50 to 10,000 gates	
Cell Library	Yes	Yes	
Design Kit Available	Yes	Yes	
Full Custom Circuits Digital	Silicon- or metal-gate CMOS	CMOS, TTL, LSTTL, I²L, ECL, Linear	PMOS, CMOS, NMOS silicon or metal-gate, isoplanar type processing.
Linear	No	Up to 75 Volt	Bipolar, CMOS
Combined Digital/Linear	Yes	Up to 20 Volt	
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Any	MCE will interface with customer anywhere in design sequence. UniDES; software.	Customer owned tooling, PG Tape, Data base tape.
Design Aids	Design Manual, CAD with VIA Systems, "Gates" design package.	Logic simulation; breadboard assistance; design rule checks; UNIDES.	Design rule checks
Production	Procured	In-house manufacturing; 4" Wafer Fab	In-house wafer fabrication; 3- and 4-inch lines procurred asembly.
Preferred Delivered Product	Any	Mapped wafers; probed wafers; scribed dice; substrate-mounted dice; packaged dice; custom packaging.	Packaged tested die, probed wafers, mapped wafers.
Test Program Generation	Yes	Yes	Yes
Production Test	In-house	Functional; parametric	Functional, parametric, burn-in, MIL STD 883.
Electrical Test Systems Available	Pragmatic designs	Teradyn J273 and A300 with laser trim; Pragmatic Inspector 200 (72 pin digital IC); Kiethley 300.	Sentry VII, Series 20
Comments	Multiple sourced	Functional arrays available CMOS MGA and SGA series; also linear function cells.	

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Microcircuits Technology, Inc.	Micro Innovators	Micro Power Systems (Page 4766)
Customized Standard Circuits	Digital, Linear, Digital/Linear	Digital	
Gate Array	Linear bipolar, metal gate NMOS, CMOS; silicon gate CMOS		
Chip Density Range (equiv. gates)	250 to 6000 gates	50 to 250 mil²	
Cell Library	Silicon gate or metal gate NMOS, CMOS, linear bipolar		Poly-gate CMOS, bipolar LSI, thin film on silicon
Design Kit Available	No	No	No
Full Custom Circuits Digital	Silicon gate CMOS, Metal Gate CMOS	Silicon- or metal-gate PMOS, NMOS, CMOS, other MOS	Low-voltage, poly-gate CMOS
Linear	Bipolar, CMOS	Silicon- or metal-gate PMOS, NMOS, CMOS, other MOS	High-gain/low current analog bipolar; thin-film resistor
Combined Digital/Linear	CMOS and bipolar	Silicon- or metal-gate PMOS, NMOS, CMOS, other MOS	Bipolar and CMOS
Provide Design Assistance	Yes		Yes
Acceptable Customer Input (in order of preference)	Logic diagram, breadboard, block diagram, functional specifications.	Functional specification; logic diagram; circuit diagram; breadboard; test vectors; customer-owned tooling.	Circuit/logic diagram; breadboard; functional specifications; customer-owned tooling.
Design Aids	Calma CAD, logic simulation, circuit simulation.	Logic simulation; breadboard assistance; design rule checks.	Breadboard assistance; cooperative design from logic/circuit diagrams.
Production	In-house, procured	In-house	In-house
Preferred Delivered Product	Packaged units	Probed wafers; packaged dice	Custom packaging; all standard configurations except mapped wafers.
Test Program Generation	Yes	Yes	Yes
Production Test	Functional, parametric, burn-in, environmental, MIL, linear	Functional; parametric; burn-in	All
Electrical Test Systems Available	Fairchild Sentry	Sentry, Teradyne, Comparator	Fairchild, Datatron, Macrodata, custom.
Comments	MOS: 3 and 5 micron channel lengths.	Tooling can be used by at least two MOS wafer manufacturers to ensure alternate sourcing.	

CUSTOM/SEMICUSTOM (Cont)

Manufacturer FOR DETAILED DATA SEE:	Micro-Sciences	Mitel Semiconductor (Page 3048)	Monolithic Memories Inc. (Page 4768)
Customized Standard Circuits	Digital	Digital	
Gate Array	CMOS	Silicon-gate CMOS	Field Programmable Logic — PAL and mask — programmed version — HAL.
Chip Density Range (equiv. gates)	300 to 6000	500 — 6000 gates	100 to 350 gates
Cell Library	CMOS, NMOS	Silicon-gate CMOS	
Design Kit Available	No	Yes	Yes
Full Custom Circuits Digital	Silicon- or metal-gate PMOS, NMOS, CMOS	Silicon-gate CMOS	
Linear		Silicon-gate CMOS, double poly	
Combined Digital/Linear		Silicon-gate CMOS, double poly	
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Logic diagram; circuit diagram; functional specification; breadboard; customer-owned tooling; known good device.	Functional specification, logic diagram, circuit diagram, customer-owned tooling.	PALs — not required, field programmable. HALs — logic equations, 25-50 "seed" vectors for test generation software.
Design Aids	Logic simulation; breadboard assistance.	Logic simulation, design rule checks.	PALASM software for simulation, fault grading, fuse pattern generation, (mask design input for HALs).
Production	Procured	In-house	In-house
Preferred Delivered Product	Packaged dice	Mapped wafers, probed wafers, scribed dice, packaged dice.	DIPs, LLCs, flat paks
Test Program Generation	Yes	Yes	Yes
Production Test	Functional; parametric; burn-in	Functional, parametric, burn-in, thermal shock, environmental, MIL linear.	Functional, parametric, burn-in, thermal shock, environmental, MIL.
Electrical Test Systems Available		Sentry VII, LTX-DS80	In-house designed
Comments	Chip debugging with portable micro prober on customer's premises.		Several commercial programmers available.

CUSTOM/SEMICUSTOM (Cont)

Manufacturer FOR DETAILED DATA SEE:	Monosil (Citel) (Page 4628)	Motorola (Page 4796)	Murray Consulting
Customized Standard Circuits	Digital	Digital	Linear, Digital, Combined Linear/Digital
Gate Array	3μ silicon-gate CMOS CMOS	MCA 600 ECL/1200 ECL; MCA 500 ALS/1300 ALS	CMOS
Chip Density Range (equiv. gates)	200 to 3200	652/1192; 533/1280	1 to 100
Cell Library	Yes	120 functions; 80 functions	BiMOS
Design Kit Available		Manuals	No
Full Custom Circuits Digital	Silicon- or metal-gate CMOS, silicon-gate NMOS, bipolar	NMOS, CMOS, ECL	Silicon-gate CMOS; TTL
Linear	Bipolar	No	
Combined Digital/Linear	CMOS	No	Silicon-gate CMOS; bipolar
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Logic diagram; circuit diagram; functional specification; breadboard, data-base tapes, PG tapes, mask sets, customer-owned tooling.	CAD interface, logic simulation, circuit documentation.	Breadboard; circuit diagram; functional specification.
Design Aids	Logic simulation, design rule checks, net-list verification.	Computer aided design package	Design rule checks
Production	In-house	High volume capability	In-house, procured
Preferred Delivered Product	Packaged units; will supply wafers or dice.	Choice of packages	Packaged dice; PC-mounted packaged units.
Test Program Generation	Yes	Yes	No
Production Test	Functional, parametric	100% AC and DC and functional	Functional
Electrical Test Systems Available	Sentry VII	Fairchild Sentry VIII and Series 21	
Comments	Complete custom capability	ECL 10K compatible, ECL 10 KH compatible, TTL-LS compatible, remote dseign centers.	Develop photo-integrated circuits: CMOS, MOS, bipolar, BiMOS.

CUSTOM/SEMICUSTOM (Cont)

Manufacturer	NEC Electronics	NCM Corporation	Nitron
FOR DETAILED DATA SEE:	(Page 4799)		
Customized Standard Circuits	Digital, Linear, Combined Digital/Linear	Linear, digital, combination	Digital
Gate Array	CMOS, ECL, TTL-LS	CMOS (si-gate, metal-gate) bipolar	Metal-gate CMOS
Chip Density Range (equiv. gates)	To 11,000	1000 (max.)	50 to 600
Cell Library	Yes	YES	Macro library of common functions (overlays)
Design Kit Available	Yes	No	Yes
Full Custom Circuits Digital		CMOS (si-gate, metal-gate) bipolar	Metal-gate PMOS, CMOS
Linear		CMOS (si-gate, metal-gate) bipolar	Metal-gate PMOS, CMOS
Combined Digital/Linear		CMOS (si-gate, metal-gate); bipolar	Metal-gate PMOS, CMOS
Provide Design Assistance		Yes	Yes
Acceptable Customer Input (in order of preference)		Functional specs, logic diagram, circuit diagram, breadboard, test vectors, customer-owned tooling, known good devices.	Customer-owned tooling with debugged test program; logic diagram, electrical specification with test vectors.
Design Aids		Logic simulation, breadboarding, design rule check, cell library.	All available
Production		Procured	In-house
Preferred Delivered Product		Packaged-units, dice, probed wafers, pc assemblies.	Packaged dice
Test Program Generation		Yes	Yes
Production Test		Functional, parametric, burn-in, thermal cycle.	All commercial and full military
Electrical Test Systems Available		In-house built. μc – controlled test systems.	Sentry
Comments			

CUSTOM/SEMICUSTOM (Cont)

Manufacturer FOR DETAILED DATA SEE:	National	Pico Design	Plessey Semiconductors (Page 4815)
Customized Standard Circuits	Digital	No	Digital, Linear, Combined Digital/Linear
Gate Array	Silicon-gate CMOS	No	Bipolar, ECL and CMOS
Chip Density Range (equiv. gates)	To 2400	10,000	ECL to 1200, CMOS to 10440
Cell Library	Yes	Yes	Yes
Design Kit Available	Yes	No	Yes
Full Custom Circuits Digital	Metal-gate PMOS, metal-or Silicon-gate NMOS, high voltage metal-gate CMOS, low voltage metal- and silicon-gate CMOS, metal double poly silicon-gate CMOS, dual layer XMOS, oxide isolated and Schottky devices, I^2L.	Silicon- or metal-gate PMOS, NMOS, CMOS, other MOS.	PMOS, NMOS, CMOS; I^2L, ECL
Linear	Same as above	No	Bipolar, CMOS
Combined Digital/Linear	Same as above	No	I^2L, ECL Bipolar, CMOS
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Any	Logic diagram, circuit schematic, breadboard, functional specification.	Logic diagram, breadboard, customer-owned tooling, data base tape.
Design Aids	Computer aided circuit analysis, logic and systems simulation, digitizing cell plotting and editing, design rule check, pattern generation, photolithography.	Logic and circuit simulation; design rule checks; CALMA GDS II.	Design rule check, testability analyzer, fault analyzer, auto-placement, auto-router, logic simulator.
Production	In-house	Procured	
Preferred Delivered Product	Packaged dice	All except PC-mounted packaged units.	Packaged tested dice, scribed dice, probed wafers, mapped wafers.
Test Program Generation	Yes	Yes	Yes
Production Test	All except linear	Functional; parametric	Functional, parametric, burn-in, MIL-STD-883.
Electrical Test Systems Available	Century VI and VII, Sentinel, Teradyne, Megatest.	Fairchild, Sentry VII and Series 20	Teradyne J274, Fairchild, Sentry special in-house.

CUSTOM/SEMICUSTOM (Cont)

Manufacturer FOR DETAILED DATA SEE:	Polycore Electronics Inc.	Precision Monolithics, Inc.	Raytheon (Page 4822)
Customized Standard Circuits		Linear	Linear, Digital
Gate Array		From customer-owned tooling	Bipolar digital ISL
Chip Density Range (equiv. gates)			800 to 2400
Cell Library		Standard parts available in chip form	Yes, TTL
Design Kit Available		Kit parts	Yes
Full Custom Circuits Digital	CMOS metal-gate	TTL, LSTTL, ISL, I^2L, ECL, ISO/CMOS-SiGate	Consult factory (bipolar)
Linear	Bipolar	20, 40, 60V supply voltage	Bipolar
Combined Digital/Linear	Power Interface/Driver Circuits	I^2L, ECL, TTL, LSTTL	Consult factory (bipolar)
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Schematics, Performance specs.	Customer-owned tooling (pattern-generator-tape, composite drawing), known good device.	TEGAS net list, circuit schematics, data base program.
Design Aids	Breadboard simulation	Kit parts	Evaluation devices, design source manual, factory tutorial.
Production	In-house wafer fabrication procurred assembly	In-house 3″, 4″ lines	Yes
Preferred Delivered Product	Packaged units, dice	Mapped wafers, probed wafers, packaged units.	
Test Program Generation	Yes	Yes	Yes
Production Test	Functional, parametric, burn-in; thermal shock, environmental, MIL.	Functional, parametric, burn-in, thermal shock, environmental, MIL, linear.	Yes
Electrical Test Systems Available	MCT 200	LTX, F-5000	Sentry 7, Sentry Series 21
Comments	Also provide silicon foundry service in linear, I^2L and CMOS metal gate.	Ion implantation; dual layer metallization; nitride passivation; thin film resistors; MIL 35810 qualified.	

CUSTOM/SEMICUSTOM (cont)

Manufacturer	RCA	Semi Processes, Inc.	Si Fab
FOR DETAILED DATA SEE:	(Page 4824)	(Page 4826)	(Page 4827)
Customized Standard Circuits	Digital	Digital	Digital
Gate Array	Silicon-gate, metal-gate CMOS	Silicon-gate CMOS	Silicon- and metal-gate
Chip Density Range (equiv. gates)	168 to 840	48 to 1400	
Cell Library	CMOS	Yes	Yes
Design Kit Available	No	Yes	
Full Custom Circuits Digital	Silicon-gate, metal-gate CMOS		CMOS
Linear			CMOS
Combined Digital/Linear			CMOS
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Logic diagram, circuit diagram, breadboard test vectors, customer-owned tooling (pattern-generator tape, composite drawing), known good device.	Logic diagram; circuit diagram; test vectors; custom-owned tooling; breadboard; functional specification.	
Design Aids	Logic simulation; breadboard assistance; design rule checks.	Design rule checks, logic simulation, circuit simulation	
Production	In-house	In-house	In-house
Preferred Delivered Product	Probed wafers, scribed dice, packaged dice.	As requested	
Test Program Generation	Yes	Yes	
Production Test	Functional, parametric, burn-in	Functional; parametric; burn-in, ac	
Electrical Test Systems Available	Teradyne; Century 7; J273, J193, J283, J325; LTX; Tester; MTS 77.	Sentry, Genrad, Pragmatic	
Comments		Breadboard assistance using SPI's proprietary 74HC low power CMOS logic IC's.	

Master Selection Guide

CUSTOM/SEMICUSTOM

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Signetics (Page 4829)	Signetics (Page 4829)	Silicon Systems (Page 4872)
Customized Standard Circuits	Digital	Digital	
Gate Array	Silicon-gate CMOS	ECL 100K and 10 K compatibility (0.5 ns)	
Chip Density Range (equiv. gates)	330 to 1100 1250 to 5000 (mid '84)	500-800	
Cell Library	Silicon-gate CMOS, TTL and LSTTL	Macrocell Library	
Design Kit Available	Yes	Yes	
Full Custom Circuits Digital	No*		Silicon- or metal-gate PMOS, NMOS, CMOS, bipolar, TTL, STL, SRTL, LSTTL, ECL, I²L
Linear	No		Silicon- or metal-gate PMOS, NMOS, CMOS, bipolar
Combined Digital/Linear	TBD		Silicon- or metal-gate CMOS, bipolar, TTL, SRTL, I²L, STL
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Logic diagram, timing diagram, and simulation output; CAD output.	Calma tapes plus simulation results; Mylar symbolic representation plus simulation results.	Functional specification, logic diagram, circuit diagram, breadboard, test vectors.
Design Aids	Schematic capture, complete simulation, auto place, auto route, auto test generation.	Logic simulation, CAD design rule checks, layout to simulation check, test generation, design manual, training sessions.	Breadboards, logic and circuit simulation, design-rule checks, test-program development.
Production	In-house	In-house	Procured and in-house
Preferred Delivered Product	Packaged units	Packaged units	Packaged units and tested dice
Test Program Generation	Yes	Yes	Yes
Production Test	Functional, parametric, burn-in	Functional, parametric and ac	Automatic testers for analog and digital devices.
Electrical Test Systems Available	Sentry VII, VIII, and 21	Tektronix (25 MHz)	
Comments	* Standard cells from 200 to 2000 gates.		

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Siltronics	Solid State Scientific	Sprague Electric Co.
Customized Standard Circuits			Linear
Gate Array			
Chip Density Range (equiv. gates)			
Cell Library			
Design Kit Available			No
Full Custom Circuits Digital	TTL, STTL, LSTTL, I^2L, ECL, other bipolar	Silicon-gate CMOS, NMOS metal-gate CMOS	
Linear	TTL, STTL, LSTTL, I^2L, ECL, other bipolar	Silicon-gate CMOS, NMOS	
Combined Digital/Linear	TTL, STTL, LSTTL, I^2L, ECL, other bipolar	Silicon-gate NMOS, CMOS	
Provide Design Assistance		Yes	
Acceptable Customer Input (in order of preference)		Minimum of functional diagram; breadboard; pattern generator tape or database tape.	Composite drawing
Design Aids	Breadboard assistance; design-rule checks.	Logic simulator assistance, breadboard assistance, design rule checks.	
Production	Breadboard wafers; in-house assembly.	In-house	In-house
Preferred Delivered Product	Fully tested assembled package.	No preference	Wafers, dice, packaged devices
Test Program Generation	Yes	Yes	
Production Test	Customized to suit	Full screening available including burn-in and full environmental screening.	
Electrical Test Systems Available	J259-style equipment; custom testers.	Sentry VII, Sentinal, Teradyne	
Comments	Specialize in mixed analog/ digital bipolar. Die sizes to 40,000 mil².	Capabilities include: design, layout, CAP, mask shop, wafer fabrication assembly, and test.	ULN-2350C and ULN-2351C basic unmetallized circuit.

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Standard Microsystems	Sunshine Semiconductor	Supertex
Customized Standard Circuits	Digital, Combined Digital/Linear	Digital, Combined Linear/Digital	Linear, Digital
Gate Array			Silicon- or metal-gate CMOS
Chip Density Range (equiv. gates)			50 to 2000
Cell Library	Silicon-gate NMOS, CMOS	Si-gate CMOS	
Design Kit Available	No		No
Full Custom Circuits Digital	Metal-gate PMOS; silicon-gate NMOS, CMOS	Silicon-gate CMOS, metal-gate CMOS, nonvolatile CMOS	Silicon- or metal-gate CMOS
Linear			Silicon- or metal-gate CMOS
Combined Digital/Linear	Silicon-gate NMOS, CMOS	Metal Gate CMOS	Silicon- or metal-gate CMOS
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Functional specification, logic diagram, Calma database tape, other.	Product description, block diagram with specifications, logic diagram.	Breadboard with functional specification and logic diagram; customer-owned tooling.
Design Aids	Logic simulation; breadboard design rule checks, electrical rule checks, transient analysis	Breadboard, circuit and logic simulation, DRC, graphics, NCC	Logic simulation; breadboard assistance.
Production	In-house	Procured	In-house
Preferred Delivered Product	Packaged devices preferred. All others available.	Packaged dice, bare dice, design and layout	Probed wafers; inspected dice; packaged dice.
Test Program Generation	Yes	Yes	Yes
Production Test	Full testing and screening, including burn-in.	Procured	Functional; parametric; burn-in; environmental.
Electrical Test Systems Available	Megatest Q8000; SMC; dedicated testers, Fairchild, Sentry and Sentinal.		Teradyne J193; GenRad 2225
Comments	Specialize in digital MOS/LSI and VLSI; will also customize by modifying MOS/LSI standard parts. Second sources available.	Services include product and specification finalization, logic and circuit design, layout, test definition.	

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Synertek (Page 4873)	Telmos (Page 4877)	Telmos (Page 4877)
Customized Standard Circuits		Digital	Digital/Linear
Gate Array		Silicon-gate and metal-gate CMOS	Silicon-gate analog/digital Silicon-gate high voltage
Chip Density Range (equiv. gates)		50 to 1260 gates	
Cell Library		Silicon-gate and metal-gate CMOS digital	100 to 1200 gates
Design Kit Available	Yes		Yes
Full Custom Circuits Digital	Silicon-gate CMOS, NMOS	Custom designs are preferred	
Linear	Same as above		
Combined Digital/Linear	Same as above	Silicon-gate analog/digital	Silicon-gate analog/digital
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Functional specification, customer owned tooling, logic diagram, circuit diagram, breadboard.	Schematic I/O requirements, functional spec. breadboard, test vectors, customer owned tooling, known good device.	Schematic I/O requirements, functional specs, breadboard test vectors, customer owned tooling, known good device.
Design Aids	Logic simulation breadboard assistance, continuity check, design rule check.	Aspec, Spice IIG — transient analysis logic, Tegas IV — logic simulation, Sentry VII — test.	Aspec, Spice 11G, transient analysis logic; Tegas IV, logic simulation.
Production	In-house	In-house wafer fab facility	In-house wafer fabrication
Preferred Delivered Product	Packaged dice, scribed dice	Wafer, dual in line packages, chip carriers.	Wafer, dual-in-line packages, chip carriers.
Test Program Generation	Yes	Yes	Yes
Production Test	All	Functional, parametric burn-in thermal shock, environmental.	Functional, parametric burn-in thermal shock, environmetal
Electrical Test Systems Available	Century, Xincom		Sentry VII
Comments	Customer interface ranges from "black box" specification to COT. Company will work with customer engineers to develop in-house capability for designing future COT.		

Master Selection Guide

CUSTOM/SEMICUSTOM

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Texas Instruments (Page 4878)	TLSI, Inc.	Torric Corporation
Customized Standard Circuits	Digital		Linear, Digital, Combined Digital/Linear
Gate Array	LPS, silicon-gate CMOS, STL	Silicon-gate CMOS	Silicon or metal-gate CMOS, Linear Bipolar, Digital ECL
Chip Density Range (equiv. gates)	540 to 4000	300 + 2500	300 — 2500
Cell Library	Software functions — bipolar CMOS MACROS	Si-gate CMOS, NMOS	Silicon-gate CMOS
Design Kit Available	Yes	No	Yes
Full Custom Circuits Digital	LPS, STL, I²L, CMOS, NMOS	CMOS, NMOS, PMOS	Silicon- or metal-gate PMOS, NMOS, CMOS, TTL, STTL, I²L
Linear	Yes	CMOS, NMOS, PMOS	Silicon- or metal-gate CMOS; TTL, STTL
Combined Digital/Linear	Yes	CMOS, NMOS, PMOS	Silicon- or metal-gate CMOS; TTL, STTL
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Logic diagram, PG tape, HDL/TDL design input, functional specification.	Specification, logic diagram schematic, breadboard COT	Functional specification; logic diagram; circuit diagram; breadboard; known good device; customer owned tooling; test vectors.
Design Aids	Simulation, testability analysis, test grading, load checker. Texas Instruments logic array design utility — TILADS.	Custom cell library, logic simulation, CAD, CAE, Design Rule checks.	Logic simulation; breadboard assistance; design rule checks; graphics CAD.
Production	In-house	Procured	Procured
Preferred Delivered Product	Packaged devices	Package die, dice	Packaged dice, printed-card-mounted packaged units.
Test Program Generation	Yes	Yes	Yes
Production Test	Functional, parametric, burn-in, MIL.	Functional, parametric, burn-in, linear	No
Electrical Test Systems Available	Sentry 20, in-house	LTX, HP, Gen Rad, dedicated Multiple production sources;	
Comments		no minimum production requirements.	

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	Trans-Data	Universal Semiconductor (Page 4930)	VLSI Design Associates
Customized Standard Circuits		Digital	Digital/Analog
Gate Array		Silicon-gate ISO-CMOS	
Chip Density Range (equiv. gates)		180 to 2400	
Cell Library		Silicon-gate ISO-CMOS	Silicon-gate CMOS, Digital and Analog
Design Kit Available		Yes	No
Full Custom Circuits Digital	Silicon-gate NMOS and CMOS	Silicon-gate ISO-CMOS	Silicon-gate CMOS and NMOS; logic and memory; nonvolatile memory.
Linear	Silicon-gate — CMOS	Same as above	Silicon-gate CMOS and NMOS; CCD; Switched capacitor filters.
Combined Digital/Linear	Silicon-gate — CMOS	Same as above	
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Functional specs, logic diagram, circuit diagram, known good device, customer tooling.	Logic reconfigured at GATE/FF Level. Logic diagram, PG tapes, masks.	Logic diagram, circuit diagram, functional specification, breadboard.
Design Aids		Logic simulation, breadboard assistance, design rule checks. Auto test generation; auto place/route; logic to layout verification.	In-house: Calma GDS II and VAX11/780.
Production	Procured	In-house	Procured
Preferred Delivered Product	Packaged dice (prototype quantities), probed wafers.	Package parts, dice probed wafers.	As requested
Test Program Generation	Yes	Yes	Yes
Production Test		Functional, parametric, burn-in, thermal shock, environmental, MIL.	Functional, parametric
Electrical Test Systems Available	Functional, Parametric, Burn-in, Thermal Shock, environmental MIL.	Micro Manipulator, Sentry II, VI, VII, Sentry System 20, pragmatic functional tester. Fairchild Series 10.	
Comments	Provide assistance to customers who will utilize gate arrays manufactured by others.	With smaller random logic circuits, prefer to start with a gate array and convert to full custom when manufacturing volumes justify the conversion.	Independent design center; multiple sources, design aids.

CUSTOM/SEMICUSTOM (cont)

Manufacturer FOR DETAILED DATA SEE:	VLSI Technology (Page 4931)	Western Digital	ZyMOS
Customized Standard Circuits		Digital	Digital, combined digital/linear
Gate Array		Up to 1000 gates, Silicon-gate NMOS	Up to 2500 gates, metal-gate CMOS 3000 gates, silicon-gate CMOS 4000 gates, NMOS.
Chip Density Range (equiv. gates)			Metal-gate CMOS, silicon-gate CMOS, NMOS
Cell Library		Yes	Yes
Design Kit Available	NMOS, HMOS, CMOS		Metal-gate CMOS, silicon-gate CMOS, NMOS
Full Custom Circuits Digital			
Linear	NMOS, CMOS		CMOS
Combined Digital/Linear	NMOS, CMOS		CMOS
Provide Design Assistance	Yes	Yes	Yes
Acceptable Customer Input (in order of preference)	Functional specification logic diagram, breadboard, customer-owned tooling, data base tape, PG tape, mask.	Functional specification logic system	Logic input through ZyP CAD system, logic diagram, functional specification, customer-owned tooling.
Design Aids	PRISM VLSI design system, including high-level design language, circuit extraction logic and circuit simulation, design rule checks, plotting, STIX.	Logic simulation, design rule checks, test program development.	Circuit simulation, logic simulation, test program generation, artwork generation all linked to common data base, design rule checks, breadboard assistance.
Production	In-house	In-house	In-house
Preferred Delivered Product	Packaged dice preferred. Any on request.	Packaged units and tested dice	Packaged dice preferred, any on request
Test Program Generation	Yes	Yes	Yes
Production Test	Functional, parametric, burn-in, thermal shock, environmental, MIL.	Functional, burn-in	Functional, parametric
Electrical Test Systems Available	Sentry 20/120, Accutest		Sentry, VII, Lomac
Comments	Multiple sourcing compatibility, foundry services, training and CAD aids to support User-Designed VLSI and Mead-Designed VLSI.	Uncommitted logic arrays, 20 pin DIP, 130 prefabricated logic elements or 28/40 pin DIP, 400 prefabricated logic elements.	ZyP CAD system — logic level design at customer's facility, CMOS and NMOS silicon level simulation.

Advanced Micro Devices

BIPOLAR LSI AND SUPPORT PRODUCTS
20-Pin IMOX™ Programmable Array Logic Elements

Features of PALs

- User customizable, high performance logic building blocks
- Custom logic patterns may be generated in minutes with PROM type programmers
- Easy to use software design aids available (PALASM*)
- Improves performance and reduces board area and cost of existing TTL SSI/MSI designs
- Aids creation of new system architectures through interactive design techniques
- Security fuse prevents copying of logic by competitors
- Slim 20 and 24-pin DIP packages

Advantages of AMD PALs

- IMOX™ oxide isolated technology insures industry's fastest (12ns typ) "A" versions and fastest half-power (24ns typ) "L" versions
- Platinum-silicide fuses and added test words insure programming yields > 98%
- Functional yield after programming > 99%
- Reliability assured through more than 40 billion fuse hours of life testing with no failures
- Full AC and DC parameter testing at the factory through on-board testing circuitry
- Power-up reset simplifies state machine design
- Industry leading quality guarantees

AMD PAL Speed/Power Families

Family	t_{pd} ns (Max)	t_s(1) ns (Max)	t_{co}(1) ns (Max)	I_{CC}(2) mA (Max)	I_{OL} mA (Min)
High Speed, "A"	25	20	15	155	24
Standard	35	30	25	155	24
Half Power, "L"	35	30	25	80	24

(1) Sequential functions.
(2) Combinatorial functions.

AMD PAL FUNCTIONS

Part Number	Array Inputs	Logic	OE	Outputs	Package Pins
16R8	Eight Dedicated Eight Feedback	Eight 8-Wide AND-OR	Dedicated	Registered Inverting	20

BIPOLAR LSI AND SUPPORT PRODUCTS
20-Pin IMOX™ Programmable Array Logic Elements

MAXIMUM RATINGS (Above which the useful life may be impaired)

Storage Temperature	−65 to +150°C
Temperature (Ambient) Under Bias	−55 to +125°C
Supply Voltage to Ground Potential (Pin 20 to Pin 10) Continuous	−0.5 to +7V
DC Voltage Applied to Outputs (Except During Programming)	−0.5V to $+V_{CC}$ max
DC Voltage Applied to Outputs During Programming	21V
Output Current Into Outputs During Programming (Max Duration of 1 sec)	200mA
DC Input Voltage	−0.5 to +5.5V
DC Input Current	−30 to +5mA

OPERATING RANGE

T_C	Operating Case Temperature				125	°C

ELECTRICAL CHARACTERISTICS OVER OPERATING RANGE (Unless Otherwise Noted)

Parameters	Description	Test Conditions			Min	Typ (Note 1)	Max	Units
V_{OH}	Output HIGH Voltage	V_{CC} = MIN, V_{IN} = V_{IH} or V_{IL}	I_{OH} = −3.2mA	COM'L	2.4	3.5		Volts
			I_{OH} = −2mA	MIL				
V_{OL}	Output LOW Voltage	V_{CC} = MIN, V_{IN} = V_{IH} or V_{IL}	I_{OL} = 24mA	COM'L			0.50	Volts
			I_{OL} = 12mA	MIL				
V_{IH} (Note 2)	Input HIGH Level	Guaranteed input logical HIGH voltage for all inputs			2.0			Volts
V_{IL} (Note 2)	Input LOW Level	Guaranteed input logical LOW voltage for all inputs					0.8	Volts
I_{IL}	Input LOW Current	V_{CC} = MAX, V_{IN} = 0.40V				−20	−250	μA
I_{IH}	Input HIGH Current	V_{CC} = MAX, V_{IN} = 2.7V					25	μA
I_I	Input HIGH Current	V_{CC} = MAX, V_{IN} = 5.5V					1.0	mA
I_{SC}	Output Short Circuit Current	V_{CC} = MAX, V_{OUT} = 0.5V (Note 3)			−30	−60	−90	mA
I_{CC}	Power Supply Current	All inputs = GND, V_{CC} = MAX	16L8, 16H8, 16HD8, 16LD8 16L8A, 16H8A, 16HD8A, 16LD8A			110	155	mA
			16R8, 16R6, 16R4 16R8A, 16R6A, 16R4A			120	180	
V_I	Input Clamp Voltage	V_{CC} = MIN, I_{IN} = −18mA				−0.9	−1.2	Volts
I_{OZH}	Output Leakage Current (Note 4)	V_{CC} = MAX, V_{IL} = 0.8V V_{IH} = 2.0V	V_O = 2.7V				100	μA
I_{OZL}			V_O = 0.4V				−100	
C_{IN}	Input Capacitance	V_{IN} = 2.0V @f = 1MHz (Note 5)				6		pF
C_{OUT}	Output Capacitance	V_{OUT} = 2.0V @f = 1MHz (Note 5)				9		

Notes:
1. Typical limits are at V_{CC} = 5.0V and T_A = 25°C.
2. These are absolute values with respect to device ground and all overshoots due to system or tester noise are included.
3. Not more than one output should be tested at a time. Duration of the short circuit should not be more than one second. V_{OUT} = 0.5V has been chosen to avoid test problems caused by tester ground degradation.
4. I/O pin leakage is the worst case of I_{OZX} or I_{IX} (where X = H or L).
5. These parameters are not 100% tested, but are periodically sampled.

PROGRAMMING

Each AMD PAL fuse is programmed with a simple sequence of voltages applied to two control pins (1 and 11) and a programming voltage pulse applied to the output under programming. Addressing of the 2048 element fuse array is accomplished with normal TTL levels on eight input pins (five select the input line number and three select the product term number). V_{CC} is maintained at a normal level throughout the programming and verify cycle – no extra high levels are required.

The necessary sequence of levels for programming any fuse is shown in the Programming Timing Diagram. The address of each fuse in terms of Input Line Number and Product Term Line Number is defined by the Fuse Address Tables 1 and 2. Current, voltage and timing requirements for each pin are specified in the Programming Parameter Table below.

The 16L8, 16R8, 16R6, 16R4, 16H8, 16LD8 and 16HD8 use identical programming conditions and sequences.

After all programming has been completed, the entire array should be reverified at V_{CCL} and again at V_{CCH}. Reverification can be accomplished by reading all eight outputs in parallel rather than one at a time. The array fuse verification cycle checks that the correct array fuses have been blown and can be sensed by the outputs.

AMD PALs have been designed with many internal test features that are used to assure high programming yield and correct logical operation for a correctly programmed part.

An additional fuse is provided on each AMD PAL circuit to prevent unauthorized copying of AMD PAL fuse patterns when design security is desired. Blowing the security fuse blocks entry to the fuse pattern verify mode.

To blow the security fuse:
1. Power up part to V_{CCP}
2. Raise Pin 5 to V_{HH}.
3. Pulse Pin 11 from ground to V_{OP} for a 50μsec duration.
4. Perform a normal end-of-programming verify cycle at V_{CCL} and V_{CCH}. All fuse locations should be sensed as blown if the security fuse has been successfully blown.

Note that parts with the security fuse blown may not be returned as programming rejects.

AMD PALs normally have high programming yields (>98%). Programming yield losses are frequently due to poor socket contact, equipment out of calibration or improperly used.

PROGRAMMING PARAMETERS T_A = 25°C

Parameters	Description		Min	Typ	Max	Units

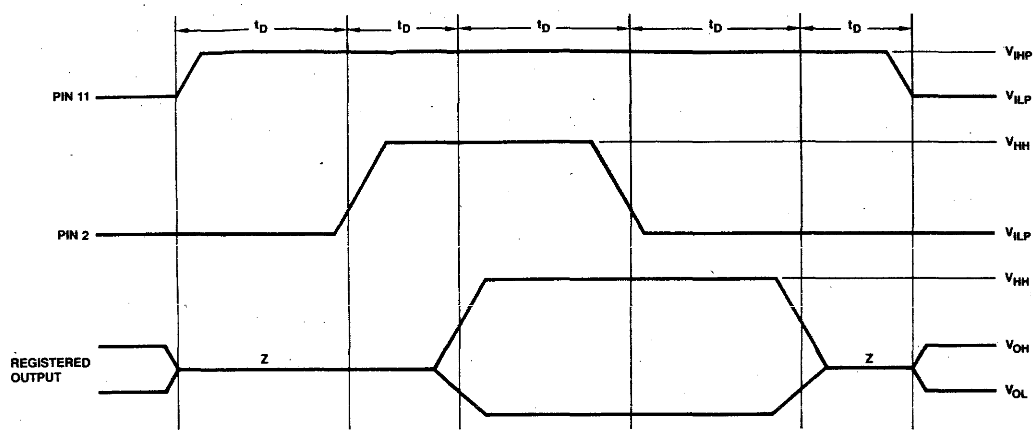
PRELOAD OF REGISTERED OUTPUTS

AMD PAL registered outputs are designed with extra circuitry to allow loading each register asynchronously to either a HIGH or LOW state. This feature simplifies testing since any initial state for the registers can be set to optimize test sequencing.

The pin levels and timing necessary to perform the PRELOAD function are detailed below:



Level forced on registered output pin during preload cycle	Output state at the output pin after cycle
V_{HH}	HIGH
0V to V_{CCH} or OPEN	LOW

Spectrum of Custom Solutions

No other company can match AMI's track record in developing state-of-the-art custom VLSI products. With more than 2000 custom devices designed and manufactured since 1966, AMI has more experience than any other integrated circuit company in building a wide variety of custom microcircuits.

AMI not only has the experience, but the design engineering organization and the advanced production and testing facilities to produce the highest quality MOS/VLSI circuits. And because AMI also offers standard memory, microprocessor, telecommunication and consumer products and the widest variety of custom VLSI processes in the industry, we're able to be objective in helping customers determine their most cost effective approach.

The Advantages of Custom Circuits

Since a single custom MOS/VLSI chip can replace expensive electromechanical devices, discrete logic components, or less efficient general purpose LSI circuits, it offers a number of benefits not available with standard logic.

Custom circuits save money. Grouping functions onto a single chip lowers production and inventory costs dramatically. That reduces your product manufacturing costs as well.

Custom circuits are more reliable. Putting a complete system on a chip trims component count, improving both product reliability and production yields. Rework, repair and replacements are minimized.

Custom circuits reduce space and power requirements. Fewer components means both space and power requirements are reduced.

Custom circuits offer superior performance. Since the circuit is designed to your requirements, features and functions can be incorporated which are not available in general purpose chips. Special tailoring reduces test requirements as well.

Custom circuits offer proprietary protection. Being tailored exactly to your requirements, a custom circuit cannot be easily duplicated. This can help put you ahead — and keep you ahead — of your competition.

The Spectrum of Solutions

The decision to use a custom circuit depends on your system design requirements — such things as complexity, features, size and power limitations. But no longer is your custom decision limited by low volume or short development time — not when you come to AMI.

AMI has a full spectrum of custom solutions to assure you get that solution which meets your system performance and time-to-market requirements at the lowest possible cost.

AMI's spectrum of solutions bridges the total span of volume, timing and interface needs of our customers. From semi-custom designs, to full custom design — somewhere on the spectrum, your development time and volume requirements can be met. For customers who already have their designs, AMI can provide custom fabrication for the customer's tooling. We will even teach custom design if that's what our customers need. And we can even go a step further and license the technology for a customer to set up his own fabrication capability. No other company offers such a spectrum of solutions. And no other company has more experience at helping you pick the best solution for your needs.

Semi-Custom Gate Arrays

AMI offers both gate arrays and standard cell design methods for semi-custom circuit development.

Gate arrays are the best solution for circuits of moderate complexity in low-to-medium volume applications or where the shortest possible development time is required. AMI offers both gate arrays and standard cell design methods for semi-custom circuit development.

AMI CMOS semi-custom gate arrays are standard logic layouts of everything except the final metal interconnect pattern. Since only the final pattern needs to be developed to customize your circuits, both development time spans and development costs are dramatically reduced. Because wafers containing arrays are preprocessed and inventoried, production lead times are short. Gate arrays are especially attractive for applications requiring circuit volumes from 1,000 to 50,000 units per year.

For more details on AMI's gate arrays, refer to the "Semi-Custom" section.

Standard Cell Custom

Standard cells are custom circuits which are designed from computer stored modular cells. The computer assembles the cells into a collection of functional blocks to form a custom circuit. Since standard cells utilize predesigned cells, development time is reduced dramatically and development costs are cut 30 to 50 percent over conventional custom design. Circuit size is likely to be slightly larger than a conventional custom circuit, so they are most appropriate where rapid development is more important than minimal size. Standard cells are cost effective in volume levels beginning around 10,000 circuits.

For more details on AMI standard cells refer to the "Semi-Custom" section.

Optimized Custom Design

Where end product volume is high — beyond 50,000 units per year — or where special requirements for lowest power, minimal space or highest performance exist, the solution is likely to be conventional custom design. By optimizing circuit elements and layout for a specific part, die size is substantially smaller than using semi-custom design methods. In high volume applications, a smaller die size results in lower unit cost to the customer.

Spectrum of Custom Solutions

In addition, custom designs allow you to combine logic elements, memory, and analog circuits in a single device. This design flexibility is not available in gate arrays and only available to a limited extent in standard cells.

Instrumental in the design of custom circuits is our Symbolic Interactive Design System (SIDS). The design is done primarily with SIDS where a layout designer works with symbols directly at a large screen alphanumeric color CRT. After the SIDS circuit design has been completed and verified, the symbols are converted to polygons and a 10X reticle tape is prepared.

SIDS uses on-line, real-time design rule checking capability to isolate design rule errors in the layout. This allows immediate correction which greatly reduces the development span time.

Also a nodal trace function permits a designer to trace and highlight a given electrical node. In this way, the designer can manually insure that the node is connected as specified in the master logic description.

Full background real-time design rule checking on windows, cells, and chips is supported, as is full background continuity checking against the master logic description. This eliminates the delay from digitizing and batch processed computer checking of circuits for accuracy.

With SIDS, error correction, circuit modification and area relocations take only minutes. That significantly reduces design cycle time and development costs.

Computer-aided hand-drawn layouts are used to reduce extremely complex circuits to the absolute smallest size. Development time and costs are higher, but in certain cases, size or complexity requirements may require the hand-drawn approach.

Customer Owned Tooling

In many cases AMI customers design their own circuits, either through an internal design center, a design house, or another vendor. In these cases, AMI can provide custom circuit fabrication from customer owned tooling. In conjunction with a silicon foundry service, AMI's Customer Owned Tooling (COT) group can offer the customer design support in the form of design rules, standard cells, a three phase development program, test program generation and general technical support. In the event of design problems, AMI's COT group utilizes the design expertise of the custom or semi-custom group for technical assistance.

Once the circuit is designed, the customer has the option of transferring the circuit tooling to AMI in PG tape, data base tape or working plate form. Close cooperation between the customer and AMI's COT Group during an established three phase prototype development program simplifies circuit debug and reduces risk of design error.

Drawing on AMI's extensive manufacturing ability, COT offers a wide range of process variations, package types, and test capabilities. Unlike most of AMI's competition in the silicon foundry market, AMI has internal photolithography (mask making) and assembly capability. This internal capability avoids the high costs and quality risks of subcontracting two very important steps in custom IC manufacturing.

Once the prototype development program is completed, AMI can ship as few as five to as many as thousands of wafers per week to the customer. AMI can ship tested die, fully tested packaged devices and devices meeting military 883-B standards.

AMI's Customer Owned Tooling group is the only vendor in the silicon foundry market that offers design support, full service manufacturing capability, flexibility and experience.

Joint Development Ventures

Through a Joint Development Team (JDV) we can teach a customer to design his own MOS/VLSI circuits. The JDV is a combination of technically skilled people from the partner company and AMI who function as a design group concentrating on the customer's products alone. The JDV partner brings his system design staff and AMI brings the MOS/VLSI staff and its design technology. The partner becomes part of an in-house AMI design group. The end result is a design capability for the partner company for circuits that AMI will fabricate.

If the customer wants to go beyond designing his own circuits to operating his own manufacturing/pilot line, AMI will license the necessary technology in those situations where a long-term business relationship can be established between the partner company and AMI.

AMI Provides Leading CAD Technology

At almost all levels of the spectrum, computer-aided design (CAD) software and hardware aids are employed to assure correctness of design each step of the way and to shorten design spans reducing customer risk and lowering design cost. Highly efficient programs have been implemented to assist in logic design and simulation, layout planning, switched capacitor analysis routines and symbolic interactive design layout, to name just a few.

Hardware design aids include:

- On-site Burroughs 7760 computer with multiprocessing capability.
- Computer terminals built around a Prime computer and engineering design facilities which tie into the on-site 7760 and time-sharing services.
- Computervision interactive graphics system which provide on-line generation and editing of composite drawings; includes drafting surfaces and CRT displays.
- Calma graphics system for both production digitizing and on-line changes.
- Calma GDS-11 high speed electrostatic plotter.

Spectrum of Custom Solutions

• High speed, high resolution Electromask 9-track pattern generator.

Software design aids include:

Logic Design

• **Register Transfer Language (RTL) Simulation** — Provides a system behavior description to define instruction sets, optimize data paths, control hardware algorithm design and establish register designs.

• **Glide** — Permits user to design layout, simulate, generate patterns and develop test programs for logic arrays.

• **Path Analysis Program (PATH)** — Permits gross logic checks to be made before design, and final logic checks from the ultimate design.

• **Logic Simulator (SIMAD)** — (SIMulator with Assignable Delays) simulates logic network behavior for design verification and propagation delays.

• **Programmable Logic Array Design Aids (PLAID)** — Uses state tables and Boolean equations to generate the optimum physical structure for random logic designs.

• **Block Oriented Logic Translator (BOLT))** — A logic description compiler that generates a common data base used by SIDS, SIMAD, LPA, continuity check, PATH and CIPAR.

• **Design Rule Checking (DRC)**

• **Trace and Continuity Checking**

Circuit Design

• **Circuit Simulator (ASPEC)** — Analyzes DC operation, DC transfer functions, time domain or transients and frequency domain or small signal AC characteristics.

• **Pole Zero Analysis (PZSLIC)** — Program analyzes the frequency domain of linear integrated circuits.

• **Switched Capacitor Analysis Routine (SCAR)** — Analyzes switched capacitor filter designs for telecommunications and other analog circuits.

• **Data Analysis Program (DAP)** — Analyzes data from circuit fabrication to maintain the parameters of circuit designs.

Mask Design

• **Layout Planning Aid (LPA)** — Lays out the chip plan and interconnection between functional blocks of an integrated circuit.

• **Symbolic Interactive Design System (SIDS)** — Permits a layout designer to work directly with a computer to lay out and check a circuit on a CRT screen, dramatically shortening layout time requirements.

• **Circuit Interactive Place and Route (CIPAR)** — Automatically creates error-free mask designs in extremely short time spans.

Test Generation

AMI utilizes numerous software programs to generate test programs for integrated circuits. All serve to reduce the time needed to develop test programs to meet customer specifications.

Digital and Analog Combinations

AMI is a leading innovator in combining digital and analog functions on a single chip. We can combine any of the functions below into an optimum circuit configuration to meet your needs. Unique combinations of these functions are already used in many applications in the communications, consumer, and industrial marketplace.

DIGITAL	ANALOG
PLA	OP AMP
ALU	Oscillator
Inverter	Comparator
RAM and ROM	Voltage Reference
Shift Register	A/D and D/A Converters
Interface Driver	Switched Capacitor Filters
Automatic Power Down	Programmable Power Down
	Phase Locked Loops

State of the Art Packaging

AMI's packaging capability spans a broad spectrum, beginning with plastic, ceramic and CERDIP and going on to chip carriers, die bonding to PC boards and, most recently, mini-flat packs. As well as being a leader in plastic packaging for the high volume, low cost consumer industry, AMI's high reliability plastic packages and chip carriers are accepted under the stringent requirements in the Telecom and Automotive industries. As many industry segments move toward space-saving packages, AMI remains in the forefront in packaging using chip carriers. AMI now is developing a family of mini-flat packs which are a plastic alternative to a chip carrier.

AMI Delivers Quality

AMI quality controls for in-process wafer inspection and final assembly and test are the best in the industry. Our care in fabrication, assembly and test mean that you get products that meet your specifications for reliability. Because over 70 percent of our total production is custom, we perform many checks routinely that would only be done on special orders and at additional cost by other manufacturers. In fact, our own in-house standards are tougher than most of our customers require. Most importantly, AMI is committed to making sure that everything we do is done right, every time we do it.

The Industry's Highest Standard

AMI has consistently pursued product excellence and has reached for higher quality levels in finished products shipped. Circuits are inspected to 0.04% AQL or your specifications, whichever is more stringent.

Spectrum of Custom Solutions

This 0.04% AQL can put you in a superior competitive position. Your incoming test and assembly costs come down since there is less reworking on the line. And your customers receive a more reliable product.

Quality Checks

Among the routine quality controls exercised over every product at AMI are:

- Full logic design checks against system specifications
- Circuit simulation to verify performance against objectives
- Working plates check on automatic checkers
- Automated mask fabrication checks
- In-process wafer fabrication checks
- Wafer sort tests
- 100% optical inspection at dicing
- 100% die attach checking
- 100% lead bonding inspection prior to package sealing
- Seal checks, fine and gross leak tests
- Final digital and analog tests
- Customer specified environmental tests

Meticulous in-process checks are performed on design and workmanship at every step, to ensure a full manufacturable device. In manufacture, lot process and yield data are captured and examined as a matter of routine.

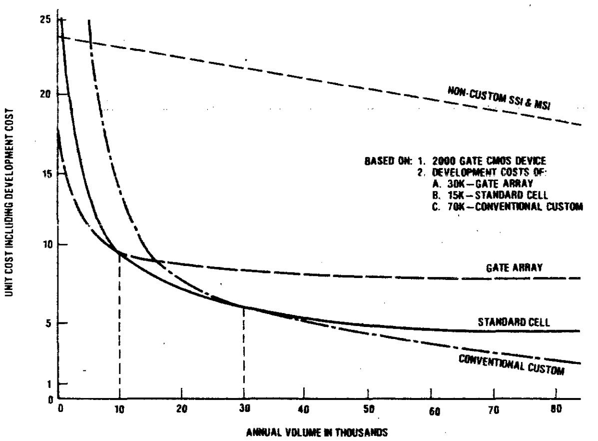
Semi-Custom Capabilities

Overview

As the semiconductor industry has marched into the new era of VLSI, a new market has appeared—fast turn custom or, as it is now called, semi-custom. AMI, a leader in custom MOS since 1966, is also a leader in this new semi-custom market. AMI has introduced CAD software and hardware tools to allow customers to design, simulate, and layout circuits using AMI gate array and standard cell families. Figure 1 shows the economic tradeoffs between gate array, standard cell, and full custom, all of which are offered by AMI.

Figure 1. Cost vs. Volume Alternatives



Gate Arrays

The simplest semi-custom ICs are gate arrays. As the name implies, a gate array consists of uncommitted component matrices of transistors (usually P- and N-type for CMOS) that allow user-defined interconnections through a single or double layer of metal. Since arrays employ fixed component locations and geometries, AMI can process the wafers up to the metallization stage and inventory the wafers for future customization. Thus gate arrays look like late mask programmable ROMs and benefit from this large-volume production because they appear to be a standard product. Thus AMI can offer them at an economical price and with fast prototyping and production turn on spans.

Standard Cells

The second semi-custom product group is standard cells.

Standard cells employ fully customized process/mask sets and must pass through all process steps before a user-specified circuit is completed. To design such chips, AMI customers use precharacterized functional cells from our cell libraries. Placing and routing the cells is done on AMI computers using specially developed software. Standard cell designs usually result in smaller chips since only the component structures required for the user-specified circuit are included, thus chips designed with cells are less expensive than gate array designed chips.

The key to success in this new market is flexibility. Flexibility to the user entails: low risk circuit implementation, short development span, lower development cost, lower piece part cost (over TTL implementations), easy to change or modify, enhanced product features, etc. For the manufacturer, flexibility means: ease of manufacture, economies of scale, and easy interface with customers. One last point: AMI offers the user the opportunity to migrate at a low cost, from a gate array to a standard cell (or possibly full custom) to further enhance his/her product. By using analog cells, significant advances in chip function integration are at the user's disposal.

In addition, AMI offers a wide selection of packages to meet specific user needs. AMI offers the CAD tools needed to work in the new market. AMI also offers the training required to move customers quickly and easily into this new technology.

2-Micron Products

AMI is developing 2-micron CMOS technology to support the next generation of semi-custom products, in both gate arrays and standard cells. These products will offer size and performance improvements of up to 50% from their 3-micron counterparts.

Introduction of the first 2-micron gate array family is planned for second quarter 1984 and is expected to offer capabilities of greater than 8000 gates.

For detailed information on Gate Arrays and Standard Cells consult the following seven pages.

AMI A Subsidiary of Gould Inc.

Gate Arrays

Features

- Arrays of Uncommitted CMOS Transistors Programmed by Metal Layer Interconnect to Implement Arbitrary Digital Logic Functions
- Multiple Developmental Interfaces: AMI or Customer Designed
- Three Array Families—5-Micron Single Metal CMOS, 3-Micron Single Metal CMOS, and 3-Micron Double Metal Versions
- Multiple Array Configurations—From 300 to 1260 Gates for 5-Micron Devices, and 500 to 5000 Gates for 3-Micron Devices
- Quick Turn Prototypes and Short Production Turn-On Time
- Economical Semi-Custom Approach for Low-to-Medium Production Volume Requirements
- Advanced Oxide-Isolated Silicon Gate CMOS Technology
- High Performance—2 to 3ns Typical Gate Delay for 3-Micron Devices
- Broad Power Supply Range—3V to 12V (± 10%)
- TTL or CMOS Compatible I/O
- Up to 134 I/O Connections
- Numerous Package Options
- Full Military Temperature Range (– 55°C to 125°C) and MIL-STD-883 Class B Screening Available

General Description

AMI's gate array products consist of arrays of CMOS devices whose interconnections are initially unspecified. By "programming" interconnect at the metal layer mask level, virtually arbitrary configurations of digital logic can be realized in an LSI implementation.

AMI gate array designs are based on topological cells—i.e., groups of uncommitted silicon-gate N-Channel and P-Channel transistors—that are placed at regular intervals along the X and Y axes of the chip with intervening polysilicon underpasses. Pads, input protection circuitry, and uncommitted output drivers are placed around the periphery.

Compared to SSI/MSI logic implementations, AMI's gate array approach offers lower system cost and, in addition, all the benefits of CMOS LSI. The lower system cost is due to significant reductions in component count, board area and power consumption. Product reliability, a strong function of component count, is thereby greatly enhanced. And compared to fully custom LSI circuits, the gate array offers several advantages: low development cost; shorter development time; shorter production turn-on time; and low unit costs for small to moderate production volumes.

AMI's CMOS gate arrays are offered in three families: the 5-micron UA series, the 3-micron single metal GA series, and the 3-micron double metal GA-D series. The 5-micron UA series has been in production since 1980 and well over one hundred circuits have been produced in that technology. The 3-micron GA and GA-D series are the high-speed high-density devices fabricated in AMI's state-of-the-art 3-micron CMOS processes.

Table 1. 5-Micron Gate Array Family

Circuit	Equivalent Two-Input Gates	Pads	LS Output Drivers	TTL Output Drivers
UA-1	300	40	17	20
UA-2	400	46	23	20
UA-3	540	52	25	24
UA-4	770	62	31	28
UA-5	1000	70	35	32
UA-6	1260	78	39	36

5-Micron Gate Array Family

The family of 5-micron CMOS products is offered in six configurations, summarized in Table I, with circuit complexities equivalent to 300, 400, 540, 770, 1000, and 1260 two-input gates, respectively. All pads can be individually configured as inputs, outputs, or I/O's. Input switching characteristics can be programmed for either CMOS or TTL compatibility. LS buffer output drivers will support CMOS levels of two low power schottky TTL loads. TTL buffer outputs will also provide CMOS levels and are capable of driving up to six LS TTL loads. All output drivers can be programmed for tri-state or open drain (open collector) operation as required.

The CMOS technology used for these products is AMI's state-of-the-art 5-micron, oxide-isolated, silicon gate CMOS process. This process offers all the conventional advantages of CMOS—i.e., very low power consumption, broad power supply voltage range (3V to 12V ± 10%), and high noise immunity—as well as dense circuits with high performance. Gate propagation delays are in the five to ten ns range for 5 volt operation at room temperature. AMI gate array products can be supplied in versions intended for operation over the standard commercial temperature range (0°C to + 70°C), the industrial range (– 40°C to + 85°C), or the full military range (– 55°C to + 125°C). MIL-STD-883 Class B screening, including internal visual inspection and high temperature burn-in, is offered. Similarly, customer-specified high reliability screening is available for commercial and industrial applications.

D.C. characteristics for the 5-micron gate array family are summarized in Table 2.

Table 2

Logic Element	2-Input Gate Equivalent
2-Input NOR	1
2-Input NAND	1
3-Input NOR	1.5
3-Input NAND	1.5
INVERTER	.5
D FLIP-FLOP W/RESET	5
D FLIP-FLOP W/SET-RESET	6
J-K FLIP-FLOP	8
CLOCKED LATCH	2.5
EXCLUSIVE OR	2.5
SCHMITT TRIGGER	2
4-BIT BCD CNTR W/RESET	27
TRANSMISSION GATE	.5

The current AMI array family, 300 gates to 1260 gates, is run in a 3-12V CMOS process (internally coded as CVA process). AMI is currently optimizing this array family for 3V to 5V operation (internally coded as CVH process). This new family, called UA-300 through UA-1260, is to be functionally identical to the existing UA-1 through UA-6. All design tools are interchangeable.

Customers who require 3V to 5V operation will be able to use the CVH family now. This optimized process will result in a 25-50% performance enhancement for 5V gate array designs. Customers who require operating voltages greater than 5V will continue to use the UA-1 to UA-6 CVA family.

In conjunction with these arrays, AMI has developed a set of "functional overlays." These are basic logic element building blocks—e.g. two input and larger gates of various types, flip-flops, and so forth—from which complete logic designs can be developed. Each functional overlay corresponds to a metal interconnect pattern that is superimposed on a set of uncommitted transistors (and polysilicon underpasses) in the array to implement the logic element. Typical functional overlay logic elements and the number of two-input gate equivalents they utilize are shown in Table 3.

Currently over 75 functional cells exist for this family.

3-Micron Gate Array Family

As part of AMI's long range semi-custom strategy in MOS/VLSI, AMI will continue to introduce new gate array products. These new products will offer performance and cost advantages not currently realizable. In conjunction with these new array products, AMI has introduced computer-aided design tools to automate the entire gate array design process.

The newest gate array family is the high-performance GA and GA-D series which is based on AMI's 3-micron CMOS silicon gate process technology. With a 3-micron drawn geometry, it is equivalent to a 2-micron effective channel length which is the state-of-the-art.

The AMI GA and GA-D series are designed for 5V operation over military temperature range (−55 to 125°C). Besides high speed (2 to 3ns typical delay) and high density (up to 5K gates), it features total I/O flexibility in that each I/O pad can be one of any 13 options.

The single metal version provides up to 2500 gates and the double metal GA-D version 5000 gates. See Table 3 for configurations.

Table 3. 3-Micron Gate Array Family

Process	Product No.	Gates	Pads
Single Metal	GA-2500	2500	84
	GA-2000	2025	74
	GA-1500	1500	64
	GA-1000	1020	52
	GA-500	540	40
Double Metal	GA-5000D	4995	134
	GA-4000D	4012	120
	GA-3000D	3080	102
	GA-2000D	2016	84
	GA-1000D	1024	64

In conjunction with these new array products, AMI will have a complete powerful set of design automation software to allow users complete design flexibility. Using a terminal tied to a central AMI owned or customer owned minicomputer or mainframe, the user will have access to a complete set of design automation software tools including:

- Schematic digitization and capture
- Logic simulation
- Circuit simulation
- Test vector generation
- Interactive or autoplace and route
- Auto continuity checking

These tools will allow the user to partially or fully automate the design task for maximum flexibility.

Customer Interfaces

Unlike other gate-array vendors, AMI offers all the services required to develop and fabricate a semi-custom circuit. In-house capabilities include circuit and logic simulation, mask making, full wafer fabrication, assembly, and test.

Gate Arrays

Gate array developments are supported in two basic ways:

1) **The AMI-Tooled Interface** is available to customers with little or no experience in semi-custom circuit development, or to experienced users with limited in-house capabilities. In these cases AMI requires a logic diagram or breadboard schematic of the circuit to be integrated, along with D.C. and A.C. specifications, and functional patterns in I/O format.

At the end of the development phase, the customer receives 25 fully tested prototypes, assembled in ceramic packages, which have been subjected to our stringent Q.A. screening requirements.

2) The **Customer-Tooled Interface** is more applicable to customers with multiple circuit development requirements and suitable in-house design capabilities. For these customers AMI will supply the necessary software tools which have been written in FORTRAN and PASCAL languages so they will be compatible not only with PRIME computers, as is presently the case, but also with VAX and IBM minis. The user in turn provides AMI with either a database tape in CALMA format, or an ELECTROMASK or DAVID MANN compatible pattern generator tape, along with test requirements. A debugged SENTRY program is preferred. AMI will then fabricate and test 25 prototypes which should be representative of the production units.

Software Support

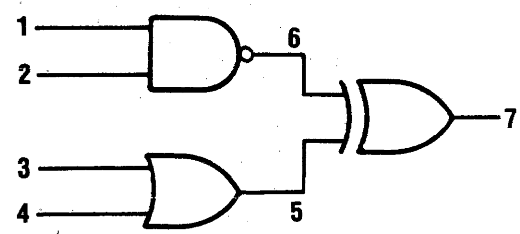
AMI CAD Technology (ACT™) is the most advanced integrated software package for CMOS/VLSI design available in the industry. It uses a common database for logic simulation, mask layout and test program generation. By operating from a common database, a gate array design can be converted into a standard cell or a fully crafted custom circuit with minimal risks.

The heart of the system is BOLT™ (Block Oriented Logic Translator) which is at the same time a hardware description language and a compiler. It allows the system designer to describe the logic network in a hierarchical fashion due to an unlimited macro nesting capability.

The common data base is created in a very simple fashion, consistent with the way that logic files are created in most timeshared logic simulators. Figure 2 shows a simple logic network and the corresponding BOLT™ file which allows programmability of rise and fall times for all gates.

GLIDE™ is the graphics editor on Prime used for interactive design of the single metal families of arrays. TRACE™ is a module that checks the layout database for continuity, and COMPARE™ verifies that the layout matches the BOLT™ logic file.

Figure 2.



```
6 ° NAND   1  2 (TDR = XX, TDF = XX);
5 ° OR     3  4 (TDR = XX, TDF = XX);
7 ° EXOR   5  6 (TDR = XX, TDF = XX);
```

GAPAR™ is the software module that allows automatic placement and routing of the double metal family of arrays. It is designed to complete at least 98% of the wiring connections on a 100% utilized array, based on a 90% confidence level using Donath-Heller-Milkhail two-dimensional model. The GAPAR™ system also offers interactive routing tools which can be used to complement the auto router when overflow conditions exist or to manually route critical delay paths.

CAPACITANCE™ calculates the actual capacitive load of the active gates from the layout database. The capacitance parameters are different for poly and metal interconnections, and for aluminum over diffusions or field oxide. In conjunction with DELAY™, it allows to accurately predict the dynamic behavior of the actual integrated circuit before it is fabricated.

TESTGEN™ is used to generate efficiently compressed functional test patterns based on the results of logic simulations from SIMAD™. This pattern compression minimizes the use of local memory on Sentry testers.

TESTPRO™ operates on Prime, allowing off-line generation of D.C. parametric tests in Factor language used in Fairchild test systems. Its output is merged with the compressed functional patterns from TESTGEN™, and the result is a full dynamic test program that can be tailored for use in any Sentry tester.

Gate Arrays

Packages

Pinout or lead count varies with die size and array complexity. The arrays are offered in standard plastic and ceramic dual-in-line packages with pin counts ranging from 16 to 64, JEDEC-Standard leadless and leaded chip carriers, miniflat packs to 84 pins, and pin grid arrays to 144 pins. AMI gate array products are also available in wafer or unpackaged die form.

Standard Cells

AMI's Standard Cells

Program Description

The cells in the Standard Cell Program are basic logic elements such as gates, flip-flops, register counter bits and I/O devices. Each cell has been previously designed and analyzed for performance. Complex digital functions can be rapidly implemented by interconnecting the various cells. Most cells have a series 4000 CMOS equivalent and a 74LS TTL equivalent for ease of breadboarding.

The cells are initially designed on an interactive color graphics terminal — AMI's SIDS (symbolic interactive design) system. The cell library is maintained within the SIDS data base. If other CAD (Computer-Aided Design) systems are used internally by a customer, the cell library can be digitized onto these systems.

Using the SIDS system, new cells or modifications of existing cells can be generated and added to the cell library rapidly, without any hand layout. Similarly, non-cell functions such as analog elements or memory arrays, RAM or ROM, can be designed using SIDS and merged with standard cells.

This ability to add special features efficiently makes AMI's standard cell program far more flexible than other manufacturer's cell development systems.

Table 5. Standard Cell Offerings

Part No.	Process Technology		Availability
XXXX-001	5μ CMOS	Single Metal	NOW
XXXX-001	4μ NMOS	Single Metal	NOW
XXXX-001	3μ CMOS	Single Metal	NOW
XXXX-001	3μ CMOS	Double Metal	NOW
XXXX-001	2μ CMOS	Double Metal	2Q'84

Performance

AMI's standard cell circuits can be successfully used in digital circuits with operating speeds up to 10MHz for NMOS (or CMOS at 10V V_{CC}) up to 40MHz for CMOS (5V V_{CC}). It should be emphasized that if only a small portion of the circuit requires faster performance, this portion can be "customized" either by creating special cells or by designing circuitry outside of the cell structure. AMI will review customer logic without obligation to determine if a cell design is feasible.

Features

The high speed, high performance 3-micron cell families are also available. These cells are designed in AMI's 3-micron single and double layer metal process. They have been characterized for 3-5V operation and over the full military temperature range. As in 4000 series CMOS, power for static operation is near zero.

3-Micron Single Metal Standard Cells

- State-of-the Art CMOS Technology
- 3-Micron Single Metal Cell as Basic Building Block
- Same Macros and Performance for Cells and Arrays

3-Micron Double Metal Standard Cells

- Automatic Placement and Routing
- Cells are Designed to Exceed the Performance of 3-Micron DLM Gate Arrays
- Fixed Cell Height/Variable Width
- Characterized at 25°C, 70°C, and 125°C with $V_{DD} = 4.5V$

NMOS Cells

This family is AMI's most complete cell family with over 135 cells in 4 speed/power combinations. V_{DD} and V_{SS} connections are metal lines running horizontally across the cell. Two other metal lines, usually used for clock signals, also run across the cell. Typical and worst case inverter delays are 5.5ns and 10.0ns, respectively.

The NMOS cells are implemented using a 4-micron silicon gate process and can be used over the full military temperature range (−55°C to 125°C). Operating voltage is 5V ± 10%. The NMOS cells have been designed with three power/speed options. The fastest cells also have the highest power consumption and use the most area. Therefore, the fast cells should be used only where circuit performance requires high speed. Most circuits are optimized by using a combination of low power, standard and high speed cells.

CMOS Cells

The CMOS cells are designed using a 5-micron silicon gate oxide-isolated process and using 3-micron single and double layer metal process. These processes are well suited for analog circuitry and some analog cells will be added to the digital cells. The 5-micron CMOS cells are characterized for 3V to 12V operation over the full military temperature range (−55°C to 125°C). CMOS cells are generally used where low power battery operation or backup are required.

AMI Standard Development

The circuit user provides a completed logic diagram and a circuit specification. AMI performs all other design activity including MOS logic design, circuit design, layout, mask generation and fabrication of wafers. This development option is recommended for most users desiring to build a single LSI device and for multiple circuit users who do not wish to become directly involved in the MOS circuit development.

Developing Your Standard Cell Design

AMI offers three basic options for developing a standard cell custom circuit. All of these apply to the Development Flow Diagram of Table 7.

Table 7. Gate Array/Standard Cell Development Flow

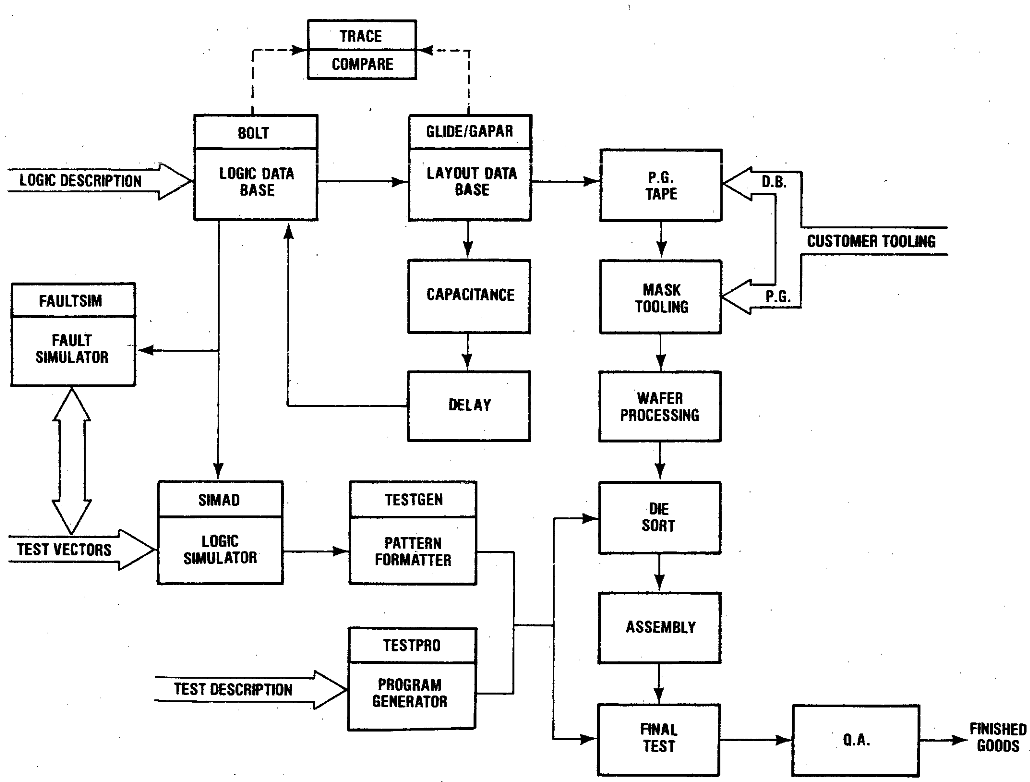

Table 8. AMI Standard Cell
3-Micron Single Metal Interface

	Logic Diagram Input		Net List Input	
No. of Gates	Cost	Max. Span	Cost	Max. Span
500	$19.7K	9 Weeks	$15.7K	7 Weeks
1000	$22.8K	11 Weeks	$16.8K	9 Weeks
2000	$31.3K	13 Weeks	$21.3K	11 Weeks

We're the last people you need to call

Look around; compare price, compare yield, compare turnaround time . . . then call BRI. We welcome your toughest VLSI design problem. Gate arrays, standard cell, PLS/PAL, Bi-CMOS, you name it. We've got a fully computerized design solution and a fabrication technique that will give you what you need, when you need it, at the right price. Volume is no obstacle.

BRI has combined a fully computerized and world-wide-accessible VLSI design system with high-volume, high-yield fabrication facilities to provide our clients with products offering both reduced die size and superior electrical characteristics. From initial design through final component assembly, or at any step in the process, BRI can bring an imaginative and cost-effective solution to your VLSI requirements. We don't have to be the first people you call but, when it comes to a final decision, we're determined to be the last.

for Semi-Custom I.C.s

Standard Cell

BRI's computer aided VLSI design features an extensive cell library which includes 7400 series, ROM/RAM and analog functions. This allows customized circuit design at lower cost and in less time. The 2 micron HCMOS dual layer metal process technology and advanced design techniques provide both increased circuit performance and reduced die size.

Gate Array

The 2 micron HCMOS dual layer metal process technology is supported by a fully automated design system to provide a family of gate arrays with 1.6 ns maximum propagation delay. All BRI gate array products are specifically designed for quick turn-around, high performance and low cost.

Analog/Digital Gate Array

Fabricated with the Bi-CMOS process technology, these arrays offer analog functions with true bipolar characteristics and low power CMOS ditigal functions in one cost-effective device. This allows the customer to maximize system integration while protecting his prioriet ary design.

PAL/PLS

These 2 micron HCMOS mask programmable products provide bipolar speed and CMOS power dissipation for greater reliability and lower cost. They are pin compatible with Signetics PLS and MMI PAL series.

For full facts on these and other BRI custom and semi-custom products, give us a call.

MA Series High Speed CMOS Gate Arrays 3μ Silicon Gate CMOS

Preliminary

Benefits

- ☐ Integrate HCMOS or standard TTL functions easily
- ☐ Reduce component count
- ☐ Reduce power dissipation and consumption
- ☐ Introduce new products quickly
- ☐ Improve system reliability
- ☐ Protect innovative designs longer

Features

- ☐ Typical propagation delay (t_p) <2.0 nsec
- ☐ Circuit/package flexibility
- ☐ Quiescent current: 0.01μA/gate
- ☐ Dedicated VLSI CAD system with complete software support
- ☐ Library of pre-designed macro cells
- ☐ Input protection on all pads
- ☐ Rapid design cycle—from 6 to 12 weeks depending on array size

General Description

The MA series of gate arrays is produced on Citel's 3μ silicon gate CMOS process, a state-of-the-art technology featuring oxide isolation, isoplanar structures and shallow functions for high speed and high density. As a fully licensed second source for both design and complete fabrication of Matra Harris gate arrays, Citel offers an extensive library of fully characterized macro cells which enables a rapid, yet reliable, logic implementation of any cell on any array.

Gate array design activity is performed on the Gatemark VLSI design system which includes such capabilities as schematic or net list entry, logic simulation, interactive layout, automatic place and route and a layout/net list check.

In addition to design and wafer fabrication, Citel offers a wide range of package options and a complete S-VII test capability for both wafer sort and final test. The I/O pad-to-gate ratio permits wide flexibility in package selection (e.g., the MA0400 fits a standard 20-pin DIP yet also provides 40 pads for those with high I/O needs). The MA Series currently includes four arrays ranging from 200 to 1200 gates. Additional semi-custom arrays and a complete library of standard cells for full custom CMOS design are in development.

CMA Silicon Gate HCMOS Gate Arrays
CMA 2000 Series

GENERAL

The CMA 2000 Series of gate arrays from Custom MOS Arrays (CMA) are a high-performance family of gate arrays, with complexity ranging from 400 to 2400 gates and pin count ranging from 40 to 110 pins.

The CMA 2000 Series uses 3-micron technology with single-level metal and programmable via holes for interconnects, and offers Schottky TTL speeds and CMOS power consumption.

FEATURES

- 400–2400 Gate Complexity
- Up to 110 Input/Output (I/O) Pins
- Schottky TTL Speeds
- Reliable and Proven 3-micron HCMOS Technology
- Fully Characterized to Military Temperature Range
- Hermetic and Plastic Packaging
- Supports 7400/4000 SSI/MSI Functions
- Full TTL/CMOS Interface Compatibility
- Ultra-Low Leakage and Standby Currents
- Proprietary Latch-Up (SCR) Resistant Design
- Proprietary Static Protection Circuits
- Hermetic Packaged Parts are Processed to MIL-STD-883, Class C

PRODUCT DESCRIPTION

The CMA 2000 Series of gate arrays are manufactured using proven oxide-isolated HCMOS technology. Single-level metal interconnect enables CMA to obtain higher yields and hence lower production cost.

The gate arrays are organized as arrays of cells, and individual N and P channel transistors are configured into a variety of logic elements called macrocells. CMA's current macrocell library is detailed in Appendix 1.

A variety of Input/Output (I/O) configurations is available:

- All I/O pads are configurable as inputs, outputs or bi-directional tri-states.
- All I/O pads can have active pull-ups or pull-downs.
- Any input may make use of TTL input shifters for TTL requirements.
- All I/O pads can drive multi-TTL loads and may be paralleled for increased drive.

The CMA 2000 Series of gate arrays are ideal in applications where speed, space and power are at a premium.

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Conditions	Limits	Unit
V_{CC}	Supply voltage	With respect to GND	−0.3~7	V
V_I	Input voltage	With respect to GND	−0.3~7	V
T_{opg}	Operating ambient temperature (Military)		−55~+125	°C
T_{opg}	Operating ambient temperature (Commercial)		0~70	°C
T_{stg}	Storage temperature (Hermetic)		−65~150	°C
T_{stg}	Storage temperature (Plastic)		−40~125	°C

PRODUCT OUTLINE

Array Number	Complexity	Max. I/O Pads	Technology	Gate Speed*
CMA 2004	400	40	3-micron	4.5 ns
CMA 2008	800	60	3-micron	4.5 ns
CMA 2011	1100	68	3-micron	4.5 ns
CMA 2015	1500	80	3-micron	4.5 ns
CMA 2024	2400	110	3-micron	4.5 ns

***Notes on Gate Speed:** 1. Two-input NAND gate, fanout = 3 with 3 mm interconnect. 2. $T_A = 70°C$, $V_{DD} = 5V \pm 10\%$. 3. $T_{pd} = ½ \cdot (T_{pLH} + T_{pHL})$.

PROPAGATION DELAYS

In CMOS technology the propagation delay is a function of:

- Fanout
- Interconnect Routing
- Supply Voltage
- Temperature
- Processing
- Input Slew Rate/Polarity

CMA's CAD system takes all of these variables into account (except Input Slew Rate/Polarity) during simulation.

After the design netlist has been entered into CMA's CAD system the worst-case delay of each cell is automatically determined, taking into account the affects of fanout and estimated interconnect capacitance.

After interconnect routing is completed, the actual interconnect loading is calculated automatically from the database and automatically inputted into the simulator and final design verification is completed.

The effects of supply voltage and temperature are illustrated in Figures 1 and 2 below. A rule of thumb for processing variation is 35% to give worst-case delay figures.

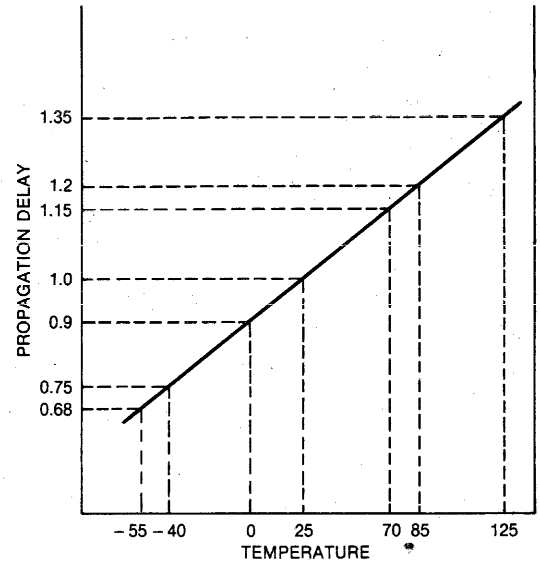

Figure 1. CMOS Delay vs. Temperature

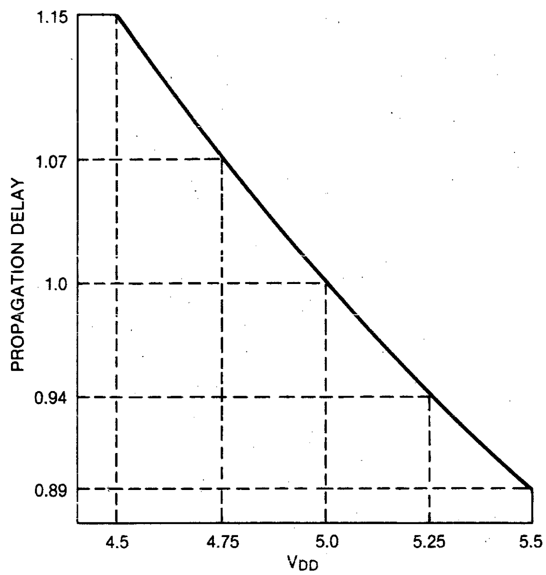

Figure 2. CMOS Delay vs. Supply Voltage

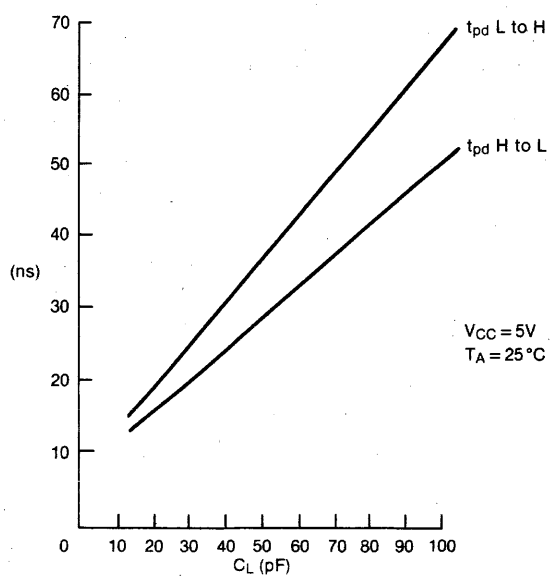

Figure 3. CMOS Driver Delay vs. Output Loading

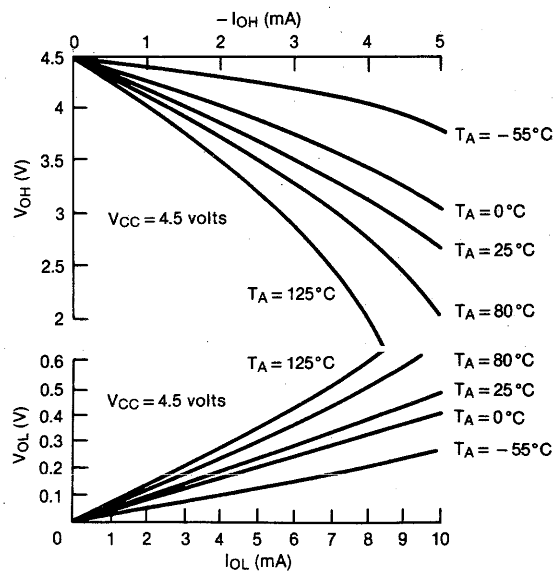

Figure 4. Output Current Drive

CUSTOM MOS ARRAYS, INC. 211 Topaz Street Milpitas, CA 95035 (408) 946-9111 TWX 910-338-2304

DC CHARACTERISTICS ($T_A = 0 \sim 70°C$, $V_{CC} = 5V \pm 10\%$)

Symbol	Parameter	Test Conditions	Limits Min.	Limits Typ.	Limits Max.	Unit
V_{IH}	High-level input voltage		2.0		V_{CC}	V
V_{IL}	Low-level input voltage		−0.3		0.8	V
V_{OH}	High-level output voltage	$I_{OH} = +1$ mA	2.4			V
V_{OL}	Low-level output voltage	$I_{OL} = 4$ mA			0.4	V
I_{IL}	Input current	$V_I = 0 \sim 5.5V$			±10	μA

POWER CONSUMPTION

In CMOS, power dissipation is a function of three elements:

- Charging and discharging circuit nodes, usually 90% total power.
- Overlap currents when P and N transistors switch, usually 10% power.
- Leakage (DC power). This is negligible, a few microwatts.

Charging and discharging circuit nodes and the associated power consumption may be calculated using the equation $P = CV^2f$, where C is node capacitance, V is supply voltage, and f the operative frequency. The following example illustrates a typical power supply calculation.

Parameter	Gate Array CMA 2004	Gate Array CMA 2024
No. of Gates	400	2400
Percent Utilization (80%)	320	1920
No. of Switching Nodes (15%)	48	288
No. of Outputs Utilized	20	80
Output Load Capacitance	45 pF	45 pF
No. of Outputs Switching (20%)	4	16
Supply Voltage	5V	5V
Core Dissipation per MHz	0.6 mW	3.6 mW
Output Dissipation per MHz	4.5 mW	18 mW
At 10 MHz Clock Speed	51 mW	216 mW
At 30 MHz Clock Speed	153 mW	648 mW

Note: Overlap power is taken into account by increasing the nodal capacitance in the above calculation.

PRODUCT OPTIONS

The CMA 2000 Series are offered in a variety of operating temperature ranges and packages.

- Military Operating Range: −55°C to +125°C
- Industrial Temperature Range: −40°C to +85°C
- Commercial Temperature Range: 0°C to +70°C
- MIL-STD-883 Levels B and C Screening
- Most commercial packages are available as well as unpackaged die.

EQUIVALENT GATE COMPLEXITY

One of the first tasks in converting your logic functions into a gate array is to estimate its logic complexity. CMA defines gate count in terms of 2-input NAND gate equivalents.

Tables 1 and 2 list the approximate equivalent CMOS 2-input NAND gate count of most of the popular 7400 and 4000 Series SSI/MSI functions.

GATE ARRAY DEVELOPMENT SYSTEM CMA 2000 SERIES

The CMA CAD system is configured to allow generation of error-free designs. The desired logic functions are entered into the system and logical and timing verification is completed via CMA's simulator. The simulated input patterns and corresponding outputs are checked for completeness and other tests added until the final test patterns are completed. The flow diagram below illustrates the design cycle.

CMA's CAD team is currently working on a personal gate array development system for customer design verification. If you are interested in more details of the personal CMA 2000 Series, contact our applications department.

Gate Array Products

Sept 1983

Gate Array Division

Fairchild's high performance gate arrays feature a wide range of gate counts and offer minimal circuit delays. The FGT0750 and the FGE1000 and FGC6000 series complement the FAST™, F100K ECL and HCMOS logic families respectively, allowing for easy integration of standard SSI/MSI functions into a unique LSI chip. Designs for all arrays are implemented using pre-defined SSI/MSI functions (macros). Fairchild's complete Computer-Aided Design System, FAIRCAD™, reduces development time and assures first time success.

FAIRCAD Computer-Aided Design System
A user friendly computer-aided design system is employed in all phases of the design cycle to assure fast turnaround times. Major functions performed by the FAIRCAD system include schematic capture, logic and timing simulation, test vector grading, automatic placement and routing and design rules checking. The user's logic description is input either interactively using a graphics workstation or entered in netlist form. Fairchild's FAIRLOGS™ simulator is used to verify array logic and timing. A fault simulator grades the effectiveness of a user-supplied test vector sequence. Placement and routing can be highly interactive processes, allowing the user to assign pins and pre-place critical path functions. Automatic routing eliminates tedious manual steps, thereby reducing routing design time from weeks to minutes. Upon routing completion, the circuit is resimulated using actual macro interconnect delays as a final verification of functionality and system performance. Design-rules checking insures that process-imposed geometry constraints are not violated.

The FAIRCAD system uses a multiple CPU configuration to insure high system availability. Remote access via telephone link is available and additional design centers are being planned worldwide. The FAIRCAD system is product and technology transparent, allowing new gate arrays and technologies to be easily integrated into the system.

TTL Gate Arrays

FUJITSU

B240, B350, B600, B1100, B2000

General Information

Fujitsu Microelectronics, Inc. offers a full line of low power, high speed bipolar gate arrays. All are fabricated using low power Schottky TTL technology with TTL-compatible inputs and outputs, and use NAND-type logic. The Fujitsu bipolar gate array family has two layer metallization for gate interconnect, automatic interconnect routing for guaranteed 90 percent cell utilization and proven device reliability. They all feature over 54 predesigned, hardwired logic cells, and over 50 predesigned 74 series MSI (softwired) macros. All Fujitsu bipolar gate arrays can accept user defined macros as well. To assure the success of your design, Fujitsu's gate arrays feature DC parametric and DC functional testing as well as AC parametric testing.

CMOS Gate Arrays

FUJITSU

C440, C770, C1275 C2000, C2600, C3900, C8000

General Information

Fujitsu offers a full line of very highly integrated, low power high speed gate arrays which are fabricated with silicon gate CMOS technology. Fujitsu also guarantees 90 percent cell utilization for fully automatic placement and routing.

The Fujitsu CMOS Gate Array family offers more than 100 macro elements and contains gate arrays ranging in size from 400 basic cells to 8000 basic cells (2-input NAND equivalents).

All use Fujitsu's sophisticated computer-aided design system, which fullly automates both the design layout and fabrication. The designs are implemented on-chip by interconnecting basic cells and I/O cells using a double layer metallization process.

To assure the success of your design, Fujitsu's gate arrays feature DC parametric and DC functional testing as well as AC parametric testing.

About Fujitsu Microelectronics, Inc.

Fujitsu Microelectronics, Inc.—A U.S. Organization
Fujitsu Microelectronics, Inc. (FMI)is a U.S. subsidiary of Fujitsu Limited of Tokyo. A California Corporation, FMI is responsible for the marketing and sales of all semiconductor products in North, Central and South America.

Fujitsu Limited manufactures and markets advanced data processing and telecommunications systems, semiconductors and electronic components on a world wide scale. Fujitsu limited is ranked as Japan's number one computer manufacturer with scales in the $2 billion range.

A Leader in Large Scale Logic
Since 1974, Fujitsu Microelectronics has executed over 3,000 gate array designs. Gate arrays from Fujitsu give your designs a significant performance edge. In 1982, we introduced our CMOS device with 8,000 gates and 2.5 ns delay times. Our leadership Schottky TTL gate arrays is the first with 2,000 gates and 0.95 ns delays. Our leadership ECL arrays, with 400-picosecond delays are the fastest production arrays in the world.

Fujitsu's logic products offer leading edge technology, a complete selection of both bipolar and si-gate CMOS devices; and experience that can serve you through the coming generations of logic products.

About Fujitsu Microelectronics. Inc.
Fujitsu Microelectronics has completed a new assembly and test facility in order to better service our North American customers. The 66,000-square-foot facility is located in Kearny Mesa Industrial Park near downtown San Diego. The building was dedicated in June 1981 and is now fully operational.

ARINC 429 Bus Interface Line Driver Circuit

Features

- INPUTS T^2L AND CMOS COMPATIBLE
- ADJUSTABLE RISE AND FALL TIMES VIA 2 EXTERNAL CAPACITORS
- PROGRAMMABLE OUTPUT DIFFERENTIAL RANGE VIA VOLTAGE REFERENCE INPUT (V_{REF})
- POWER STROBE INPUT PERMITS LOW QUIESCENT POWER OF < 20mW
- OUTPUTS ARE INHIBITED (0 VOLTS) IF DATA (A) AND DATA (B) INPUTS ARE BOTH IN THE "LOGIC ONE" STATE
- CAN OPERATE UP TO A 100 KILOBITS DATA RATE
- OUTPUT SHORT CIRCUIT PROOF AND CONTAINS OVERVOLTAGE PROTECTION
- DATA "A" AND DATA "B" SIGNALS ARE "AND'D" WITH CLOCK AND SYNC SIGNALS
- FULL MILITARY TEMPERATURE RANGE

Description

The HS-3182 ARINC 429 bus interface driver circuit is a monolithic dielectrically isolated bipolar differential line driver designed to meet the specifications of ARINC 429. This device is intended to be used with a companion chip, HS-3282 CMOS ARINC bus interface circuit, which provides the data formatting and processor interface function.

All logic inputs are T^2L and CMOS compatible. In addition to the DATA(A) and DATA(B) inputs there are also inputs for a CLOCK and SYNC signal which are AND'D with the DATA inputs. This feature was added to enhance system performance and to allow the HS-3182 to be used with devices other than the HS-3282. Also adding to system performance is the $\overline{\text{STROBE}}$ input. To minimize power consumption the $\overline{\text{STROBE}}$ input can be asserted to place the chip in the power-down mode where it draws substantially less current. Four power supplies are required: $+V = +15V \pm 10\%$, $-V = -15V \pm 10\%$, $V_1 = 5V \pm 5\%$ and V_{REF}. V_{REF} is used to program the output voltage swing, such that V_{OUT} (DIFF) $= \pm 2V_{REF}$. Typically, $V_{REF} = V_1 = 5V \pm 5\%$.

The driver output impedance is $75\Omega \pm 20\%$ at 25°C. Output rise and fall times are programmed through the use of two external capacitors, C_A and C_B. To meet the requirements for rise and fall times as specified in ARINC 429, $C_A = C_B = 75pF$ for the high speed operation (100 KBPS) and 500 pF for the low speed operation (12-14.5 KBPS). The outputs are protected against overvoltage and short circuit as shown in the Block Diagram. This device is designed to operate with a case temperature range of −55°C to +125°C.

Truth Table

I_{SC} (−V)	Supply Current −V (Short Circuit)			−150	mA	Short to GND

NOTES:

① Heat sink may be required for 100KBPS @ +125°C and outout short circuit @ +125°C.
Thermal Characteristics: $T_{CASE} = T_{(Junction)} - \Theta_{(Junction - Case)} P_{(Dissipation)}$.

Where: $T_{(Junction\ Max)} = +175°C$
$\Theta_{(Junction-Case)} = 19.6°C/W$
$\Theta_{(Junction-Ambient)} = 86.5°C/W$

② Full Load for ARINC 429: $R_L = 400\Omega$ and $C_L = 30{,}000pF$ in parallel between A_{OUT} and B_{OUT}. (See Block Diagram).

③ Output Overvoltage Protection: The fuses used for output overvoltage protection may be blown by a fault at each output of greater than ±6.5V relative to GND.

POWER SPECIFICATIONS

NOMINAL POWER @25°C, +V = 15V, −V = −15V, $V_1 = V_{REF} = 5V$

DATA RATE (KBPS)	LOAD	+V	−V	V_1	CHIP POWER	POWER DISSIPATION IN LOAD

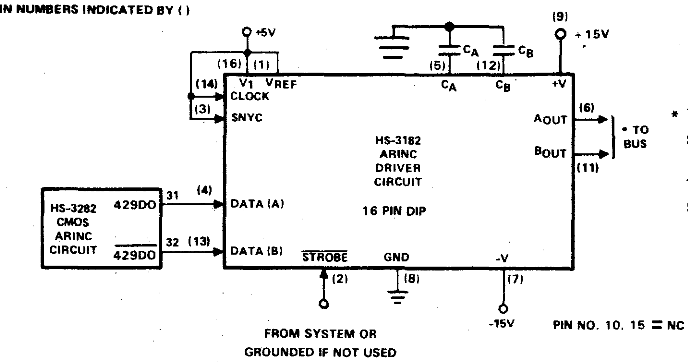
Harris Semiconductor

CUSTOM/SEMICUSTOM

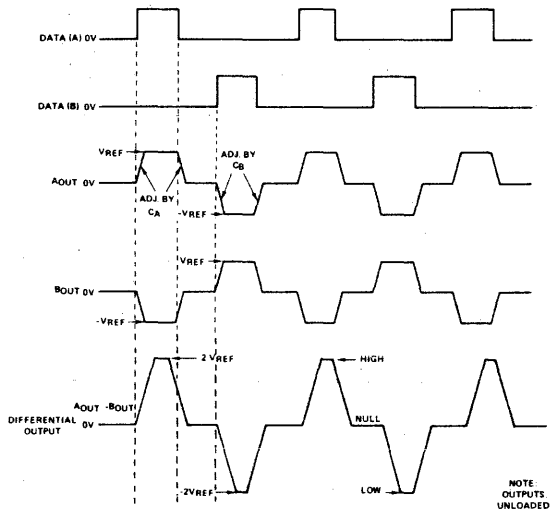
Typical Application

PIN NUMBERS INDICATED BY ( )



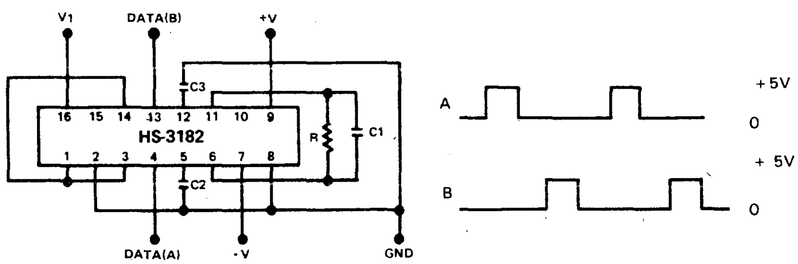
* The rise and fall time of the outputs are set to ARINC specified values by C_A and C_B. Typical $C_A = C_B$ = 75pF for high speed and 500pF for low speed operation. The output HI and low levels are set to ARINC specifications by V_{REF}.

Driver Waveforms



When the Data (A) input is in the Logic One state and the Data (B) input is in the Logic Zero state, A Out is equal to V_{REF} and B Out is equal to $-V_{REF}$ this constitutes the Output High state. Data (A) and Data (B) both in the Logic Zero state causes both A Out and B Out to be equal to 0V which designates the output Null state. Data (A) in the Logic Zero state and Data (B) in the Logic One state cause A Out to be equal to $-V_{REF}$ and B Out to be equal to V_{REF} which is the Output Low state. Both A Out and B Outputs are high impedance when the transmitter is disabled via the power strobe input.

Burn-In Schematic



R = 400Ω, ¼ watt.
C1 = 0.03μF
C2 = C3 = 500 pF, NPO.
+V = +15V ± 10%.
−V = −15V ± 10%.
V_1 = +5V ± 10%.

A 0.01 F decoupling capicitor is required on each of the three supply lines (+V, −V, and V_1) at every 3rd Burn-in socket.

Ambient Temp. Max = +125°C
Package = 16 Lead Brazed Dip
Pulse Conditions =
A & B = 6.25KHz, 25% on & 75% off duty cycle.
B is delayed one-half cycle and in sync with A.

HS-3282

CMOS ARINC Bus Interface Circuit

Description

The Harris HS-3282 is a high performance CMOS bus interface circuit that is intended to meet the requirements of ARINC Specification 429, and similar encoded, time multiplexed serial data protocols. The ARINC 429 bus interface circuit consists of two (2) receivers and a transmitter operating independently as shown in Figure 1. The two receivers operate at a frequency that is ten (10) times the receiver data rate, which can be the same or different from the transmitter data rate. Although the two receivers operate at the same frequency, they are functionally independent and each receives serial data asynchronously. The transmitter section of the ARINC bus interface circuit consists mainly of a First-In First-Out (FIFO) memory and timing circuit. The FIFO memory is used to hold eight (8) ARINC data words for transmission serially. The timing circuit is used to correctly separate each ARINC word as required by ARINC Specification 429.

Even though ARINC Specification 429 specifies a 32-bit word, including parity, the HS-3282 can be programmed to also operate with a word length of 25 bits. The incoming receiver data word parity is checked, and a parity status is stored in the receiver latch and is outputted on Pin BD08 during the 1st word. [A logic "0" indicates that an odd number of logic "1"s were received and stored; a logic "1" indicates that an even number of logic "1"s were received and stored]. In the transmitter the parity generator will generate either odd or even parity depending upon the status of PARCK control signal. A logic "0" on BD12 will cause odd parity to be generated and inputted to the output data stream. Conversely, a logic "1" on BD12 will result in the generation of even parity that will be inputted to the output data stream.

More versatility is provided in both the transmitter and receiver by the addition of an external TTL clock input allowing the bus interface circuit to operate at data rates from 0 to 0.1 megabits. The TTL external clock must be ten (10) times the data rate to insure no data ambiguity.

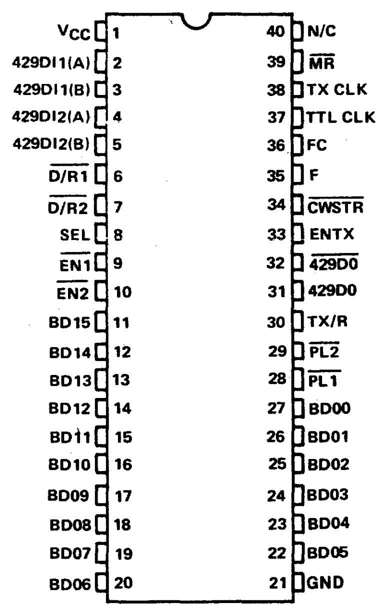
The ARINC bus interface circuit is fully guaranteed to support the data rates of ARINC specification 429 over both the voltage (± 5%) and full military temperature range. It interfaces with TTL, CMOS or NMOS support circuitry, and uses the standard 5-volt V_{CC} supply.

Features

- ARINC SPECIFICATION 429 COMPATIBLE
- DATA RATES OF 100 KILOBITS OR 12.5 KILOBITS
- SEPARATE RECEIVER AND TRANSMITTER SECTION
- DUAL AND INDEPENDENT RECEIVERS, CONNECTING DIRECTLY TO ARINC BUS
- SERIAL TO PARALLEL RECEIVER DATA CONVERSION
- PARALLEL TO SERIAL TRANSMITTER DATA CONVERSION
- WORD LENGTHS OF 25 OR 32 BITS
- PARITY STATUS OF RECEIVED DATA
- GENERATE PARITY OF TRANSMITTER DATA
- AUTOMATIC WORD GAP TIMER
- SINGLE 5-VOLT SUPPLY
- LOW POWER DISSIPATION
- FULL MILITARY TEMPERATURE RANGE

Pinout

TOP VIEW



ABSOLUTE MAXIMUM RATINGS

Voltage at any Pin (Except 2, 3, 4, & 5)	$-0.3V$ to V_{CC} $+0.3V$
Voltage at Pins 2, 3, 4, & 5	$-29V$ to $+29V$
Maximum V_{CC}	7.0V
Operating Temperature Range	−55°C to +125°C
Storage Temperature	−65°C to +150°C

CAUTION: To prevent permanent damage to this device, care should be exercised to insure that the absolute maximum ratings for supply voltages, temperature and voltage or current at any pin is not exceeded during both static and dynamic operation.

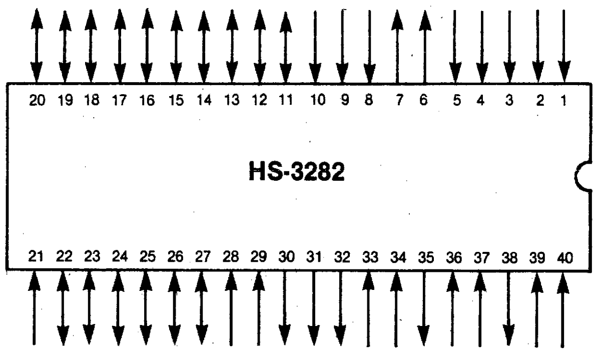
Pin Assignments

PIN	SYMBOL	SECTION	DESCRIPTION
1	V_{CC}	Receiver/ Transmitter	Supply pin. 5 volts ± 5%.
2	429 DI1 (A)	Receiver	ARINC 429 data input to Receiver 1.
3	429 DI1 (B)	Receiver	ARINC 429 data input to Receiver 1.
4	429 DI2 (A)	Receiver	ARINC 429 data input to Receiver 2.
5	429 DI2 (B)	Receiver	ARINC 429 data input to Receiver 2.
6	$\overline{D/R1}$	Receiver	Device ready flag output from Receiver 1 indicating a valid data word is ready to be fetched.
7	$\overline{D/R2}$	Receiver	Device ready flag output from Receiver 2 indicating a valid data word is ready to be fetched.
8	SEL	Receiver	Bus Data Selector - input signal to select one of two 16-bit words from either Receiver 1 or 2.
9	$\overline{EN1}$	Receiver	Input signal to enable data from Receiver 1 onto the data bus.
10	$\overline{EN2}$	Receiver	Input signal to enable data from Receiver 2 onto the data bus.
11	BD15	Receiver/ Transmitter	Bi-directional data bus for fetching data from either of the Receivers, or for loading data into the Transmitter memory or control word register. See Control Word Table for description of Control Word bits.
12	BD14	Receiver/ Transmitter	See pin 11.

PIN	SYMBOL	SECTION	DESCRIPTION
13	BD13	Receiver/ Transmitter	See pin 11.
14	BD12	Receiver/ Transmitter	See pin 11.
15	BD11	Receiver/ Transmitter	See pin 11.
16	BD10	Receiver/ Transmitter	See pin 11.
17	BD09	Receiver/ Transmitter	See pin 11.
18	BD08	Receiver/ Transmitter	See pin 11.
19	BD07	Receiver/ Transmitter	See pin 11.
20	BD06	Receiver/ Transmitter	See pin 11.
21	GND	Receiver/ Transmitter	Circuit ground.
22	BD05	Receiver/ Transmitter	See pin 11.
23	BD04	Receiver/ Transmitter	See pin 11. Control Word function not applicable.
24	BD03	Receiver/ Transmitter	See pin 11. Control Word function not applicable.
25	BD02	Receiver/ Transmitter	See pin 11. Control Word function not applicable.
26	BD01	Receiver/ Transmitter	See pin 11. Control Word function not applicable.
27	BD00	Receiver/ Transmitter	See pin 11. Control Word function not applicable.
28	$\overline{PL1}$	Transmitter	Parallel load input signal loading the first 16-Bit word into the Transmitter memory.

Pinout



PIN	SYMBOL	SECTION	DESCRIPTION
29	$\overline{PL2}$	Transmitter	Parallel load input signal loading the second 16-Bit word into the Transmitter memory and initiates data transfer into the memory stack.
30	TX/R	Transmitter	Transmitter flag output to indicate the memory is empty.
31	429D0	Transmitter	Data output from Transmitter.
32	$\overline{429D0}$	Transmitter	Data output from Transmitter.
33	ENTX	Transmitter	Transmitter Enable Input signal to initiate data transmission from FIFO memory.
34	$\overline{CWSTR}$	Receiver/ Transmitter	Control word input strobe signal to latch the control word from the data bus into the control word register.
35	NC	Receiver/ Transmitter	This pin should be left open.

PIN	SYMBOL	SECTION	DESCRIPTION
36	NC	Receiver/ Transmitter	No connect. This pin may be left open or tied low but never tied high.
37	TTLCLK	Receiver/ Transmitter	External clock input. May be either ten (10) or eighty (80) times the data rate. If using both ARINC data rates it must be ten (10) times the highest data rate. (Typically 1 MHz). If using crystal oscillator, this pin may be left open or tied high but never tied low.
38	TXCLK	Transmitter	Transmitter Clock output. Delivers a clock frequency equal to the transmitter data rate.
39	$\overline{MR}$	Receiver/ Transmitter	Master Reset. Active low pulse used to reset FIFO, bit counters, gap timmer, word count signal, TX/R and various other flags and controls. Usually only used on Power-Up or System Reset.
40	—	—	No connection.

The HS-3282 is designed to support ARINC Specification 429 and other serial data protocols that use a similar format by collecting the receiving, transmitting, synchronizing, timing and parity functions on a single, low power LSI circuit. It goes beyond the ARINC requirements of providing for either odd or even parity, and giving the user a choice of either 25 or 32 bit word lengths. The receiver and transmitter sections operate independently of each other. The serial-to-parallel conversion required of the receiver and the parallel-to-serial conversion requirements of the transmitter have been incorporated into the bus interface circuit.

Provisions have been made through the addition of an external TTL clock input to provide data rate flexibility. This requires an external TTL clock that is 10 times the data rate.

To obtain the flexibility discussed above, a number of external control signals are required. To reduce the pin count requirements, an internal control word register is used. The control word is latched from the data bus into the register by the Control Word Strobe (CWSTR) signal going to a logic "0". Eleven (11) control functions are used, and along with the bus data (BD) line are listed below:

CONTROL WORD

PIN NAME	SYMBOL	FUNCTION
BD05	SLFTST	Connects the self test signal from the transmitter directly to the receiver shift registers, bypassing the input receivers. Receiver 1 receives Data true and Receiver 2 receives Data not. Note that the transmitter output remains active. (Logic "0" on SLFTST Enables Self Test).
BD06	SDENB1	Signal to activate the Source Destination (SD) Decoder for Receiver 1. (Logic "1" activates SD Decoder).
BD07	X1	If SDENB1 = "1" then this bit is compared with ARINC Data Bit #9. If Y1 also matches (see Y1), the word will be accepted by the Receiver 1. If SDENB1 = "0" this bit becomes a don't care.
BD08	Y1	If SDENB1 = "1" then this bit is compared with ARINC Data Bit #10. If X1 also matches (see X1), the word will be accepted by the Receiver 1. If SDENB1 = "0" this bit becomes a don't care.
BD09	SDENB2	Signal to activate the Source Destination (SD) Decoder for Receiver 2. (Logic "1" activates SD Decoder).
BD10	X2	If SDENB2 = "1" then this bit is compared with ARINC Data Bit #9. If Y2 also matches (see Y2), the word will be accepted by the Receiver 2. If SDENB2 = "0" this bit becomes a don't care.
BD11	Y2	If SDENB2 = "1" then this bit is compared with ARINC Data Bit #10. If X2 also matches (see X2), the word will be accepted by the Receiver 2. If SDENB2 = "0" this bit becomes a don't care.
BD12	PARCK	Signal used to invert the transmitter parity bit for test of parity circuits. Logic "0" selects normal odd parity. Logic "1" selects even parity.
BD13	TXSEL	Selects high or low Transmitter data rate. If TXSEL = "0" then transmitter data rate is equal to the clock rate divided by ten (10). If TXSEL = "1" then transmitter data rate is equal to the clock rate divided by eighty (80).
BD14	RCVSEL	Selects high or low Receiver data rate. If RCVSEL = "0" then the received date rate should be equal to the clock rate divided by ten (10). If RCVSEL = "1" then the received data rate should be equal to the clock rate divided by eighty (80).
BD15	WLSEL	Selects word length. If WLSEL = "0" a 32-bit word format will be selected. If WLSEL = "1" a 25-bit word format will be selected.

ARINC 429 DATA FORMAT as input to the Receiver and output from the Transmitter is as follows:

TABLE 1 - ARINC 429 DATA FORMAT

ARINC BIT #	FUNCTIONS
1 - 8	Label
9 - 10	SDI or Data
11	LSB
12 - 27	Data
28	MSB
29	Sign
30, 31	SSM
32	Parity

This format is shuffled when seen on the sixteen bi-directional input/outputs. The format shown below is used from the receivers and input to the transmitter:

TABLE 2 - WORD 1 FORMAT

10, 9	SSM Status	31, 30
8	Parity	32
7 - 00	Label	1 - 8

TABLE 3 - WORD 2 FORMAT

BIDIRECTIONAL BIT #	FUNCTION	ARINC BIT #
15	Sign	29
14	MSB	28
13 - 00	Data	27 - 14

If the receiver input data word string is broken before the entire data word is received, the receiver will reset and ignore the partially received data word.

If the transmitter is used to transmit consecutive data words, each word will be separated by a four (4) bit "null" state (both positive and negative outputs will maintain a zero (0) volt level).

RECEIVER OPERATION

Since the two receivers are functionally identical, only one will be discussed in detail, and the block diagram will be used for reference in this discussion. The receiver consists of the following circuits:

- The Line Receiver functions as a voltage level translator. It transforms the 10 volt differential line voltage, ARINC 429 format, into 5 volt internal logic level.
- The output of the Line Receiver is one of two inputs to the Self-Test Data Selector (SEL). The other input to the Data Selector is the Self-Test Signal from the Transmitter section.
- The incoming data, either Self-Test or ARINC 429, is double sampled by the Word Gap Timer to generate a Data Clock. The Receiver sample frequency (RCVCLK), 1 MHz, or 125 KHz, is generated by the Receiver/Transmitter Timing Circuit. This sampling frequency is ten times the Data Rate to ensure no data ambiguity.
- The derived data clock then shifts the data down a 32-bit long Data Shift Register (Data S/R1). The Data Word Length is selectable for either 25-Bits or 32-Bits long by the Control Signal (WLSEL). As soon as the data word is completely received, an internal signal (WDCNT1) is generated by the Word Gap Timer Circuit.
- The Source/Destination (S/D) Decoder compares the user set code (X and Y) with Bits 9 and 10 of the Data Word. If the two codes are matched, a positive signal is generated to enable the WDCNT1 signal to latch in the received data. Otherwise, the data word is ignored and no latching action takes place. The S/D Decoder can be Enabled and Disabled by the control signal S/D ENB. If the data word is latched, an indicator flag ($\overline{\text{D/R1}}$) is set. This indicates a valid data word is ready to be fetched by the user.
- The parity of the incoming word is checked and the status (i.e., logic "0" for odd parity and logic "1" for even parity) stored in the receiver latch and outputted on BD08 during the Word No. 1.
- Assuming the user desires to access the data, he first sets the Data Select Line (SEL) to a Logic "0" level and pulses the Enable ($\overline{\text{EN1}}$) line. This action causes the Data Selector (SEL1) to select the first-data word, which contains the label field and Enable it onto the Data Bus. To obtain the second data word, the user sets the SEL line to a Logic "1" level and pulse the Enable ($\overline{\text{EN1}}$) line again. The Enable pulse duration is matched to the user circuit requirement needed to latch in the Data Word from the Data Bus. The second Enable pulse is also used to reset the Device Ready ($\overline{\text{D/R1}}$) flip-flop. This completes a receiving cycle.

TRANSMITTER OPERATION

The Transmitter section consists of an 8-word deep by 31-Bit long FIFO Memory, Parity Generator, Transmitter Word Gap Timing Circuit and Driver Circuit.

- The FIFO Memory is organized in such a way that data loaded in the input register is automatically transferred to the output register for Serial Data Transmission. This eliminates a large amount of data managing time since the data need not be clocked from the input register to the output register. The FIFO input register is made up of two sets of 16 D-type flip-flops, which are clocked by the two parallel load signals ($\overline{\text{PL1}}$ and $\overline{\text{PL2}}$). The data from the Data Bus is clocked into the D-type flip-flop on the positive going edge of the $\overline{\text{PL}}$ signals. If the FIFO memory is initially empty, or the stack is not full, the data will be automatically transferred down the Memory Stack and into the output register or to the last empty FIFO storage register. If the

Transmitter Enable signal (ENTX) is not active, a Logic "0", the data remains at the output register. The FIFO Memory has storage locations to hold eight 31-Bit words. If the memory is full and new data is again strobed with $\overline{PL}$, the old data at the input register is written over by the new data. Data will remain in the Memory until ENTX goes to a Logic "1". This activates the FIFO Clock and data is shifted out serially to the Transmitter Driver.

- The Output Register of the FIFO is designed such that it can shift out a word of 25-Bits long or 32-Bits long. This word length is again controlled by the WLSEL bit. The TX Word Gap Timer Circuit also automatically inserts a gap equivalent to 4-Bit Times between each word. This gives a minimum requirement of 29-Bit time or 36-Bit time for each word transmission. Assuming the signal, ENTX, remains at a Logic "1", a transfer to stack signal is generated to transfer the data down the Memory Stack one position. This action is continued until the last word is shifted out of the FIFO memory. At this time a Transmitter Ready (TX/R) flag is generated to signal the user that the Transmitter is ready to receive eight more data words.
- A Bit Counter is used to detect the last Bit shifted out of the FIFO memory and replaces it with the Parity Bit generated by the Parity Generator. The Parity Generator has a control signal, Parity Check (PARCK), which establishes whether odd or even parity is inserted into the output data word. PARCK set to a logic "0" will result in odd parity and when set to a logic "1" will result in even parity.

SAMPLE INTERFACE TECHNIQUE

From Figure 1, one can see that the Data Bus is time shared between the Receiver and the Transmitter. Therefore, bus controlling must be synchronously shared between the Receiver and the Transmitter. Figure 2 shows the typical interface timing control of the ARINC Chip for Receiving function and for Transmitting function. Timing sequence for loading the Transmitter FIFO Memory is shown in Timing Interval A. A Transmitter Ready (TX/R) Flag signals the user that the Transmitter Memory is empty. The user then Enables the Transmitter Data, a 16-Bit word, on the Data Bus and strobes the Transmitter with a Parallel Load ($\overline{PL1}$) Signal. The second part of the 32-Bit word is similarly loaded into the Transmitter with $\overline{PL2}$, which also initiates data transfer to stack. This is continuous until the Memory is full, which is eight 31-Bit words. The user must keep track of the number of words loaded into the Memory to ensure no data is written over by other data. During the time the user is loading the Transmitter, he does not have to service the Receiver, even if the Receiver flags the user with the signal $\overline{D/R1}$ that a valid received word is ready to be fetched. This is shown by the Timing Interval B. If the user decides to obtain the received data before the Transmitter is completely loaded, he sets the two parallel load signals ($\overline{PL1}$ and $\overline{PL2}$) at a Logic "1" state, and strobe $\overline{EN1}$ while the signal SEL is at a Logic "0" state. After the negative edge of $\overline{EN1}$, the first 16-Bit segment of the received word becomes valid on the Data Bus. At the positive edge of $\overline{EN1}$, the user should toggle the signal SEL to ready the Receiver for the second 16-Bit word. Strobing the Receiver with $\overline{EN1}$, the second time, enables the second 16-Bit word and resets the Receiver Ready Flag $\overline{D/R1}$. The user should now reset the signal SEL to a Logic "0" state to ready the Receiver for another Read Cycle. During the time period that the user is fetching the received words, he can load the transmitter. This is done by interlacing the $\overline{PL}$ signals with the $\overline{EN}$ signals as shown in the Timing Interval B. Servicing the Receiver 2 is similar and is illustrated by Timing Interval C. Timing Interval D shows the rest of the Transmitter loading sequence and the beginning of the transmission by switching the signal TX Enable to a Logic "1" state. Timing Interval E is the time it takes to transmit all data from the FIFO Memory, either 288 Bit times or 232 Bit times.

Video Character Generator

Features

- OPERATION (DOT CLOCK) FROM 1.0 TO 27 MHz
- DESIGNED TO INTERFACE WITH INTEL 8275 PROGRAMMABLE CRT CONTROLLER
- DIRECTLY DECODES (FROM ON-CHIP ROM);
  - ASCII 96 CHARACTER SET
  - 32 PSEUDO-GRAPHIC CHARACTERS
  - 10 OVERLAY PATTERNS
- EXPANDABLE CHARACTER TABLE
- 9 X 12 DOT MATRIX WITH DESCENDER CAPABILITY
- HANDLES VIDEO MODIFIERS;
  - BLANK
  - VIDEO SUPPRESS
  - REVERSE VIDEO
  - LIGHT ENABLE

Description

The HS-3819 is a CMOS/LSI Video Character Generator designed to help interface an Intel 8275 Programmable CRT Controller to a video monitor. The character generator must be supplied with a clock frequency of between 1 and 27 MHz which will be used as the dot clock. This signal is then divided by nine to form the character clock output needed by the CRT Controller. The HS-3819 then converts character data into a video output signal, through use of an internal (ROM) character table. Stored in this ROM are the standard 96 ASCII characters, 32 pseudo-graphic characters and 10 overlay patterns used to modify characters. Additional characters, if needed, can easily be decoded from an external memory field.

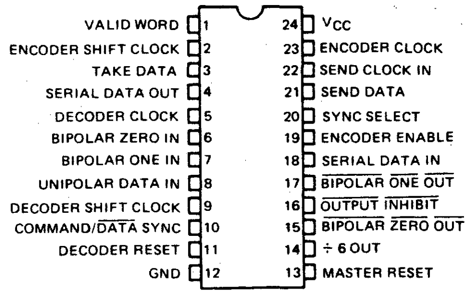
HS-15530RH

Radiation Resistant CMOS Manchester Encoder-Decoder

Features

- SUPPORT OF MIL-STD-1553
- 1.0 MEGABIT/SEC DATA RATE
- SYNC IDENTIFICATION AND LOCK-IN
- CLOCK RECOVERY
- MANCHESTER II ENCODE, DECODE
- SEPARATE ENCODE AND DECODE
- LOW OPERATING POWER: 50mW AT 5 VOLTS
- FULL MILITARY TEMPERATURE RANGE
- FUNCTIONAL TOTAL DOSE . . . 1×10^4 RAD(Si)
- LATCH-UP FREE TO . . . . 5×10^{11} RAD (Si)/sec

Pinout



Description

The Harris HS-15530RH is a high performance, radiation resistant, CMOS device intended to service the requirements of MIL-STD-1553 and similar Manchester II encoded, time division multiplexed serial data protocals. This LSI chip is divided into two sections, an Encoder and a Decoder. These sections operate completely independent of each other, except for the Master Reset function.

This circuit provides many of the requirements of MIL-STD-1553. The Encoder produces the sync pulse and the parity bit as well as the encoding of the data bits. The Decoder recognizes the sync pulse and identifies it as well as decoding the data bits and checking parity.

This integrated circuit is fully guaranteed to support the 1MHz data rate of MIL- STD-1553 over both temperature and voltage while residing in a radiation environment. It interfaces with CMOS, TTL or N channel support circuitry, and uses a standard 5 volt supply.

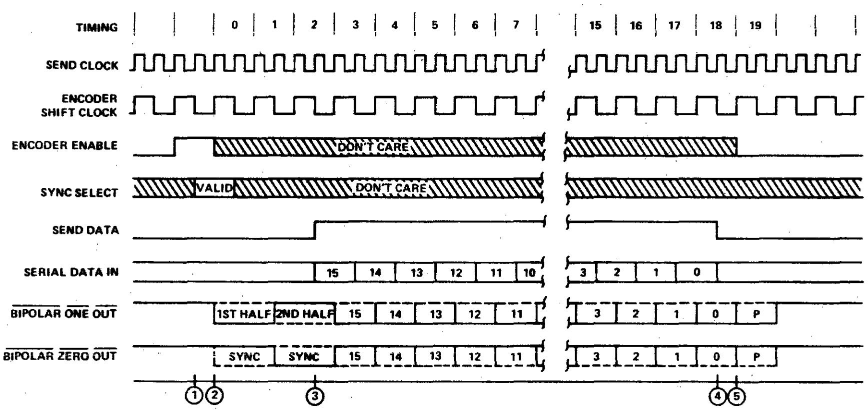
PIN	SECTION	NAME	DESCRIPTION
1	Decoder	VALID WORD	Output high indicates receipt of a valid word.
2	Encoder	ENCODER SHIFT CLOCK	Output for shifting data into the Encoder. This clock shifts data on a low-to-high transition.
3	Decoder	TAKE DATA	Output is high during receipt of data after identification of a sync pulse.
4	Decoder	SERIAL DATA OUT	Delivers received data in correct NRZ format.
5	Decoder	DECODER CLOCK	Input drives the transition finder, and the synchronizer which in turn supplies the clock to the balance of the Decoder.
6	Decoder	BIPOLAR ZERO IN	A high input should be applied when the bus is in its negative state. This pin must be held high when the Unipolar input is used.
7	Decoder	BIPOLAR ONE IN	A high input should be applied when the bus is in its positive state, this pin must be held low when the Unipolar input is used.
8	Decoder	UNIPOLAR DATA IN	With pin 6 high and pin 7 low, this pin enters unipolar data into the transition finder circuit. If not used this input must be held low.
9	Decoder	DECODER SHIFT CLOCK	Output which delivers a frequency (Decoder Clock ÷ 12), synchronized by the recovered serial data stream.
10	Decoder	COMMAND SYNC	Output of a high from this pin occurs during output of decoded data which was preceded by a Command (or Status) synchronizing character. A low output indicates a Data synchronizing character.
11	Decoder	DECODER RESET	A high input to this pin during a rising edge of DECODER SHIFT CLOCK resets the decoder bit counting logic to a condition ready for a new word.
12	Both	GROUND	Ground supply pin.
13	Both	MASTER RESET	A high on this pin clears 2:1 counters in both the Encoder and Decoder.
14	Encoder	÷ 6 OUT	Output from 6:1 divider which is driven by the ENCODER CLOCK.
15	Encoder	$\overline{\text{BIPOLAR}}$ $\overline{\text{ZERO}}$ $\overline{\text{OUT}}$	An active low output designed to drive the zero or negative sense of a bipolar line driver.
16	Encoder	$\overline{\text{OUTPUT}}$ $\overline{\text{INHIBIT}}$	A low on this input forces pin 15 and pin 17 high, the inactive states.
17	Encoder	$\overline{\text{BIPOLAR}}$ $\overline{\text{ONE}}$ $\overline{\text{OUT}}$	An active low output designed to drive the one or positive sense of a bipolar line driver.
18	Encoder	SERIAL DATA IN	Accepts a serial data stream at a data rate equal to ENCODER SHIFT CLOCK.
19	Encoder	ENCODER ENABLE	A high on this input initiates the encode cycle. (Subject to the preceding cycle being complete.)
20	Encoder	SYNC SELECT	Actuates command sync for an input high and data sync for an input low.
21	Encoder	SEND DATA	Is an active high output which enables the external source of serial data.
22	Encoder	SEND CLOCK IN	Clock input at a frequency equal to the data rate X2.
23	Encoder	ENCODER CLOCK.	Input to the 6:1 divider.
24	Both	VCC	Positive supply pin.

Encoder Operation

The Encoder requires a single clock with a frequency of twice the desired data rate applied at the SEND CLOCK input. An auxillary divide by six counter is provided on chip which can be utilized to produce the SEND CLOCK by dividing the DECODER CLOCK.

The Encoder's cycle begins when ENCODER ENABLE is high during a falling edge of ENCODER SHIFT CLOCK ①. This cycle lasts for one word length or twenty ENCODER SHIFT CLOCK periods. At the next low-to-high transition of the ENCODER SHIFT CLOCK, a high at SYNC SELECT input actuates a command sync or a low will produce a data sync for that word ② . When the Encoder is ready to accept data, the SEND DATA output will go high and remain high for sixteen ENCODER SHIFT CLOCK periods ③ . During these sixteen periods the data should be clocked into the SERIAL DATA input with every low-to-high transition of the ENCODER SHIFT CLOCK ③ – ④ . After the sync and the Manchester II coded data are transmitted through the $\overline{\text{BIPOLAR ONE}}$ and $\overline{\text{BIPOLAR ZERO}}$ outputs, the Encoder adds on an additional bit which is the parity for that word ⑤ . At any time a low on $\overline{\text{OUTPUT INHIBIT}}$ input will force both bipolar outputs to a high state but will not affect the Encoder in any other way.

To abort the Encoder transmission a positive pulse must be applied at MASTER RESET. Anytime after or during this pulse, a low to high transition on SEND CLOCK clears the internal counters and initializes the Encoder for a new word.



Decoder Operation

The Decoder requires a single clock with a frequency of 12 times the desired data rate applied at the DECODER CLOCK input. The Manchester II coded data can be presented to the Decoder in one of two ways. The BIPOLAR ONE and BIPOLAR ZERO inputs will accept data from a comparator sensed transformer coupled bus as specified in Military Spec 1553. The UNIPOLAR DATA input can only accept non-inverted Manchester II coded data. (e.g. from $\overline{\text{BIPOLAR ZERO OUT}}$ of an Encoder.)

The Decoder is free running and continuously monitors its data input lines for a valid sync character and two valid Manchester data bits to start an output cycle. When a valid sync is recognized ①, the type of sync is indicated on COMMAND/$\overline{\text{DATA}}$ SYNC output. If the sync character was a command sync, this output will go high ② and remain high for sixteen DECODER SHIFT CLOCK periods ③ , otherwise it will remain low. The TAKE DATA output will go high and remain high ② – ③ while the Decoder is transmitting the decoded data through SERIAL DATA OUT. The decoded data available at SERIAL DATA OUT is in a NRZ format. The DECODER SHIFT CLOCK is provided so that the decoded bits can get shifted into an external register on every low-to-high transition of this clock ② – ③ .

After all sixteen decoded bits have been transmitted ③ the data is checked for odd parity. A high on VALID WORD output ④ indicates a successful reception of a word without any Manchester or parity errors. At this time the Decoder is looking for a new sync character to start another output sequence.

At any time in the above sequence a high input on DECODER RESET during a low-to-high transition of DECODER SHIFT CLOCK will abort transmission and initialize the Decoder to start looking for a new sync character.

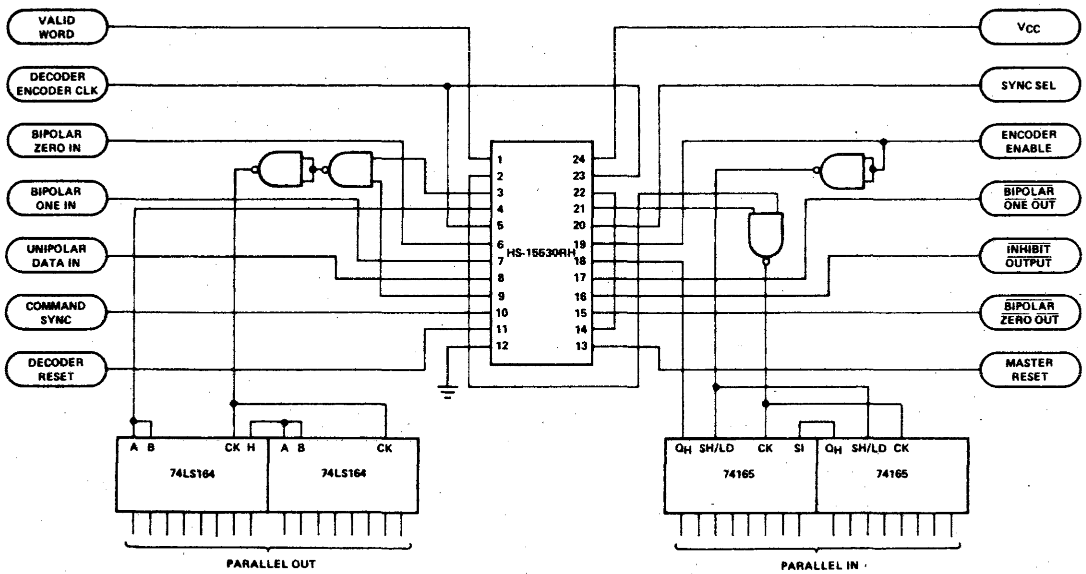
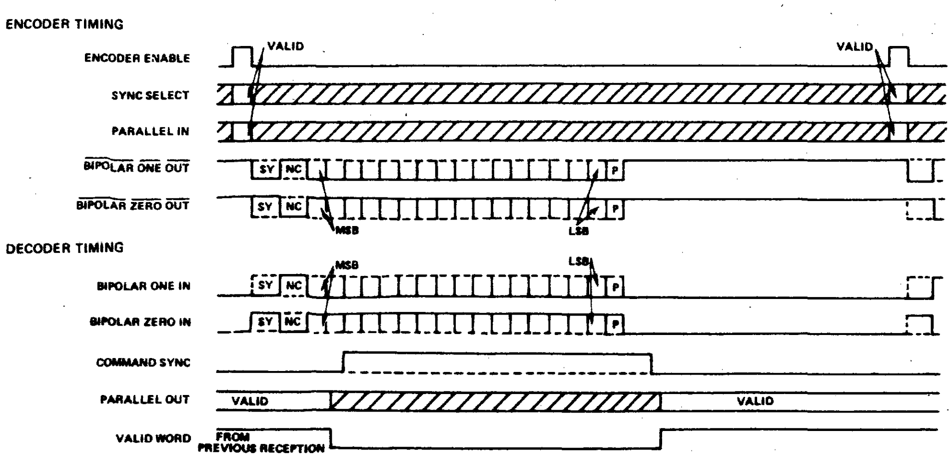
Applications

How to Make Our MTU Look Like a Manchester Encoded UART



Typical Timing Diagrams for a Manchester Encoded UART



The 1553 standard defines a time division multiplexed data bus for application within aircraft. The bus is defined to be bipolar, and encoded in a Manchester II format, so no DC component appears on the bus. This allows transformer coupling and excellent isolation among systems and their environment.

The HS-15530RH supports the full bipolar configuration, assuming a bus driver configuration similar to that in Figure 1. Bipolar inputs from the bus, like Figure 2, are also accommodated.

The signaling format in MIL-STD-1553 is specified on the assumption that the network of 32 or fewer terminals are controlled by a central control unit by means of Command Words, and Data. Terminals respond with Status Words, and Data. Each word is preceded by a synchronizing pulse, and followed by parity bit, occupying a total of 20 μsec. The word formats are shown in Figure 4. The special abbreviations are as follows:

- P — Parity, which is defined to be odd, taken across all 17 bits.
- R/T — Receive on logical zero, transmit on ONE.
- ME — Message Error if logical 1.
- TF — Terminal Flag, if set, calls for controller to request self-test data.

The paragraphs above are intended only to suggest the content of MIL-STD-1553, and do not completely describe its bus requirements, timing or protocols.

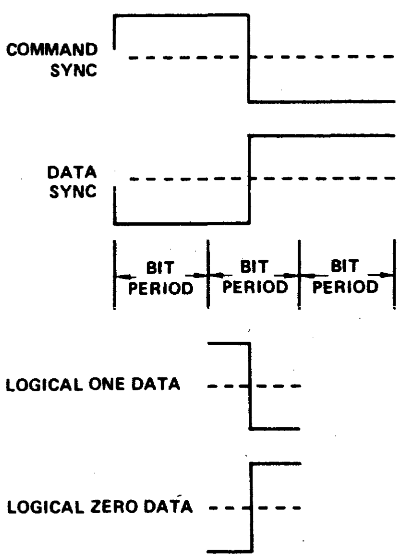

FIGURE 3 – MIL-STD-1553 Character Formats

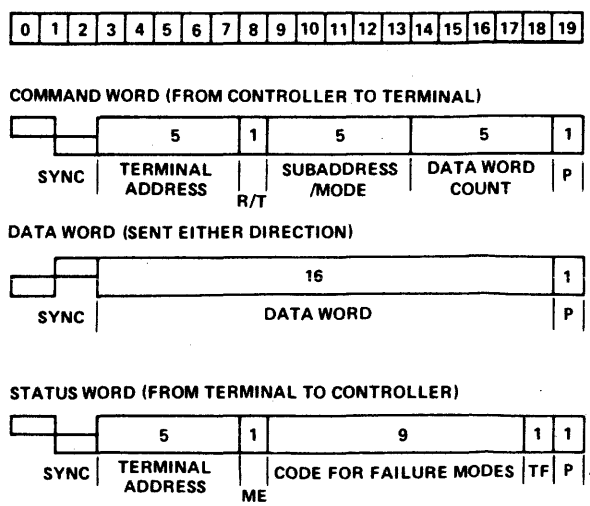

FIGURE 4 – MIL-STD-1553 Word Formats

NOTE: This page is a summary of MIL-STD-1553 and is not intended to describe the operation of the HS-15530RH

Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from ≥20% of the wafers in a run. (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)

(2) The sample die shall be assembled and tested for functionality.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 1 x 10^4 Rad(Si +10% from a Gamma Cell 220 Cobalt 60 source or equivalent. The samples shall be biased at 5 volts with all inputs high. The dose rate shall be between 50 rads/sec and 200 rads/sec.

(4) I_{CCSB} at V_{CC} = 5 volts will be measured and recorded for each device within one hour (±15 minutes) after irradiation. The lot will be accepted only if the average of these measure values is ≤5mA.

Radiation Effects

The HS--15530RH is processed with the same mask set as is used for HARRIS' equivalent commercial part. Latchup free operation, achieved by the use of special starting material and improved total dose hardness, is obtained with special high temperature processing cycles. These process techniques can, in principal, be applied to any standard HARRIS CMOS product.

The primary failure mode under exposure to ionizing radiation is an increase in static leakage current (I_{CCSB}). Functional failure due to the increased leakage currents will typically occur for dose levels in excess of 5 x 10^4 RAD-Si. AC and DC parameters other than ICC will change less than 10% for total dose levels under 5 x 10^4 RAD-Si. The excess leakage currents will anneal at room temperature and are typically reduced by a factor of 3-10 within 24 hours after irradiation.

On a production basis, HARRIS is able to perform screens only for a total dose hardness. Transident radiation tests, however, have shown the following results:

Latchup free doses ≥5 x 10^{11} rads/sec. Upset (loss of stored data) typically ≥ 10^8 rads/sec.

Package

Description

The HS–6504RH is a 4096 x 1 static CMOS RAM fabricated using the Harris Custom Integrated Circuits Division radiation hardened self-aligned silicon gate technology. The device utilizes synchronous circuitry to achieve high performance and low power operation.

On-chip latches are provided for addresses, data input and data output allowing efficient interfacing with microprocessor systems. The data output can be forced to a high impedance for use in expanded memory arrays.

The HS–6504RH is a fully static RAM and may be maintained in any state for an indefinite period of time.

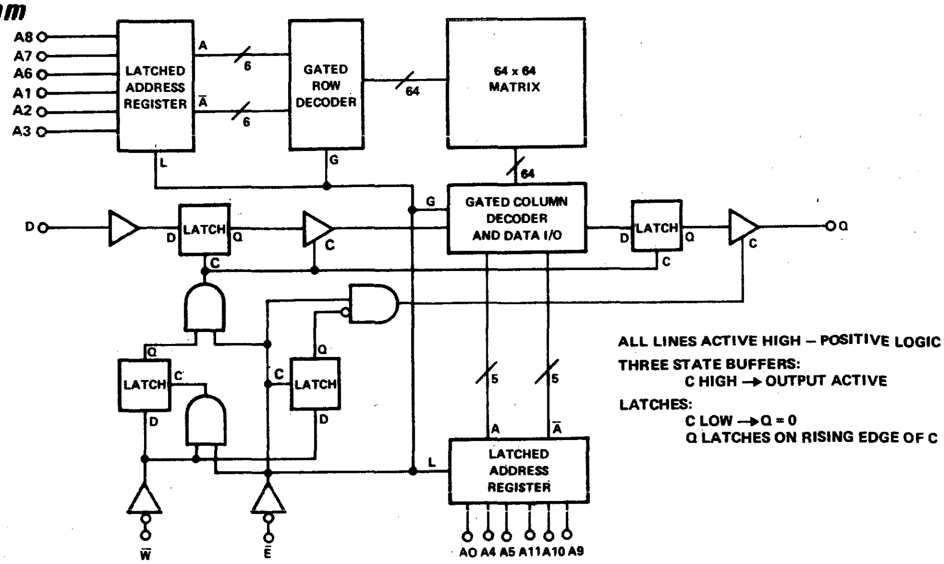
Functional Diagram



Information on this device is preliminary. Data is subject to change unless otherwise specifically agreed. No obligations are assumed for notice of change or future manufacture of this device.

CAUTION: These devices are sensitive to electrostatic discharge.

Symbols and Abbreviations

This data sheet utilizes a new set of specification nomenclature. This new format is an IEEE and JEDEC supported standard for semiconductor memories. It is intended to clarify the symbols, abbreviations and definitions, and to make all memory data sheets consistent. We believe that, once acclimated, you will find this standardized format easy to read and use.

ELECTRICAL PARAMETER ABBREVIATIONS

All abbreviations use upper case letters with no subscripts. The initial symbol is one of these four characters:

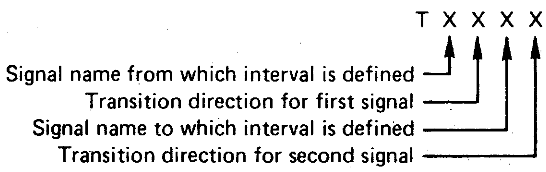
V (Voltage)
I (Current)
P (Power)
C (Capacitance)

The second letter specifies input (I) or output (O), and the third letter indicates the high (H), low (L) or off (Z) state of the pin during measurements. Examples:

VIL — Input Low Voltage
IOZ — Output Leakage Current

TIMING PARAMETER ABBREVIATIONS

All timing abbreviations use upper case characters with no subscripts. The initial character is always T and is followed by four descriptors. These characters specify two signal points arranged in a "from-to" sequence that define a timing interval. The two descriptors for each signal point specify the signal name and the signal transitions. Thus the format is:



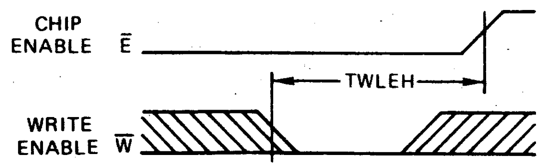
Signal Definitions:

A = Address
D = Data In
Q = Data Out
W = Write Enable
E = Chip Enable
S = Chip Select
G = Output Enable

Transition Definitions:

H = Transition to High
L = Transition to Low
V = Transition to Valid
X = Transition to Invalid or Don't Care
Z = Transition to Off (High Impedance)

EXAMPLE:



The example shows Write pulse setup time defined as TWLEH-Time from Write enable Low to chip Enable High.

TIMING LIMITS

The table of timing values shows either a minimum or a maximum limit for each parameter. Input requirements are specified from the external system point of view. Thus, address set-up time is shown as a minimum since the system must supply at least that much time (even though most devices do not require it). On the other hand, responses from the memory are specified from the device point of view. Thus, the access time is shown as a maximum since the device never provides data later than that time.

WAVEFORMS

WAVEFORM SYMBOL	INPUT	OUTPUT
	MUST BE VALID	WILL BE VALID
	CHANGE FROM H TO L	WILL CHANGE FROM H TO L
	CHANGE FROM L TO H	WILL CHANGE FROM L TO H
	DON'T CARE: ANY CHANGE PERMITTED	CHANGING: STATE UNKNOWN
	—	HIGH IMPEDANCE

ABSOLUTE MAXIMUM RATINGS

Supply Voltage - (VCC - GND)	-0.3V to +7.0V
Input or Output Voltage Applied	(GND -0.3V) to (VCC +0.3V)
Storage Temperature	-65°C to +150°C

OPERATING RANGE

Operating Supply Voltage	4.5V to 5.5V
Operating Temperature	-55°C to +125°C

CAUTION: To prevent permanent damage to this device, care should be exercised to insure that the absolute maximum ratings for supply voltages, temperature and voltage or current at any pin is not exceeded during both static and dynamic operation.

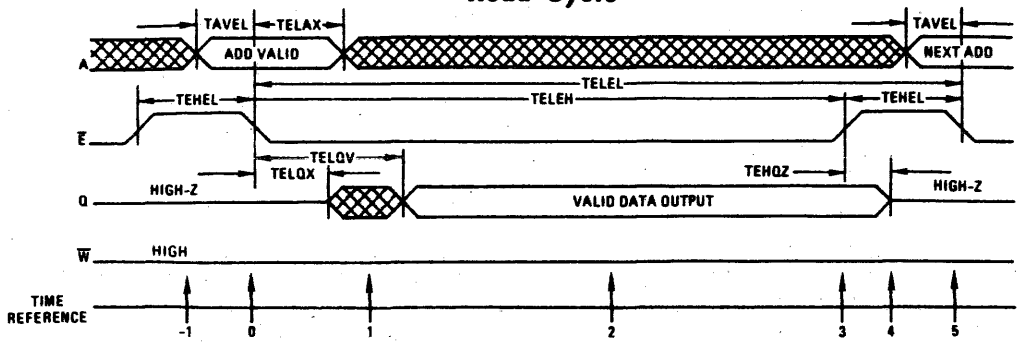
NOTES:
1. All devices guaranteed at worst case limits. Room temp., 5 volt data provided for information and not guaranteed.
2. Operating Supply Current (ICCOP) is proportional to Operating Frequency. Post Rad Data @ TD = 1 x10^5.
3. Capacitance sampled and guaranteed – not 100% tested.
4. AC test Conditions: Inputs: TRISE = TFALL ≤ 20nsec; Outputs: 1TTL Load and 50 pF. All timing measurements at 1/2 VCC.
5. Pre-Radiation and Post-Radiation limits.

Read Cycle

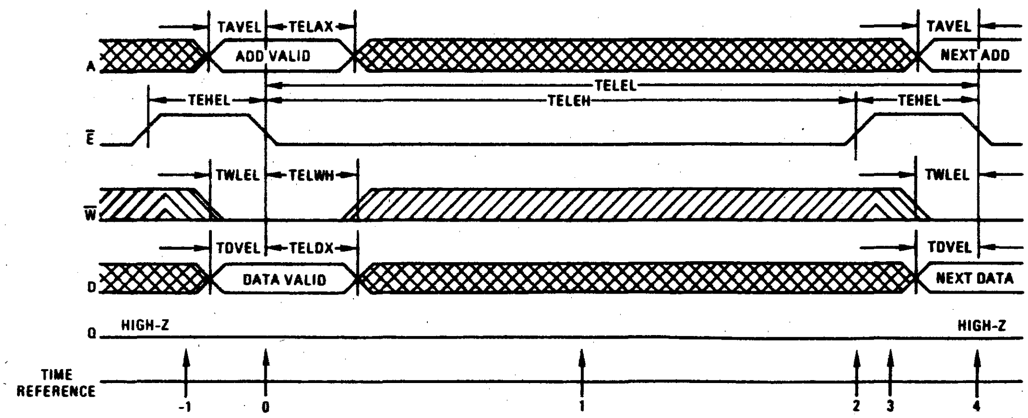


TRUTH TABLE

TIME REFERENCE	INPUTS Ē	W̄	A	OUTPUT Q	FUNCTION
-1	H	X	X	Z	MEMORY DISABLED
0	↘	H	V	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	H	X	X	OUTPUT ENABLED
2	L	H	X	V	OUTPUT VALID
3	↗	H	X	V	READ ACCOMPLISHED
4	H	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS -1)
5	↘	H	V	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The address information is latched in the on chip registers on the falling edge of Ē (T = 0). Minimum address set up and hold time requirements must be met. After the required hold time, the addresses may change state without affecting device operation. During time (T = 1) the output becomes enabled but data is not valid until during time (T = 2). W̄ must remain high until after time (T = 2). After the output data has been read, Ē may return high (T = 3). This will disable the output buffer and ready the RAM for the next memory cycle (T = 4).

Early Write Cycle

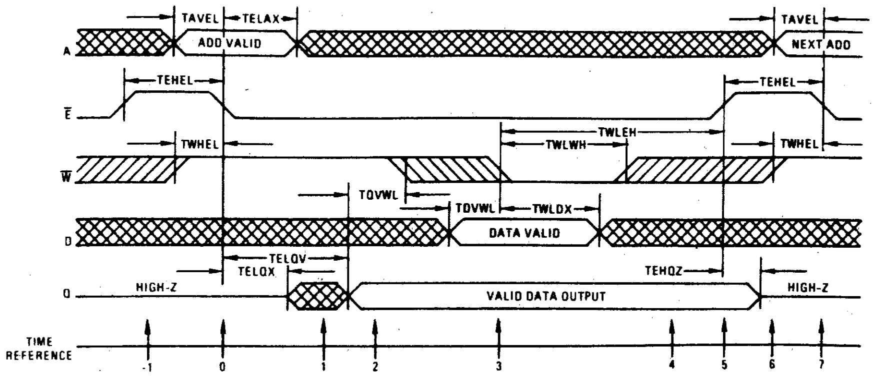


TRUTH TABLE

TIME REFERENCE	INPUTS Ē	W̄	A	D	OUTPUT Q	FUNCTION
-1	H	X	X	X	Z	MEMORY DISABLED
0	↘	L	V	V	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	X	X	X	Z	WRITE IN PROGRESS INTERNALLY
2	↗	X	X	X	Z	WRITE COMPLETED
3	H	X	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS -1)
4	↘	L	V	V	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The early write cycle is the only cycle where the output is guaranteed not to become active. On the falling edge of Ē (T = 0), the addresses, the write signal, and the data input are latched in on chip registers. The logic value of W̄ at the time Ē falls determines the state of the output buffer for that cycle. Since W̄ is low when Ē falls, the output buffer is latched into the high impedance state and will remain in that state until Ē returns high (T = 2). For this cycle, the data input is latched by Ē going low; therefore data set up and hold times should be referenced to Ē. When Ē (T = 2) returns to the high state the output buffer disables and all signals are unlatched. The device is now ready for the next cycle.

Read Modify Write Cycle



TRUTH TABLE

TIME REFERENCE	INPUTS Ē	W̄	A	D	OUTPUT Q	FUNCTION
-1	H	X	X	X	Z	MEMORY DISABLED
0	⤥	H	V	X	Z	CYCLE BEGINS, ADDRESS ARE LATCHED
1	L	H	X	X	X	OUTPUT ENABLED
2	L	H	X	X	V	OUTPUT VALID, READ AND MODIFY TIME
3	L	⤥	X	V	V	WRITE BEGINS, DATA IS LATCHED
4	L	X	X	X	V	WRITE IN PROGRESS INTERNALLY
5	⤤	X	X	X	V	WRITE COMPLETED
6	H	X	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS -1)
7	⤥	H	V	X	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The read modify write cycle begins as all other cycles on the falling edge of Ē (T= 0). The W̄ line should be high at (T = 0) in order to latch the output buffers in the active state. During (T = 1) the output will be active but not valid until (T = 2). On the falling edge of the W̄ (T = 3) the data present at the output and input are latched. The W̄ signal also latches itself on its low going edge. All input signals excluding Ē have been latched and have no further effect on the RAM. The rising edge of Ē (T = 5) completes the write portion of the cycle and unlatches all inputs and output. The output goes to a high impedance and the RAM is ready for the next cycle.

NOTES: In the above descriptions the numbers in parenthesis (T = n) refer to the respective timing diagrams. The numbers are located on the time reference line below each diagram. The timing diagrams shown are only examples and are not the only valid method of operation.

Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from ≥ 20% of the wafers in a run. (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)

(2) The sample die shall be assembled and tested to the production test program for proper operation.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 1 x 10^5 Rad Si (± 10%) from a Gamma Cell 220 Cobalt 60 source or equivalent. The samples shall be biased at 5 volts with all inputs high. The dose rate shall be between 50 rads/sec and 200 rads/sec.

(4) The samples will be tested to the data sheet limits within one hour (±15 minutes) after irradiation. The lot will be accepted only if all units, exclusive of non-radiation failures, meet the data sheet limits.

Radiation Effects

The HS-6504RH is an RH memory designed to survive in a radiation environment and to meet the electrical characteristics and be pin compatible to the Harris equivalent commercial part. Latchup free operation, achieved by the use of special starting material and improved total dose hardness, is obtained with special high temperature processing cycles. These process techniques can, in principle, be applied to any standard HARRIS CMOS product.

On a production basis, HARRIS only performs screens for total dose hardness to a level of 1 x 10^5 rad-Si. Transient radiation tests, however, have shown the following results:

Latchup free to doses ≥ 5 x 10^{11} rads/sec.
Upset (loss of stored data) typically ≥ 10^8 rads/sec.

9	External Visual	2009 Sample Inspection

Notes:

- Traceability: All devices are assigned date code identification that provides traceability back to the inspection lot.
- Branding: All devices are branded with the part number and EIA date code.
- Aged Products: Product that has been held for more than 24 months will be reinspected prior to shipment to group A inspection requirements.
- Additional Requirements: Sample Group A electrical tests are performed on a lot acceptance basis.

Symbols and Abbreviations

This data sheet utilizes a new set of specification nomenclature. This new format is an IEEE and JEDEC supported standard for semiconductor memories. It is intended to clarify the symbols, abbreviations and definitions, and to make all memory data sheets consistent. We believe that, once acclimated, you will find this standardized format easy to read and use.

ELECTRICAL PARAMETER ABBREVIATIONS

All abbreviations use upper case letters with no subscripts. The initial symbol is one of these four characters:

V (Voltage)
I (Current)
P (Power)
C (Capacitance)

The second letter specifies input (I) or output (O), and the third letter indicates the high (H), low (L) or off (Z) state of the pin during measurements. Examples:

VIL — Input Low Voltage
IOZ — Output Leakage Current

TIMING PARAMETER ABBREVIATIONS

All timing abbreviations use upper case characters with no subscripts. The initial character is always T and is followed by four descriptors. These characters specify two signal points arranged in a "from-to" sequence that define a timing interval. The two descriptors for each signal point specify the signal name and the signal transitions. Thus the format is:

T X X X X

- Signal name from which interval is defined (first X)
- Transition direction for first signal (second X)
- Signal name to which interval is defined (third X)
- Transition direction for second signal (fourth X)

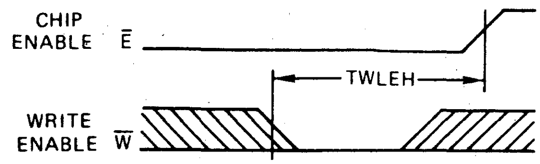
Signal Definitions:

A = Address
D = Data In
Q = Data Out
W = Write Enable
E = Chip Enable
S = Chip Select
G = Output Enable

Transition Definitions:

H = Transition to High
L = Transition to Low
V = Transition to Valid
X = Transition to Invalid or Don't Care
Z = Transition to Off (High Impedance)

EXAMPLE:



The example shows Write pulse setup time defined as TWLEH-Time from Write enable Low to chip Enable High.

TIMING LIMITS

The table of timing values shows either a minimum or a maximum limit for each parameter. Input requirements are specified from the external system point of view. Thus, address set-up time is shown as a minimum since the system must supply at least that much time (even though most devices do not require it). On the other hand, responses from the memory are specified from the device point of view. Thus, the access time is shown as a maximum since the device never provides data later than that time.

WAVEFORMS

WAVEFORM SYMBOL	INPUT	OUTPUT
	MUST BE VALID	WILL BE VALID
	CHANGE FROM H TO L	WILL CHANGE FROM H TO L
	CHANGE FROM L TO H	WILL CHANGE FROM L TO H
	DON'T CARE: ANY CHANGE PERMITTED	CHANGING: STATE UNKNOWN
	—	HIGH IMPEDANCE

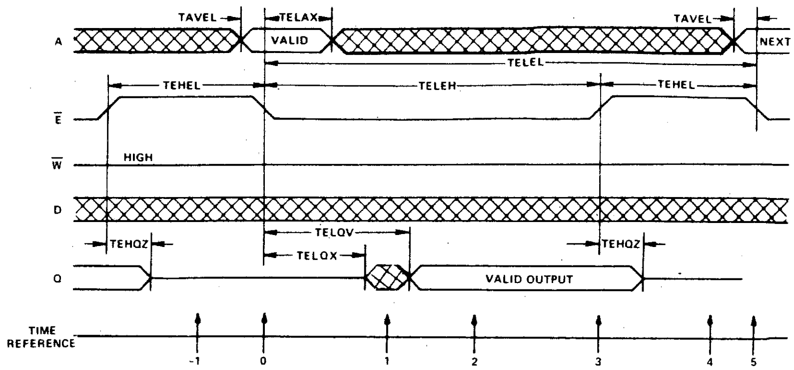
NOTES:
1. All devices guaranteed at worst case limits. Room temp., 5 volt data provided for information and not guaranteed.
2. Operating Supply Current (ICCOP) is proportional to Operating Frequency. Example: Typical ICCOP = 1.5mA/MHz.
3. Capacitance sampled and guaranteed — not 100% tested.
4. AC Test Conditions: Inputs — TRISE = TFALL = 20nsec; Outputs — 1 TTL load and 50pF. All timing measurements at 1/2 VCC.
5. Pre-Radiation characteristics. See Radiation effects section for Post-Radiation characteristics.

Read Cycle

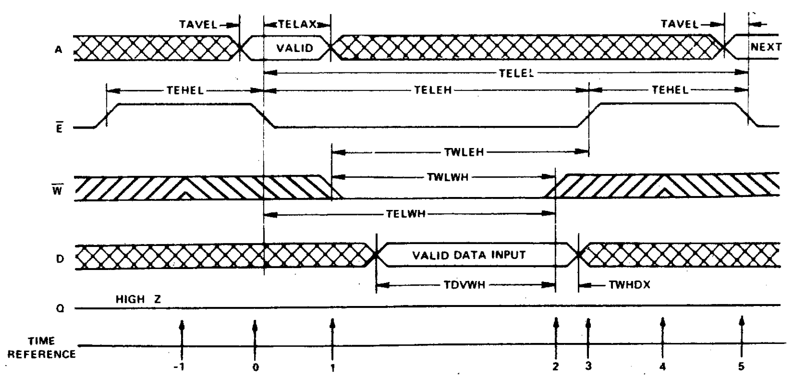


TRUTH TABLE

TIME REFERENCE	INPUTS $\overline{E}$	$\overline{W}$	A	D	OUTPUTS Q	FUNCTION
-1	H	X	X	X	Z	MEMORY DISABLED
0	↓	H	V	X	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	H	X	X	X	OUTPUT ENABLED
2	L	H	X	X	V	OUTPUT VALID
3	↑	H	X	X	V	READ ACCOMPLISHED
4	H	X	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS -1)
5	↓	H	V	X	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

In the HS-6508RH Read Cycle, the address information is latched into the on-chip registers on the falling edge of $\overline{E}$ (T = 0). Minimum address setup and hold time requirements must be met. After the required hold time, the addresses may change state without affecting device operation. During time (T = 1) the data output becomes enabled; however, the data is not valid until during time (T = 2). $\overline{W}$ must remain high for the read cycle. After the output data has been read, $\overline{E}$ may return high (T = 3). This will disable the chip and force the output buffer to a high impedance state. After the required $\overline{E}$ high time (TEHEL) the RAM is ready for the next memory cycle (T = 4).

Write Cycle



TRUTH TABLE

TIME REFERENCE	INPUTS $\overline{E}$	$\overline{W}$	A	D	OUTPUTS Q	FUNCTION
-1	H	X	X	X	Z	MEMORY DISABLED
0	↓	X	V	X	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	↓	X	X	Z	WRITE PERIOD BEGINS
2	L	↑	X	V	Z	DATA IS WRITTEN
3	↑	H	X	X	Z	WRITE COMPLETED
4	H	X	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS -1)
5	↓	X	V	X	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The write cycle is initiated by the falling edge of $\overline{E}$ which latches the address information into the on-chip registers. The write portion of the cycle is defined as both $\overline{E}$ and $\overline{W}$ being low simultaneously. $\overline{W}$ may go low anytime during the cycle provided that the write enable pulse setup time (TWLEH) is met. The write portion of the cycle is terminated by the first rising edge of either $\overline{E}$ or $\overline{W}$. Data setup and hold times must be referenced to the terminating signal.

If a series of consecutive write cycles are to be performed, the $\overline{W}$ line may remain low until all desired locations have been written. When this method is used, data setup and hold times must be referenced to the rising edge of $\overline{E}$. By positioning the $\overline{W}$ pulse at different times within the $\overline{E}$ low time (TELEH), various types of write cycles may be performed.

If the $\overline{E}$ low time (TELEH) is greater than the $\overline{W}$ pulse (TWLWH) plus an output enable time (TELQX), a combination read write cycle is executed. Data may be modified an indefinite number of times during any write cycle (TELEH). The data input and data output pins may be tied together for use with a common I/O data bus structure. When using the RAM in this method allow a minimum of one output disable time (TWLQZ) after $\overline{W}$ goes low before applying input data to the bus. This will insure that the output buffers are not active.

Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from $\geq$20% of the wafers in a run. (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)

(2) The sample die shall be assembled and tested for functionality.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 2 x 10^4 Rad Si($\pm$10%) from a Gamma Cell 220 Cobalt 60 source or equivalent. The samples shall be biased at 5 volts with all inputs high. The dose rate shall be between 50 rads/sec and 200 rads/sec.

(4) I_{CCSB} at V_{CC} = 5 volts will be measured and recorded for each device within one hour ($\pm$15 minutes) after irradiation. The lot will be accepted only if the average of these measured values is $\leq$10mA.

Radiation Effects

The HS-6508RH is a radiation hardened memory processed with the same mask set as is used for HARRIS' equivalent commercial part. Latchup free operation, achieved by the use of special starting material and improved total dose hardness, is obtained with special high temperature processing cycles. These process techniques can, in principal, be applied to any standard HARRIS CMOS product.

The primary failure mode under exposure to ionizing radiation is an increase in static leakage current (ICCSB). Functional failure due to the increased leakage currents will typically occur for dose levels in excess of 5 x 10^4 RAD-SI. AC and DC parameters other than ICC will change less than 10% for total dose levels under 5 x 10^4 RAD-SI. The excess leakage currents will anneal at room temperature and are typically reduced by a factor of 3-10 within 24 hours after irradiation.

On a production basis, HARRIS is able to perform screens only for total dose hardness. Transient radiation tests, however, have shown the following results:

Latchup free to doses $\geq$ 5 x 10^{11} rads/sec.
Upset (loss of stored data) typically $\geq 10^8$ rads/sec.

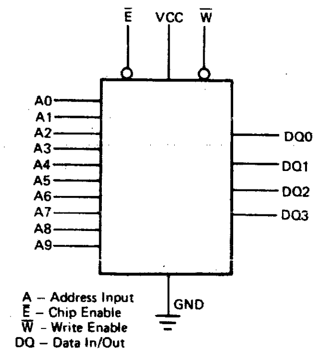
Description

The HS–6514RH is a 1024 x 4 static CMOS RAM fabricated using the Harris Custom Integrated Circuits Division radiation hardened self-aligned silicon gate technology. The device utilizes synchronous circuitry to achieve high performance and low power operation.

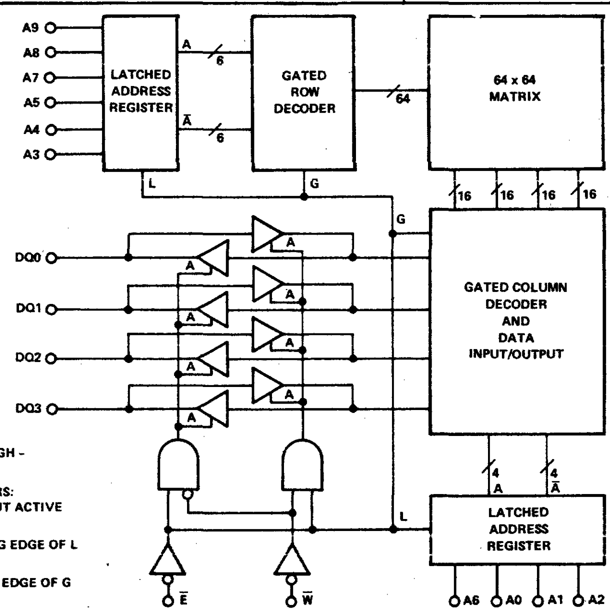
On-chip latches are provided for the addresses allowing efficient interfacing with microprocessor systems. The data output can be forced to a high impedance state for use in expanded memory systems.

The HS–6514RH is a fully static RAM and may be maintained in any state for an indefinite period of time.

Logic Symbol



Functional Diagram



Information on this device is preliminary. Data is subject to change unless otherwise specifically agreed. No obligations are assumed for notice of change or future manufacture of this device.

CAUTION: **These devices are sensitive to electrostatic discharge.**

Symbols and Abbreviations

This data sheet utilizes a new set of specification nomenclature. This new format is an IEEE and JEDEC supported standard for semiconductor memories. It is intended to clarify the symbols, abbreviations and definitions, and to make all memory data sheets consistent. We believe that, once acclimated, you will find this standardized format easy to read and use.

ELECTRICAL PARAMETER ABBREVIATIONS

All abbreviations use upper case letters with no subscripts. The initial symbol is one of these four characters:

V (Voltage)
I (Current)
P (Power)
C (Capacitance)

The second letter specifies input (I) or output (O), and the third letter indicates the high (H), low (L) or off (Z) state of the pin during measurements. Examples:

VIL — Input Low Voltage
IOZ — Output Leakage Current

TIMING PARAMETER ABBREVIATIONS

All timing abbreviations use upper case characters with no subscripts. The initial character is always T and is followed by four descriptors. These characters specify two signal points arranged in a "from-to" sequence that define a timing interval. The two descriptors for each signal point specify the signal name and the signal transitions. Thus the format is:

T X X X X

Signal name from which interval is defined
Transition direction for first signal
Signal name to which interval is defined
Transition direction for second signal

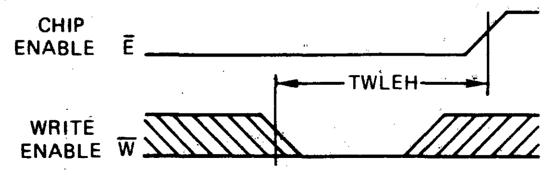
Signal Definitions:

A = Address
D = Data In
Q = Data Out
W = Write Enable
E = Chip Enable
S = Chip Select
G = Output Enable

Transition Definitions:

H = Transition to High
L = Transition to Low
V = Transition to Valid
X = Transition to Invalid or Don't Care
Z = Transition to Off (High Impedance)

EXAMPLE:



The example shows Write pulse setup time defined as TWLEH-Time from Write enable Low to chip Enable High.

TIMING LIMITS

The table of timing values shows either a minimum or a maximum limit for each parameter. Input requirements are specified from the external system point of view. Thus, address set-up time is shown as a minimum since the system must supply at least that much time (even though most devices do not require it). On the other hand, responses from the memory are specified from the device point of view. Thus, the access time is shown as a maximum since the device never provides data later than that time.

WAVEFORMS

WAVEFORM SYMBOL	INPUT	OUTPUT
	MUST BE VALID	WILL BE VALID
	CHANGE FROM H TO L	WILL CHANGE FROM H TO L
	CHANGE FROM L TO H	WILL CHANGE FROM L TO H
	DON'T CARE: ANY CHANGE PERMITTED	CHANGING: STATE UNKNOWN
	—	HIGH IMPEDANCE

ABSOLUTE MAXIMUM RATINGS

Supply Voltage – (VCC -GND)	-0.3V to +7.0V
Input or Output Voltage Applied	(GND -0.3V) to (VCC + 0.3V)
Storage Temperature	-65°C to +150°C

OPERATING RANGE

Operating Supply Voltage	4.5V to 5.5V
Operating Temperature	–55°C to +125°C

CAUTION: To prevent permanent damage to this device, care should be exercised to insure that the absolute maximum ratings for supply voltages, temperature and voltage or current at any pin is not exceeded during both static and dynamic operation.

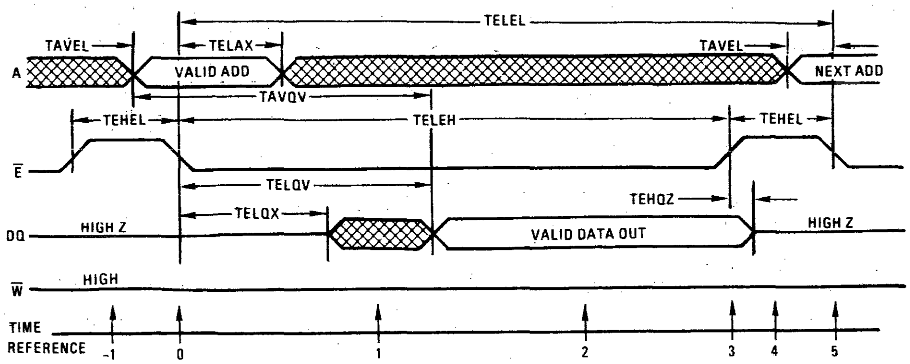
CUSTOM/SEMICUSTOM

Read Cycle



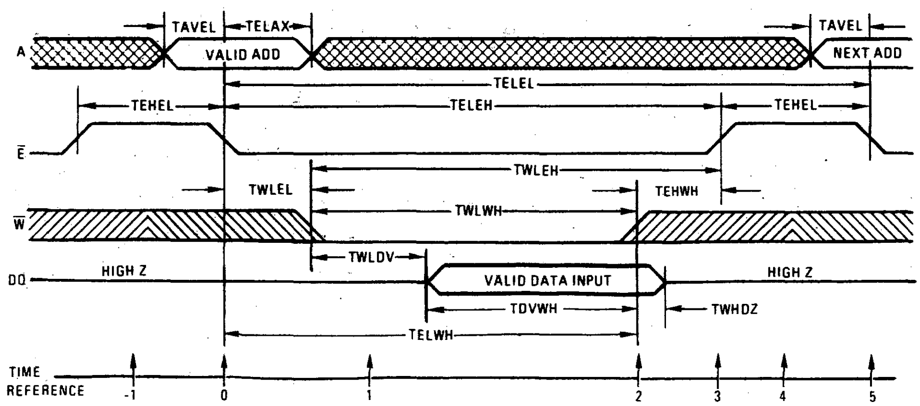
TRUTH TABLE

TIME REFERENCE	INPUTS E	W	A	DATA I/O DQ	FUNCTION
1	H	X	X	Z	MEMORY DISABLED
0	⌐_	H	V	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	H	X	X	OUTPUT ENABLED
2	L	H	X	V	OUTPUT VALID
3	_/	H	X	V	READ ACCOMPLISHED
4	H	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS -1)
5	⌐_	H	V	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The address information is latched in the on chip registers on the falling edge of $\overline{E}$ (T = 0). Minimum address setup and hold time requirements must be met. After the required hold time the addresses may change state without affecting device operation. During time (T = 1) the outputs become enabled but data is not valid until time (T = 2).

$\overline{W}$ must remain high throughout the read cycle. After the data has been read $\overline{E}$ may return high (T = 3). This will force the output buffers into a high impedance mode at time (T = 4). The memory is now ready for the next cycle.

Write Cycle



TRUTH TABLE

TIME REFERENCE	INPUTS E	W	A	DQ	FUNCTION
-1	H	X	X	Z	MEMORY DISABLED
0	⌐_	X	V	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	L	X	Z	WRITE PERIOD BEGINS
2	L	_/	X	V	DATA IN IS WRITTEN
3	_/	H	X	Z	WRITE COMPLETED
4	H	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS -1)
5	⌐_	X	V	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The write cycle is initiated by the falling edge of $\overline{E}$ (T = 0), which latches the address information in the on chip registers. There are two basic types of write cycles, which differ in the control of the common data-in/data-out bus.

Case 1: $\overline{E}$ falls before $\overline{W}$ falls

The output buffers may become enabled (reading) if $\overline{E}$ falls before $\overline{W}$ falls. $\overline{W}$ is used to disable (three-state) the outputs so input data can be applied. TWLDV must be met to allow the $\overline{W}$ signal time to disable the outputs before applying input data. Also, at the end of the cycle the outputs may become active if $\overline{W}$ rises before E. The RAM outputs will disable (three-state) after E rises (TEHQZ). In this type of write cycle TWLEL and TEHWH may be ignored.

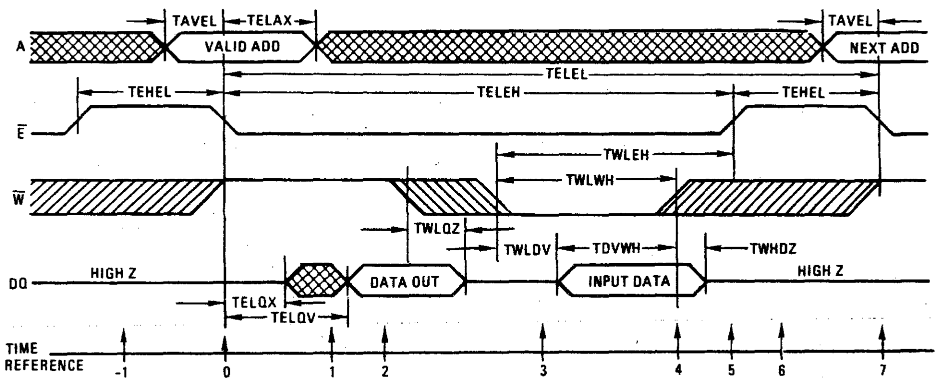
Case 2: $\overline{E}$ falls equal to or after $\overline{W}$ falls, and $\overline{E}$ rises before or equal to $\overline{W}$ rises.

This $\overline{E}$ and $\overline{W}$ control timing will guarantee that the data outputs will stay disabled throughout the cycle, thus simplifying the data input timing. TWLEL and TEHWH must be met but TWLDV becomes meaningless and can be ignored. In this cycle TDVWH and TWHDZ become TDVEH and TEHDZ. In other words, reference data setup and hold times to the $\overline{E}$ rising edge.

	IF	OBSERVE	IGNORE
Case 1	$\overline{E}$ falls before $\overline{W}$	TWLDV	TWLEL
Case 2	$\overline{E}$ falls after $\overline{W}$ & $\overline{E}$ rises before $\overline{W}$	TWLEL TEHWH	TWLDV TWHDV

If a series of consecutive write cycles are to be performed, $\overline{W}$ may be held low until all desired locations have been written (an extension of Case 2).

Read Modify Write Cycle



TRUTH TABLE

TIME REFERENCE	INPUTS $\overline{E}$	$\overline{W}$	A	DATA I/O DQ	FUNCTION
-1	H	X	X	Z	MEMORY DISABLED
0	↓	H	V	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	H	X	X	READ MODE, OUTPUT ENABLED
2	L	H	X	V	READ MODE, OUTPUT VALID
3	L	L	X	Z	WRITE MODE, OUTPUT HIGH Z
4	L	↑	X	V	WRITE MODE, DATA IS WRITTEN
5	↑	H	X	Z	WRITE COMPLETED
6	H	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS -1)
7	↓	H	V	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

If the pulse width of $\overline{W}$ is relatively short in relation to that of $\overline{E}$ a combination read-write cycle may be performed. If $\overline{W}$ remains high for the first part of the cycle, the outputs will become active during time (T = 1). Data out will be valid during time (T = 2). After the data is read, $\overline{W}$ can go low. After minumum TWLWH, $\overline{W}$ may return high. The information just written may now be read or $\overline{E}$ may return high, disabling the output buffers and preparing the device for the next cycle. Any number or sequence of read-write operations may be performed while $\overline{E}$ is low providing all timing requirements are met.

NOTES:

In the above descriptions the numbers in parenthesis (T = n) refer to the respective timing diagrams. The numbers are located on the time reference line below each diagram. The timing diagrams shown are only examples and are not the only valid method of operation.

Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from ≥ 20% of the wafers in a run. (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)

(2) The sample die shall be assembled and tested to the production test program for proper operation.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 1 x 10^5 Rad Si (± 10%) from a Gamma Cell 220 Cobalt 60 source or equivalent. The samples shall be biased at 5 volts with all inputs high. The dose rate shall be between 50 rads/sec and 200 rads/sec.

(4) The samples will be tested to the data sheet limits within one hour (±15 minutes) after irradiation. The lot will be accepted only if all units, exclusive of non-radiation failures, meet the data sheet limits.

Radiation Effects

The HS-6514RH is an RH memory designed to survive in a radiation environment and to meet the electrical characteristics and be pin compatible to the Harris equivalent commercial part. Latchup free operation, achieved by the use of special starting material and improved total dose hardness, is obtained with special high temperature processing cycles. These process techniques can, in principle, be applied to any standard HARRIS CMOS product.

On a production basis, HARRIS only performs screens for total dose hardness to a level of 1 x 10^5 rad-Si. Transient radiation tests, however, have shown the following results:

Latchup free to doses ≥ 5 x 10^{11} rads/sec.
Upset (loss of stored data) typically ≥ 10^8 rads/sec.

VIL — Input Low Voltage
IOZ — Output Leakage Current

TIMING PARAMETER ABBREVIATIONS

All timing abbreviations use upper case characters with no subscripts. The initial character is always T and is followed by four descriptors. These characters specify two signal points arranged in a "from-to" sequence that define a timing interval. The two descriptors for each signal point specify the signal name and the signal transitions. Thus the format is:

T X X X X

Signal name from which interval is defined
Transition direction for first signal
Signal name to which interval is defined
Transition direction for second signal

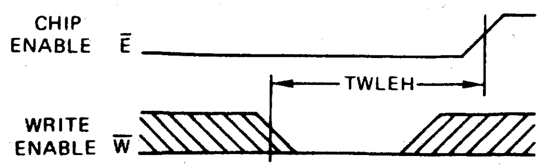
Signal Definitions:

A = Address
D = Data In
Q = Data Out
W = Write Enable
E = Chip Enable
S = Chip Select
G = Output Enable

Transition Definitions:

H = Transition to High
L = Transition to Low
V = Transition to Valid
X = Transition to Invalid or Don't Care
Z = Transition to Off (High Impedance)

EXAMPLE:



The example shows Write pulse setup time defined as TWLEH-Time from Write enable Low to chip Enable High.

TIMING LIMITS

The table of timing values shows either a minimum or a maximum limit for each parameter. Input requirements are specified from the external system point of view. Thus, address set-up time is shown as a minimum since the system must supply at least that much time (even though most devices do not require it). On the other hand, responses from the memory are specified from the device point of view. Thus, the access time is shown as a maximum since the device never provides data later than that time.

WAVEFORMS

WAVEFORM SYMBOL	INPUT	OUTPUT
	MUST BE VALID	WILL BE VALID
	CHANGE FROM H TO L	WILL CHANGE FROM H TO L
	CHANGE FROM L TO H	WILL CHANGE FROM L TO H
	DON'T CARE: ANY CHANGE PERMITTED	CHANGING: STATE UNKNOWN
	—	HIGH IMPEDANCE

ABSOLUTE MAXIMUM RATINGS

Supply Voltage -VCC	+7V
Applied Input or Output Voltage	GND -0.3V VCC +0.3V
Storage Temperature	-65°C to +150°C

OPERATING RANGE

Operating Supply Voltage -VCC	4.5V to 5.5V
Operating Temperature	-55°C to +125°C

CAUTION: To prevent permanent damage to this device, care should be exercised to insure that the absolute maximum ratings for supply voltages, temperature and voltage or current at any pin is not exceeded during both static and dynamic operation.

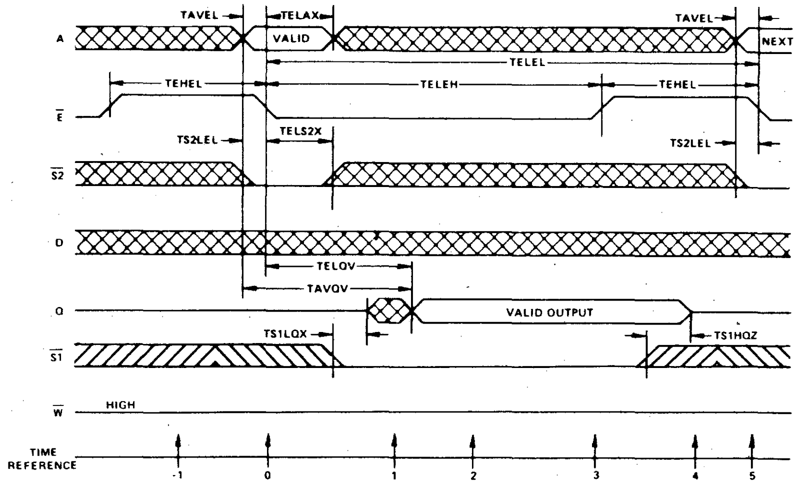
NOTES:
1. All devices tested at worst case limits. Room temp., 5 volt data provided for information – not guaranteed.
2. Operating Supply Current (ICCOP) is proportional to Operating Frequency. Example: Typical ICCOP = 1.5mA/MHz.
3. Capacitance sampled and guaranteed – not 100% tested.
4. AC Test Conditions: Inputs – TRISE = TFALL = 20nsec; Outputs – 1 TTL load and 50pF. All timing measurements at 1/2 VCC.
5. Pre-radiation characteristics, see radiation effects for Post-Radiation characteristics.

Read Cycle



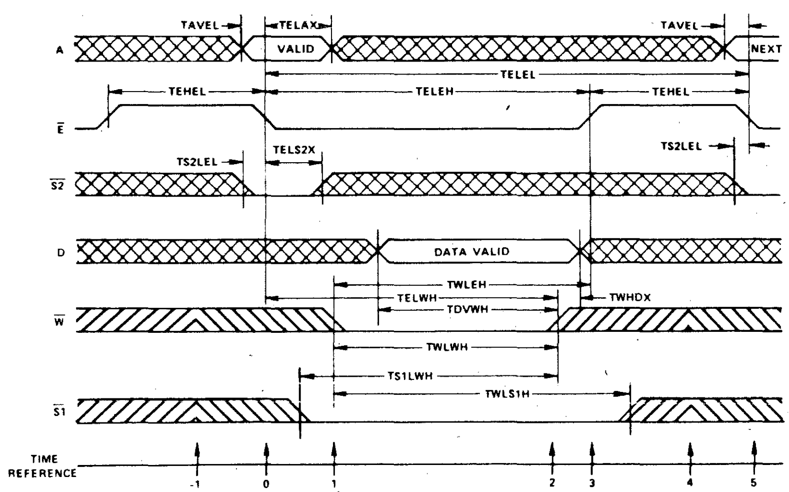
TRUTH TABLE

TIME REFERENCE	INPUTS E	S̅1	S̅2	W̅	A	D	OUTPUTS Q	FUNCTION
-1	H	H	X	X	X	X	Z	MEMORY DISABLED
0	↘	X	L	H	V	X	Z	ADDRESSES AND S̅2 ARE LATCHED, CYCLE BEGINS
1	L	L	X	H	X	X	X	OUTPUT ENABLED BUT UNDEFINED
2	L	L	X	H	X	X	V	DATA OUTPUT VALID
3	↗	L	X	H	X	X	V	OUTPUTS LATCHES, VALID DATA
4	H	H	X	X	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS -1)
5	↘	X	L	H	V	X	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The HS-6551RH Read Cycle is initiated by the falling edge of E̅. This signal latches the input address word and S̅2 into on-chip registers providing that minimum setup and hold times are met. After the required hold time, these inputs may change state without affecting device operation. S̅2 acts as a higher order address and simplifies decoding. For the output to be read, E̅, S̅1 must be low and W̅ must be high. S̅2 must have been latched low on the falling edge of E̅. The output data will be valid at access time (TELQV).

The HS-6551RH has output data latches that are controlled by E̅. On the rising edge of E̅ the present data is latched and remains in that state until E̅ falls. Either or both S̅1 or S̅2 may be used to force the output buffers into a high impedance state.

Write Cycle



TRUTH TABLE

TIME REFERENCE	INPUTS						OUTPUTS	FUNCTION
	E	S1	S2	W	A	D	Q	
-1	H	H	X	X	X	X	Z	MEMORY DISABLED
0	↓	X	L	X	V	X	Z	CYCLE BEGINS, ADDRESSES AND $\overline{S2}$ ARE LATCHED
1	L	L	X	↓	X	X	Z	WRITE PERIOD BEGINS
2	L	L	X	↑	X	V	Z	DATA IN IS WRITTEN
3	↑	X	X	H	X	X	Z	WRITE IS COMPLETED
4	H	H	X	X	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS -1)
5	↓	X	L	X	V	X	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

In the Write Cycle the falling edge of $\overline{E}$ latches the addresses and $\overline{S2}$ into on-chip registers. $\overline{S2}$ must be latched in the low state to enable the device. The write portion of the cycle is defined as $\overline{E}$, $\overline{W}$, $\overline{S1}$ being low and $\overline{S2}$ being latched low simultaneously. The $\overline{W}$ line may go low at any time during the cycle providing that the write pulse setup times (TWLEH and TWLS1H) are met. The write portion of the cycle is terminated on the first rising edge of either $\overline{E}$, $\overline{W}$, or $\overline{S1}$.

If a series of consecutive write cycles are to be executed, the $\overline{W}$ line may be held low until all desired locations have been written. If this method is used, data setup and hold times must be referenced to the first rising edge of $\overline{E}$ or $\overline{S1}$. By positioning the write pulse at different times within the $\overline{E}$ and $\overline{S1}$ low time (TELEH) various types of write cycles may be performed. If the $\overline{S1}$ low time (TS1LS1H) is greater than the $\overline{W}$ pulse plus an output enable time (TS1LQX), a combination read-write cycle is executed. Data may be modified an indefinite number of times during any write cycle (TELEH).

The HS-6551RH may be used on a common I/O bus structure by tying the input and output pins together. The multiplexing is accomplished internally by the $\overline{W}$ line. In the write cycle, when $\overline{W}$ goes low, the output buffers are forced to a high impedance state. One output disable time delay (TWLQZ) must be allowed before applying input data to the bus.

Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from $\geq$20% of the wafers in a run. (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)

(2) The sample die shall be assembled and tested for functionality.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 2 x 10^4 Rad Si (+10%) from a Gamma Cell 220 Cobalt 60 source or equivalent. The samples shall be biased at 5 volts with all inputs high. The dose rate shall be between 50 rads/sec and 200 rads/sec.

(4) I_{CCSB} at V_{CC} = 5 volts will be measured and recorded for each device within one hour ($\pm$15 minutes) after irradiation. The lot will be accepted only if the average of these measured values is $\leq$10mA.

Radiation Effects

The HS-6551RH is a radiation hardened memory processed with the same mask set as is used for HARRIS' equivalent commercial part. Latchup free operation is achieved by the use of special starting material and improved total dose hardness is obtained with special high temperature processing cycles. These process techniques can, in principal, be applied to any standard HARRIS CMOS product.

The primary failure mode under exposure to ionizing radiation is an increase in static leakage current (ICCSB). Functional failure due to the increased leakage currents will typically occur for dose levels in excess of 5 x 10^4 RAD-Si. AC and DC parameters other than ICC will change less than 10% for total dose levels under 5 x 10^4 RAD-Si. The excess leakage currents will anneal at room temperature and are typically reduced by a factor of 3-10 within 24 hours after irradiation.

On a production basis, HARRIS is able to perform screens only for total dose hardness. Transient radiation tests, however, have shown the following results:

Latchup free to doses $\geq$ 5 x 10^{11} rads/sec.
Upset (loss of stored data) typically $\geq$ 10^8 rads/sec.

HARRIS

HS-6564RH

Radiation Resistant

8K x 8, 16K x 4 CMOS RAM

Preliminary

Features

- LOW POWER STANDBY — 500µW MAX
- LOW POWER OPERATION — 180mW/MHz MAX
- DATA RETENTION — 3.0 V MIN
- TTL COMPATIBLE IN/OUT
- THREE STATE OUTPUTS
- FAST ACCESS TIME — 250 nsec TYP.
- MILITARY TEMPERATURE RANGE — -55°C TO +125°C
- ON CHIP ADDRESS REGISTERS
- ORGANIZABLE 8K×8 OR 16K×4
- 40 PIN DIP PINOUT 2.000″ × 0.900″
- FUNCTIONAL TOTAL DOSE — 1×10^5 RAD Si
- DATA UPSET — $>10^8$ RAD Si/SEC
- LATCH-UP FREE TO — $>5\times10^{11}$ RAD Si/SEC

Description

The HS-6564RH is a radiation resistant 64K bit, synchronous CMOS RAM. It consists of 16 HS-6504RH 4K×1 radiation resistant CMOS RAMs, in leadless carriers, mounted on a ceramic substrate. The HS-6564RH is configured as an extra wide, standard length 40 pin DIP. The memory appears to the system as an array of 16 4K×1 static RAMs. The array is organized as two 8K by 4 blocks of RAM sharing only the address bus. The data inputs, data outputs, chip enables and write enables are separate for each block of RAM. This allows the user to organize the HS-6564RH RAM as either an 8K by 8 or a 16K by 4 array.

This 64K memory provides a unique blend of low power CMOS semiconductor technology and advanced packaging techniques. The HS-6564RH is intended for use in radiation environments where a large amount of RAM is needed, and where power consumption and board space are prime concerns. On-chip latches are provided for addresses, data input and data output allowing efficient interfacing with microprocessor systems. The data output can be forced to a high impedance for use in expanded memory arrays. The guaranteed low voltage data retention characteristics allow easy implementation of non-volatile read/write memory by using very small batteries mounted directly on the memory circuit board.

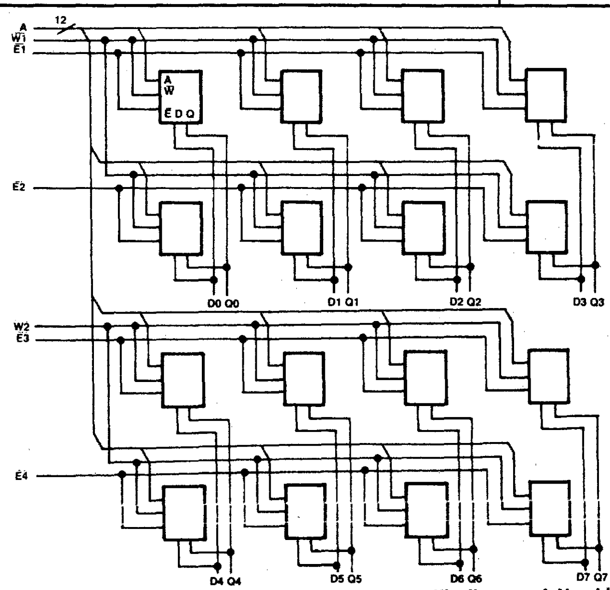
Q7	19	22	Q3
*VCC	20	21	GND*

***NOTES:**

Pins 20 and 40 (VCC) are internally connected. Similarly pins 1 and 21 (Ground) are connected. The user is advised to connect all four VCC pins and Ground pins to his board busses. This will improve power distribution across the array and will enhance decoupling.

Pin 10 is internally connected to pin 11, and pin 30 is connected to pin 31. For those users wishing to preserve board compatibility with possible future RAM arrays, we recommend connections to the write lines be made at pins 11 and 31, leaving pins 10 and 30 free for future expansion.

Functional Diagram



Information on this device is preliminary. Data is subject to change unless otherwise specifically agreed. No obligations are assumed for notice of change or future manufacture of this device.

CAUTION: These devices are sensitive to electronic discharge. Proper I.C. handling procedures should be followed.

Harris Semiconductor

CUSTOM/SEMICUSTOM

Symbols and Abbreviations

This data sheet utilizes a new set of specification nomenclature. This new format is an IEEE and JEDEC supported standard for semiconductor memories. It is intended to clarify the symbols, abbreviations and definitions, and to make all memory data sheets consistent. We believe that, once acclimated, you will find this standardized format easy to read and use.

ELECTRICAL PARAMETER ABBREVIATIONS

All abbreviations use upper case letters with no subscripts. The initial symbol is one of these four characters:

V (Voltage)
I (Current)
P (Power)
C (Capacitance)

The second letter specifies input (I) or output (O), and the third letter indicates the high (H), low (L) or off (Z) state of the pin during measurements. Examples:

VIL – Input Low Voltage
IOZ – Output Leakage Current

TIMING PARAMETER ABBREVIATIONS

All timing abbreviations use upper case characters with no subscripts. The initial character is always T and is followed by four descriptors. These characters specify two signal points arranged in a "from-to" sequence that define a timing interval. The two descriptors for each signal point specify the signal name and the signal transitions. Thus the format is:

T X X X X
Signal name from which interval is defined (1st X)
Transition direction for first signal (2nd X)
Signal name to which interval is defined (3rd X)
Transition direction for second signal (4th X)

Signal Definitions:

A = Address
D = Data In
Q = Data Out
W = Write Enable
E = Chip Enable
S = Chip Select
G = Output Enable

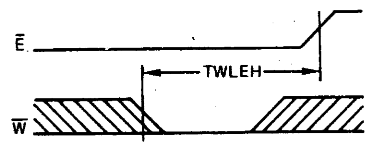
Transition Definitions:

H = Transition to High
L = Transition to Low
V = Transition to Valid
X = Transition to Invalid or Don't Care
Z = Transition to Off (High Impedance)

EXAMPLE:

CHIP ENABLE

WRITE ENABLE



The example shows Write pulse setup time defined as TWLEH-Time from Write enable Low to chip Enable High.

TIMING LIMITS

The table of timing values shows either a minimum or a maximum limit for each parameter. Input requirements are specified from the external system point of view. Thus, address set-up time is shown as a minimum since the system must supply at least that much time (even though most devices do not require it). On the other hand, responses from the memory are specified from the device point of view. Thus, the access time is shown as a maximum since the device never provides data later than that time.

WAVEFORMS

WAVEFORM SYMBOL	INPUT	OUTPUT
	MUST BE VALID	WILL BE VALID
	CHANGE FROM H TO L	WILL CHANGE FROM H TO L
	CHANGE FROM L TO H	WILL CHANGE FROM L TO H
	DON'T CARE: ANY CHANGE PERMITTED	CHANGING: STATE UNKNOWN
	—	HIGH IMPEDANCE

ABSOLUTE MAXIMUM RATINGS*

Supply Voltage – (VCC – GND)	−0.3V to +7.0V
Input or Output Voltage Applied	(GND −0.3V) to (VCC +0.3V)
Storage Temperature	−65°C to +150°C

OPERATING RANGE

Operating Supply Voltage	+4.5 to +5.5V
Operating Temperature	−55°C to +125°C

** CAUTION: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied.*

	CO2	Output Capacitance (16K × 4) ③		100			pF	f = 1MHz, VO = VCC or GND

NOTES:

① Each individual RAM in the leadless carrier is fully tested at worst case limits of temperature and voltage. The complete assembled HS-6564RH array is tested at room temperature only. The worst case parameters are guaranteed over the specified temperature and voltage ranges. Room temperature, 5 volt data is provided for information purposes and is not guaranteed.

② Operating supply current is proportional to operating frequency. ICCOP is specified at an operating frequency of 1MHz, indicating repetive accessing at a 1μs rate. Operation at slower rates will decrease ICCOP proportionally.

③ Capacitance sampled and guaranteed – not 100% tested.

④ Pre Radiation and Post Radiation limits.

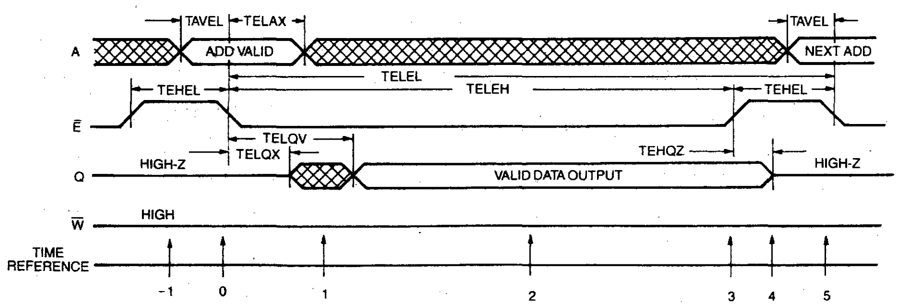
Read Cycle

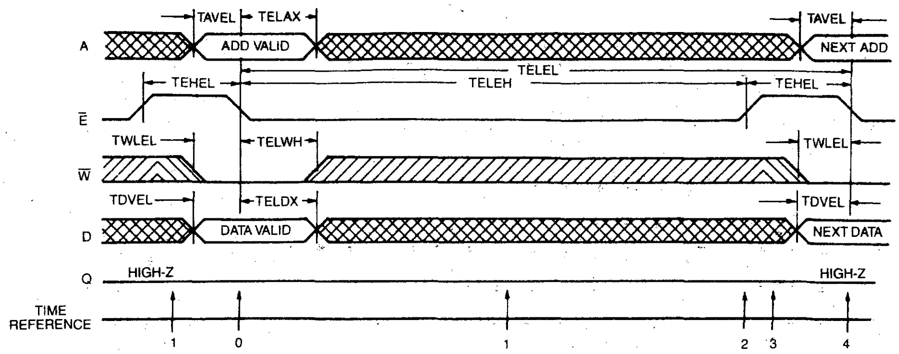


TRUTH TABLE

TIME REFERENCE	INPUTS E	W	A	OUTPUT Q	FUNCTION
−1	H	X	X	Z	MEMORY DISABLED
0	↓	H	V	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	H	X	X	OUTPUT ENABLED
2	L	H	X	V	OUTPUT VALID
3	↑	H	X	V	READ ACCOMPLISHED
4	H	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS −1)
5	↓	H	V	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The address information is latched in the on chip registers on the falling edge of E (T = 0). Minimum address set up and hold time requirements must be met. After the required hold time, the addresses may change state without affecting device operation. During time (T = 1) the output becomes enabled but data is not valid until during time (T = 2). W must remain high until after time (T = 2). After the output data has been read, E may return high (T = 3). This will disable the output buffer and ready the RAM for the next memory cycle (T = 4).

Early Write Cycle

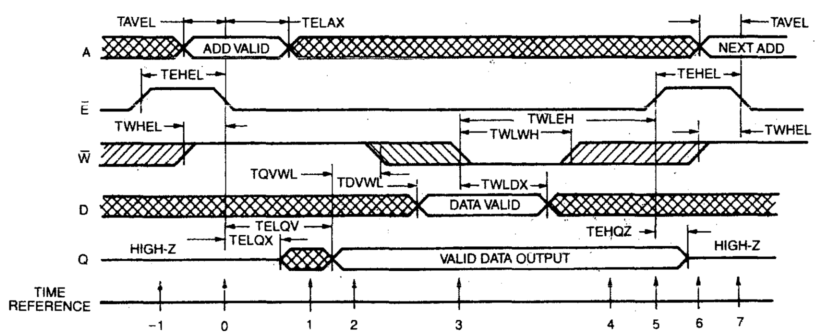


TRUTH TABLE

TIME REFERENCE	INPUTS Ē	W̄	A	D	OUTPUT Q	FUNCTION
−1	H	X	X	X	Z	MEMORY DISABLED
0	↘	L	V	V	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	X	X	X	Z	WRITE IN PROGRESS INTERNALLY
2	↗	X	X	X	Z	WRITE COMPLETED
3	H	X	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS −1)
4	↘	L	V	V	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The early write cycle is the only cycle where the output is guaranteed not to become active. On the falling edge of Ē (T = 0), the addresses, the write signal, and the data input are latched in on chip registers. The logic value of W̄ at the time Ē falls determines the state of the output buffer for that cycle. Since W̄ is low when Ē falls, the output buffer is latched into the high impedance state and will remain in that state until Ē returns high (T = 2). For this cycle, the data input is latched by Ē going low; therefore data set up and hold times should be referenced to Ē. When Ē (T = 2) returns to the high state, the output buffer disables and all signals are unlatched. The device is now ready for the next cycle.

Read Modify Write Cycle



TRUTH TABLE

TIME REFERENCE	INPUTS Ē	W̄	A	D	OUTPUT Q	FUNCTION
−1	H	X	X	X	Z	MEMORY DISABLED
0	↘	H	V	X	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	H	X	X	X	OUTPUT ENABLED
2	L	H	X	X	V	OUTPUT VALID, READ AND MODIFY TIME
3	L	↘	X	V	V	WRITE BEGINS, DATA IS LATCHED
4	L	X	X	X	V	WRITE IN PROGRESS INTERNALLY
5	↗	X	X	X	V	WRITE COMPLETED
6	H	X	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS −1)
7	↘	H	V	X	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The read modify write cycle begins as all other cycles on the falling edge of Ē (T = 0). The W̄ line should be high at (T = 0) in order to latch the output buffers in the active state. During (T = 1) the output will be active but not valid until (T = 2). On the falling edge of the W̄ (T = 3) the data present at the output and input are latched. The W̄ signal also latches itself on its low going edge. All input signals excluding Ē have been latched and have no further effect on the RAM. The rising edge of Ē (T = 5) completes the write portion of the cycle and unlatches all inputs and output. The output goes to a high impedance and the RAM is ready for the next cycle.

NOTES: In the above descriptions the numbers in parenthesis (T = n) refer to the respective timing diagrams. The numbers are located on the time reference line below each diagram. The timing diagrams shown are only examples and are not the only valid method of operation.

Board Size Tradeoffs

Printed circuit board real estate is a costly commodity. Actual board costs depend on layout tolerances, density, complexity, number of layers, choice of board material, and other factors.

The following table compares board space for 16 standard DIP 4K RAMs to the HS-6564RH RAM array. Both fine line, close tolerance layout and standard "easy" layout board sizes are shown in the comparison.

64K ARRAY OF 16 4K RAMs ON A PC BOARD V.S. THE HS-6564RH

PACKAGE	CIRCUIT SUBSTRATE	SIZE
18 Pin DIP	Standard Two Sided PCB	12 to 15 sq. in.
18 Pin DIP	Fine Line or Multilayer PCB	9 to 11 sq. in.
18 Pin Leadless Carrier	Multilayer Alumina Substrate	3 to 5 sq. in.
HS-6564RH	Two Sided Mounting Multilayer Alumina Substrate	2 sq. in.

The cost of semiconductor circuits decline with time. If actual costs were included, they would be out of date in a very short time. We urge you to contact your local Harris office or sales representative for accurate pricing allowing cost tradeoff analysis. In your cost analysis, also consider the advantages of a lighter, smaller overall package for your system. Consider how much more valuable your system will be when the memory array size is decreased to about 1/6 of normal size.

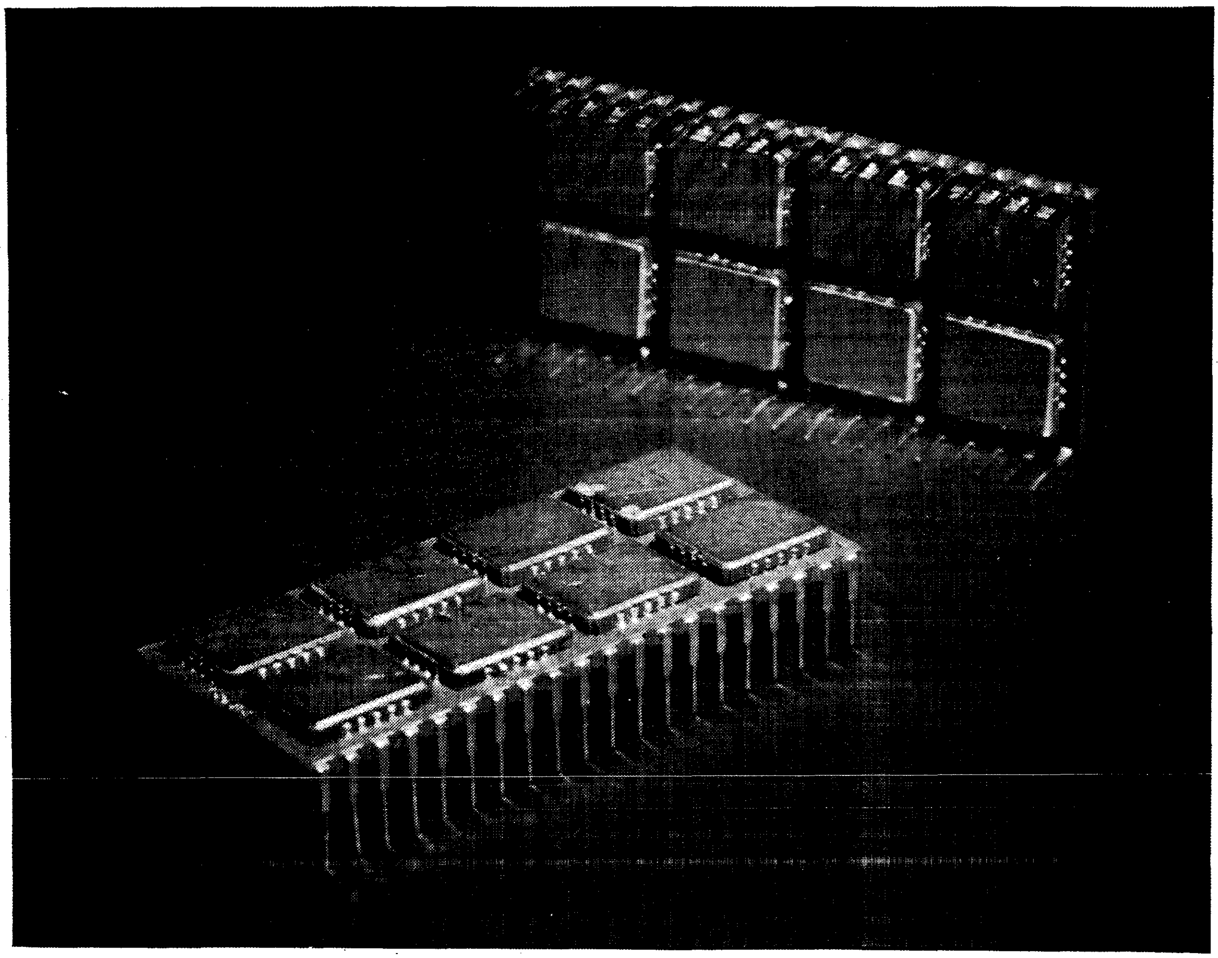
Consider how much more valuable your system will be when the memory array size is decreased to about 1/6 of normal size.



HS-6564RH – 64K BIT CMOS RAM

Organization Guide

To Organize 8K × 8:		To Organize 16K × 4:	
Connect: $\overline{E}$1 with $\overline{E}$3	(Pins 9 + 32)	Connect: Q0 with Q4	(Pins 2 + 39)
$\overline{E}$2 with $\overline{E}$4	(Pins 12 + 29)	D0 with D4	(Pins 3 + 38)
$\overline{W}$1 with $\overline{W}$2	(Pins 11 + 31)	Q1 with Q5	(Pins 4 + 37)
		D1 with D5	(Pins 5 + 36)
		D2 with D6	(Pins 16 + 25)
		Q2 with Q6	(Pins 17 + 24)
		D3 with D7	(Pins 18 + 23)
		Q3 with Q7	(Pins 19 + 22)
		Optional $\overline{W}$1 may be common with $\overline{W}$2	(Pins 11 + 31)

Concerns for Proper Operation of Chip Enables:

The transition between blocks of RAM requires a change in the chip enable being used. When operating in the 8K × 8 mode, use the chip enables as if there were only two, $\overline{E}$1 and $\overline{E}$2. In the 16K × 4 mode, all chip enables must be treated separately. Transitions between chip enables must be treated with the same timing constraints that apply to any one chip enable. All chip enables must be high at least one chip enable high time (TEHEL) before any chip enable can fall. More than one chip enable low simultaneously, for devices whose outputs are tied common either internally or externally, is an illegal input condition and must be avoided.

Printed Circuit Board Mounting:

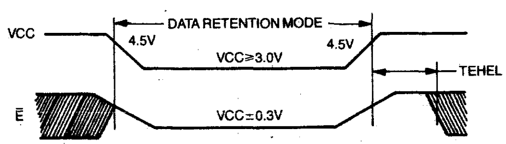
The leadless chip carrier packages used in the HS-6564RH have conductive lids. These lids are electrically floating, not connected to VCC or GND. The designer should be aware of the possibility that the carriers on the bottom side could short conductors below if pressed completely down against the surface of the circuit board. The pins on the package are designed with a standoff feature to help prevent the leadless carriers from touching the circuit board surface.

Low Voltage Data Retention

HARRIS CMOS RAMs are designed with battery backup in mind. Data retention voltage and supply current are guaranteed over temperature. The following rules insure data retention:

1. Chip Enable ($\overline{E}$) must be held high during data retention; within VCC + 0.3V to VCC − 0.3V.
2. All other inputs should be held either high (at CMOS VCC) or at ground to minimize ICCDR.
3. Inputs which are to be held high (e.g. $\overline{E}$) must be kept between VCC + 0.3V and 70% of VCC during the power up and power down transitions.
4. The RAM can begin operation one TEHEL after VCC reaches the minimum operating voltage (4.5 volts).

DATA RETENTION TIMING



Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from ≥ 20% of the wafers in a run. (All wafers in a "run" will have been processed together through all high temperature processing steps and through metal-lization.)

(2) The sample die shall be assembled and tested for functionality.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 1×10^5 Rad Si (± 10%) from a Gamma Cell 220 Cobalt 60 source or equivalent. The samples shall be biased at 5 volts with all inputs high. The dose rate shall be between 50 rads/sec and 200 rads/sec.

(4) The samples will be tested to the data sheet limits within one hour (± 15 minutes) after irradiation. The lot will be accepted only if all units, exclusive of non-radiation failures, meet the data sheet limits.

Radiation Effects

The HS-6564RH is a radiation resistant memory module designed to survive in a radiation environment and to meet the electrical characteristics and be pin compatible to the Harris equivalent commercial part. Latchup free operation, achieved by the use of special starting material and improved total dose hardness, is obtained with special high temperature processing cycles. These process techniques can, in principle, be applied to any standard HARRIS CMOS product.

On a production basis, HARRIS only performs screens for total dose hardness to a level of 1×10^5 rad-Si. Transient radiation tests, however, have shown the following results:

Latchup free to doses $\geq 5 \times 10^{11}$ rads/sec.
Upset (loss of stored data) typically $\geq 10^8$ rads/sec.

HARRIS

CUSTOM INTEGRATED CIRCUITS DIVISION

HS-3516RH

High Slew Rate, Wideband, Radiation Resistant, Operational Amplifier

HARRIS

Preliminary

Features

- HIGH SLEW RATE . . . . >±22V/µs
- FAST SETTLING TIME 450ns
- WIDE POWER BANDWIDTH. 12MHz
- LOW OFFSET VOLTAGE. . . . . ±5mV
- LOW POWER SUPPLY CURRENT 6.5mA
- SHORT CIRCUIT PROTECTION
- RADIATION ENVIRONMENT
  - NEUTRON FLUENCE (ϕ) 5×10^{12} n/cm^2 (E≥10KeV)
  - GAMMA RATE ($\dot{\gamma}$) . . . . . 1×10^9 RADs Si/s
  - GAMMA DOSE (γ) . . . . . . 1×10^6 RADs Si

Description

The HS-3516RH is a monolithic, high slew rate, wideband, radiation resistant, operational amplifier. It provides a bandwidth (unity gain stable) of greater than 10MHz and a slew rate in excess of 22V/µsec. Optional frequency compensation adjustment is provided. The HS-3516RH has an internal unity gain frequency compensation capacitor which is internally connected. A clamp node feature enables the user to clamp the output voltage via pin 3 which can source or sink up to 3mA for high frequency clamped switching purposes.

This device is designed to operate from −55°C to +125°C and in strategic-level radiation environments.

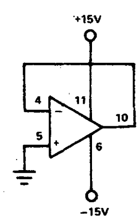
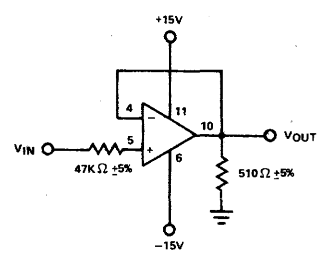
IRRADIATION CIRCUIT



BURN-IN CIRCUIT



V_{IN} = 50 KHz SQUARE WAVE 50% DUTY CYCLE −4.0V TO +4.0V

Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from ≥ 20% of the wafers in a run. (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)

(2) The sample die shall be assembled and tested for functionality.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 1×10^6 Rad (Si) ±10% from a gamma cell 220 cobalt 60 source or equivalent. The devices will be powered in the configuration illustrated with VSUPPLY = ±15V. The dose rate shall be between 50 rads/sec and 200 rads/sec.

(4) AVOL, VIO, and IBIAS, with VSUPPLY = ±15V, will be measured and recorded for each device within one hour after irradiation. The lot will be accepted only if the sample, exclusive of non-radiation failures, meets the limits of AVOL ≥ 80dB, VIO ≤ ±5.0mV and IBIAS ≤ ±400nA at room temperature.

Radiation Effects

(1) Total Dose

Little or no effect will be observed at 1×10^5 Rad (Si). IBIAS, IIO, and AVOL starts to degrade between 1×10^5 and 1×10^6 Rad (Si).

(2) Dose Rate

Devices are constructed in DI and consequently are latchup free.

(3) Neutron Fluence

Performance degradation is insignificant at 5×10^{12}n/cm^2.

HARRIS

HS-3530RH

Low Power-Radiation Resistant Programmable Operational Amplifier

Features

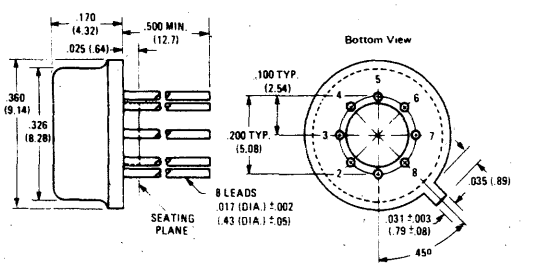
- WIDE RANGE AC PROGRAMMING
  - SLEW RATE 06 TO3V/μs
  - GAIN X BANDWIDTH . . . . 100KHz TO 5.0MHz
- WIDE RANGE DC PROGRAMMING
  - POWER SUPPLY RANGE . . . . $\pm$1.5V TO $\pm$18V
  - SUPPLY CURRENT . . . . 10μA TO 1.2mA
- SHORT CIRCUIT PROTECTION
- RADIATION ENVIRONMENT
  - NEUTRON FLUENCE(ϕ) . 5 x 10^{12} n/cm^2 (E $\geq$ 10KeV)
  - GAMMA RATE($\dot{\gamma}$) . . . . 1 x 10^9 RADS (Si)/s
  - GAMMA DOSE(γ) . . . . 1 x 10^6 RADS (Si)

Description

The HS-3530 is a Low Power Operational Amplifier which is an internally compensated monolithic device offering a wide range of performance specifications. Parameters such as power dissipation, slew rate, bandwidth, noise and input DC parameters are programmed by selecting an external resistor or current source. Supply voltages as low as $\pm$3 volts may be used with little degradation of AC performance. The HS-3530 has been specifically designed to meet exposure to radiation environments. Operation from $-55°C$ to $+125°C$ is guaranteed.

A major advantage of the HS-3530 is that operating characteristics remain virtually constant over a wide supply range (+3V to +15V), allowing the amplifier to offer maximum performance in almost any system, including battery operated equipment. A primary application for this device is in active filtering and conditioning for a wide variety of signals that differ in frequency and amplitude. Also, by modulating the set current, it can be used for designs such as current controlled oscillators/modulators, sample and hold circuits and variable active filters.

Package



1. All dimensions in inches; millimeters are shown in parentheses.
2. All dimensions $\pm$ .010 ($\pm$0.25mm) unless otherwise shown.

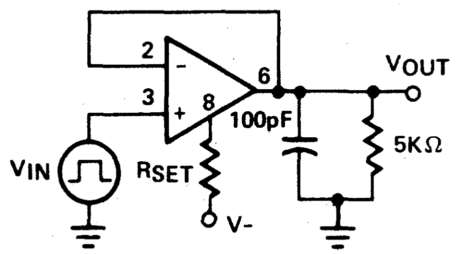
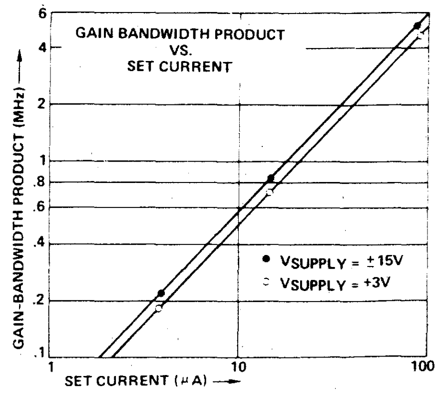
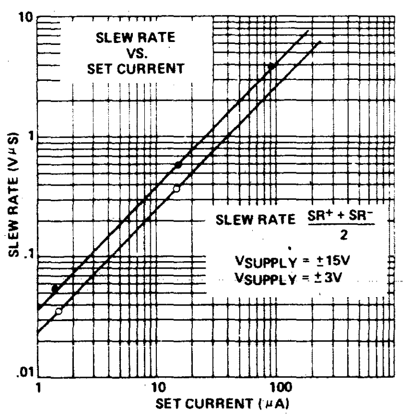
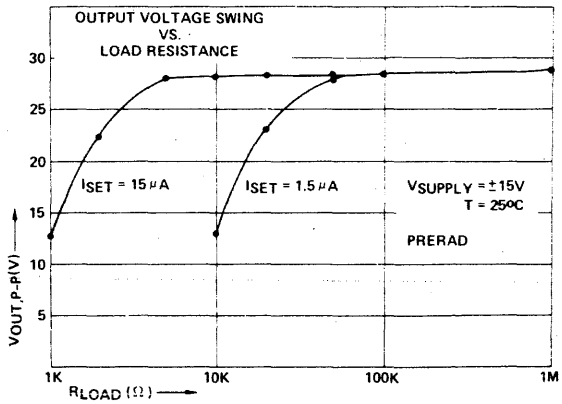
Transient Response/Slew Rate Circuit

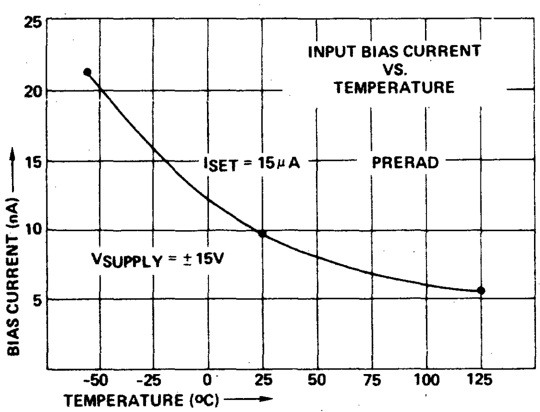


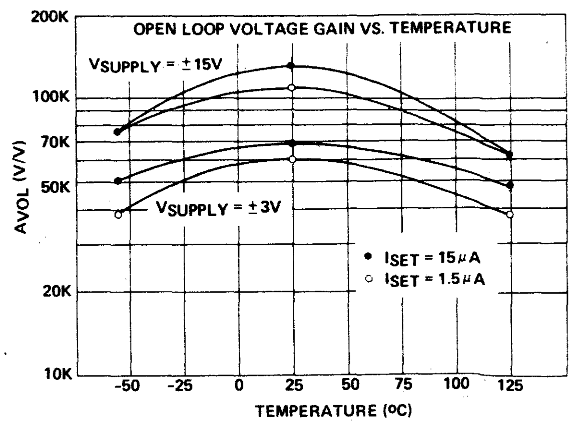


Typical Performance Curves









Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from ≥20% of the wafers in a run. (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)

(2) The sample die shall be assembled and tested for functionality.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 1 x 10^6 Rad (Si) ±10% from a Gamma Cell 220 Cobalt 60 source or equivalent. The devices will be powered in a voltage follower configuration, with I_{SET} = 15 μA and V_{SUPPLY} = ±15V. The dose rate shall be between 50 rads/sec and 200 rads/sec.

(4) A_{VOL} and V_{IO}, with I_{SET}= 15 μA, V_{SUPPLY} = +15V and R_L = 25K, will be measured and recorded for each device within one hour after irradiation. The lot will be accepted only if the sample, exclusive on non-radiation failures, meets the limits of $A_{VOL} \geq$ 20K V/V and $V_{IO} \leq$ 3.5 mV at room temperature.

Radiation Effects

(1) Total Dose:
Very little degradation of any of the parameters will be seen up to γ= 10^4 Rad (Si). Moderate degradation of open loop gain, bias current, and offset current begins at greater than 10^5 and less than 10^6 Rad (Si).

(2) Dose Rate:
During transient ionizing radiation at a level of 1 x 10^9 rad (Si)/s, the peak level of supply current will be about 150 to 200 mA. After about 0.1 to 0.5 μS this current drops about 10%. Maximum recovery time will be about 6 to 8 μS.

(3) Neutron Fluence:
Large signal voltage gain degrades rapidly for low supply voltages and low set currents. For V_{SUPPLY} = +15V and I_{SET} > 10 μA, large signal voltage gain degrades by only about 50%. Input bias current doubles for ϕ= 5 x 10^{12}n/cm^2.

HS-3546RH

Radiation Resistant High Performance Operational Amplifier

Features

- LOW OFFSET VOLTAGE 0.3mV
- HIGH SLEW RATE ±4V/µs
- WIDE BANDWIDTH 8MHz
- LOW DRIFT 2µV/°C
- FAST SETTLING (0.01%, 10V STEP) 4.2µs
- LOW POWER CONSUMPTION 35mW
- SUPPLY RANGE ±5V TO ±20V
- RADIATION ENVIRONMENT
  - NEUTRON FLUENCE (ϕ) . 5×10^{12} n/cm² (E ≥ 10KeV)
  - GAMMA RATE ($\dot{\gamma}$) . . . . 1×10^{9} RADS (Si)/s
  - GAMMA DOSE (γ) . . . . 1×10^{6} RADS (Si)

Description

The HS-3546RH is a radiation resistant, high performance dielectrically isolated monolithic operational amplifier with superior specifications. This amplifier offers excellent dynamic performance coupled with low values for offset voltage and drift, input noise voltage and power consumption.

A wide range of applications can be achieved by using the features made available by the HS-3546RH. With wide bandwidth (8MHz), low power (35mW) and internal compensation, these devices are ideally suited for precision active filter designs. For audio applications these amplifiers offer low noise (8nV/√Hz) and excellent full power bandwidth (60 KHz). The HS-3546RH is particularly useful in designs requiring low offset voltage (0.3mV) and drift (2µV/°C), such as instrumentation and signal conditioning circuits. The high slew rate (4V/µs) and fast settling time (4.2 µs to 0.01%, 10V step) makes this amplifier a useful component in fast, accurate data acquisition systems.

The HS-3546RH has been specifically designed to meet exposure to radiation environments. It is available in a 14 Pin Ceramic Flatpack package and is guaranteed operational from -55°C to +125°C.

NOTES:

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
2. For supply voltages less than ±15V, the absolute maximum input voltage is equal to the supply voltage.
3. Any one amplifier may be shorted to ground indefinitely.
4. Derate 5.8mW/°C above T_A = +25°C.
5. V_{OUT} = ±10V; R_L = 2K ohms.
6. Output current is measured with V_{OUT} = ±5 volts.
7. For transient response test circuits and measurement conditions refer to Test Circuits section of the data sheet.
8. ΔV = ±5.0 volts.
9. Settling time is measured to 0.1% of final value for a 10 volt input step, A_V = -1.

Test Circuits

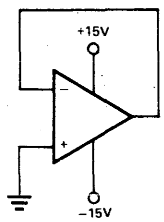
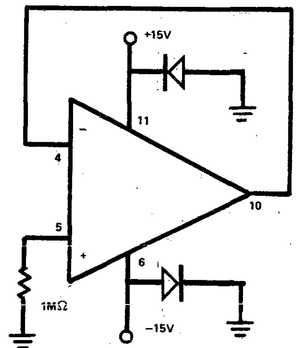
1. POWER SUPPLY DECOUPLING: Although not absolutely necessary, it is recommended that all power supply lines be decoupled with .01 μ F ceramic capacitors to ground. Decoupling capacitors should be located as near to the amplifier terminals as possible.

2. In high frequency applications where large value feedback resistors are used, a small capacitor (3pF) may be needed in parallel with the feedback resistor to neutralize the pole introduced by input capacitance.

Irradiation Circuit



Burn-in Circuit



NOTES:
T_A = +125°C
D = IN4002 OR EQUIVALENT

Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from $\geq$20% of the wafers in a run (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)

(2) The sample die shall be assembled and tested for functionality.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 1 x 10^5 Rad (Si) ±10% from a gamma cell 220 cobalt 60 source or equivalent. The devices will be powered in the configuration illustrated with V_{SUPPLY} = ±15V. The dose rate shall be between 50 rads/sec and 200 rads/sec.

(4) A_{VOL}, V_{IO}, AND I_{BIAS}, with V_{SUPPLY} = ±15V, will be measured and recorded for each device within one hour after irradiation. The lot will be accepted only if the sample, exclusive of non-radiation failures, meets the limits of $A_{VOL} \geq$ 50K, $V_{IO} \leq$ ±2.5mV and $I_{BIAS} \leq$ 1.0 μA at room temperature.

Radiation Effects

(1) Total Dose
Little or no effect will be observed at 1 x 10^4 Rad (Si). I_{BIAS}, I_{IO} and A_{VOL} starts to degrade between 1 x 10^4 and 1 x 10^5 Rad (Si).

(2) Dose Rate
Devices are constructed in DI and consequently are latchup free.

  - GAMMA DOSE (γ) . . . . 1×10^6 RADS (Si)

Description

The HS-4602RH is a radiation resistant, high performance dielectrically isolated monolithic quad operational amplifier with superior specifications not previously available in a quad amplifier. This amplifier offers excellent dynamic performance coupled with low values for offset voltage and drift, input noise voltage and power consumption.

A wide range of applications can be achieved by using the features made available by the HS-4602RH. With wide bandwidth (8MHz), low power (35mW/amp), and internal compensation, these devices are ideally suited for precision active filter designs. For audio applications these amplifiers offer low noise (8nV/$\sqrt{\text{Hz}}$) and excellent full power band-width (60KHz). The HS-4602RH is particularly useful in designs requiring low offset voltage (0.3mV) and drift (2μV/°C), such as instrumentation and signal conditioning circuits. The high slew rate (4V/μs) and fast settling time (4.2μs to 0.01%, 10V step) makes this amplifier a useful component in fast, accurate data acquisition systems.

The HS-4602RH has been specifically designed to meet exposure to radiation environments. It is available in a 14 pin dual-in-line package and is guaranteed operational from −55°C to +125°C.

CUSTOM/SEMICUSTOM

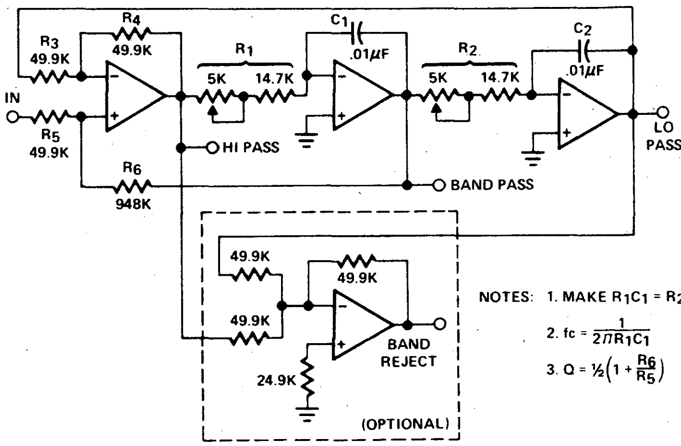
1. <u>POWER SUPPLY DECOUPLING:</u> Although not absolutely necessary, it is recommended that all power supply lines be decoupled with .01 μ F ceramic capacitors to ground. Decoupling capacitors should be located as near to the amplifier terminals as possible.

2. <u>UNUSED OP AMPS:</u> Unused op amp sections should be connected in a non-inverting follower configuration with the (+) input tied to ground in order to insure optimum performance of devices being used.

3. In high frequency applications where large value feedback resistors are used, a small capacitor (3pF) may be needed in parallel with the feedback resistor to neutralize the pole introduced by input capacitance.

Applications

2ND ORDER STATE VARIABLE FILTER (1kHz, Q = 10)



NOTES: 1. MAKE $R_1C_1 = R_2C_2$

2. $f_c = \frac{1}{2\pi R_1 C_1}$

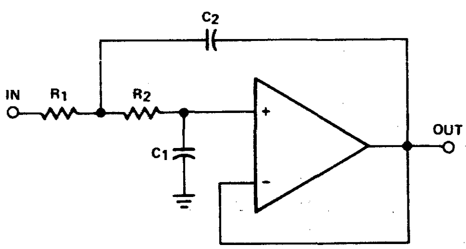
3. $Q = \frac{1}{2}\left(1 + \frac{R_6}{R_5}\right)$

The state variable filter is relatively insensitive to component changes (changes can be adjusted out with potentiometers) and also has low sensitivity to amplifier bandwidths. (Amplifier gain bandwidth product should be $\gg Q \times f_C$).

This filter finds wide application because multiple filtering functions are available simultaneously (High pass, Lo pass, Band pass, Band reject). In this circuit the various RC products are matched with pot adjustments allowing for non-interactive adjustment of Q and f_C. This allows capacitors (C_1, C_2) with loose tolerances to be used. To tune for f_C, apply a sine wave at f_C to the input, adjust R_1 for equal amplitudes at the Hi pass and Band pass terminals (they will be phased 90^o apart) then adjust R_2 for equal amplitudes at the Band pass and Lo pass terminals.

The state variable filter is often used as building blocks in multiple pole Butterworth of Chebyshev filters. Many references contain normalized tables indicating settings for Q and f_C of each pole-pair section.

SALLEN AND KEY 2ND ORDER LO PASS FILTER



NOTES:

1. Make $R_1 = R_2$

2. $f_c = \frac{1}{2\pi R_1 \sqrt{C_1 C_2}}$

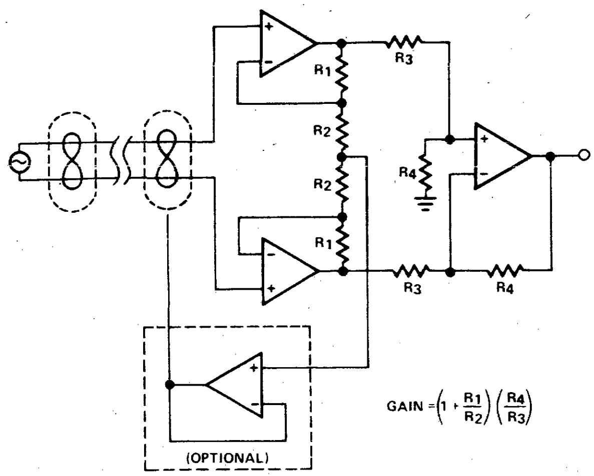
3. $Q = \frac{1}{2}\sqrt{\frac{C_2}{C_1}}$

The advantage of using the Sallen and Key filter is simplicity, but in any application this must be weighed against the state-variable type filter for accuracy, practicality, and cost. Amplifier bandwidth limitations are much more apparent at moderate frequencies and Q values with this filter design. (For accuracy, amplifier gain-bandwidth product should be $\gg f_C \times Q^2$). The wide bandwidth of the HS-4602RH is particularly advantageous in this design even at audio frequencies.

In this filter all component values affect both Q and f_C. Precision, temperature stable resistors and capacitors must be used.

For economy, this filter could be used in the low Q stages of multiple-pole filter design, while the state variable type is used in the more critical stages.

INSTRUMENTATION AMPLIFIER

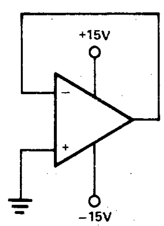


Instrumentation amplifiers (differential amplifiers) are specifically designed to extract and amplify small differential signals from much larger common mode voltages.

To serve as building blocks in instrumentation amplifiers, op amps must have very low offset voltage drift, high gain and wide bandwidth. The HS-4602RH is ideally suited for this application, delivering superior input and speed characteristics.

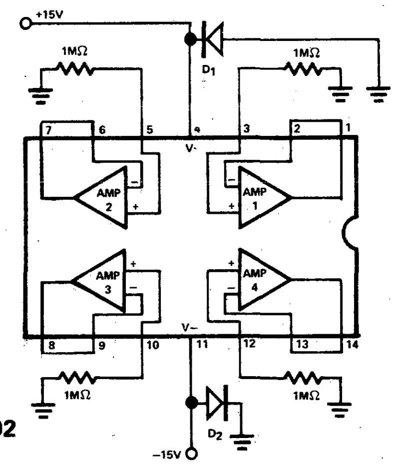
The optional circuitry makes use of the fourth amplifier section as a shield driver which enhances the AC common mode rejection by nullifying the effects of capacitance-to-ground mismatch between input conductors.

Irradiation Circuit



(1/4 OF HS-4602RH DEPICTED)

Burn-in Circuit



NOTES:
T_A = +125°C
D_1, D_2 = IN4002

Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from ≥20% of the wafers in a run (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)

(2) The sample die shall be assembled and tested for functionality.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 1 x 10^5 Rad (Si) ±10% from a gamma cell 220 cobalt 60 source or equivalent. The devices will be powered in the configuration illustrated with V_{SUPPLY} = ±15V. The dose rate shall be between 50 rads/sec and 200 rads/sec.

(4) A_{VOL}, V_{IO}, AND I_{BIAS}, with V_{SUPPLY} = ±15V, will be measured and recorded for each device within one hour after irradiation. The lot will be accepted only if the sample, exclusive of non-radiation failures, meets the limits of $A_{VOL} \geq$ 50K, $V_{IO} \leq$ ±2.5mV and $I_{BIAS} \leq$ 1.0 µA at room temperature.

Radiation Effects

(1) Total Dose
Little or no effect will be observed at 1 x 10^4 Rad (Si). I_{BIAS}, I_{IO} and A_{VOL} starts to degrade between 1 x 10^4 and 1 x 10^5 Rad (Si).

(2) Dose Rate
Devices are constructed in DI and consequently are latchup free.

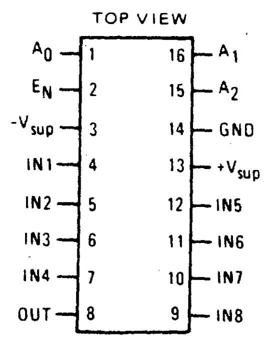
HS-508ARH

Radiation Resistant 8 Channel CMOS Analog Multiplexer With Overvoltage Protection

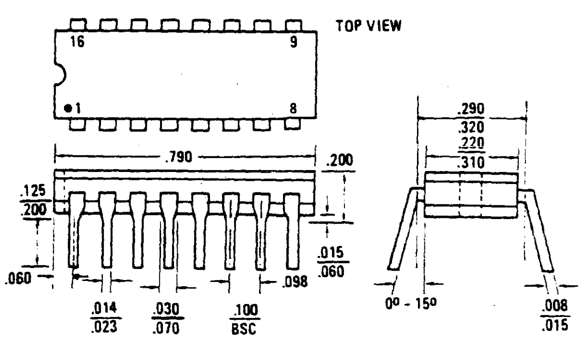
Features

- ANALOG/DIGITAL OVERVOLTAGE PROTECTION
- FAIL SAFE WITH POWER LOSS (NO LATCHUP)
- BREAK-BEFORE-MAKE SWITCHING
- DTL/TTL AND CMOS COMPATIBLE
- ANALOG SIGNAL RANGE ±15V
- ACCESS TIME (TYP.) 500ns
- SUPPLY CURRENT AT 1MHz ADDRESS TOGGLE (TYP.) 4mA
- STANDBY POWER (TYP.) 7.5mW
- RADIATION ENVIRONMENT
  - NEUTRON FLUENCE (ϕ) 1×10^9 n/cm^2 (E $\geqslant$ 10KeV)
  - GAMMA RATE ($\dot{\gamma}$) . . . . 1×10^8 RADs(Si)/s
  - GAMMA DOSE (γ) . . . . 1×10^5 RADs(Si)

Pinout



Package

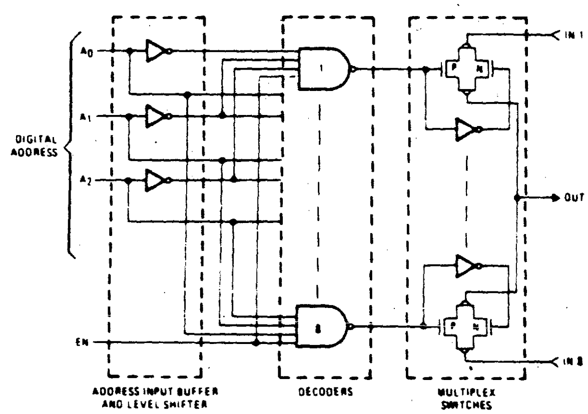


Description

The HS-508ARH is a dielectrically isolated, radiation resistant, CMOS analog multiplexer incorporating an important feature; it withstands analog input voltages much greater than the supplies. This is essential in any system where the analog inputs originate outside the equipment. They can withstand a continuous input up to 10 volts greater than either supply, which eliminates the possibility of damage when supplies are off, but input signals are present. Equally important, it can withstand brief input transient spikes of several hundred volts; which otherwise would require complex external protection networks. Necessarily, ON resistance is somewhat higher than similar unprotected devices, but very low leakage current combine to produce low errors. Reference Application Notes 520 and 521, available from the Analog Products Division of Harris, for further information on the 508A multiplexer in general.

The HS-508ARH has been specifically designed to meet exposure to radiation environments. Operation from −55°C to +125°C is guaranteed.

Functional Diagram



CAUTION: These devices are sensitive to electrostatic discharge.

Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from ≥20% of the wafers in a run. (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)

(2) The sample die shall be assembled and tested for functionality.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 1 x 10^5 Rad (Si) ±10% from a Gamma Cell 220 Cobalt 60 source or equivalent. The devices will be powered in the configuration illustrated with V_{SUPPLY} = ±15V. The dose rate shall be between 50 rads/sec and 200 rads/sec.

(4) On Current Leakage $I_{D(ON)}$ with V_{SUPPLY} = ±15V will be measured and recorded for each device within one hour after irradiation. The lot will be accepted only if the sample meets the limit of $I_{D(ON)} \leq 1\mu A$ when tested at 25°C.

Radiation Effects

(1) TOTAL DOSE:
Very little degradation of any of the parameters will be seen up to $\gamma = 1 \times 10^5$ Rad (Si).

(2) DOSE RATE:
The HS508A RH is manufactured in DI, consequently, it is latch up free.

Description

The HS-1840RH is a radiation resistant, monolithic 16 channel multiplexer constructed with the Harris Linear Dielectric Isolation CMOS process. It is designed to provide a high input impedance to the analog source if device power fails (open) or the analog signal voltage inadvertently exceeds the supply rails during powered operation. Excellent for use in redundant applications, since the secondary device can be operated in a standby unpowered mode affording no additional power drain. But more significantly, a very high impedance exists between the active and inactive devices preventing any interaction. One of sixteen channel selection is controlled by a 4-bit binary address plus an Enable-Inhibit input which conveniently controls the ON/OFF operation of several multiplexers in a system. All digital inputs have electrostatic discharge protection.

The HS-1840RH has been specifically designed to meet exposure to radiation environments. It is available in a 28 pin dual-in-line package and is guaranteed operational from −55°C to +125°C.

Functional Diagram

Description

Harris Custom Integrated Circuits Division offers a complete family of custom and semicustom logic. The HGA-C00600, HGA-C01200 and HGA-C02500 are three CMOS gate arrays manufactured using the HARRIS state-of-the-art SAJI IV process. This local oxidation process offers 3 m channel lengths and 2 minimum features. Typical propagation gate delay is 3ns with 50MHz toggle frequencies possible. Personalization is accomplished by patterning two levels of interconnection on three mask layers: polysilicon, contacts and metal.

The entire process is fully supported by advanced CAD Teledesign™* software. With the HARRIS Dial-A-Chip℠** design automation system a customer chooses the amount of his participation in the design and development of his circuit. Using the HARRIS Teledesign™ timeshare system, logic description, simulation, and artwork editing can all be performed by the customer in his own office via a digital data communications link or if he so chooses, he may use the Customer Design Center in Melbourne.

The HARRIS system minimizes the amount of design and logic coding by offering a library of 74LS equivalent SSI and MSI function designs. There is no need to implement large MSI functions with primative gates. Each function has a complete data sheet specifying propagation delays and A. C. parameters. A final software program verifies that the original logic description matches the finished artwork.

Each input-output buffer can be individually specified to be input, output, three-state, or bi-directional. CMOS or TTL compatiblity can also be specified. The large number of I/O buffers keeps the input/output to gate ratio high insuring that the design is not pin limited.

Transition from gate arrays to standard cell circuits is very simple. The same logic description files are used as input to the Dial-A-Chip℠ software. Both utilize the same SSI, MSI 74LS library.

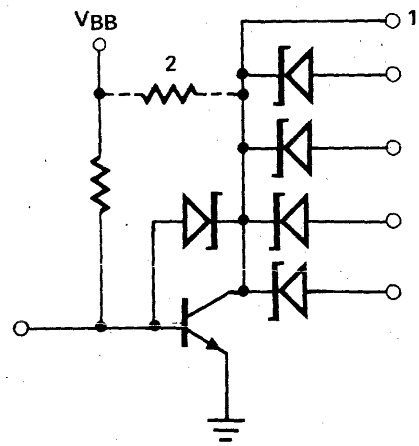
- MILITARY TEMPERATURE RANGE
- MULTIPLE PACKAGE OPTIONS
- 265 MICROWATTS PER GATE TYPICAL



Notes: 1. Ohmic contact for Common Base connections.
2. Collector Resistor Option for high Fan-Out. Refer to appropriate HBAXXX Data Sheets.

Harris Semiconductor

CUSTOM/SEMICUSTOM

Description

Harris Custom Integrated Circuits Division offers a complete family of custom and semi-custom logic. The HGA-B01500 and HGA-B02500 are ASTL gate arrays manufactured using the HARRIS state of the art advanced schottky transistor logic process. The process offers 10μm metal pitch and 3μm minimum features. Typical propagation gate delay is 1.0ns with 150MHz toggle frequencies possible. Personalization is accomplished by patterning two levels of aluminum interconnection on four mask layers.

The entire process is fully supported by advanced CAD Teledesign™* software. With the HARRIS Dial-A-Chip℠** design automation system a customer chooses the amount of his participation in the design and development of his circuit. Using the HARRIS Teledesign ™ software, logic description, simulation, and artwork editing can all be performed by the customer in his own office via a digital data communications link or if he so chooses, he may use the Customer Design Center in Melbourne.

The HARRIS system minimizes the amount of design and logic coding by offering a library of 74LS equivalent SSI and MSI function designs. There is no need to design large MSI functions with primitive gates. Each function has a complete data sheet specifying propagation delays and A.C. parameters. A final software program verifies that the original logic description matches the finished artwork.

Each input-output buffer can be individually specified to be input, output, three-state, or bi-directional. The large number of I/O buffers keeps the gate to input/output ratio low insuring that the design is not pin limited.

Transition from gate arrays to a standard cell design is very simple. The same logic description files are used as input to the Teledesign™ software. Both utilize the same SSI, MSI 74LS library, functions.

Description

Harris Custom Integrated Circuits Division offers a complete family of custom and semicustom products. The HARRIS Standard Cell product is a very cost effective alternative to gate arrays or full custom. The standard cell circuit is manufactured using the HARRIS state-of-the-art SAJI IV local oxidation process. The process offers 3 μm channel lengths with typical gate delays of 3ns and toggle frequencies of 50MHz. Each input-output buffer can be individually programmed as input, output, three-state or bi-directional. CMOS and TTL compatibility can be specified. The same SSI MSI 74LS functions used to design the gate array are used for the standard cell circuits.

The logic description and simulator functions are identical for both standard cell circuits and gate arrays. However, the standard cell circuit dimensions can change dynamically for each individual circuit. Where the gate array is a fixed number of gates and fixed chip size, the standard cell uses only enough silicon to fully implement the desired logic function. Typically a standard cell chip is 30% smaller than a fully utilized gate array offering a cost savings benefit to those customers with medium to high volumes.

The standard cell chip does require a complete set of masks rather than the three required by the gate array. The standard cell circuit is fully supported by the HARRIS Teledesign™ software and the HARRIS Dial-A-Chip℠ timeshare service. This allows the customer to perform as much of the design and development as he desires from his own office with a data terminal.

YOU DON'T NEED TO GO BACK TO SCHOOL JUST TO BUY CUSTOM ICs.

If you're more interested in getting an IC solution than an IC education, Holt may have what you're looking for.

We figure that you have enough problems designing and testing your own products. That you have better things to do than trying to cope with the latest IC software models, or thumbing through reams of computer printout.

Use Holt, and tend to your own business. Let us be your IC experts for design and production.

Just give us a schematic or your functional specs. We'll take it from there.

As we proceed from chip definition to final integration, we'll be maintaining a dialog with you, at whatever technical level you prefer.

Early on, your engineers will receive a breadboard of the proposed chip, built with standard logic and proprietary silicon analog aids. The design review is conducted in a language your engineers will understand—hardware.

To get all the details of our low-risk approach to the integration of your circuit, call Mark Ellsberry. We promise, he won't try to send you back to school. Holt Inc., 8 Chrysler Avenue, Irvine, CA 92714. Telephone (714) 859-8800. Telex 182704.

33 MONOCHIPS FROM THE LEADER IN SEMI-CUSTOM ICs

Interdesign offers the most complete line of linear Monochips and digital gate arrays in the semiconductor industry. Regardless of your requirement, chances are that one of the 33 currently available Monochips can enable you to convert your existing discrete or SSI/MSI circuitry to a cost-effective, compact, custom I.C. The tables below list the Monochips you can choose from.

LINEAR MONOCHIPS

You Can Design Your Own I.C.

Designing you own custom I.C. is a lot easier than you might think. In fact, more than 1400 engineers have already designed their own Monochip. Each Monochip Design Kit or Manual contains all of the information you need to start and complete your design. ORDER TODAY!

- MOK Design Kit (Linear) **$59**
- Metal Gate CMOS Design Manual **$25**
- Silicon Gate CMOS Design Manual **$25**
- Analog CMOS Design Kit **$59**
- ULA Design Kit **$59**
- CML Design Manual **$25**

Production—After your integration has been completed and you've approved prototypes, your production parts can be delivered, in large volumes, at unit prices starting at less than $1 depending on chip size, technology, circuit complexity, etc.

Product Literature—Each type of Monochip is described in detail in a separate, full-color brochure. This information is available from stock at no charge. **WRITE OR CALL TODAY!**

IC MASTER BELONGS ON YOUR BOOKSHELF

If you use IC MASTER frequently, you can obtain your own copy by ordering now. Use the order cards contained in this publication, or order by telephone as described below.

IC MASTER is a two-volume set of technical data carefully organized to direct the engineer to the integrated circuits and related products that are closest to his specific needs. It is the surest way to find the optimum device to answer an engineering design requirement. By ordering now, you won't have to borrow or search for IC MASTER the next time you need it.

Typical Use of IC MASTER

Can an engineer find out who makes a 64K dynamic RAM with an access time of 120 nanoseconds or faster in less than 30 seconds?
He can if he turns to the Memory section of IC MASTER and looks for the 64K organization (words and bits per word) that he needs.
Because each device is listed in order of access time, he can easily determine the devices that satisfy his speed requirements.

In the United States only:

You can order IC MASTER simply by charging it to your VISA or Master Card credit card. To place your order, call now: (516) 222-2500.
Ask for Extension 314.

ORDER YOUR COPY NOW

PLAN B

A 3-micron CMOS custom circuit is better than what you've got now, and we can have working parts on your desk in just 14 weeks. We've already done it 5 million times this year.

Even better, we'll do it with your tooling, our tooling or standard cells (hand drawn takes a little longer).

You ought to talk to us about custom VLSI MOS before you cast Plan A in concrete.

The IGC10000 Series CMOS Gate Arrays

FEATURES

- **Complexity from 408 to 1500 Equivalent 2-input Gates**
- **Mature Silicon Gate CMOS Technology**
  - **—Low development cost**
  - **—3.3 to 9V nominal power supply range ±10%**
  - **—Full CMOS temperature range: −55°C to +125°C**
  - **—Resistance to latch-up and electrostatic discharge**
- **Extensive Macro Cell Library**
  - **—Numerous combinational and sequential macros**
  - **—Facilitates 7400 and 4000-based designs**
  - **—TTL or CMOS compatible I/O**
  - **—Analog capability**
- **Fully Integrated CAD Software Support**
  - **—Highly efficient auto-routing capability**
  - **—Layout fully verified against input logic**
  - **—Accurate post-layout simulation with calculated RC delays**
  - **—Automatic test code conversion**

GENERAL DESCRIPTION

An IGC10000 Gate Array is a matrix of identical cells, each containing 3 uncommitted N-P transistor pairs. Large numbers of identical arrays are prefabricated and stockpiled. A particular circuit is constructed from a prefabricated array by specifying the interconnections among the transistors within and between cells on the final metal layer. Because all except the final metal layer are prefabricated, the cost advantages of mass production can be realized even for low-volume applications. In addition, prefabrication provides a saving in both design and manufacturing time; in some cases customers can receive prototype chips in as few as 6 weeks after initiation of the project.

In most cases IGC10000 gate arrays are processed with one mask step (a customized metal mask along with a standardized contact mask). For some analog applications or where more routing flexibility is needed, users have the option of programming the contact mask in addition to the metal mask.

THE IGC10000 FAMILY OF GATE ARRAYS

Figure 1 shows a structural representation of an IGC10000 Gate Array. Each rectangle in the body of the matrix represents an array cell; the rectangles

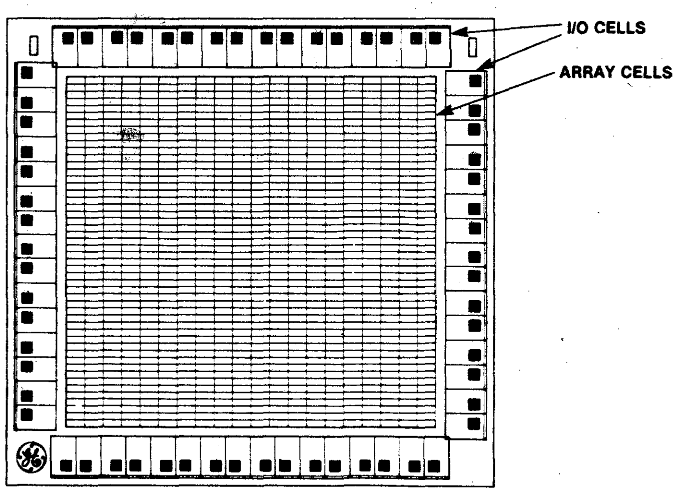

Figure 1. Gate Array Configuration

along each of the four sides of the chip represent I/O cells. Table 1 lists the members of the IGC10000 Gate Array family with their capacities and cell counts.

Table 1. The IGC10000 Gate Array Family

Part No.	Equivalent 2-Input Gates	Number of Array Cells	Bonding Pads and I/O Cells
IGC10408	408	272	34
IGC10756	756	504	44
IGC11500	1500	1000	62

TECHNOLOGY

IGC10000 gate arrays are fabricated using Intersil's high performance selectively oxidized 4-micron silicon gate CMOS process with single-layer metal interconnect. Wafers are processed using state-of-the-art processing technology with these features:

- Positive photoresist
- 1-1 scanning projection lithography
- Polysilicon, nitride and silicon dioxide plasma etching
- Ion implantation for source/drain doping and threshold adjustment
- Sputter metal deposition
- Industry standard oxidation and diffusion techniques
- Nitride and polysilicon Low Pressure Chemical Vapor Deposition (LPCVD)

ARRAY CELLS

An array cell, shown in topographical form in Figure 2, consists of three complementary transistor pairs and five strips of polysilicon (called crossunder strips) for making horizontal interconnections among array cells. Power (V_{DD}) and ground (V_{SS}) buses run vertically as shown. Metal strips (not shown) on top of the crossunder strips make the vertical interconnections within the array. The top and bottom polysilicon strips (called feed-throughs) are used for feeding horizontal connections through the array cell beneath the power and ground buses.

Figure 3 shows the circuit diagram for the array cell. Small hollow circles represent possible connection points; V_{SS} and V_{DD} metal strips are shown as dotted lines.

Intersil

CUSTOM/SEMICUSTOM

I/O CELLS

I/O cells are used to interface the array with external circuitry. Each I/O cell consists of an array of transistors of varying sizes, and allows construction of normal digital I/O interface circuits as well as analog circuitry of simple to moderate complexity.

I/O cells have these features:

- Protection against electrostatic discharge (ESD)
- Logic level translation (CMOS-to-TTL and TTL-to-CMOS)
- Bonding pad for connecting the cell to its corresponding package pin
- Ratioed transistors for analog implementation

The output drive capability of a single output buffer is one TTL load. Applications that require additional drive capability can be handled by using multiple I/O cells in parallel. (In a typical application, not all available I/O cells are needed for external connections; unused cells will thus usually be available to provide added drive capability where needed.)

MACROS

A macro is a physical implementation of a functional block and is realized by interconnections among transistors in one or more array cells. For example, the NOR function is constructed by connecting two p-channel transistors in series to V_{DD} and two n-channel transistors in parallel to V_{SS}, as shown in the topographical and schematic diagrams, Figures 4 and 5.

Designers implement their circuits by selecting and interconnecting the macros in the Macro Library, listed in Table 2.

Table 2. IGC10000 MACRO Library (continued)

IGC10000 Digital I/O Cell Macros	
Type	**Description**
Bidirectional	Tristate output/unbuffered input Tristate output/inverting TTL input buffer
Feedthrough	Input feedthrough
Internal Buffer	Inverting internal buffer Internal tristate buffer
Input Buffer	Non-inverting TTL input buffer Non-inverting CMOS input buffer with pull-up options
Output Buffer	Open drain output buffer Non-inverting TTL output buffer Inverting TTL output buffer Tristate output buffer Symmetrical drive output buffer

IGC10000 Analog I/O Cell Macros

The list below represents a sample of custom macros developed for specific analog applications. Consult your Intersil Representative for suitability to your design.

- Analog Transmission Gate
- Auto Null Comparator
- Comparator
- Compensated Op Amp
- Crystal Oscillator
- Current Multiplier
- Current Reference
- Op Amp
- Power-on Reset
- RC Oscillator
- Schmitt Trigger

COMPUTER AIDED DESIGN SOFTWARE TOOLS

The IGC10000 family is supported by a proprietary computer aided design (CAD) system developed at the General Electric Microelectronics Center. The system provides CAD tools for logic simulation, accurate prediction of circuit speed performance, automated design of interconnect circuitry, electrical and design rule checking, post-layout simulation using RC delays extracted from the layout, and automatic conversion of simulation test pattern files into tester format.

The CAD tools are integrated under a supervisory program called the CADEXEC (for CAD Executive) that runs on a Digital Equipment Corporation VAX computer. Once the user has entered the circuit's interconnect information into the computer, this information is converted into a common database accessed by all other parts of the software through the CADEXEC.

Logic Simulation: Users have access to the TEGAS logic simulator. For pre-layout logic (functional) verification, customers may perform TEGAS simulation using our Unit Delay Macro Library database; for design verification (pre-layout timing analysis), calculated delays based on fanout are used in conjunction with Best, Typical, and Worst Case libraries, whose parameters are described in Table 3.

Table 3. Best, Typical, and Worst Case Parameters

Parameter	Best	Typical	Worst
Voltage (V)	5.5	5.0	4.5
Temperature (°C)	0	27	70
Process	Best	Typical	Worst

Routing: The SILICA layout system uses a proprietary automatic router developed at the General Electric Microelectronics Center. The SILICA router has consistently performed with higher completion rate and lower CPU time than other commercially available routers; in addition, the router improves the overall performance of the circuit by selecting paths that produce the smallest delay. Like many routers, the SILICA router has a Critical Net feature that minimizes polysilicon and total net length by routing the critical net first. Unique to the SILICA router is the Super Critical Net feature, which prohibits the use of polysilicon gates in a specified net.

Electrical and Design Rule Checking: SILICA DRC (Design Rule Checker) performs electrical and design rule checking in minutes instead of hours and extracts geometric data from the layout for input into the RC delay extraction software.

Manual editing: In rare instances manual layout editing may be done on one of our CALMA workstations. CALMA output is fed into SILICA DRC for convenient verification of electrical integrity.

Post-layout simulation: A specialized circuit simulator has been developed at the General Electric Microelectronics Center to compute the delays of the RC-interconnect nets from the topology of the network after performing layout. The RC Delay extraction software uses a full transient analysis for each net; delays are based on resistance as well as capacitance of the interconnection nets. The software calculates delays as a function both of load switching voltage and driver output impedance and handles loops, bidirectional drivers, and multiple drivers on the net.

After the RC delay information is extracted, the CADEXEC system inserts the delays into the network database for post-layout TEGAS simulation and critical path analysis, thus providing an additional opportunity for refining the layout prior to PG tape generation.

Tester Tape Generation: Test program conversion software automatically translates the customer's final TEGAS simulation output file into a test vector pattern file to be used in testing the finished device.

PACKAGING

Five types of packages are available for the IGC10000 gate arrays. Dual inline packages are available in plastic (Plastic DIP), ceramic (CerDIP) and multilayer ceramic (Side Brazed DIP); leadless chip carriers and pin grid arrays are provided in multilayer ceramic. Table 4 presents recommended package types for each pin count and array size.

Table 4. Recommended Package Types

Number of Pins	Plastic DIP	CerDIP	Side Brazed DIP	Leadless Chip Carrier	Pin Grid Array
8	408		408		
14	408	408	408		
16	408	408	408		
18	408	408	408		
20		408	408		
24	408	408	408		
	756	756	756		
	1500	1500	1500		
28	408	408	408		
	756	756	756		
	1500	1500	1500		
40	408	408	408		
	756	756	756		
	1500	1500	1500		
44				756	
				1500	
48			756		
			1500		
52				1500	
68				1500	1500

DEVELOPMENT

An overview of the gate array development process is shown in the flow chart of Figure 6. During Phase 1 (Design Translation), most of the responsibility lies with the customer; during Phase 3 (Fabrication), with Intersil. In Phase 2 (Design Implementation), most of the activities are performed by Intersil, but require customer interaction and approval. Figure 6 delineates the responsibilities of the customer and of Intersil. For more information, contact either your local Intersil representative, or Semicustom Marketing at the General Electric Microelectronics Center, Research Triangle Park, NC, telephone 919-549-3607.

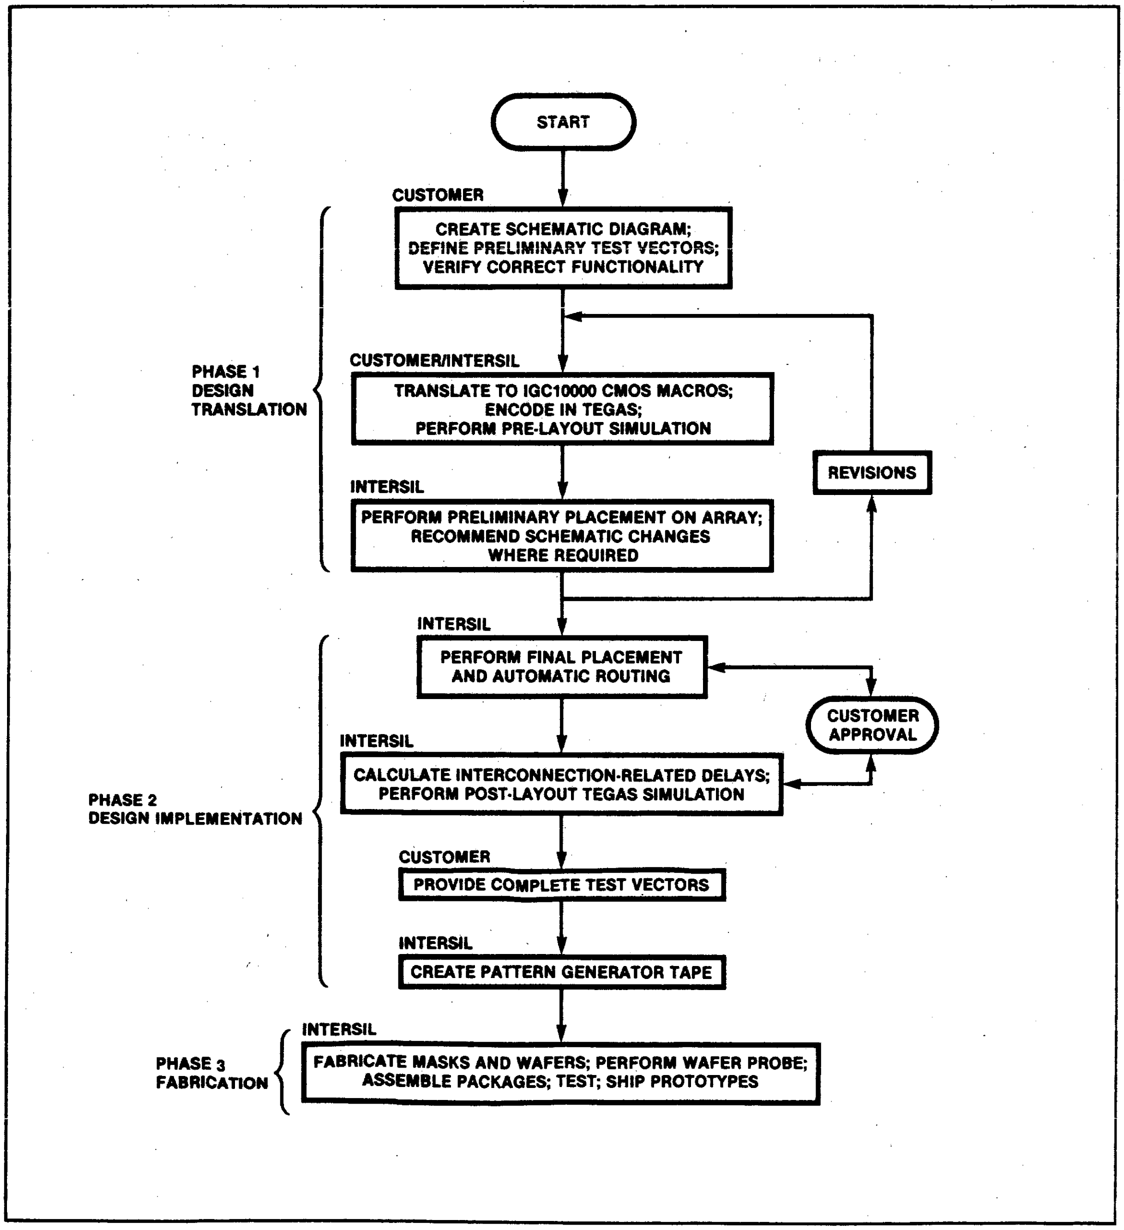

Figure 6. Simplified Flowchart for Gate Array Development

OPERATING CHARACTERISTICS[1]

Absolute Maximum Ratings[2] (Referenced to V_{SS})

Parameter	Symbol	Limits	Units
DC Supply Voltage	V_{DD}	−0.5 to +10.0	V
Input Voltage	V_I	−0.5 to V_{DD} + 0.5	V
DC Input Current	I_I	±10	mA
Operating Ambient Temperature Range	T_A	−55 to +125	°C
Storage Temperature Range (Ceramic)	T_{STG}	−65 to +150	°C
Storage Temperature Range (Plastic)	T_{STG}	−40 to +125	°C

NOTE 1: Stress ratings only. Functional operation of the device at these or any conditions beyond those indicated as Recommended Operating Conditions is not implied.
NOTE 2: Stresses above those listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Recommended Operating Conditions

Parameter	Symbol	Limits	Units
DC Supply Voltage	V_{DD}	3.3±0.3V to 9.0±0.9V	V
Typical Operating Frequency	f_{CK}	8.0	MHz
Operating Ambient Temperature Range[1]	T_A	−55 to +125	°C

NOTE 1: IGC10000 gate array macros are currently characterized between 0 and 70°C.

AC CHARACTERISTICS

Specified for nominal processing = 5V, 27°C.
Calculated for a fanout of 1.

	Parameter	Typical Delay (ns)
Array Cell Macros		
2-input NAND	D to Output	6
2-input NOR	D to Output	6
4-input NAND	D to Output	8
4-input NOR	D to Output	18
1X inverter	D to Output	5
4X inverter	D to Output	4
2-1 AND-OR invert	D to Output	9
D flip-flop with reset	CK to Output	9
Schmitt trigger	Input to Output	18
Up counter with reset	CK to Output	11
I/O Cell Macros		
Input feedthrough	Pad to Output	1
Non-inverting Input Buffer	Pad to Output	9
Non-inverting Output Buffer	D to Pad	10 (15 pF) 19 (50 pF)

DC CHARACTERISTICS

V_{DD} = 5V ± 10%

Symbol	Parameter	Condition	Limits[1] 0°C Min.	0°C Max.	25°C Min.	25°C Typ.	25°C Max.	70°C Min.	70°C Max.	Units
I_{DD}[2]	Quiescent Device Current	$V_I = V_{DD}$ or V_{SS}				0.3			100	μA
V_{OL}	Low Level Output Voltage	$\|I_O\| \leq 1\mu A$		0.05			0.05		0.05	V
V_{OH}	High Level Output Voltage	$\|I_O\| \leq 1\mu A$	V_{DD} − 0.05		V_{DD} − 0.05			V_{DD} − 0.05		V
V_{IL}	Low Level Input Voltage	CMOS I/O Macro		1.5			1.5		1.5	V
V_{IH}	High Level Input Voltage	CMOS I/O Macro	3.5		3.5			3.5		V
V_{IL}	Low Level Input Voltage	TTL I/O Macro		0.8			0.8		0.8	V
V_{IH}	High Level Input Voltage	TTL I/O Macro	2.0		2.0			2.0		V
I_{OL}[3]	Output Low[4] (Sink Current)	$V_O = 0.4V$	1.8		1.8	3.6		1.6		mA
		$V_O = 2.5V$	3.8		3.8	7.6		3.4		mA
I_{OH}[3]	Output High (Source Current)	$V_O = 4.6V$	0.3		0.3	0.6		0.25		mA
		$V_O = 2.5V$	1.8		1.8	3.6		1.6		mA
I_{IN}	Input Leakage Current	V_{IN} = 0 or V_{DD}		± 0.1		± .001	± 0.1		± 1.0	μA
I_{OZ}	Tristate Output Leakage Current	V_O = 0 or V_{DD}		± 1.0		± .001	± 1.0		± 10	μA
C_{IN}	Input Capacitance	Any Input				5.0				pF

NOTES:

1. IGC10000 gate arrays are designed to perform under conditions up to 125°C. Limits reflect temperature range at which the macro library is characterized.
2. Any internal oscillators disabled.
3. Results depend on specific output macro used.
4. There may be limitations on maximum current when many outputs are simultaneously low.

WHEN PICKING A CUSTOM LSI MANUFACTURER, THE FIRST THING TO LOOK AT IS HOW GOOD THEY ARE. THE SECOND IS WHERE THEY'RE LOCATED.

If you're even thinking about a custom circuit, you're aware of the benefits it will give you: it will, over the long run, cost less to produce than any form of semi-custom; by incorporating the maximum number of functions, it will give you the most savings in board space, shipping, inventory control, inspection, manufacturing operations, and reliability. A properly designed custom chip will greatly increase your product's versatility, and give you an enormous marketing advantage.

But how can you be sure you'll actually get all these benefits?

1 ARE THEY CUSTOM SPECIALISTS?

Even with all the computerized assistance available today, it takes a trained specialist to give you a custom chip that lives up to your expectations. It takes years of experience to design the chip that will work most effectively with your system; to know how many functions can *safely* be included, i.e., how much can be included without risk of the chip's not working. *LSI Computer Systems, Inc., has been creating custom MOS/LSI circuits for over 14 years.* That's a long, long time, in this business.

2 ARE THEY EASY TO WORK WITH?

The second way to make sure you get the most out of your custom chip is to work very closely with the manufacturer's engineers. The more active the interplay between you (or your engineers) and the manufacturer's designers, the more your chip will do for you (and, we might add, the faster the design will be completed).

And it's a lot easier to work closely with somebody when you can step in your car and be at his place in an hour or so. Or vice versa.

Well, if you're anywhere within 50 miles of New York, we — LSI Computer Systems, Inc. — are just such an easy drive away. We're right smack in the middle of Long Island.

Of course, being "easy to work with" is not solely a function of geographical location. It's also a function of accessibility, and *that's* largely a function of size. Many of our customers who have also worked with big LSI manufacturers tell us that our engineers are far more accessible than the big outfits' engineers are. We'd like to be big someday, too, but accessible is one thing we'll always be. It's one of the things that made us as big as we are.

Call Ron Colino. He's our VP/Marketing, and he can tell you a lot more reasons why you should come with us if you're thinking of custom. He can also tell you a lot of reasons why you *should* be thinking of custom if you're not.

LSI COMPUTER SYSTEMS INC.

Beyond the Microprocessor

LSI LOGIC CORPORATION

LL3000 Series
Silicon-Gate HCMOS Logic Arrays

Preliminary

Features

- Silicon-gate 3.5-micron (drawn) HCMOS technology
- Single-layer metal interconnection
- HTTL and LSTTL speeds—5 ns through a 2-input NAND gate and interconnection, T_A = 25 degrees C, fanout = 2, V_{DD} = 5V
- Optimal block structure of 2N and 2P transistors
- Complexities ranging from 272 to 2550 blocks
- Pin counts ranging up to 104
- Fully supported by LDS™ (LSI Design System)
- Extensive macrocell and macrofunction libraries
- All non-power pads configurable as inputs, outputs or bidirectional
- TTL/CMOS I/O compatibility
- Configurable output drive up to 4.8mA
- All inputs and outputs protected from over-voltage and latch-up
- Full Military capability
- Ceramic and plastic packages
- LL3110Q evaluation device available

LSI Logic

CUSTOM/SEMICUSTOM

LSI LOGIC CORPORATION

LL5000 Series
Silicon-Gate HCMOS Logic Arrays

Features

- Silicon-gate 3-micron (drawn) HCMOS technology
- Schottky TTL speeds - 2.5ns through 2-input NAND gate and interconnection, T_A = 25°C, fanout = 2, V_{DD} = 5V
- Optimal block structure of 2N and 2P transistors
- Complexities ranging from 880 to 6000 blocks
- Pin counts ranging up to 180
- Fully supported by LDS™ (LSI Design System)
- Extensive macrocell and macrofunction libraries
- All non-power pads configurable as inputs, outputs or bidirectional
- TTL/CMOS I/O compatibility
- Configurable output drive up to 6.0mA
- All inputs and outputs protected from over-voltage and latch-up
- Full military capability
- Ceramic and plastic packages
- Alternately-sourced
- LL5220Q evaluation device available

LSI LOGIC CORPORATION, 1601 McCarthy Boulevard, Milpitas, CA 95035 408/263-9494 Telex-172 153

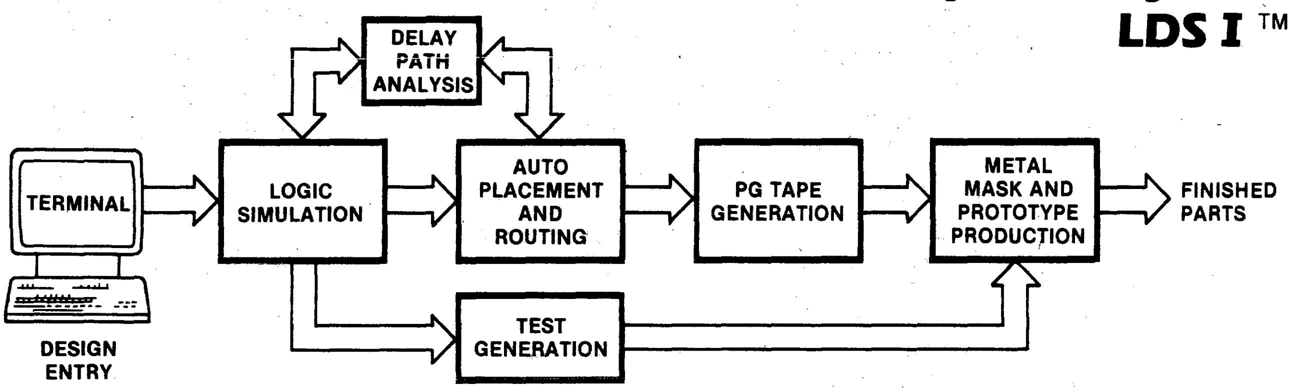
LL7000 Series Silicon-Gate HCMOS Logic Arrays

Advance Information

Features

- Silicon-gate 2.0-micron (drawn) HCMOS technology
- Faster than Schottky TTL speeds - 1.4ns through 2-input NAND gate and interconnection, $T_A = 25°C$, fanout = 2, $V_{DD} = 5V$
- Optimal block structure of 2N and 2P transistors
- Complexities ranging from 968 to 10,013 blocks
- Pin counts ranging up to 180
- Fully supported by LDS™ (LSI Design System)
- Extensive macrocell and macrofunction libraries
- All non-power pads configurable as inputs, outputs or bidirectional
- TTL/CMOS I/O compatibility
- Configurable output drive up to 6.0mA
- All inputs and outputs protected from over-voltage and latch-up
- Full military capability
- Ceramic and plastic packages
- Alternately-sourced
- LL7220Q evaluation device available

LSI Development System LDS I ™



Development Support and Interface

The LDS I™ (LSI Development System I) is used for logic simulation, design verification, test pattern generation, layout and mask design. The system may be accessed using a variety of remote terminals, including the Tektronix 4014 and 4112 vector-display terminals. The desired logic function may be entered alpha numerically or schematically into the system and the design electronically breadboarded using the LDS I™ logic simulator. The simulated input patterns may be checked for completeness, and other tests added (automatically if desired) until the final test pattern is completed. The personality masks may then be designed remotely by the customer using the LDS I™ interactive/automatic placement and routing program. Alternately, LSI LOGIC CORPORATION will complete the metal mask design. For more details see the LDS I™ Product Description available from LSI LOGIC CORPORATION.

For new designs, the LDS I™ Development System may be used to verify the design, generate test patterns and (optionally) design the metal masks. Four possible interfaces to LDS I™ are offered.

1. Use the complete LSI LOGIC CORPORATION system in Milpitas, California.
2. Install a remote terminal in your facility connected to LSI LOGIC CORPORATION mainframe. The Tektronix 4014 and 4112 are both supported, with the 4112 providing significantly higher performance. In either case a Tektronix 4662 11-inch×17-inch plotter may be used for graphics hard copy.
3. Install a turnkey LDS I™ system in your facility.
4. LSI Logic can specify design rules and provide macro layouts so that a customer's own CAD system may be used.

The following material is required by LSI LOGIC CORPORATION to alternate source an existing CDI-HC or AMI-UA array part.

- Calma data base or PG tape of the metal mask
- Sentry test tape
- AC test specifications
- Package and marking specifications
- Bonding diagram
- Four devices meeting all required specifications

WAFER PROCESSING

Technology: PMOS, CMOS, NMOS Silicon or Metal Gate, Bipolar Linear. Minimum feature size is 4 micron and Isoplaner type processing is available for Silicon Gate MOS. Epi thickness 6-12 micron with Arsenic/antimony buried layer. 3 or 4 inch wafers.

Clean Room: 5000 ft^2 of class 100 clean room.

Engineering Run: 25 wafer starts with 10 guaranteed to meet your Process parameters. Delivery is 5 weeks with plates.

Production Run: 25 wafer minimum with no minimum annual volume. 10,000 wafer starts per month capacity. Delivery is 4 weeks, expedited to 10 days.

Customer Supplies: Tooling, design criteria and test software. We'll honor non-disclosure agreements.

Ion Implant: Varian DF4U/Veeco 2100

WAFER/PACKAGED IC TESTING:

Wafer Test: Map and test to process parameters.

Packaged IC Test: Mil STD 883 B Group A, using high/low temperature handlers.

Wafer Probing/Packaged IC: 3 Sentry VIIs or Series 20 VLSI Testers with handlers.

SEM Analysis: Mil STD 883B using ISI 5 x 30, 5-30KEV.

Screening: Mil STD 883B class B or customer requirement.

GATE ARRAY MYTHS vs.

MYTHS .... VS............ REAL CUSTOM

MYTH 1 — User Friendly
"My logic diagram will always work when put in a gate array. A myth!"

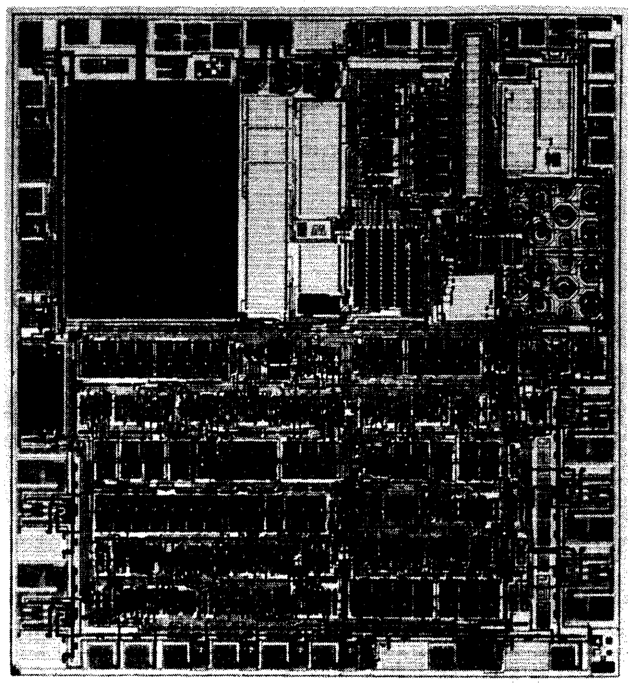
MYTH 2 — No System Timing Problems
"Circuit will never have any race conditions. A myth!"

MYTH 3 — Development Times Are Never Extended
"Chip will always work the first time, and never use more than one mask. A myth!"

MYTH 4 — No Customer Risk
"Development cost is low. A myth!" (Actually you pay double if chip doesn't work the first time.)

MYTH 5 — Testing Is Simple
"A myth!" (Actually testing is more difficult than the design.)

MYTH 6 — You're Never Switched from Gate Array to Full Custom
"The biggest myth of all."



*MPS Real Custom Chip (*HALLMOS circuit)*

Micro Power Systems

CUSTOM/SEMICUSTOM

MYTH ∞
"Quick. Take your logic diagram to any gate array company and in a few days/weeks — and almost like magic — tested production parts will appear, at a very low price. Now you can beat out your competitors."

FACTS
At Micro Power Systems, prospects are taken through the *Gate Array vs. Real Custom* analysis. Facts not myths determine the next step: (1) MPS' Real Custom, (2) MPS' Full Custom, or (3) other's gate arrays.

REAL CUSTOM
When you work in the real world of today — you need MPS' Real Custom to achieve your design and marketing goals. Over 65% of Micro Power's prospects fall into the Real Custom category. Here MPS uses an advanced, low-cost standard cell approach (over 2000 cells) for 80% of the design and 20% new design to optimize the interconnects and provide system enhancements. Quick turn-around and lower production costs are achieved by a proprietary interconnect system that provides a fast layout technique and optimizes silicon utilization.

FULL CUSTOM
Another 10% of our prospects take advantage of MPS' full custom. This is a 9 to 12-month joint effort where advanced circuit design, system definitions, and custom processing provide a quantum jump over the competition.

* *HALLMOS is a major breakthrough technology that combines precision linear bipolar, high accuracy thin film resistors, and high density CMOS all on the same monolithic integrated circuit. This process has a big potential in systems that utilize both analog and digital functions.*

MICRO POWER SYSTEMS'

REAL CUSTOM

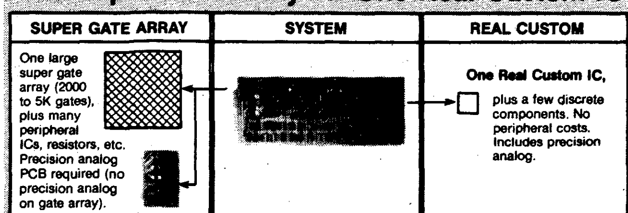
GATE ARRAYS

About 20 to 25% of our prospects require less than 500 parts per month. These prospects need a gate array company. We suggest they look for solid companies with their own foundries, testing, engineering support, and with realistic pricing and scheduling.

1 REAL CUSTOM vs. 1 GATE ARRAY

Compare MPS' Real Custom against one super gate array (see chart). Even comparing one super gate array shows major advantages for the Real Custom IC. Not only do you have significant parts and testing advantages — you can't use any precision analog in the super gate array. Is there a big difference between gate array and Real Custom delivery schedules? No! First, the gate array companies don't quote on a complete schedule. They use the time from when your circuit design is accepted (i.e., after you change your circuit to meet their technology limitations). Second, they quote to the most optimistic delivery date of the first prototype. You should prepare a realistic schedule with all the required events (yours and the vendors) from concept to delivery of production quantities. Then compare it to a Real Custom schedule and you'll find that they provide very little time savings, if any.

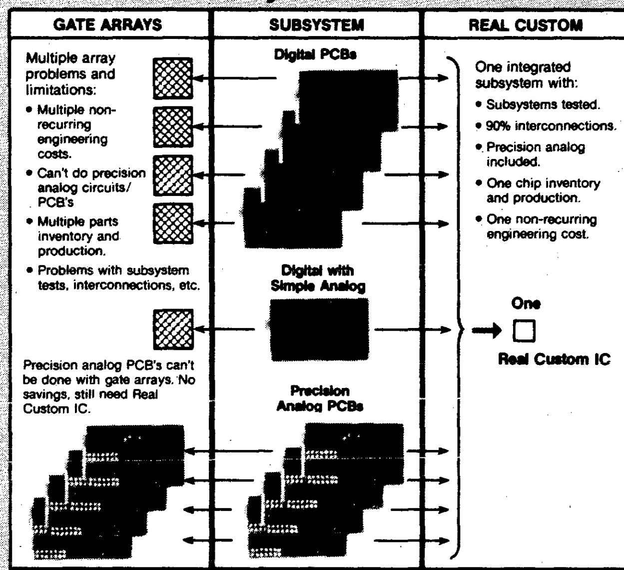
One Super Gate Array vs. One Real Custom IC



1 REAL CUSTOM vs. MULTIPLE ARRAYS

Look at the significant difference between using multiple gate arrays and one Real Custom IC in a digital/analog subsystem (see chart). Don't forget to add in your multiple gate array costs and costs for system definition, interconnection, and testing. With arrays, extensive interconnections remain at the system/board level and system testing becomes very difficult. Implementation of precision analog circuits are not even considered practical on arrays. Real Custom has inherently lower system development costs and lower production costs over solutions requiring multiple gate arrays.

Standard Gate Arrays vs. One Real Custom IC



CUSTOM CHIPS DELIVERED IN 1971

MPS has delivered full custom and Real Custom for over 13 years. We have advanced processes and design capabilities immediately available. For example, we routinely combine low noise bipolar transistors, CMOS logic, and thin film resistors on the same monolithic circuit. All these advanced technologies are currently in volume production.

RUN-AROUND

If you're in management and your personnel have been giving you the run-around about why your gate array project has gone through several redesigns and why the schedule has slipped — you'd better check out what the new projected production costs (piece price) are going to be. It may no longer fit into your marketing plan.

MYTH PERSISTS

We can't stop the gate array myth, but if you're serious about your company's future and being second best is not acceptable, then send for our *MPS Real Custom Plan*, or call Bob Sabo (ext. 210). A gate array shakeout is happening now. Do you want to deal in myths or facts?

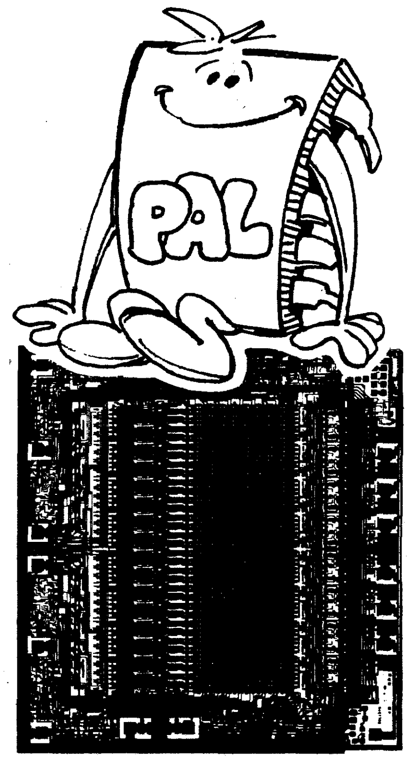
Micro Power Systems is the Leader in Refractory Gate MOS Technology



The PAL® Concept

Monolithic Memories' family of PAL devices gives designers a powerful tool with unique capabilities for use in new and existing logic designs. The PAL saves time and money by solving many of the system partitioning and interface problems brought about by increases in semiconductor device technology.

Rapid advances in large scale integration technology have led to larger and larger standard logic functions; single I.C.s now perform functions that formerly required complete circuit cards. While LSI offers many advantages, advances have been made at the expense of device flexibility. Most LSI devices still require large numbers of SSI/MSI devices for interfacing with user systems. Designers are still forced to turn to random logic for many applications.

The designer is confronted with another problem when a low to medium complexity product is designed. Often the function is well defined and could derive significant benefits from fabrication as an integrated circuit. However, the design cycle for a custom circuit is long and the costs can be very high. This makes the risk significant enough to deter most users. The technology to support maximum flexibility combined with fast turn around on custom logic has simply not been available. Monolithic Memories offers the programmable solution.

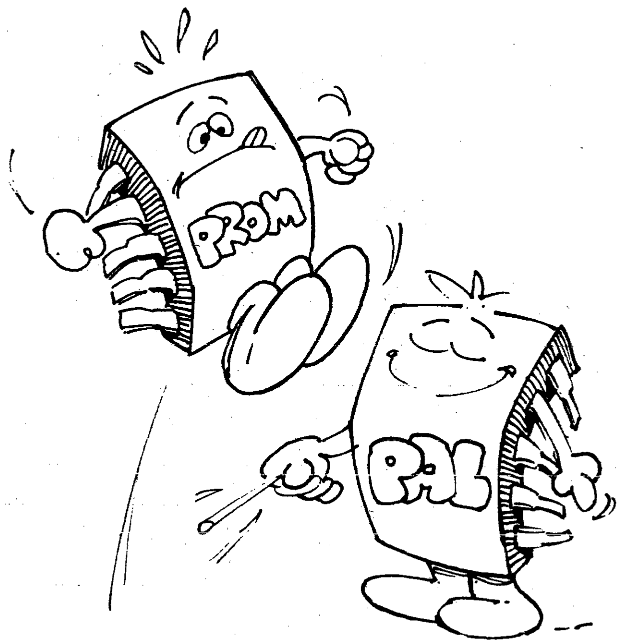
The PAL family offers a fresh approach to using fuse programmable logic. PAL circuits are a conceptually unified group of devices which combine programmable flexibility with high speed and an extensive selection of interface options. PAL devices can lower inventory, cut design cycles and provide high complexity with maximum flexibility. These features, combined with lower package count and high reliability, truly make the PAL a circuit designer's best friend.

PAL® is a registered trademark of Monolithic Memories.

2175 Mission College Boulevard, Santa Clara, CA 95050 Tel: (408) 970-9700 TWX: 910-338-2376 TWX: 910-338-2374

Monolithic Memories MMI

The PAL—Teaching Old PROMs New Tricks



MMI developed the modern PROM and introduced many of the architectures and techniques now regarded as industry standards. As the world's largest PROM manufacturer, MMI has the proven technology and high volume production capability required to manufacture and support the PAL.

The PAL is an extension of the fusible link technology pioneered by Monolithic Memories for use in bi-polar PROMs. The fusible link PROM first gave the digital systems designer the power to "write on silicon." In a few seconds he was able to transform a blank PROM from a general purpose device into one containing a custom algorithm, microprogram, or Boolean transfer function. This opened up new horizons for the use of PROMs in computer control stores, character generators, data storage tables and many other applications. The wide acceptance of this technology is clearly demonstrated by today's multi-million dollar PROM market.

The key to the PROM's success is that it allows the designer to quickly and easily customize the chip to fit his unique requirements. The PAL extends this programmable flexibility by utilizing proven fusible link technology to implement logic functions. Using PAL circuits the designer can quickly and effectively implement custom logic varying in complexity from random gates to complex arithmetic functions.

ANDs and ORs

The PAL implements the familiar sum of products logic by using a programmable AND array whose output terms feed a fixed OR array. Since the sum of products form can express any Boolean transfer function, the PAL circuit uses are only limited by the number of terms available in the AND - OR arrays. PAL devices come in different sizes to allow for effective logic optimization.

Figure 1 shows the basic PAL structure for a two input, one output logic segment. The general logic equation for this segment is

$$\text{Output} = (I_1+\bar{f}_1)(\bar{I}_1+\bar{f}_2)(I_2+\bar{f}_3)(\bar{I}_2+\bar{f}_4) + (I_1+\bar{f}_5)(\bar{I}_1+\bar{f}_6)(I_2+\bar{f}_7)\ (\bar{I}_2+\bar{f}_8)$$

where the "f" terms represent the state of the fusible links in the PAL AND array. An unblown link represents a logic 1. Thus,

fuse blown, f = 0

fuse intact, f = 1

An unprogrammed PAL has all fuses intact.

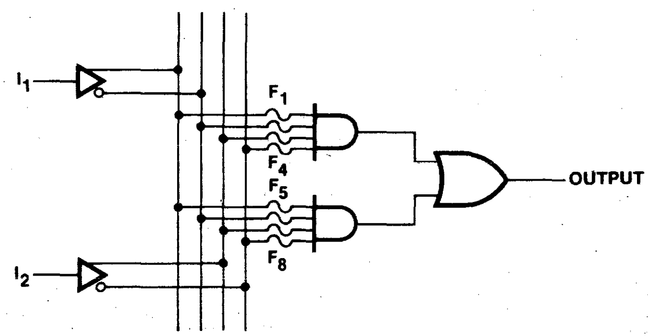


Figure 1

PAL Notation

Logic equations, while convenient for small functions, rapidly become cumbersome in large systems. To reduce possible confusion, complex logic networks are generally defined by logic diagrams and truth tables. Figure 2 shows the logic convention adopted to keep PAL logic easy to understand and use. In the figure, an "x" represents an intact fuse used to perform the logic AND function. (Note: the input terms on the common line with the x's are not connected together.) The logic symbology shown in Figure 2 has been informally adopted by integrated circuit manufacturers because it clearly establishes a one-to-one correspondence between the chip layout and the logic diagram. It also allows the logic diagram and truth table to be combined into a compact and easy to read form, thereby serving as a convenient shorthand for PAL circuits. The two input - one output example from Figure 1 redrawn using the new logic convention is shown in Figure 3.

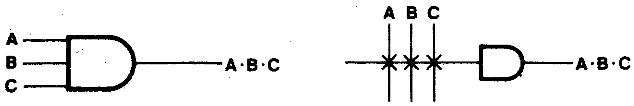

Figure 2

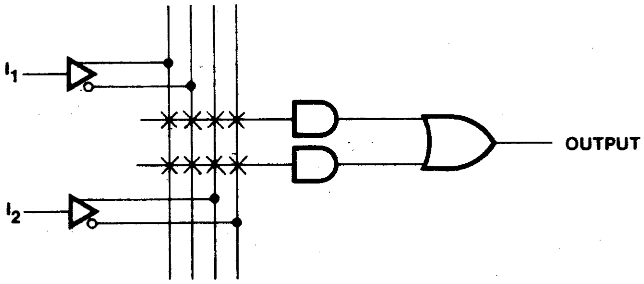

Figure 3

As a simple PAL example, consider the implementation of the transfer function:

Output = $I_1\bar{I}_2 + \bar{I}_1 I_2$

The normal combinatorial logic diagram for this function is shown in figure 4, with the PAL logic equivalent shown in figure 5.

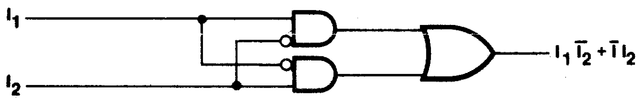

Figure 4

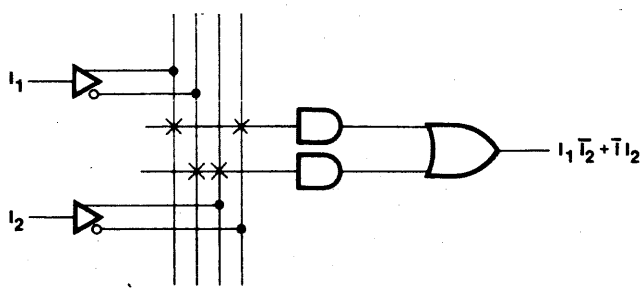

Figure 5

Using this logic convention it is now possible to compare the PAL structure to the structure of the more familiar PROM and PLA. The basic logic structure of a PROM consists of a fixed AND array whose outputs feed a programmable OR array (figure 6). PROMs are low-cost, easy to program, and available in a variety of sizes and organizations. They are most commonly used to store computer programs and data. In these applications the fixed input is a computer memory address; the output is the contents of that memory location.

PROM
16 Words X4 Bits

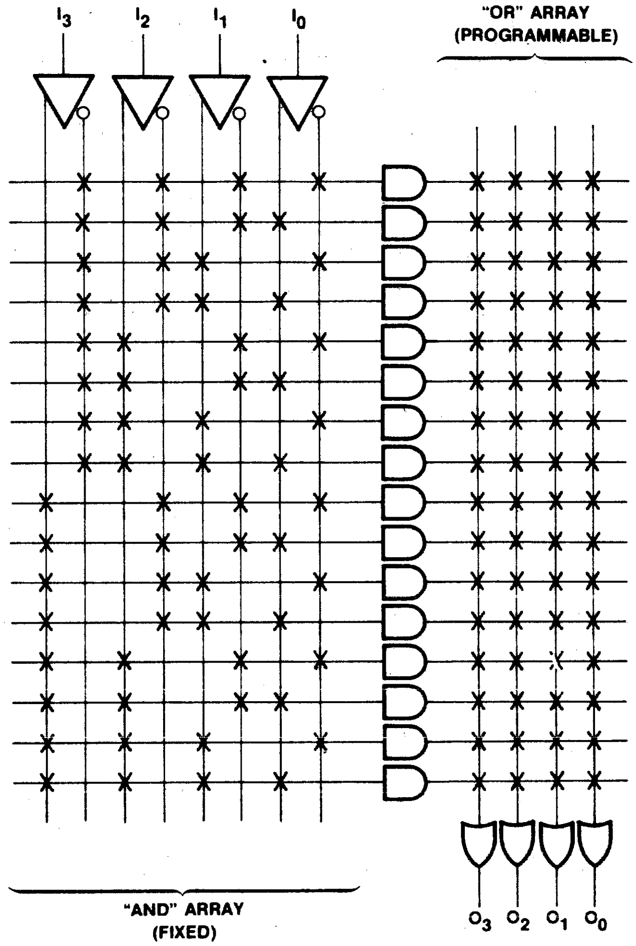

Figure 6

The basic logic structure of the PLA consists of a programmable AND array whose outputs feed a programmable OR array (Figure 7). Since the designer has complete control over all inputs and outputs, the PLA provides the ultimate flexibility for implementing logic functions. They are used in a wide variety of applications. However, this generality makes PLAs expensive, quite formidable to understand, and costly to program (they require special programmers).

The basic logic structure of the PAL, as mentioned earlier, consists of a programmable AND array whose outputs feed a fixed OR array (Figure 8). The PAL combines much of the flexibility of the PLA with the low cost and easy programmability of the PROM. Table 1 summarizes the characteristics of the PROM, PLA, and PAL logic families.

Table 2

[1] Simultaneous AND-OR and AND-NOR outputs

PAL Circuits For Every Task

The members of the PAL family and their characteristics are summarized in Table 2. They are designed to cover the spectrum of logic functions at reduced cost and lower package count. This allows the designer to select the PAL that best fits his application. PAL units come in the following basic configurations:

Gate Arrays

PAL gate arrays are available in sizes from 12x10 (12 input terms, 10 output terms) to 20x2, with both active high and active low output configurations available (figure 9). This wide variety of input/output formats allows the PAL to replace many different sized blocks of combinatorial logic with single packages.

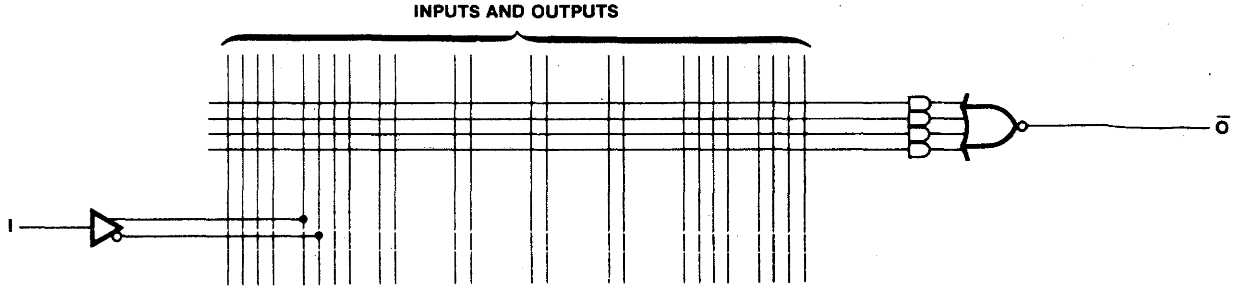

Figure 9

Programmable I/O

A feature of the high-end members of the PAL family is programmable input/output. This allows the product terms to directly control the outputs of the PAL (Figure 10). One product term is used to enable the three-state buffer, which in turn gates the summation term to the output pin. The output is also fed back into the PAL array as an input. Thus the PAL drives the I/O pin when the three-state gate is enabled; the I/O pin is an input to the PAL array when the three-state gate is disabled. This feature can be used to allocate available pins for I/O functions or to provide bi-directional output pins for operations such as shifting and rotating serial data.

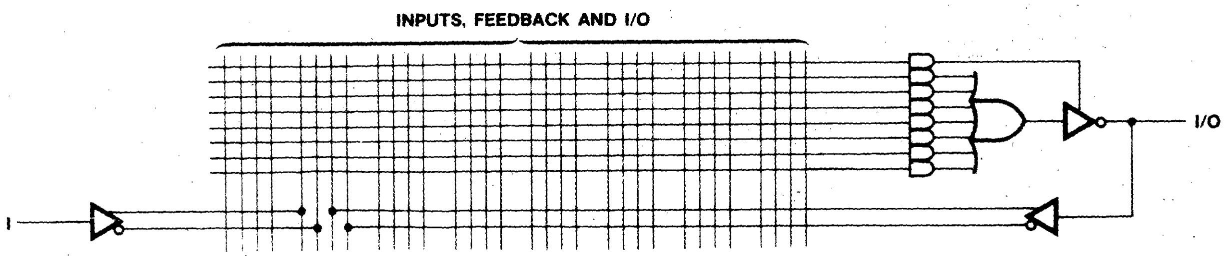

Figure 10

Registered Outputs with Feedback

Another feature of the high end members of the PAL family is registered data outputs with registered feedback. Each product term is stored into a D-type output flip-flop on the rising edge of the system clock (Figure 11). The Q output of the flip-flop can then be gated to the output pin by enabling the active low three-state buffer.

In addition to being available for transmission, the Q output is fed back into the PAL array as an input term. This feedback allows the PAL to "remember" the previous state, and it can alter its function based upon that state. This allows the designer to configure the PAL as a state sequencer which can be programmed to execute such elementary functions as count up, count down, skip, shift, and branch. These functions can be executed by the registered PAL at rates of up to 25 MHz.

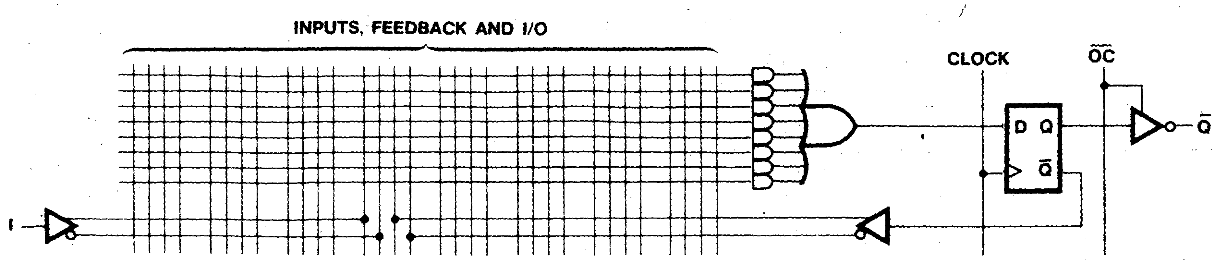

Figure 11

XOR PALs

These PAL devices feature an exclusive OR function. The sum of products is segmented into two sums which are then exclusive ORed (XOR) at the input of the D-type flip-flop (Figure 12). All of the features of the Registered PALs are included in the XOR PAL unit. The XOR function provides an easy implementation of the HOLD operation used in counters and other state sequencers.

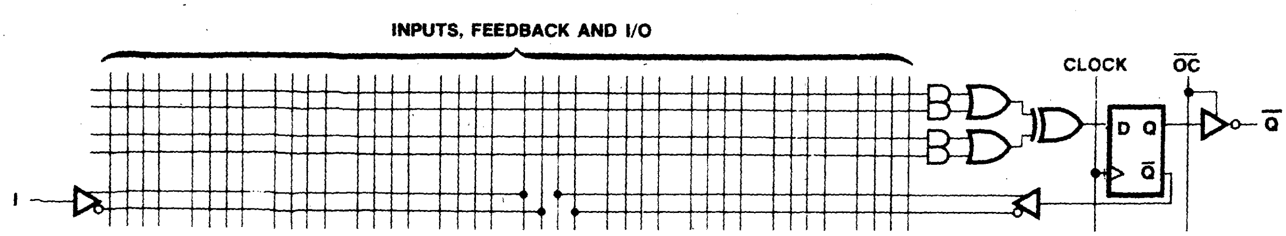

Figure 12

Arithmetic Gated Feedback

The arithmetic functions (add, subtract, greater than, and less than) are implemented by addition of gated feedback to the features of the XOR PAL device. The XOR at the input of the D-type flip-flop allows carrys from previous operations to be XORed with two variable sums generated by the PAL array. The flip-flop Q output is fed back to be gated with input terms A (Figure 13). This gated feedback provides any one of the possible Boolean combinations which are mapped in the Ka naugh map (Figure 15). Figure 14 shows how the PAL array ca be programmed to perform these 16 operations. These feature provide for versatile operations on two variables and facilitat the parallel generation of carrys necessary for fast arithmetic operations.

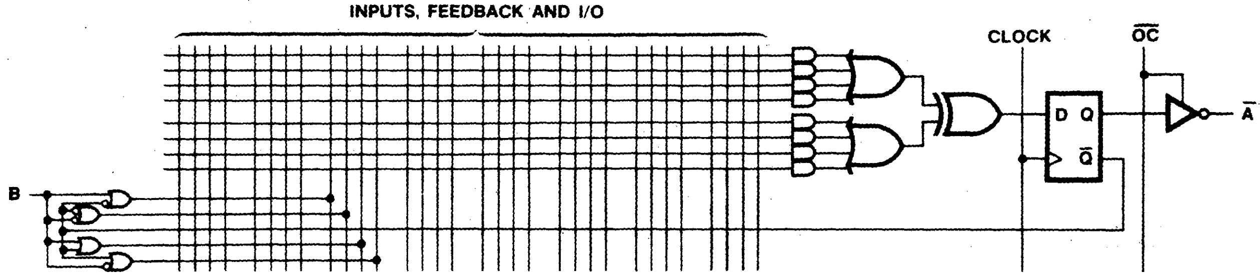

Figure 13

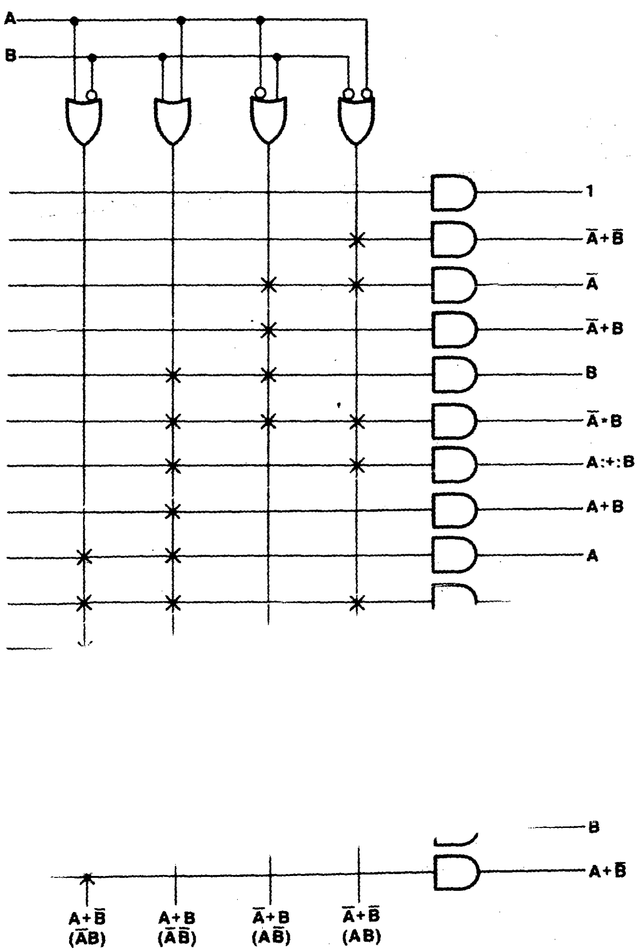

Figure 14

$(\overline{A}+B),(\overline{A}+\overline{B})$ / $(A+\overline{B}),(A+B)$

	--	-x	xx	x-
--	1	$\overline{A}+\overline{B}$	$\overline{A}$	$\overline{A}+B$
-x	A+B	A:+:B	$\overline{A}\cdot B$	B
xx	A	$A\cdot\overline{B}$	0	A · B

Programmable I/O

A feature of the high-end members of the PAL family is programmable input/output. This allows the product terms to directly control the outputs of the PAL (Figure 10). One product term is used to enable the three-state buffer, which in turn gates the summation term to the output pin. The output is also fed back into the PAL array as an input. Thus the PAL drives the I/O pin when the three-state gate is enabled; the I/O pin is an input to the PAL array when the three-state gate is disabled. This feature can be used to allocate available pins for I/O functions or to provide bi-directional output pins for operations such as shifting and rotating serial data.

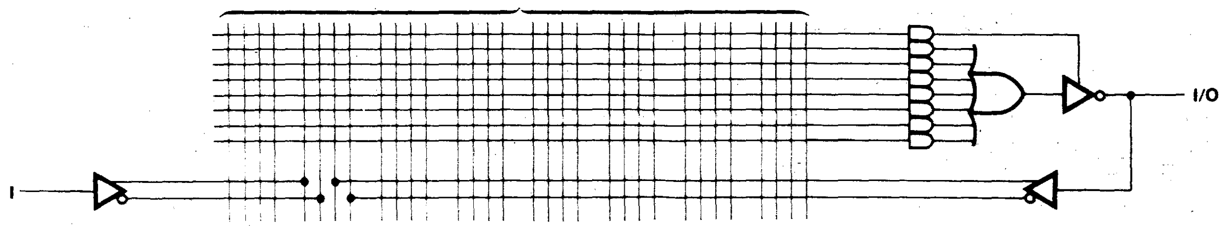

Figure 10

Registered Outputs with Feedback

Another feature of the high end members of the PAL family is registered data outputs with registered feedback. Each product term is stored into a D-type output flip-flop on the rising edge of the system clock (Figure 11). The Q output of the flip-flop can then be gated to the output pin by enabling the active low three-state buffer.

In addition to being available for transmission, the Q output is fed back into the PAL array as an input term. This feedback allows the PAL to "remember" the previous state, and it can alter its function based upon that state. This allows the designer to configure the PAL as a state sequencer which can be programmed to execute such elementary functions as count up, count down, skip, shift, and branch. These functions can be executed by the registered PAL at rates of up to 25 MHz.

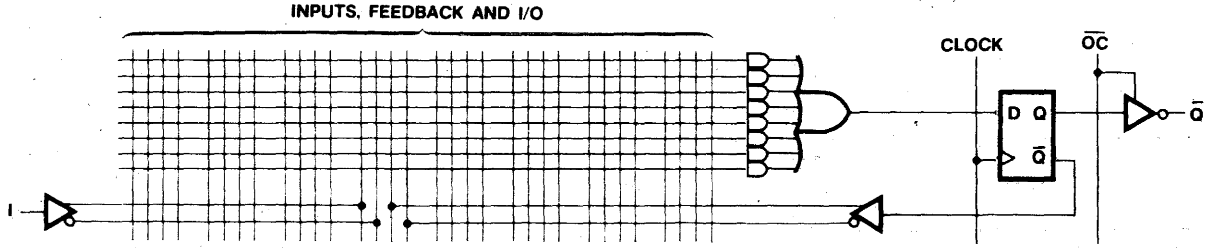

Figure 11

XOR PALs

These PAL devices feature an exclusive OR function. The sum of products is segmented into two sums which are then exclusive ORed (XOR) at the input of the D-type flip-flop (Figure 12). All of the features of the Registered PALs are included in the XOR PAL unit. The XOR function provides an easy implementation of the HOLD operation used in counters and other state sequencers.

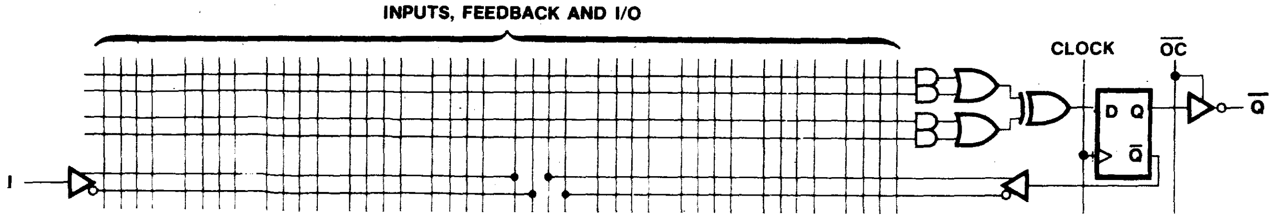

Figure 12

Arithmetic Gated Feedback

The arithmetic functions (add, subtract, greater than, and less than) are implemented by addition of gated feedback to the features of the XOR PAL device. The XOR at the input of the D-type flip-flop allows carrys from previous operations to be XORed with two variable sums generated by the PAL array. The flip-flop Q output is fed back to be gated with input terms A (Figure 13). This gated feedback provides any one of the 16 possible Boolean combinations which are mapped in the Karnaugh map (Figure 15). Figure 14 shows how the PAL array can be programmed to perform these 16 operations. These features provide for versatile operations on two variables and facilitate the parallel generation of carrys necessary for fast arithmetic operations.

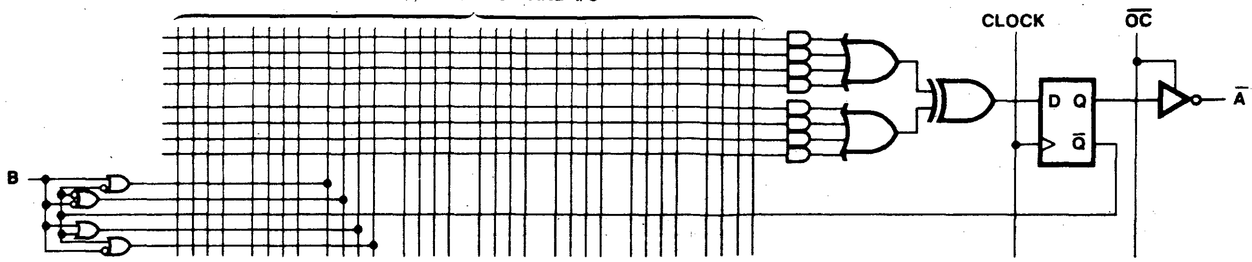

Figure 13

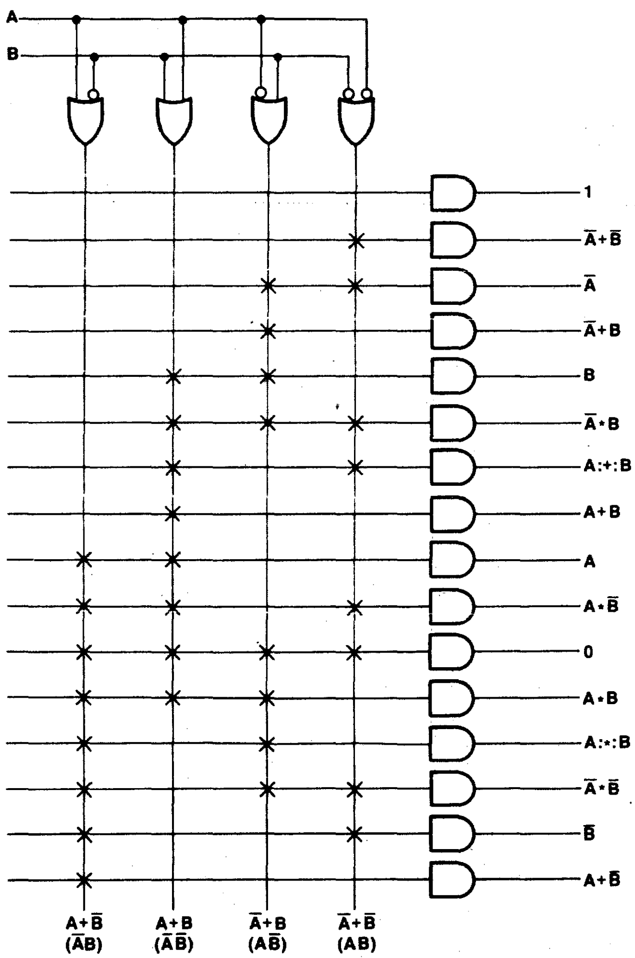

Figure 14

Figure 15

It should now be clear that the PAL family can replace most Small-Scale Integrated Logic (SSI) logic in use today, thereby lowering product cost and giving the designer even greater flexibility in implementing logic functions.

PAL Programming

PAL devices can be programmed in most standard PROM programmers with the addition of a PAL personality card. The PAL appears to the programmer as a PROM. During programming half of the PAL outputs are selected for programming while the other outputs and the inputs are used for addressing. The outputs are then switched to program the other locations. Verification uses the same procedure with the programming lines held in a low state.

PALASM (PAL Assembler)

PALASM is the software used to define, simulate, build, and test PAL units. PALASM accepts the PAL Design Specification as an input file. It verifies the design against an optional function table and generates the fuse plot which is used to program the PAL devices. PALASM is available upon request for many computers and is documented in the PAL Design Concepts section.

HAL (Hard Array Logic)

The HAL family is the mask programmed version of a PAL. The HAL is to a PAL just as a ROM is to a PROM. A standard wafer is fabricated to the 6th mask. Then a custom metal mask is used to fabricate Aluminum links for a HAL instead of the programmable Ti-W fuse array used in a PAL.

The HAL is a cost-effective solution for large quantities and is unique in that it is a gate array with a programmable prototype.

HMSI (HAL Medium Scale Integration)

The HMSI family is derived from the PAL using HAL technology. These devices perform predetermined functions which are not available in the existing TTL family. Because they are produced in volume, the user receives the benefit of volume pricing. HMSI PAL designs are given in the Applications section with their industry standard 74LS part number in line 2 of the PAL Design Specification.

PMSI (PAL Medium Scale Integration)

The PMSI family is derived in a similar fashion to HMSI except this product is produced entirely from a PAL circuit. A HAL circuit mask is not generated and an industry standard 74LS part number is not assigned unless sales warrant it.

PAL Technology

PAL circuits are manufactured using the proven TTL Schottky bipolar Ti-W fuse process to make fusible-link PROMs. An NPN emitter follower array forms the programmable AND array. PNP inputs provide high-impedance inputs (0.25 mA max) to the array. All outputs are standard TTL drivers with internal active pull-up transistors. Typical PAL propagation delay time is 25 ns, and all PALs are packaged in space saving 20-pin and 24-pin SKINNYDIP® packages.

PAL Data Security

The circuitry used for programming and logic verification can be used at any time to determine the logic pattern stored in the PAL array. For security, the PAL has a "last fuse" which can be blown to disable the verification logic. This provides a significant deterrent to potential copiers, and it can be used to effectively protect proprietary designs.

2175 Mission College Boulevard, Santa Clara, CA 95050 Tel: (408) 970-9700 TWX: 910-338-2376 TWX: 910-338-2374
Monolithic Memories

PAL®-Programmable Array Logic
HAL®-Hard Array Logic

Features/Benefits

- **Reduces SSI/MSI chip count greater than 5 to 1**
- **Saves space with SKINNYDIP® packages**
- **Reduces IC inventories substantially**
- **Expedites and simplifies prototyping and board layout**
- **PALASM™ silicon compiler provides auto routing and test vectors**
- **Security fuse reduces possibility of copying by competitors**

Description

The PAL family utilizes an advanced Schottky TTL process and the Bipolar PROM fusible link technology to provide user programmable logic for replacing conventional SSI/MSI gates and flip-flops at reduced chip count.

The HAL family utilizes standard Low-Power Schottky TTL process and automated mask pattern generation directly from logic equations to provide a semi-custom gate array for replacing conventional SSI/MSI gates and flip-flops at reduced chip count.

There are four different speed/power families offered. Choose from either the standard, high speed, half power, or quarter power family to maximize design performance.

The PAL/HAL lets the systems engineer "design his own chip" by blowing fusible links to configure AND and OR gates to perform his desired logic function. Complex interconnections which previously required time-consuming layout are thus "lifted" from PC board etch and placed on silicon where they can be easily modified during prototype check-out or production.

The PAL transfer function is the familiar sum of products. Like the PROM, the PAL has a single array of fusible links. Unlike the PROM, the PAL is a programmable AND array driving a fixed OR array (the PROM is a fixed AND array driving a programmable OR array).

The HAL transfer function is the familiar sum of products. Like the ROM, the HAL has a single array of selectable gates. Unlike the ROM, the HAL is a selectable AND array driving a fixed OR array (the ROM is a fixed AND array driving a selectable OR array).

In addition the PAL/HAL provides these options:

- **Variable input/output pin ratio**
- **Programmable three-state outputs**
- **Registers with feedback**
- **Arithmetic capability**
- **Exclusive-OR gates**

PAL®, (Programmable Array Logic), PALASM®, HAL®, and SKINNYDIP® are registered trademarks and PMSI, and HMSI are trademarks of Monolithic Memories Inc.

Unused inputs are tied directly to V_{CC} or GND. Product terms with all fuses blown assume the logical high state, and product terms connected to both true and complement of any single input assume the logical low state. Registers consist of D type flip-flops which are loaded on the low-to-high transition of the clock. PAL/HAL Logic Diagrams are shown with all fuses blown, enabling the designer to use the diagrams as coding sheets.

The entire PAL family is programmed using inexpensive conventional PROM programmers with appropriate personality and socket adapter cards. Once the PAL is programmed and verified, two additional fuses may be blown to defeat verification. This feature gives the user a proprietary circuit which is very difficult to copy.

To design a HAL, the user first programs and debugs a PAL using PALASM and the "PAL DESIGN SPECIFICATION" standard format. This specification is submitted to Monolithic Memories where it is computer processed and assigned a bit pattern number, e.g., P01234.

Monolithic Memories will provide a PAL sample for customer qualification. The user then submits a purchase order for a HAL of the specified bit pattern number, e.g., HAL18L4 P01234. See Ordering Information below.

Ordering Information

PAL 16 L8 -2 M J 883B P01234

- PAL = PROGRAMMABLE FAMILY
HAL = HARD ARRAY FAMILY
- NUMBER OF ARRAY INPUTS
- OUTPUT TYPE
  - H = ACTIVE HIGH
  - L = ACTIVE LOW
  - C = COMPLEMENTARY
  - R = REGISTERED
  - X = EXCLUSIVE-OR REGISTERED
  - A = ARITHMETIC REGISTERED
- NUMBER OF OUTPUTS
- SPEED/POWER
  - A = HIGH SPEED
  - -2 = 1/2 POWER
  - -4 = 1/4 POWER
  - A-2 = HIGH SPEED AND 1/2 POWER
  - A-4 = HIGH SPEED AND 1/4 POWER
- TEMPERATURE RANGE
  - C = 0C TO +75C
  - M = -55C TO +125C
(CASE TEMPERATURE)
- PACKAGE
  - N = PLASTIC DIP, 20 PIN
  - J = CERAMIC DIP, 20 PIN
  - F = FLAT PACK
  - L = LEADLESS CHIP CARRIER
  - NS = MOLDED SKINNYDIP, 24 PIN
  - JS = CERAMIC SKINNYDIP, 24 PIN
- OPTIONAL HI-REL PROCESSING
  - 883B = MIL-STD-883, METHOD 5004 & 5005 LEVEL B
  - 883C = MIL-STD-883, METHOD 5004 & 5005 LEVEL C
  - B = MIL-STD-883, METHOD 5004 EQUIVALENT
  - C = MIL-STD-883, METHOD 5004 EQUIVALENT

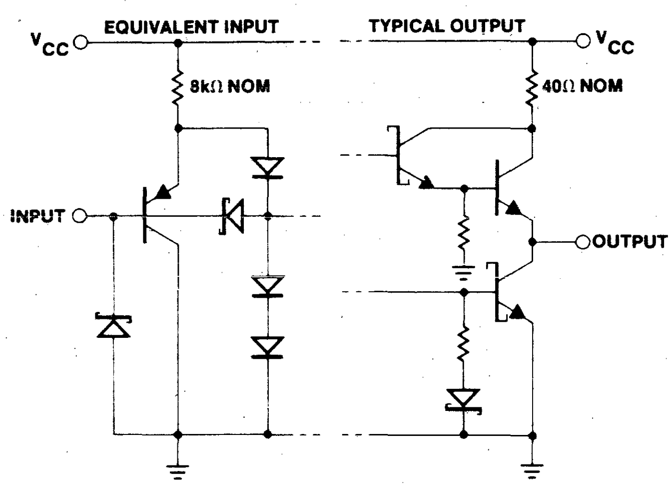
Absolute Maximum Ratings

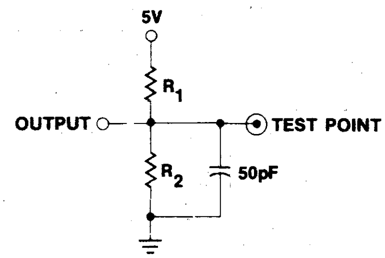
	Operating	Programming
Supply Voltage, V_{CC}	-0.5 to 7.0V	-0.5 to 12.0V
Input Voltage	-1.5 to 5.5V	-1.0 to 22V ⊕
Off-state output Voltage	5.5V	12.0V
Storage temperature		-65° to +150°C

⊕ Pins 1 and 11 may be raised to 20V

Schematic of Inputs and Outputs



Test Load



Other loads may be used.

Typical notes for all the following specifications

Notes: Apply to electrical and switching characteristics

† I/O pin leakage is the worst case of I_{OZX} or I_{IX} e.g., I_{IL} and I_{OZH}.

* These are absolute voltages with respect to the ground pin on the device and includes all overshoots due to system and/or tester noise. Do not attempt to test these values without suitable equipment.

* * Only one output shorted at a time.

Monolithic Memories MMI

Programming/Verifying Procedure

NOTES: For programming purposes many PAL pins have double functions.

For The PAL 20:

As long as Pin 1 is at HH, Pin 11 is at ground, and Pin 12 is either at HH or Z (as defined in Table 1) — Pins 16, 17, 18, and 19 are outputs. The other pin functions are: I0 (Pin 2) through I7 (Pin 9) plus Pin 12 address the proper row; A0 (Pin 15), A1 (Pin 14), and A2 (Pin 13) address the proper product lines.

When Pin 11 is at HH, Pin 1 is at ground and Pin 19 is either at HH or Z — Pins 12, 13, 14, and 15 are outputs. The other pin functions are: I0 (Pin 2) through I7 (Pin 9) plus Pin 19 address the proper row; A0 (now Pin 18), A1 (now Pin 17), and A2 (now Pin 16) address the proper product lines.

For The PAL 24:

As long as Pin 1 is at HH, Pin 13 is at ground and Pin 14 is either at HH or Z (as defined in Table 1) — Pins 19, 20, 21, 22, and 23 are outputs. The other pin functions are: I0 (Pin 2) through I9 (Pin 11) plus Pin 14 address the proper row; A0 (Pin 15), A1 (Pin 16), and A2 (Pin 17) address the proper product lines.

As long as Pin 13 is at HH, Pin 1 is at ground, and Pin 23 is either at HH or Z (as defined in Table 1) — Pins 14, 15, 16, 17, and 18 are outputs. The other pin functions are: I0 (Pin 2) through I9 (Pin 11) plus Pin 23 address the proper row; A0 (Pin 22), A1 (Pin 21), and A2 (Pin 20) address the proper product lines.

For The PAL 24A:

As long as Pin 1 is at HH, Pin 13 is at ground, and Pin 14 is either at HH or Z (as defined in Table 1) — Pins 19, 20, 21, and 22 are outputs. The other pin functions are: I0 (Pin 2) through I9 (Pin 11) plus Pin 14 address the proper row; A0 (Pin 15), A1 (Pin 16), and A2 (Pin 17) address the proper product lines.

As long as Pin 13 is at HH, Pin 1 is at ground, and Pin 23 is either at HH or Z (as defined in Table 1) — pins 15, 16, 17, and 18 are outputs. The other Pin functions are: I0 (Pin 2) through I9 (Pin 11) plus Pin 23 address the proper row; A0 (Pin 22), A1 (Pin 21), and A2 (Pin 20) address the proper product lines.

Pre-Verification

5.1.1 Raise V_{CC} to 5.0 volts.

5.1.2 Raise Output Disable pin, OD, to VIHH.

5.1.3 Select an input line by specifying Inputs and L/R as shown in Table 1 or Table 2.

5.1.4 Select a product line by specifying A0, A1, and A2 one-of-eight select as shown in Table 3, Table 4 or Table 5.

5.1.5 Pulse the CLOCK pin and verify (with CLOCK at VIL) that the output pin, O, is in the state corresponding to an unblown fuse.

— For verified unblown condition, continue procedure from 5.1.3 through 5.1.5.

— For verified blown condition, stop procedure and reject part.

Programming Algorithm

5.2.1 Raise Output Disable pin, OD, to VIHH

5.2.2 Programming pass. For all fuses to be blown:

5.2.2.1 Lower CLOCK pin to ground.

5.2.2.2 Select an input line by specifying Inputs and L/R as shown in Table 1 or Table 2.

5.2.2.3 Select a product line by specifying A0, A1, and A2 one-of-eight select as shown in Table 3, Table 4 or Table 5.

5.2.2.4 Raise V_{CC} to VIHH.

5.2.2.5 Program the fuse by pulsing the output pins of the selected product group -one at a time- to VIHH (as shown in the Programming Waveforms, Section 5.5).

5.2.2.6 Lower V_{CC} to 5.0 volts.

5.2.2.7 Repeat this procedure from 5.2.2.2 until pattern is complete.

5.2.3 First verification pass. For all fuse locations:

5.2.3.1 Select an input line by specifying Inputs and L/R as shown in Table 1 or Table 2.

5.2.3.2 Select a product line by specifying A0, A1, and A2 one-of-eight select as shown in Table 3, Table 4 or Table 5.

5.2.3.3 Pulse the CLOCK pin and verify (with CLOCK at VIL) that the output pin, O, is in the correct state.

— For verified output state, continue procedure

— For overblow condition, stop procedure and reject part.

— For underblow condition, reexecute steps 5.2.2.4 through 5.2.2.6 and 5.2.2.3. If successful, continue procedure. After three attempts to blow fuse without success, reject part but continue procedure.

5.2.3.4 Repeat this procedure from 5.2.3.1 until the entire array is exercised.

5.2.4 High Voltage Verify. For all fuse locations:

5.2.4.1 Raise V_{CC} to 5.5 volts.

5.2.4.2 Select an input line by specifying Inputs and L/R as shown in Table 1 or Table 2.

5.2.4.3 Select a product line by specifying A0, A1, and A2 one-of-eight select as shown in Table 3, Table 4 or Table 5.

5.2.4.4 Pulse the CLOCK pin and verify (with CLOCK at VIL) that the output pin, O, is in the correct state.

— For verified output state, continue procedure

— For invalid output state, stop procedure and reject part.

5.2.4.5 Repeat this procedure from 5.2.4.1 until the entire array is exercised.

5.2.5 Low Voltage Verify. For all fuse locations:

5.2.5.1 Lower V_{CC} to 4.5 volts.

5.2.5.2 Select an input line by specifying Inputs and L/R as shown in Table 1 or Table 2.

5.2.5.3 Select a product line by specifying A0, A1, and A2, one-of-eight select as shown in Table 3, Table 4 or Table 5.

5.2.5.4 Pulse the CLOCK pin and verify (with CLOCK at VIL) that the output pin, O, is in the correct state.
- For verified output state, continue procedure.
- For invalid output state, continue procedure and reject part.

Programming the Security Fuses

5.3.1 Verify per Section 5.2.4 and 5.2.5.

5.3.2 Raise V_{CC} to 6 volts.

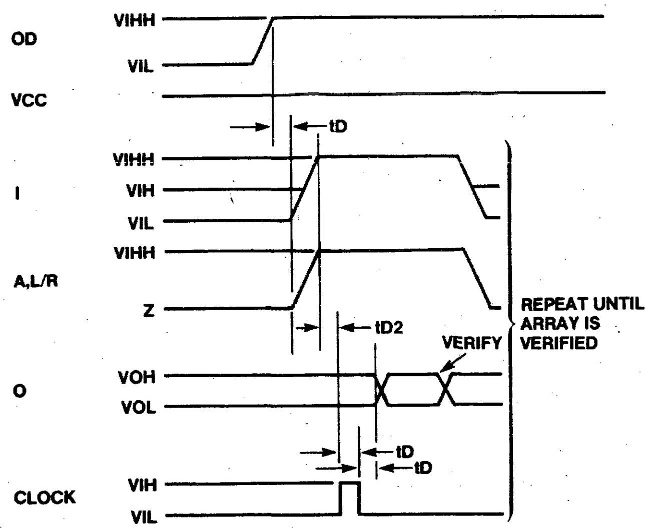
5.3.3 For PAL 20:
- Program the first fuse by pulsing Pin 1 to VP. (From 1 to 5 pulses is acceptable.)
- Program the second fuse by pulsing Pin 11 to VP. (From 1 to 5 pulses is acceptable.)

5.3.4 For PAL 24 and PAL 24A:
- Program the first fuse by pulsing Pin 1 to VP. (From 1 to 5 pulses is acceptable.)
- Program the second fuse by pulsing Pin 13 to VP. (From 1 to 5 pulses is acceptable.)

5.3.5 Verify per Section 5.2.4 and 5.2.5:
- A device is "secure" if either half fails to verify.

5.4 Programming Parameters

SYMBOL	PARAMETER		LIMITS MIN	TYP	MAX	UNIT
V_{IHH}	Program-level input voltage		11.5	11.75	12	V
I_{IHH}	Program-level input current	Output Program Pulse			50	mA
		OD, L/R			50	mA
		All other inputs			10	mA
I_{CCH}	Program Supply Current				900	mA
t_{VCCP}	Pulse Width of V_{CC} @ V_{IHH}				60	µS
T_P	Program Pulse Width		10	20	50	µS
t_D	Delay Time		100			ns
t_{D2}	Delay Time after L/R Pin		10			µS
	V_{CCP} Duty Cycle				20	%
V_P	Security Fuse Programming Voltage		18	18.5	19	V
I_P	Security Fuse Programming Supply Current				400	mA
T_{PP}	Security Fuse Programming Pulse Width		10	40	70	µS
	Security Fuse Programming Duty Cycle				50	%
t_{RP}	Rise time of output programming and address pulses		1	1.5	10	V/µS
t_{RP}	Rise Time of security fuse programming pulses		1	1.5	10	V/µS
V_{CCPP}	V_{CC} value during security fuse programming		5.75	6.0	6.25	V
	V_{CC} value for first verify		4.75	5.0	5.25	V
	V_{CC} value for High V_{CC} verify		5.4	5.5	5.6	V
	V_{CC} value for Low V_{CC} verify		4.4	4.5	4.6	V



NOTE: VCC (Low Voltage Verify) = 4.5 volts
VCC (High Voltage Verify) = 5.5 volts
VCC (First Verify) = 5.0 volts
A Delay (tD2) must always precede the Positive Clock Transition. (e.g see section 5.2.3.3 for underblow condition)

MOTOROLA

FOR CUSTOM LSI/VLSI BIPOLAR CIRCUITS

High Performance ALS-TTL-Compatible Macrocell Arrays

MCA500ALS MCA1300ALS MCA2800ALS

In addition to standard logic lines, Motorola also offers a variety of TTL-compatible Macrocell Arrays. These products provide a means for developing economical custom LSI/VLSI logic circuits. Performance is achieved by the combination of an advanced MOSAIC I (Motorola Oxide-Isolated Self-Aligned Implanted Circuit) oxide isolated bipolar integrated circuit process and a series gated emitter-coupled logic (ECL) macrocell circuit technology. Input and output circuits provide level translation to and from the internal array logic for standard TTL/MOS interface.

Each cell within the arrays contains a number of unconnected transistors and resistors. Stored within a computer are the specifications to automatically interconnect these elements forming SSI/MSI logic cells (rather than simple gates) called macrocells. These macrocells take the form of standard logic blocks such as dual type D flip-flops, dual full adders, quad latches and many other pre-defined "library" functions. Presently, the macrocell library for the ALS-TTL arrays contains more than 80 logic functions.

Generating an LSI/VLSI design is simply a matter of selecting the appropriate macrocells and describing the proper interconnection network to implement the design. Motorola's CAD (Computer-Aided-Design) interface provides automatic placement and routing of the cells (intraconnection of the cell itself is automatically accomplished when placed), full logic and fault-testing capabilities, AC delay simulations, generation of test tapes and custom metallization to complete the IC processing sequence.

The ability to stockpile fully diffused wafers provides a very fast turnaround time (the time from customer notification of a completed design to delivery of finished parts) of currently nine weeks.

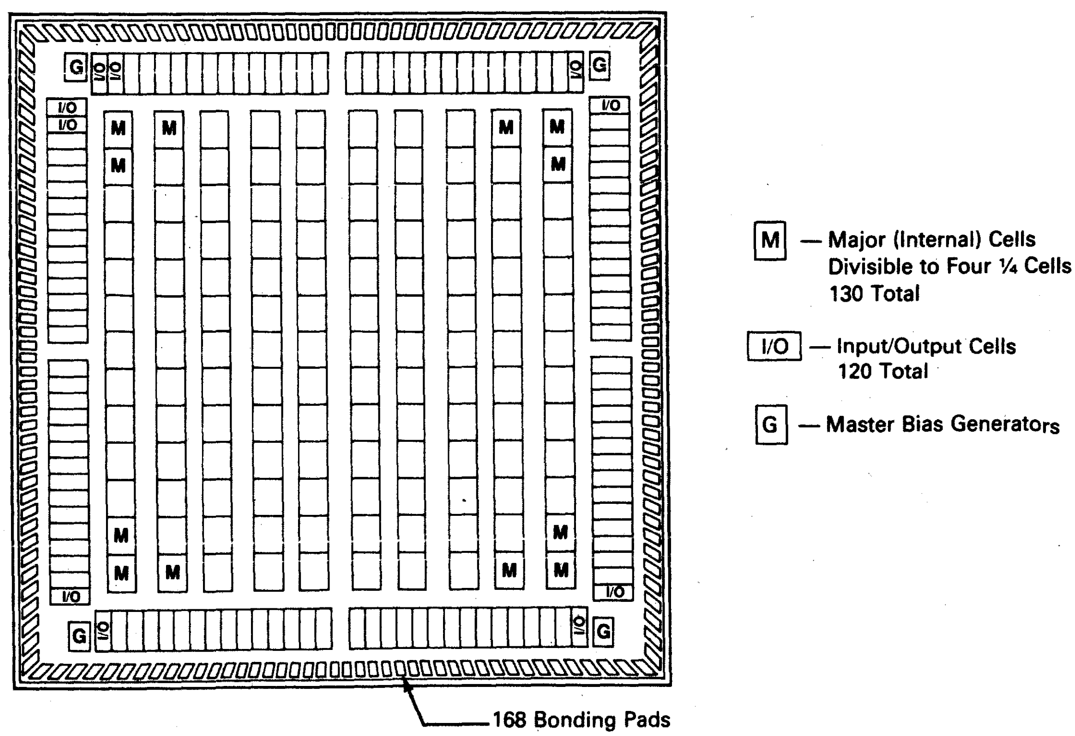
MCA2800ALS MACROCELL ARRAY LAYOUT



MOTOROLA

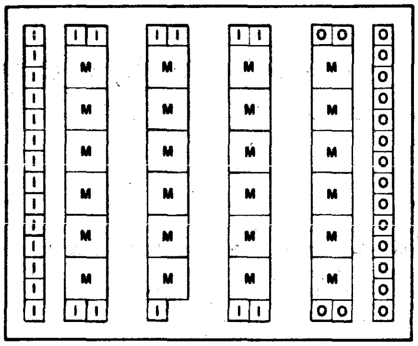
MECL 10,000 Macrocell Array Family

The Macrocell Array Concept combines a pre-diffused array of components with computer-aided design techniques to offer system designers a rapid, cost-effective means for implementing semi-custom, high-speed digital logic systems with VLSI circuitry.

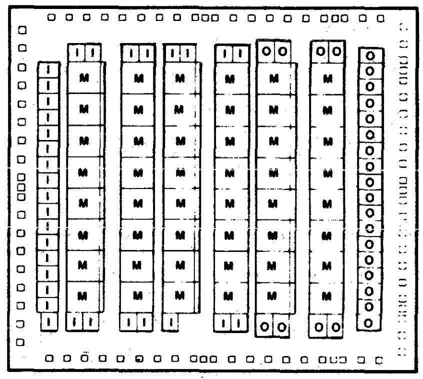
Compared with equivalent systems developed with discrete logic (separately packed SSI/MSI logic functions) the high packing density of the Macrocell array chip offers up to 100-to-1 reduction in system component count, with a power dissipation improvement (reduction) of as much as 12 to 1.

Compared with the conventional approach to custom LSI circuits, the Macrocell approach offers a tremendous reduction in delivery time. With a stockpile of fully diffused wafers, turnaround time (from the time the customer gives the go-ahead signal for generating masks until he receives finished parts) is seven weeks.

MECL Macrocell Array family members presently consist of the MCA1200ECL (68 Pin) Array, the MCA600ECL (28, 40 and 68 Pin) Array, and the MCA2500ECL (149 Pin) Array.



THE MCA600ECL
Total of 67 cell locations—24 Major, 25 Interface and 18 Output cell locations.



THE MCA1200ECL
Total of 106 cell locations—48 Major, 32 Interface and 26 Output cell locations.

M10900 Family

The M10900 family is a series of very high performance bipolar LSI products designed off the MECL Macrocell Array offering. While the Macrocell Array is normally used for custom circuits which require option development time and costs, the M10900 family is a standard product ordered like any other MECL 10K circuit.

Device	Description	Comments
MC10900Z	8-Bit ALU with Parity Slice	17.8 ns Max Addition of 2 8-Bit Words. Introduced
MC10901Z	8 x 8-Bit Array Multiplier	Expandable to 32 x 32. 24.3 ns Max Delay for 8 x 8 Multiply. Introduced
MC10902Z	8-Bit Binary/BCD ALU Slice	Expandable to 32-Bits. 17.9 ns Max Add Delay. Introduced
MC10904Z	8-Bit Micro Code Sequencer Slice	Expandable to 24-Bits. 14.0 ns Max Clock to Output.
MC10905Z	Error Detect and Correct Circuit	16-Bit Check and Correct with 1 Chip. Expandable to 64-Bits. 16-Bit Check and Correct in 19.7 ns Max.

μPB6300 SERIES HIGH SPEED ECL GATE ARRAYS

Description

The μPB6300 series consists of three high speed ECL gate arrays manufactured using advanced bipolar technology. The μPB6301, μPB6310, and μPB6320 have 300, 1200, and 2000 equivalent gates, respectively. Specific LSI designs are built by interconnecting cells (2.5 gates) by means of advanced CAD tools such as logic simulation, automatic placement and routing, delay simulation, and test program generation. Customers can use the GE MARK III® time sharing system through their own terminals for logic simulation.

Customers can choose from a wide range of package types. The μPB6300 gate arrays are available in 72 = to 132 = pin grid arrays (PGA) packages and a 68-pin leadless dip carrier (LCC) package.

Features

- ☐ High speed: ☒ 0.5ns/gate (fan-in (=) fan-out (=) 2.5, L = 2.0mm)
- ☐ ECL 100K compatible
- ☐ Shallow junction dielectric isolation
- ☐ 68 available macros in function block library
- ☐ Fully supported by advanced CAD with direct customer access
- ☐ Quick Turn Around Time ☒ available 8~10 weeks after logic validation

CONSTITUTION

μPB6101/μPB6102/μPB6103 BIPOLAR GATE ARRAYS

Description

The μPB6101/6102/6103 are high-speed, low-power TTL compatible gate arrays using an advanced NEC bipolar technology. They consist of an uncommitted configurable logic array and TTL compatible input/output (I/O) buffers.

NEC's comprehensive CAD support system and master slice system significantly reduce the time and expense normally associated with semi-custom devices.

Normal turnaround time, after logic validation, is only 8~10 weeks. Advanced CAD tools, such as: logic simulation, automatic placement and routing, delay simulation, and test program generation are used to insure accurate error-free designs of all NEC gate arrays.

Features

- ☐ Choice of three (3) Array Sizes
- ☐ High Speed 2.5nS/gate
- ☐ Low Power 1.4 mW/gate
- ☐ Comprehensive CAD for Rapid, Error-Free Designs
- ☐ Remote CAD Access on the GE Mark III Time Share Network Using Customer Terminal for Logic Simulation
- ☐ Four Output Buffer Types Available (Totem Pole, Open Collector, Three-State, Bidirectional)
- ☐ Package Options Dual-in-Line packages, Flat-Packages, Pin-Grid Arrays
- ☐ 8~10 Week Delivery After Logic Simulation

Packaging

The package type (dual-in-line, flat package, or pin-gride array) is generally determined by the customer, while the number of pins is a function (sum) of the utilized I/O and power pins. The μPB610X Series can be packaged in a 16-pin DIP (μPB6101) (minimum) through 72-pin (μPB6103) (maximum) PGA

The Series consists of three (3) devices:

Part Number	Gates	Output Buffers	Input Buffers
μPB6101	256	32	38
μPB6102	598	52	64
μPB6103	918	69	69

Package Pin Counts

Part	Package Pins	
Number	Minimum	Maximum
μPB6101	**16**	**40**
μPB102	**20**	**72**
μPB6103	**20**	**72**

ABSOLUTE MAXIMUM RATINGS

ITEM	SYMBOL	RATING	UNIT
Power Supply Voltage	V_{CC}	+7.0	V
Input Voltage	V_I	−0.5 to +7.0	V
Output Voltage	V_O	−0.5 to +5.5	V

RECOMMENDED OPERATING CONDITION

ITEM	SYMBOL	CONDITION	UNIT
Power Supply	V_{CC}	5 ± 10 %	V
Operating Temperature	T_{OP}	0 to 85	°C
"H" Level Output Current	I_{OH}	100 MAX.	μA
"L" Level Output Current	I_{OL}	12 MAX.	mA

ELECTRICAL CHARACTERISTICS

D.C. CHARACTERISTICS (T_a=25 °C)

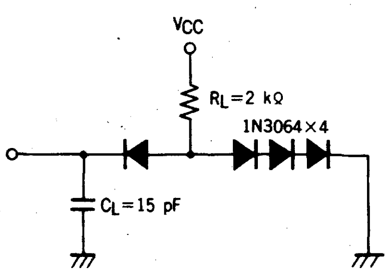
ITEM	SYMBOL	TEST CONDITIONS	MIN.	TYP.	MAX.	UNIT
Low Level Input Voltage	V_{IL}				0.8	V
High Level Input Voltage	V_{IH}		2.0			V
Input Clamp Voltage	V_{IC}	V_{CC}=4.5 V, I_{IL}=−18 mA	−1.5			V
Low Level Output Voltage	V_{OL}	V_{CC}=4.5 V, I_{OL}=12 mA		0.3	0.5	V
High Level Output Voltage	V_{OH}	V_{CC}=4.5 V, I_{OH}=1 mA Note 1	2.5	3.0		V
Short Circuit Output Current	I_{OS}	V_{CC}=5.5 V, V_O=0 V	−100		−25	mA
Low Level Input Current	I_{IL}	V_{CC}=5.5 V, V_I= 0.4 V	−200			μA
High Level Input Current	I_{IH}	V_{CC}=5.5 V, V_I=2.7 V			20	μA
High Level Output Current	I_{OH}	V_{CC}=5 V, V_O=5.5 V			100	μA
Off State Output Current	I_{OZ}	V_{CC}=4.5 V, V_O=0.4 V/2.4 V (3 State Output)	−20		20	μA
Off State Output Current	I_{OZ}	(Bidirectional)	−200		40	μA

Note 1: Does not apply to Open-Collector Outputs

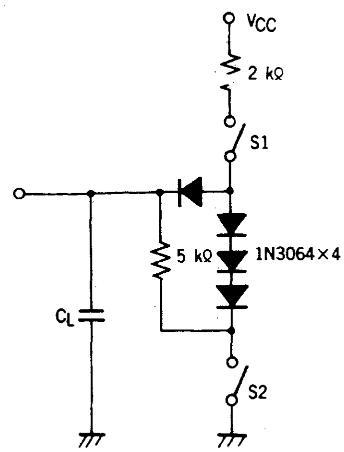
A.C. CHARACTERISTICS (T_a= 25 °C)

ITEM	SYMBOL	TEST CONDITIONS	MIN.	TYP.	MAX.	UNIT
Delay Time/Gate	t_{PHL}	F/O=1 l=2 mm	1.0	1.8	2.7	ns
	t_{PLH}		1.4	2.5	3.7	ns
Delay Time/Input Buffer	t_{PHL}	F/O=1 l=2 mm	1.0	1.8	2.7	ns
	t_{PLH}		1.3	2.3	3.5	ns
Delay Time/Output Buffer	t_{PHL}	C_L=15 pF	2.8	4.7	7.1	ns
	t_{PLH}	C_L=15 pF	3.2	5.4	8.1	ns

OUTPUT LOAD CONDITION



i) for ordinary output



ii) for Three state output

EXAMPLE OF POWER DISSIPATION

ITEM	SYMBOL	POWER DISSIPATION	UNIT
Internal Gate	F010	1.4	mW
Input Buffer	M001	1.9	mW
Output Buffer (Totem-Pole)	B001	2.4	mW
Output Buffer (Open Collector)	B002	2.4	mW
Output Buffer (Three State)	B003	2.5	mW
Output Buffer (Bidirectional)	B004	4.4	mW
Output Buffer (Bidirectional D.C.)	B007	4.4	mW

NEC Electronics

CUSTOM/SEMICUSTOM

Chip Architecture

The arrays are divided into three basic areas. The I/O buffers are placed uniformly on the periphery of each device so that there are an equal number on each die edge. At each signal pad location, the pin function can be one of several possible I/O function configurations.

The area between the cells and the bonding pads contains all of the peripheral circuitry which convert from I/O levels to the internal logic, and a voltage generating for the internal power supply.

The center of the die contains rows of continuous gates separated by horizontal routing channels. The density of the array is a factor of the total cell count (row × line). Each cell is made up of two transistors and four resistors.

V000	0 LEVEL GENERATOR	1	1.4
JWI	WIRED AND	–	–
C005	DELAY GATE	4	3.7
CS10	OUTPUT LEVEL SHIFT	1	2.5

DEVELOPMENT PROCEDURE

Chart 1 illustrates the development step of both customer and NEC. The following two types of interfaces are available for customers.

1) CAD interface (Interface A) ..... most common method.

In this method the customer will begin at the logic design stage and proceed through to the logic simulation stage. NEC will then carry on from automatic placement and routing through sample delivery to final shipment of product.

The major benefit of this method is that the customer can perform the logic simulation on their own premises by using the NEC CAD facilities through the GE MARK III time share system, thus reducing the time needed for design.

Document

(1) contact and non-disclosure agreement
(2) circuit drawing based on NEC's functional block
(3) interconnection data file (LOGINC)
(4) test data pattern file (LOGPAT)
(5) Pin-assignment (if required)
(6) Critical path assignment (if required)

2) Circuit drawing interface (interface B)

(1) logic drawing . . . . Here the customer will prepare the logic drawing according to the block library shown in Fig. 1 and the design manual.
(a typical example is shown in Fig. 2)

(2) test pattern sheet. . . . . The test pattern sheet also needs to be prepared
(a typical example is shown in Fig. 3)

The remaining stages from logic simulation to shipment are performed by NEC. Design rule check and logic simulation results are reported to the customers.

NEC will furnish evaluation samples within 10 weeks of logic validation.

μPD65000 SERIES ADVANCE SILICON CMOS CMOS GATE ARRAYS

Description

The μPD 65000 Series is a family of low power, high-speed gate arrays manufactured using advanced Silicon gate CMOS technology. The series consists of from 427 to 11,250 gate devices that are available in a variety of package types.

The semi-custom approach of using Gate Arrays offers a unique and effective method of manufacturing I.C.'s with greatly reduced cost and development time. NEC makes this possible by stocking wafers which are completely fabricated except for the final step of interconnection of components to make up the required circuit configuration. This enables a designer the freedom of interconnecting the uncommitted components to achieve his unique circuit configuration.

The semi-custom approach is intended for customers seeking cost effective alternatives. By using Gate Arrays, customers can reduce component count and board size so that they can be more competitive in the markets which they serve. NEC's Gate Array program allows a customized I.C. to be developed with a short turn around time and at a small fraction of the cost of a full custom development program.

An advanced Computer-Aided Design (CAD) system is provided by NEC to achieve high quality, low cost and fast semi-custom I.C. development. Two kinds of interface are available for the customer. Interface "A" requires the customer to do the logic simulation either at one of the NEC's design centers or at his own facility through a terminal linked to G.E. Mark III time-sharing system. Interface "B" only requires the customer to provide the logic diagram and timing chart and NEC will do the rest.

So, contact us now and let NEC's Gate Array help you to succeed in your business.

Part Number	Number of Gates	Configuration	Input Buffers	Output Buffers
3-Micron Geometry				
μPD65002	858	66 × 13	50	50
μPD65003	427	61 × 7	38	36
μPD65010	1368	76 × 18	64	64
μPD65020	2112	96 × 22	80	80
2-Micron Geometry				
μPD65040	4104	152 × 27	120	116
μPD65060	6528	192 × 34	148	138
μPD65100	11,250	250 × 45	196	176

Notes:
1. A gate consists of 2 P-ch and 2 N-ch transistors.

Features

Features	3-micron	2-micron
☐ High Speed	3ns/gate	2ns/gate
☐ Low Power	30μW/gate	20μW/gate

- ☐ Comprehensive CAD for rapid, error-free designs
- ☐ Remote CAD access on the GE Mark III time share network using customer terminal for logic simulation.
- ☐ Four output buffer types available (normal, open drain, three state, bidirectional).
- ☐ Quick turnaround time (10~12 weeks)
- ☐ Fully supported by advanced CAD
- ☐ 20K gate automatic placement and routing capability
- ☐ Logic simulation
- ☐ Test program generation
- ☐ Delay simulation

ABSOLUTE MAXIMUM RATINGS

($T_A = 25°C$)

ITEM	SYMBOL	RATING	UNIT
Power Supply Voltage	V_{DD}	-0.5 ~ 7	V
Input Voltage	V_I	-0.5 ~ V_{DD} + 0.5	V
Output Current	I_O	10	mA
Operating Temperature	T_{OPT}	-40 ~ +85	°C
Storage Temperature	T_{STG}	-65 ~ +150	°C

Chip Structure

The LSI chip consists of two areas; an internal cell area and a peripheral area.

Input/Output Buffer

All I/O buffers can be configured as input, schmit trigger input, normal output, open drain output, three state output or bidirectional.

All I/O buffers are fully CMOS/TTL compatible.

All assigned outputs are capable of driving 8 LS-TTL loads. Additional driving capability can be obtained by connecting output buffers in parallel.

Internal Cell

One cell has 2 p-channel transistors and 2 n-channel transistors, which are arranged in an array surrounded by routing channels

One cell can be used as 2 input NAND gate so the number of cells is equal to the number of gates.

Function Block

LSI logic function can be realized using the internal cell area. SSI/MSI logic functions are configured in units of circuit assemblage called "block" or "macro" which can be placed in any location of the internal cell area. NEC has over 140 kinds of macro's. This enables flexible LSI design and reduces design TAT.

Package Availability

Plastic and ceramic DIP packages range from 40 pins to 64 pins, flat packages from 64 pins to 100 pins, and Pin Gride Arrays (PGA) packages from 72 pins to 208 pins.

A customer can select a specific package type according to design and I/O pin requirement.

RECOMMENDED OPERATING CONDITION

ADVANCE INFORMATION

SCD4000 600 Gate ECL Array

General Description

The Plessey SCD4000 is part of a family of semi-custom gate arrays using emitter coupled logic (ECL) circuits fabricated on a high performance bipolar process to give very fast switching speeds. ECL technology offers the fastest possible gate arrays. SCD4000 achieves basic gate delays of 400ps and D-type flip-flop clock rates of 400MHz typical. The array can be used as an economical replacement for several ECL 10K and 100K standard SSI and MSI parts even at low volumes. The design procedure consists of customising two metallisation layers which are then applied to pre-processed slices held in stock to manufacture quickly a new circuit or follow-on order from the customer.

Features

- Approx. 600 logic gate complexity.
- Compound (OR-AND-OR) gate delays typically 500ps.
- Basic gate delays typically 400ps.
- Series gated (or stacked) ECL logic uses reduced internal voltage swings (500mV).
- ECL 10K compatibility.
- Fully automated design procedure.
- Extensive library of standard cells.
- Two layer metallisation allows up to 100 per cent utilisation.
- 56 input/output pins, 10 power connection pins.
- Maximum power dissipation typically 3.5 watts (100 per cent utilisation).

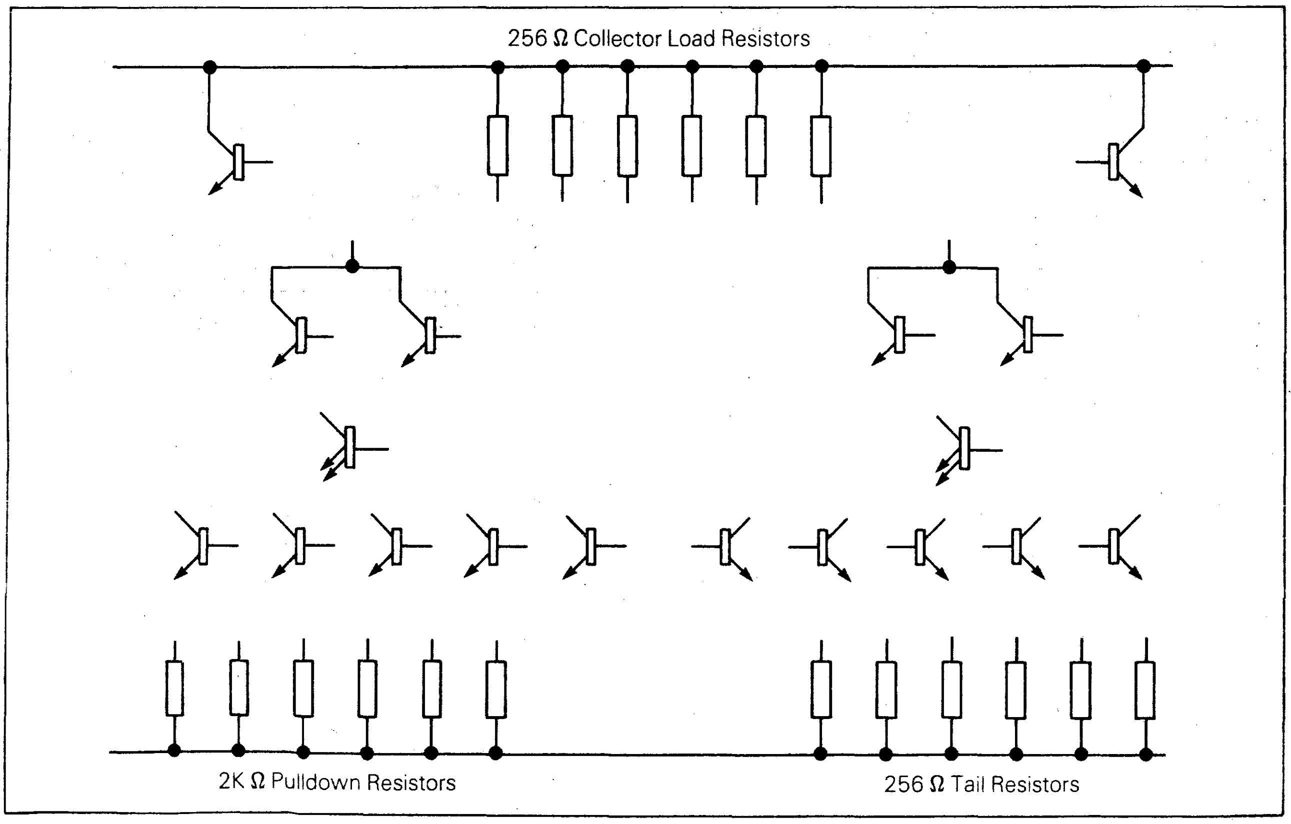
(chip size 170 × 170 mil)

Plessey Semiconductors

CUSTOM/SEMICUSTOM

Figure 2 **SCD4000 Cell Components**



Array Organisation

The array is configured into 8 × 8 cells each of which contains 20 transistors and 18 resistors as shown in figure 2. Each pair of cells shares a common voltage bias which provides all the reference levels required for internal ECL circuits and also for interfacing ECL 10K logic levels. Three of the reference levels are used for series gating. This enables complex functions to be implemented with a single cell.

The cell components have no predefined interconnect pattern. Consequently logic functions can be implemented using any required component configuration. Furthermore, additional logic is available by using the wired-AND and wired-OR functions. The result of using these powerful techniques is a 64 cell array which provides a conservative 600 logic gate complexity. (In fact, were the array to be implemented with high efficiency functions such as parity gates, a gate count of 960 would be achieved even before using the wired function).

The array has 64 edge pads of which 10 are reserved for power connections. The remaining 54 edge pads are freely available for either input or output functions as each pad site contains high current output transistors and input interface components.

Power Dissipation

Clearly power dissipation is dependent both upon the complexity and implementation of a given design. A completely full array will have a power dissipation of about 3.5 watts. The use of series gated logic greatly reduces the power necessary to perform a logical function as complex functions (e.g. 4 to 1 multiplexer) can be implemented on a single current source.

Cell Library Coding

The contents of the cell library are shown in Table 1. Each cell may contain more than one logic element and each element may have a number of options. For each cell there is a functional description showing logic levels, truth table and other circuit elements such as level shifters. A particular code is required to define the function of a specific element used within a cell. The format is as follows.

GE WW X Y Z

Where
- GE is the library cell.
- WW defines the cell.
- X selects gate or circuit element.
- Y defines variant option.
- Z input reference level.

SCD4000 Design Procedure

SCD4000 is supported by a fully automated software package including CLASSIC (an event driven logic simulator) and SCARP (an autoroute program) together with comprehensive electrical and rule violation checks. The flow diagram in figure 3 indicates the typical design procedure.

The design route outlined here will enable customers to successfully produce an ECL gate array in typically 10-16 weeks. The customer does not need to acquire specialised integrated circuit knowledge to be able to design devices. A number of customer/Plessey interfaces are possible during the course of a given design, ranging from simple logic specification at one extreme to magnetic tape (containing all the information necessary to drive the maskmaking pattern generator) at the other.

Figure 3 **Typical Design Flow Chart**

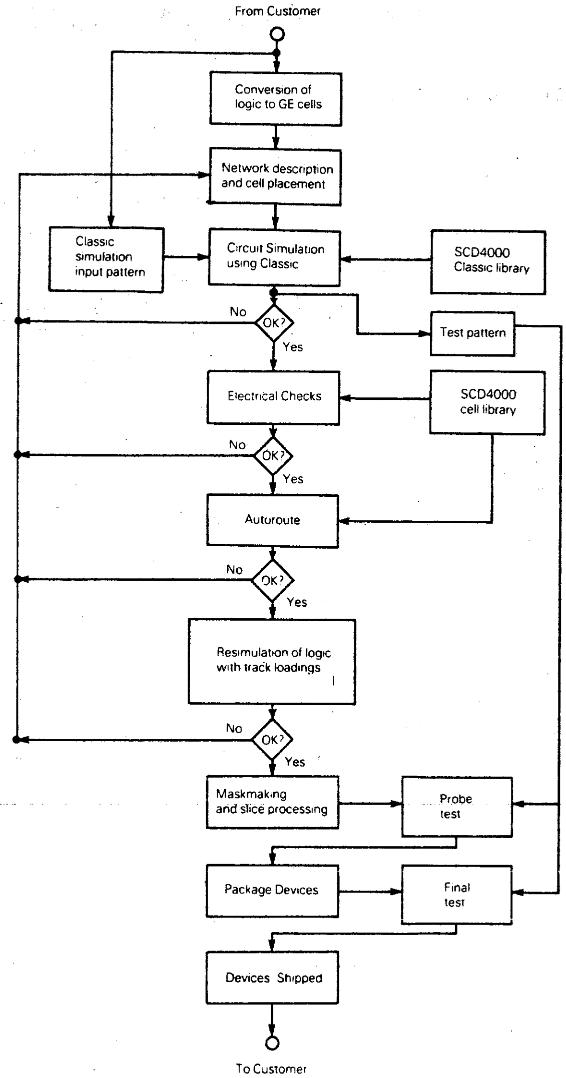


Table 1 GE Cell Library

Cell Name	Logic Function	Input/Output Buffer Compatible Input	Output
GEAA	3 input buffer gate + 2 input OR	Yes	Yes

Semi-Custom Design

Plessey offers high density cell-based and *Gate Array Semi-Custom* devices fabricated on the best Bipolar, CMOS and NMOS technologies currently available. A full custom design and custom processing facility is also available.

The selection of the best approach for a particular problem depends upon a number of factors such as circuit size, development time and cost, and unit production cost amongst others.

Plessey will be pleased to assist in the selection of an optimal solution on receipt of complete information.

CUSTOM/SEMICUSTOM

CMOS MICROCELL MV2000 Series
2.5 MICRON DOUBLE LAYER METAL

Introduction

Microcell is a powerful blend of more conventional standard cell, distributed gates, and generated logic approaches to LSI circuit design. It uses Plessey's well established CMOS process and versatile double layer metal interconnect. Very high circuit speeds are possible with the 2 1/2 micron geometry used.

This approach allows circuit costs to approach those of full custom ICs without the time and cost penalties normally associated wtih full custom.

Design Process

The design process is arranged to allow the fullest possible checking to ensure first time success. The Microcell approach itself reduces the amount of checking to be done as all standard cells are proven and, hence, only the interconnections require checking in the simulation. Design is done using the same comprehensive and versatile CAD system developed over many years for Plessey's existing range of microcell and gate array products.

Specification 25°C

Gate delay (typ) (output falling) 2 input NAND FO 1 2 input NAND FO 3	 0.8nS 1.2nS
Maximum system clock	25MHz
Maximum toggle frequency	50MHz
Power consumption/gate (average)	1 W/MHz
Power supply	3 to 7v (5V preferred)
Operating temperature	-55 to +125°C
I/O Compatibility	CMOS, TTL, LSTTL
Store Temperature	-65 to +150°C

Packaging

Standard packages are as follows:

24, 28, 40, 48 pin DII 68, 84 pin LCC, 68, 84, 108, 132 PGA

Supply of devices in other packages is subject to negotiation. Below 24 pins standard DIL packages are standard.

Cell Library

CTINV1	Small Inverter
CTINV4	Large Inverter
CTNAND2	Two Input Nand Gate
TNAND3	Three input Nand Gate
CTNAND4	Four Input Nand Gate
CTNOR2	Two Input Nor Gate

CTCKDS	Clock Filler Cell
CTCKFIL1	Clock Filler Cell
CTCKFIL2	Clock Filler Cell
CTSRFIL	Filler Cell for CTSR and CTSRRS

Other cells including PLA, ROM, RAM and a Microprocessor will be introduced in due course.

Qualification

Parts are normally supplied to Plessey's stringent commercial release standards. Screening to MIL883B and equivalent standards is available on request at additional cost.

Eliminate Gate

With Raytheon's Full Service Approach to Advanced Bipolar ISL Configurable Gate Array Problem Solving.

Your reason for considering semicustom gate arrays is for the time and cost effective superior product solutions they provide. Raytheon achieves those goals for you, recognizing and avoiding the many potentially risk inducing pitfalls that could affect your objectives.

Employing service intensive customer applications support and proven automated design techniques, Raytheon strives for error-free gate array implementation the first time.

Experience

Raytheon was among the very first to design and manufacture gate arrays. Our long standing dedication to hard-to-do, high-performance, high-reliability design and production requirements carries over to all aspects of our gate array programs.

We began with a 60-gate device in 1974, followed by a 300-gate device in 1978 and a bipolar ISL 1620-gate density array in 1981. Over 70 circuit designs have been successfully developed, and are now in volume production. We now have five members of our ISL CGA family, ranging from 800 to 2400-gates.

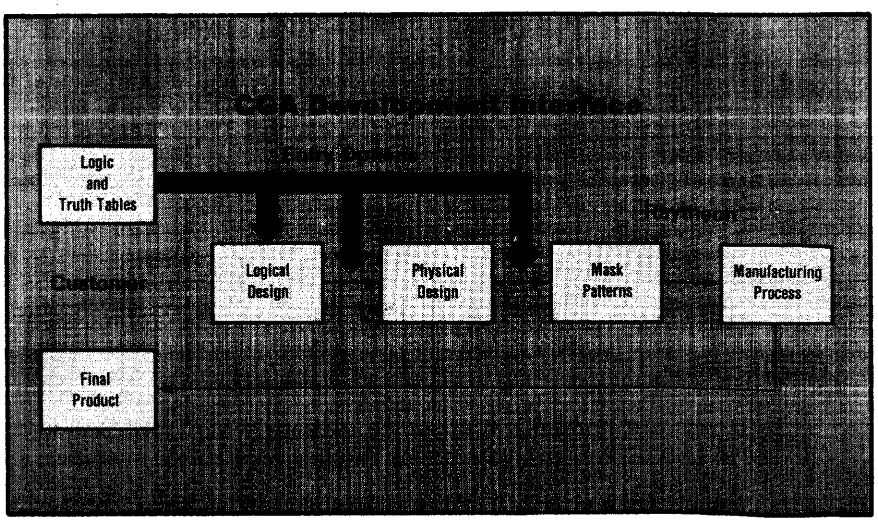
Personalized Development Support

Raytheon's cost effective approach to semicustom circuit implementation makes it fast and easy to develop your prototypes. Working parts can be in your system within 8 weeks.

Raytheon can start with your logic diagram and truth tables or divide the design tasks with you to optimize cost, minimize the turnaround time, and ensure design control.

Regardless of the design entry point that you choose, the Raytheon design engineering team will work closely with your designers to help assure optimum product performance, cost-effective partitioning, accurate logic translation, and required testability.

A comprehensive design source manual and an intensive 3-day tutorial are available to those customers who will be performaing the circuit design portions of development.



Array Anxiety

Design Automation

Raytheon's CAD facility offers a comprehensive assortment of analysis and design software, in a **common data base** environment, to quickly produce error-free prototype devices:

- Schematic Capture
- Logic Simulation
- Fault Grading
- Auto-Placement and Routing (Auto-Layout)
- Performance Verification

Performance Characteristics

Raytheon ISL CGAs are all designed for radiation tolerance and to operate over the -55° C to +125° C temperature range. Full MIL-STD-883, Class B or S processing, program management, and other custom or special requirments can be satisfied.

Bipolar ISL Technology

Raytheon's highly manufacturable 3 micron bipolar ISL process produces high density, superior performance, and efficient power consumption on all configurable gate arrays.

Interdensity compatibility exists between all arrays. Topological uniformity permits universal macrofunction and I/O designs.

All Raytheon CGA's are fully TTL compatible. You can choose the desired function from a list of 35 I/O configurations and situate it at any signal pad location.

Package Options

Everything will be done to put your array in the package you need. Choose from ceramic DIPs, leadless chip carriers, flatpaks, pin grid arrays, or name the custom package you require.

Dedicated Service

Raytheon's high level of applications support begins before an order is received. Call us today. Let's examine your needs, and explore a thoroughly analyzed and properly executed configurable gate array development. Raytheon means service and dedication.

Custom and Semicustom LSI

RCA Semicustom LSI Capabilities

Automated GAs

Features

- Easy to Design and Change
- Fast Turnaround • CMOS Performance
- Wafer Stockpiling • CAD Compatible
- Library of Logic Macros

As gate counts and design complexities increase, manual layout of GAs becomes costly and time consuming. Therefore, RCA has developed automated placement and routing techniques.

The Automated GA System requires only one unique metal mask level. Artwork for this level is generated automatically from RCA's extensive library of logic cells.

The metal mask describes the required logic functions on the array and then defines a unique interconnect pattern. Artwork for the mask is generated automatically from RCA's extensive library of logic macros (predefined logic structures or cells).

Automated GA software has proved to be very effective, providing 100% connectivity and gate utilization up to 98% for complex random logic applications.

PaCMOS (Programmable Automated Cell CMOS) Standard Cells

PaCMOS is an RCA computer-automated design approach to LSI. It is based on a group of circuit building blocks, called standard cells, that can be automatically chosen, placed, and interconnected by a computer program.

RCA has a large and expanding library of previously designed, verified, and life-tested standard cells — available in C^2L (closed-geometry silicon-gate CMOS-bulk), bulk CMOS (5μ and 3μ), and silicon-gate CMOS on sapphire substrate.

As a design aid in selecting appropriate cells, a standard cell notebook is available. In it, all of the logic cells are fully characterized and documented in the form of data sheets.

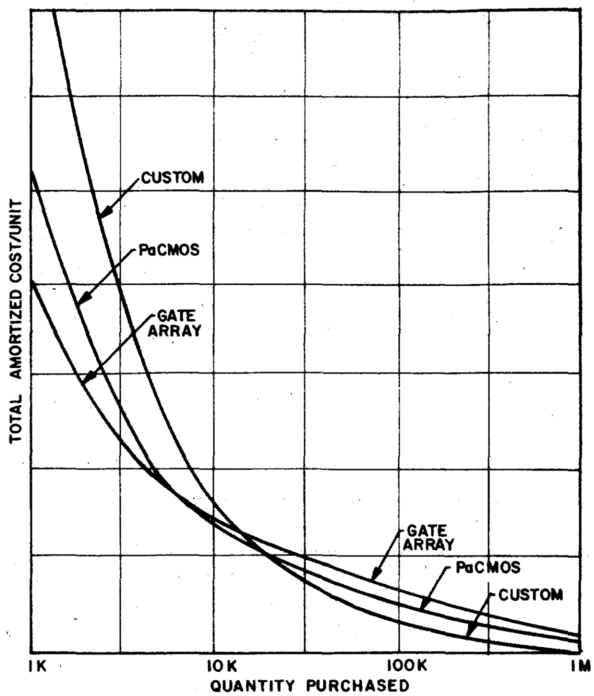
It provides the name and function of the cell, the circuit and logic configuration, the Boolean equation, the truth table, and the dynamic performance data.

By using the standard cell notebook, the designer can match his particular circuit configuration with the available standard cells and generate an input net list.

In addition to the standard cells, PaCMOS can also accommodate subchip options. Regular structures such as RAMs, ROMs, PLAs, PROMS, EPROMs, and register stacks, which have been remotely designed by conventional handcrafted techniques, can be automatically connected while the remainder of the host chip is computer generated.

PaCMOS VERSUS GA

A PaCMOS semicustom LSI offers attractive tradeoffs between development time, die size, and cost for many IC designs. Although its development time is slightly longer than a gate array, its die size is smaller. And in volume production PaCMOS can provide significant cost advances over GA designs.



92CS-35972

Design Automated Tools

MIMIC

A powerful software simulation program, called MIMIC, allows designers of GAs, as well as other RCA semicustom and custom LSI devices, to model the logical operation of digital circuits before device fabrication. Through the program, designers can discover logical flaws, race, hazard, or spike conditions, and timing and critical path uncertainties.

CRITIC (Computer Recognition of Illegal Technology in Integrated Circuits)

Another software tool available in the design of GAs, as well as other RCA semicustom and custom LSI devices, is the CRITIC program. CRITIC checks mask artwork by describing the mask as a series of polygons in terms of the vertices that define them. The program then automatically searches for and reports on minimum tolerance violations (width, spacing, and enclosure) and illegal topology relations (overlap, abut, cross, contain, and disjoint).

AFTER

The AFTER program (Automatic Functional Test Encoding Routine) aids the IC designer in generating functional test patterns required for the testing of digital IC's on Automatic Test Equipment (ATE). Input/output truth tables, representing these tests, can be created by the designer using the MIMIC logic simulation program by specifying the IC's inputs to MIMIC; its outputs are calculated by MIMIC. ATEs currently supported are the Fairchild Sentry/Sentinel/Series 20, the Teradyne J283, and the Datatron test systems.

CONCERT

(CONnectivity CERTification) is a layout analysis program which aids the verification of the logical and electrical correctness of the mask artwork produced by the APAR automatic layout programs. The layout generated by RCA's APAR programs (MP2D and GA) consists of standard cell placements and wire interconnects.

Custom and Semicustom LSI

Features

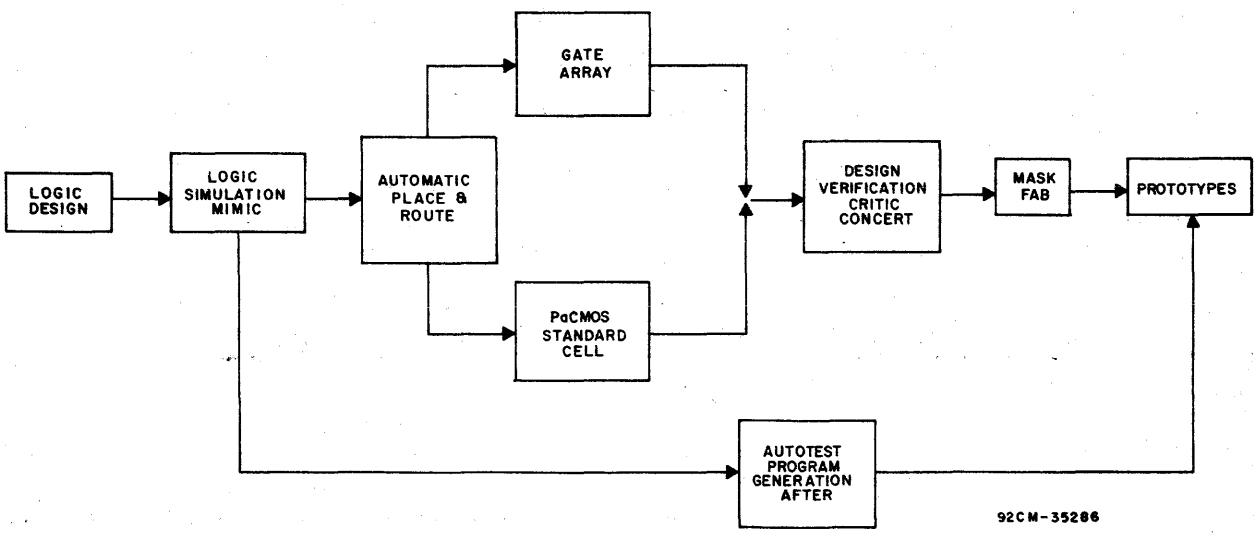
- Full Range of Cost-Effective Design Capabilities
  Gate Arrays — automatically placed and routed
  CMOS I (5μ) — CMOS II (3μ)
  PaCMOS — standard cells
  Full Custom LSI
- Fully Suported Design Automation
  MIMIC — logic simulation
  CRITIC — design rule vertification
  AFTER — test program generation
  CONCERT — connectivity check
- Long Experience
  More than 15 years of custom/semicustom service to demanding customers.

Comparison of Custom/Semicustom LSI Options*

	Semicustom		Full Custom
	Gate Array	PaCMOS Std. Cell	
Development Cost	0.2	0.3	1
Development Time	0.17	0.23	1
Risk (1st time success)	1	1.05	2
Final Die Size	1.5-2.0	1.1-1.4	1
Production Die Cost	3-4	1.5-2.0	1
Efficiency of Chip Utilization	0.8	1	1

*All comparisons normalized to a full custom basis assuming a 1000 gate complexity function.

RCA Design Automation System



RCA presently offers a variety of Gate Arrays classified according to:

Gate complexity: 250 to 6000 gates

RCA offers 17 Automated Universal Arrays (AUAs). The interconnect mask patterns for AUAs are generated solely by user-accessible software via the techniques of design automation (DA). AUAs are classified according to:

Process technology:
CMOS I — 5μ silicon gate
CMOS II — 3μ silicon gate
CMOS/SOS — 4μ silicon on sapphire
CMOS II — Double level metal — 3μ silicon gate

RCA presently offers a variety of PaCMOS cell libraries as follows:

Gate complexity: User defined

Process technology:
CMOS silicon gate (C^2L)
CMOS silicon on sapphire (CMOS/SOS)
CMOS I — 5μ bulk CMOS
CMOS II — 3μ bulk CMOS

RCA will soon offer additional APAR cell libraries. They are classified by:

Process technology:
CMOS/SOS — 2μ
CMOS II — Double level metal

All of the above will be offered in plastic, ceramic, side-brazed ceramic, and leadless and leaded chip carrier packages.

SP7000 SERIES CMOS GATE ARRAYS

FEATURES

- Utilizes SPI's Selective Oxidation, Silicon-Gate CMOS Process.
- High Speed 3.5nS Gate Delay
- Low Cost
- Operates Over 3 to 7 Volt Supply Range
- Prototypes 8-10 Weeks
- TTL/CMOS Compatible Inputs

SP7210	1200	84	72	186 x 251	6mA	4mA

Note: Some device specifications can be altered to meet customer requirements.

SPI's gate array in HCMOS will provide the key to reducing board space, lowering power requirements and improving cost effectiveness.

Whatever your gate array needs, SPI can tailor an interface program to match them. If you have a specific circuit you would like to implement in HCMOS, SPI will be glad to review your application and provide a detailed quotation on cost, delivery and technical parameters.

CHLA CMOS LOGIC ARRAY FAMILY

FEATURES

- Utilizes SPI's Selective Oxidation Silicon Gate
- CMOS Process
- Low static power dissipation — 1.0 μW
- High speed
- 3 to 6 volt power supply range
- Full TTL interface compatibility
- High noise immunity
- Low cost semi-custom

DESCRIPTION

The CHLA is a logic array with uncommitted logic cells driving output structures that may be configured as normal output buffers, 3-state buffers, or as D type edge triggered latches. To design with these devices the designer needs only to supply the necessary logic equations. Depending on the logic equations up to 64 product terms may be implemented. Since all logic gates are CMOS the static power supply current is independent of the number of product terms and is less than 2.0 μA.

C-MOS HARD ARRAY LOGIC
SI-HAL SERIES 20 & 24

DESCRIPTION

The Si-HAL family provides a rapid economical way of customizing several SSI or MSI integrated circuits into one device. Si-HALs can be used to replace bipolar PALs and HALs or they can be developed from a unique logic schematic. Unlike bipolar HALs, C-MOS Si-HALs are not limited to fixed logic functions. You have a totally uncommited logic format to work with in developing your semi-custom circuit. You may choose from a wide range of logic functions including, but not limited to, AND, NOR, OR, NAND gates and various flip flops.

All of the Monolithic Memories HAL Series 20 & 24 can be pin for pin replaced with a Si-HAL Series 20 & 24.

The C-MOS Si-HAL family features an advanced silicon-gate process which gives all the advantages of C-MOS, and still is a direct replacement for many bipolar PALs and HALs.

Si-Fab ii is a unique process, which goes beyond the performance characteristics of conventional silicon-gate C-MOS. It has the same low power characteristics, but in addition demonstrates improved speed. On-chip gate delays are comparable to silicon-gate (1-3ns), but the data entry speeds are improved 50-75%. This speed enhancement is made possible through our unique Si-Fab II output drivers. Also, output drive is improved to handle up to 20 LSTTL loads.

HAL DEVELOPMENT

The following procedures can be followed in developing a Si-HAL semi-custom circuit.

1. Purchase a bipolar PAL and debug it to your circuit requirement.
2. Send Si-Fab two of your PAL circuits with either
   a. copy of circuit logic equations
   or
   b. a schematic drawing (checked for revisions and accuracy)

NOTE: If you are not interested in developing a circuit using a PAL first, a Si-HAL can be directly developed from your circuit schematic diagram.

Call Si-Fab with any questions you may have regarding Si-HALs or semi-custom circuit development

MAIN BENEFITS

- **Semi-custom solution to random logic**
- **Direct C-MOS replacement of bipolar HALs and PALs**
- **Easy, economical implementation from logic schematics**
- **Si-Fab II C-MOS provides low power, high speeds, high output drive**
- **Variety of packages available**

PART NO.	DESCRIPTION
Si-HAL 10H8	Octal 10input And-Or Gate Array
Si-HAL 12H6	Hex 12input And-Or Gate Array
Si-HAL 14H4	Quad 14input And-Or Gate Array
Si-HAL 16H2	Dual 16input And-Or Gate Array
Si-HAL 16C1	16input And-Or/And-Or-Invert Gate Array
Si-HAL 10L8	Octal 10input And-Or-Invert Gate Array
Si-HAL 12L6	Hex 12input And-Or-Invert Gate Array
Si-HAL 14L4	Quad 14input And-Or-Invert Gate Array
Si-HAL 16L2	Dual 16input And-Or-Invert Gate Array
Si-HAL 16L8	Octal 16input And-Or-Invert Gate Array
Si-HAL 16R8	Octal 16input Registered And-Or Gate Array
Si-HAL 16R6	Hex 16input Registered And-Or Gate Array
Si-HAL 16R4	Quad 16input Registered And-Or Gate Array
Si-HAL 16X4	Quad 16input Registered And-Or-Xor Gate Array
Si-HAL 16A4	Quad 16input Reg And-Carry-Or-Xor Gate

PACKAGING

Si-HALs can be shipped in chip or package form. A variety of packages are available. Request of quote for your package requirements.

Series 20 has 20 lead maximum.
Series 24 has 24 lead maximum.

PRICING

Prices will vary depending on circuit complexity, quantity, and package required. A one time development charge will be assessed on all orders, but this will be partially rebated on production orders according to quantity on all orders exceeding 1000 pieces.

Price List available on request.

THE COMPLETE SEMICUSTOM SOLUTION

To meet your semicustom needs Signetics has developed a comprehensive semicustom service that offers one-stop shopping with state-of-the-art technology. This service gives you a choice of silicon systems ranging from CMOS to T²L and ECL, the widest range of semicustom products in the industry, with performance capable of meeting all your semicustom logic needs. All are supported with complete in-house capability for processing and fabrication, will full service CAD, which simplifies your design task and guarantees first-pass success for your semicustom program.

STATE-OF-THE-ART CAD

Signetics' CAD system encompasses the complete semicustom design process, from schematic input through auto place and route, design rule checking and test generation. This fully automated procedure speeds design and makes your job easy and guarantees that your semicustom chip is developed without error and on schedule. With Signetics' CAD you are using the most up-to-date semicustom design system available.

SCHEMATIC INPUT — FAST AND EASY

In designing a semicustom chip the first step is to enter your circuit into the computer. The most advanced method of circuit entry is Signetics schematic input system. This system only requires you to enter your schematic by use of a keyboard and mouse, which is fast and easy. The computer then automatically converts your schematic to a net list which is used for simulation and auto place and route.

For circuit entry Signetics gives you a choice of two schematic input systems, one with software originally developed by Future Net and one by Mentor. The Future Net system operates on a low cost IBM Personal Computer which you can use in your own shop or in a Signetics' sales office. The Mentor schematic input system operates on an Apollo computer which is available in one of Signetics' design centers. With either input system you will find the schematic entry step fast and easy.

COMPUTER SIMULATION — EASY AND SURE

Once your schematic has been entered, the next and final step is to simulate the logic using our TEGAS 5 Program. To do this you enter your test vectors then submit the job from your IBM PC to Signetics' computer via telephone link. If you are using one of our design centers the simulation can be performed on-site with the Apollo computer. Upon completion of simulation the computer returns to you the resulting output vectors to allow you to check your design. Computer simulation ensures that your circuit is functioning properly before Signetics manufactures your semicustom chip.

WHAT SIGNETICS DOES — MORE CAD

After completion of simulation your job is finished. Signetics takes over and completes the manufacture of your semicustom device, which involves the use of additional Signetics CAD. The effects of wire delay, if any, are compensated using our WIDGET program. Using your net list which was produced by the schematic input system, Signetics performs a comprehensive design rule check, then routes the chip automatically. Using your test vectors Signetics automatically produces a test tape for final testing using our SENGEN program. The routed chip is then masked and processed using our advanced semiconductor methodology.

In performing Signetics part of the task, a key step is auto place and route, and Signetics has placed a high emphasis on developing these programs. The MEDS program automatically routes at the gate level and is used for gate arrays and creation of macros. The CALMP program is used for more advanced structures, such as Signetics FLEXX™ Array. CALMP assembles macros and gates with automatically variable routing space for optimal packing of the chip. These and other similar programs allow Signetics to offer comprehensive use of auto-routing in all our semicustom products.

FULL IN-HOUSE CAPABILITY

As a full capability semiconductor supplier and in semicustom since 1975, Signetics has all the in-house support necessary for producing your semicustom chip. In addition to a full service CAD facility, Signetics has complete masking, wafer fabrication and processing, including military processing, for Source Control Drawing or MIL STD 883B parts production. This full capability ensures availability of parts and that your semicustom device will be processed according to your needs and on schedule.

A FULL CHOICE OF SILICON

With Signetics you can implement your semicustom requirement with silicon that is advanced in technology and architecture. In technology you have a choice of three levels of CMOS and five kinds of bipolar arrays with gate speed ranging from 8 nsec to 0.5 nsec and various output drive levels. In architecture these products are structured as gate arrays, masterslice, composite cell, and FLEXX™ arrays, with up to 5000 gates and 128 I/Os. These devices have been configured to encompass the complete range of semicustom applications to allow Signetics to meet your own specific needs.

CMOS GATE ARRAYS

Signetics CMOS gate arrays are oxide-isolated, silicon gate devices built on an epi substrate which virtually eliminates latch-up. Input/Output is compatible with CMOS or LSTTL logic. These are highly advanced CMOS gate arrays with a full selection of technology and architecture.

M-Series CMOS Gate Arrays Single layer metal, 330 to 1100 gates, up to 68 I/Os, with 8 nsec gate delay typical for a 2 output gate with 5V V_{DD}.

H-Series CMOS Gate Arrays Single layer metal, 330 to 1100 gates, up to 68 I/Os, with 4 nsec gate delay typical for a 2 output gate with 5V V_{DD}.

SH-Series CMOS Gate Arrays Dual layer metal, 1250 to 5000 gates, up to 128 I/Os, with 2 nsec gate delay typical for a 2 output gate with 5V V_{DD}.

BIPOLAR SEMICUSTOM DEVICES

Signetics bipolar semicustom devices are available with both junction isolation and oxide isolation, for T^2L and ECL applications. They are designed for high speed and high output drive.

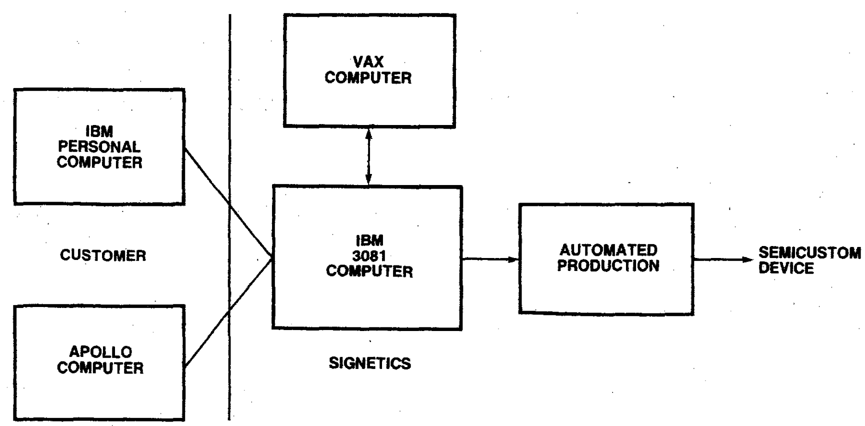
8AXXXX Series ISL Gate Arrays Dual layer metal junction isolated Integrated Schottky Logic for T^2L applications, 1200 to 2100 gates, up to 76 I/Os, with 4 nsec gate speed typical. Full military criteria.

Composite Cell Logic Three standard cell dual-layer metal libraries ranging from 3.5 nsec to 5 nsec typical gate delay. Up to 1000 actual gates, I/Os limited by package. Up to 80 mA output drive for T^2L applications. Full military criteria.

8HXXXX Series ISL Gate Arrays Dual layer metal, oxide isolated Integrated Schottky Logic for T^2L applications, 1600 to 3200 gates, up to 120 I/Os, with 1.5 nsec gate speed typical. Full military criteria.

FLEXX™ Array User-created or standard cells, dual-layer metal, variable routing space for optimal chip size, up to 2000 gates, I/Os limited by package. Oxide-isolated Integrated Schottky Logic for T^2L applications, 1.5 nsec gate delay typical. Full military criteria.

ACE Masterslice Array Oxide isolated CML for ECL 10 K, ECL 100 K and T^2L applications, 600 to 2200 gates, optional RAM on chip, up to 128 I/Os, 0.5 nsec gate delay, air cooled.



Signetics Computer Aided Design Facility used for design of semicustom devices. Provides remote access for schematic input and simulation. Signetics completes the design with design rule checking, automatic place and route, and automatic test tape generation before producing the semicustom device.

FEATURES

- 1.5 nsec typical gate delay
- Up to 2000 actual gates
- I/Os limited by package
- 250uW per gate
- Up to 48 mA output drive
- TTL Compatible
- Full CAD support
- Automatic schematic input
- Circuit simulation
- Automatic place and route
- Automatic macro generation
- Hard and soft macros
- Variable die size
- Plastic and ceramic chip carriers
- Standard DIPs

BENEFITS

- Fast, easy design
- Efficient use of silicon
- Proprietary LSI device
- High speed
- Replaces up to 100 SSI/MSI parts
- Reduces PCB area
- Saves manufacturing costs
- Reduces size, weight and power
- Improves system reliability

PRODUCT DESCRIPTION

The FLEXX™ array represents a major advance in semicustom technology which combines a new concept in architecture with the most advanced CAD available. With it you can create your proprietary semicustom LSI device quickly and easily, much like gate array or standard cell methodology, but with silicon utilization as efficient as standard LSI products designed by traditional handpacking methods. As a result of its superior design and silicon utilization efficiency the FLEXX™ Array is being used by Signetics to develop standard LSI products. The FLEXX™ Array is now available to Signetics customers as a semicustom development tool.

FLEXX™ Array Architecture

As shown in the figure, the FLEXX™ Array is composed of macros, which are rectangular assemblies of gates, with additional random gates included as required. The macros are variable in length and width for optimum routing efficiency, and the routing channel width is variable to accommodate only those traces required to route the chip. No unused gates are included. As a result of this architecture, the FLEXX™ Array is much more efficient in silicon utilization than a gate array or standard cell array, which means that the end device will have a smaller die and therefore a lower cost.

Multi-Level Software

To assembly the FLEXX™ Array Signetics uses multi-level automatic place and route software. The first level automatically generates the macros; it establishes the macro width and interconnects the gates within the macro. The second level places and interconnects the macros as well as individual gates; it varies the spacing between macros to accommodate the required interconnecting traces. This process is fully automatic and can be done quickly which speeds the development of your FLEXX™ Array.

Fully Automatic Design

To design a FLEXX™ Array the user enters the schematic and test vectors with a remote terminal then reviews the computer simulation of the circuit. In this procedure the user has the choice of using established ("hard") macros from Signetics computer library, modifying these macros or creating new ("soft") macros as required. Once the simulation is completed, Signetics takes over and routes the chip and procedures prototypes within ten weeks.

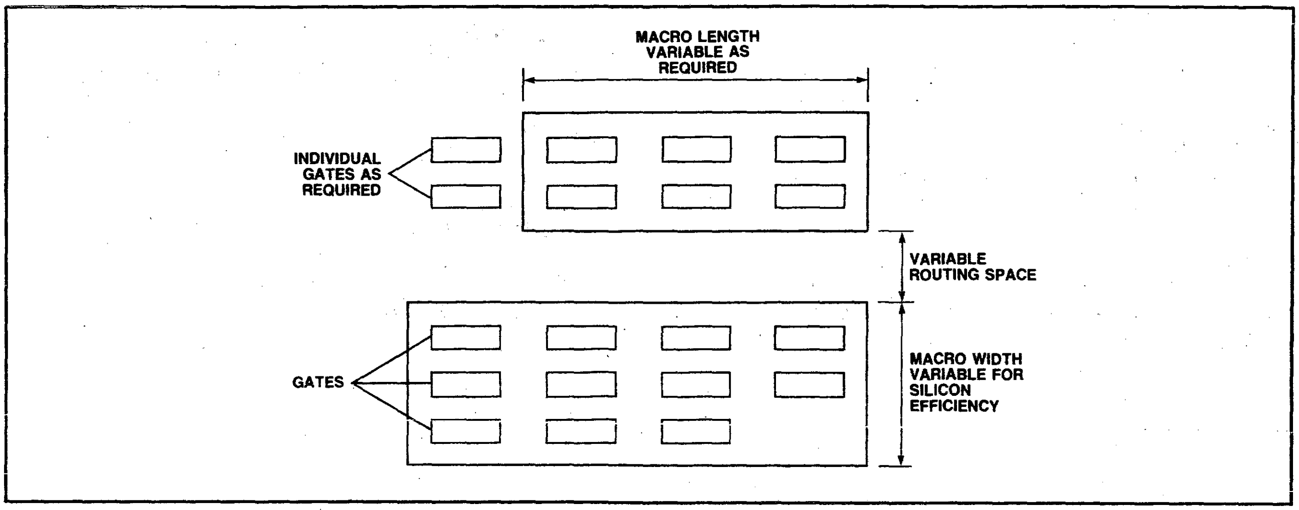
Silicon Technology — Performance

The FLEXX™ Array is a methodology for assembling a logic design on silicon; it is therefore largely independent of the particular silicon technology and can be used with CMOS and varieties of bipolar technology.

The first technology used to implement the FLEXX™ Array is oxide isolated ISL or Integrated Schottky Logic. ISL provides a superior speed power product with the speed of LSTTL at one-tenth the power. With oxide isolation, both the speed-power product and the gate delay of ISL are reduced by a factor of three, giving the FLEXX™ Array speed approaching ECL and power efficiency that allows large scale integration in a plastic package without special cooling.

With oxide-isolated ISL the gate used in the FLEXX™ Array has a typical delay time of 1.5 nsec. Output buffers are capable of driving up to 48 mA. The number of actual gates which can be placed on the FLEXX™ Array is limited to about 2000 by thermal constraints. The number of I/Os is limited only by package pin-out. Available packages currently include standard plastic and ceramic DIPs and a variety of chip carriers.

FLEXX™ ARRAY ARCHITECTURE



ISL GATE ARRAY

8A1200

PRODUCT DESCRIPTION

The 8A1200 Gate Array (Figure 1) is an uncommitted array of ISL gates (Figure 2), Schottky buffers (Figure 3) and LSTTL-compatible I/O cells (Figure 4). Thus, up to 1200 gates can be custom interconnected to provide the advantages of both Large Scale Integration (LSI) and proprietary design. The 8A1200 array is based on a technological subset of LSI called ISL (Integrated Schottky Logic). ISL combines the best features of low-power Schottky and I^2L Bipolar technologies.

Designing with the 8A1200 is easy and fast, requiring no more than conventional logic design, logic simulation, and custom coding of metal interconnections among preprocessed logic gates on the array—refer to Table 1 for a comparison of ISL and 74LS logic functions. The design techniques and the implementation processes are analogous to the design of a Printed Circuit Board.

Logic functions are defined by the user and are implemented by interconnecting 1144 ISL NAND gates, using two layers of metal routing. Fifty-two Schottky buffers are provided to drive multi-load internal clock or enable signals. For external interface, up to 36 LSTTL I/O buffers can be specified. As shown in Figure 4, each I/O can be configured to implement any one of 11 different functions: inputs, input/output, totem-pole, open collector, and three-state.

FEATURES

- **Customer programmable LSI**
- **1144 ISL (NAND) gates**
- **Two-layer metal interconnection**
- **52 Schottky buffers**
- **36 I/O buffers**
- **LSTTL compatible**
- **Standard PNP inputs**
- **8mA output current sink**
- **−55°C to +125°C ambient temperature**
- **4ns gate speed (typical)**
- **Speed-power product—0.7 picojoules**
- **22, 28, 40, or 44-pin package**

	T_{ON} (in ns)	18.00	22.00	DATA→$\overline{Q}$	T_{ON} (in ns)	7.00	26.00
	T_{OFF} (in ns)	24.00	30.00		T_{OFF} (in ns)	16.00	26.00
EXCLUSIVE NOR (74266)	Power (in mW)	0.90	18.00				
	T_{ON} (in ns)	15.00	30.00				
	T_{OFF} (in ns)	16.00	30.00				

Notes:
1. Power and delay times are given for 150°C MAX.
2. T_{OFF} is 2ns for each input; T_{OFF} can be reduced to 0ns with a pullup cell which uses 0.3 mW.
3. LS power dissipation is based on $V_{CC} \times I_{MAX}$.

AC AND DC ELECTRICAL CHARACTERISTICS

Conditions:

Commercial—
V_{CC} = 5.0V (± 5%)
V_{BB} = 1.5V (± 10%)
T_A[1] = 0°C to 70°C

Military—
V_{CC} = 5.0V (± 10%)
V_{BB} = 1.5V (± 10%)
T_A[1] = −55°C to 125°C

ABSOLUTE MAXIMUM RATINGS

PARAMETER	DESCRIPTION	RATING	UNIT
V_{CC}	Supply voltage	+7.0	V
V_{BB}	ISL gate supply voltage	+7.0	V

I_{OZL}	Three-state off current, output low	V_{OUT} = 0.4V			– 20			– 20	μA
I_{OZH}	Three-state off current, output high	V_{OUT} = 2.4V			20			20	μA
t_{pdLH}	Propagation delay, low to high output	See Figure 5d		4	9		4	9	ns
t_{pdHL}	Propagation delay, high to low output			6	10		6	10	ns
t_{pdZL}	Propagation delay, HI Z to low output			11	14		11	14	ns
t_{pdZH}	Propagation delay, HI Z to high output			10	13		10	13	ns
t_{pdLZ}	Propagation delay, low to HI Z output			6	12		6	12	ns
t_{pdHZ}	Propagation delay, high to HI Z output			7	7		7	7	ns

Notes:
1. Maximum power dissipation limit of circuit is determined by package selection.
2. Guaranteed value is t_{pdAV}.
3. For all input parameters on TEOC and TTS, the "from Three-State" input should be high.

8A1200 EVALUATION CIRCUIT

CG1001

PRODUCT DESCRIPTION

The 8A1200/CG1001 Evaluation Circuit is a committed array of ISL gates, Schottky buffers, and LSTTL I/O cells, providing the user with several logic functions that can be easily and economically implemented by the use of semi-custom LSI. Basically, the CG1001 provides a demonstration vehicle for characterizing design functions of the 8A1200 ISL Gate Array; the demonstration part contains logic functions that are representative of, and can be compared with, those of standard 7400-series parts.

Also, the CG1001 contains several test configurations that can be used in evaluating circuit performance under various logical, topological, and environmental conditions. A block diagram of the Gate Array Evaluation Circuit is shown in Figure 2 and logic representations of each discrete function are shown in Figures 3 through 6.

FEATURES

REPRESENTATIVE LOGIC FUNCTIONS:

- 8 to 1 Multiplexer (Figure 3)—similar to 74152.
- 4-Bit Adder (Figure 4)—similar to 7483.
- 4-Bit Universal Shift Register (Figure 5)—similar to 74194

SPECIAL TEST CIRCUITS

- D-flip flop wired as a toggle flip flop
- Demonstration of fanout effects on ISL gates
- Test of fanin and pattern sensitivity effects on ISL gates
- Ring oscillators which show the basic gate delays of ISL gates and Schottky buffers under various layout and logical conditions

In(↑)	Out	Oscillator Calculations: The ten 11-gate rings oscillate with a period (t_{osc}) equal to 22 gate delays. Average gate delay (t_{avg} = half pair delay) can be calculated as follows:									

$$t_{avg} = \frac{t_{osc}}{22} = \frac{t_{pdLH} + t_{pdHL}}{2}$$

Notes:

1. Measure t_{pdLH} and t_{pdHL} from "In" to "Out" for each path.
2. Discharge input (pin 27) must meet both MIN and MAX times for setup and hold– see WAVEFORM 1.
3. For Q_0 and Q_1 outputs (pins 7 and 8), propagation delay is representative of the delay through an input buffer, a three-state output buffer with a fan-in of 1, and a standard ISL "D" flip-flop.
4. For the Q_2 output (pin 9), the propagation delay will differ from that of Q_0 and Q_1 by the Δ time delay caused by the additional fan-in of 4 on the three-state output buffer.
5. For the Q_3 output (pin 10), the propagation delay will differ from that of Q_0 and Q_1 by the Δ time delay caused by the additional fan-in of 2 on the three-state output buffer.

ISL GATE ARRAY

8A1260

PRODUCT DESCRIPTION

The 8A1260 Gate Array (Figure 1) is an uncommitted array of ISL gates (Figure 2), Schottky buffers (Figure 3) and LSTTL-compatible I/O cells (Figure 4). Thus, up to 1200 gates can be custom interconnected to provide the advantages of both Large Scale Integration (LSI) and proprietary design. The 8A1260 array is based on a technological subset of LSI called ISL (Integrated Schottky Logic). ISL combines the features of Schottky and the density of I²L Bipolar technologies.

Designing with the 8A1260 is easy and fast, requiring no more than conventional logic design, logic simulation, and custom coding of metal interconnections among preprocessed logic gates on the array. Refer to Table 1 for a comparison of ISL and 74LS logic functions. The design techniques and the implementation processes are analogous to the design of a Printed Circuit Board.

Logic functions are defined by the user and are implemented by interconnecting 1144 ISL NAND gates, using two layers of metal routing. Fifty-two Schottky buffers are provided to drive multi-load internal clock or enable signals. For external interface, up to 60 LSTTL I/O buffers can be specified. Each I/O can be configured as 1-of-4 input buffers, 1-of-4 output buffers, or as a combination of one input buffer and one output buffer for a transceiver.

FEATURES

- **Customer programmable LSI**
- **1144 ISL (NAND) gates**
- **Two-layer metal interconnection**
- **52 Schottky buffers**
- **60 I/O buffers**
- **LSTTL compatible**
- **Standard PNP inputs**
- **8mA output current sink**
- **−55°C to +125°C ambient temperature**
- **4ns gate speed (typical)**
- **Speed-power product—0.7 picojoules**
  68 pin package

PRODUCT DESCRIPTION

The 8A1542 Gate Array (Figure 1) is an uncommitted array of ISL gates (Figure 2), Schottky buffers (Figure 3) and LSTTL-compatible I/O cells (Figure 4). Thus, up to 1400 gates can be custom interconnected to provide the advantages of both Large Scale Integration (LSI) and proprietary design. The 8A1542 array is based on a technological subset of LSI called ISL (Integrated Schottky Logic). ISL combines the best features of low-power Schottky and I^2L Bipolar technologies.

Designing with the 8A1542 is easy and fast, requiring no more than conventional logic design, logic simulation, and custom coding of metal interconnections among preprocessed logic gates on the array—refer to Table 1 for a comparison of ISL and 74LS logic functions. The design techniques and the implementation processes are analogous to the design of a Printed Circuit Board.

Logic functions are defined by the user and are implemented by interconnecting 1408 ISL NAND gates, using two layers of metal routing. Sixty-four Schottky buffers are provided to drive multi-load internal clock or enable signals. For external interface, up to 42 LSTTL I/O buffers can be specified. As shown in Figure 4, each I/O can be configured to implement any one of 11 different functions: inputs, input/output, totem-pole, open collector, and three-state.

FEATURES

- **Customer programmable LSI**
- **1408 ISL (NAND) gates**
- **Two-layer metal interconnection**
- **64 Schottky buffers**
- **42 I/O buffers**
- **LSTTL compatible**
- **Standard PNP inputs**
- **8mA output current sink**
- **−55°C to +125°C ambient temperature**
- **4ns gate speed (typical)**
- **Speed-power product—0.7 picojoules**
- **28, 40, or 44-pin package**

t_{pdHZ}	Propagation delay, high to HI Z output			7	7		7	7	ns

Notes:
1. Maximum power dissipation limit of circuit is determined by package selection.
2. Guaranteed value is t_{pdAV}.
3. For all input parameters on TEOC and TTS, the "from Three-State" input should be high.

PRODUCT DESCRIPTION

The 8A1664 Gate Array (Figure 1) is an uncommitted array of ISL gates (Figure 2), Schottky Buffers (Figure 3), and the LSTTL compatible I/O cells. Thus, up to 1600 gates can be custom interconnected to provide the advantages of both Large Scale Integration (LSI) and proprietary design. The 8A1664 array is based on a technological subset of LSI called ISL (Integrated Schottky Logic). ISL combines the features of Schottky and the density of I^2L Bipolar technologies.

Designing with the 8A1664 is easy and fast, requiring no more than conventional logic design, logic simulation, and custom coding of metal interconnections among preprocessed logic gates on the array. The design techniques and the implementation processes are analogous to the design of a Printed Circuit Board.

Logic functions are defined by the user and are implemented by interconnecting 1560 ISL NAND gates, using two layers of metal routing. Sixty Schottky buffers are provided to drive multi-load internal clock or enable signals. For external interface, up to 64 LS TTL I/O buffers can be specified. Each 8-milliampere I/O site can be configured as 1-of-6 input/internal buffers or as 1-of-8 output buffers; each 24-milliampere I/O site can also be configured as 1-of-6 input/internal buffers but the output buffer configuration can be 1-of-12. For a transceiver, either I/O site can be connected in combinations of one input and one output buffer.

FEATURES

- **Customer programmable LSI**
- **1560 ISL (NAND) gates**
- **Two-layer metal interconnection**
- **60 Schottky buffers**
- **64 I/O buffers**
- **LS TTL compatible**
- **Standard PNP inputs**
- **8-, or 24-milliamperes output current sink**
- **−55°C to +125°C ambient temperature**
- **4-nanosecond gate speed (typical)**
- **Speed-power product — 0.7 picojoules**
- **68 pin package**

PRODUCT DESCRIPTION

The 8A1864 Gate Array (Figure 1) is an uncommitted array of ISL gates (Figure 2). Schottky buffers (Figure 3) and LSTTL-compatible I/O cells. Thus, up to 1740 gates and 60 buffers can be interconnected to provide the advantages of both Large Scale Integration (LSI) and proprietary design. The 8A1864 array is based on a technological subset of LSI called ISL (integrated Schottky Logic). ISL combines the features of Schottky and the density of I^2L Bipolar technologies.

Designing with the 8A1864 is easy and fast, requiring no more than conventional logic design, logic simulation, and coding of metal interconnections between preprocessed logic gates on the array. The design techniques and the implementation processes are analogous to the design of a Printed Circuit Board.

Logic functions are defined by the user and are implemented by interconnecting up to 1740 ISL NAND gates, and up to 60 buffers, using two layers of metal routing. Sixty Schottky buffers are provided to drive multi-load internal clock or enable signals. For external interface, up to 64 LS TTL I/O buffers can be specified. Each 8-milliampere I/O site can be configured as 1-of-6 input/internal buffers or as 1-of-8 output buffers; each 24-milliampere I/O site can also be configured as 1-of-6 input/internal buffers but the output buffer configuration can be 1-of-12. For a transceiver, either I/O site can be connected in combinations of one input and one output buffer.

FEATURES

- **Customer programmable LSI**
- **1740 ISL (NAND) gates**
- **Two-layer metal interconnection**
- **60 Schottky buffers**
- **72 I/O buffers**
- **LS TTL compatible**
- **Standard PNP inputs**
- **8-, or 24-milliamperes output current sink**
- **−55°C to +125°C ambient temperature**
- **4-nanosecond gate speed (typical)**
- **Speed-power product — 0.7 picojoules**
- **40-, 44-, 50- or 68-pin packages**

PRODUCT DESCRIPTION

The 8A2176 Gate Array (Figure 1) is an uncommitted array of ISL gates (Figure 2), Schottky buffers (Figure 3) and LSTTL-compatible I/O cells. Thus, up to 2016 gates can be custom interconnected to provide the advantages of both Large Scale Integration (LSI) and proprietary design. The 8A2176 76 array is based on a technological subset of LSI called ISL (Integrated Schottky Logic). ISL combines the features of Schottky and the density of I^2L Bipolar technologies.

Designing with the 8A2176 is easy and fast, requiring no more than conventional logic design, logic simulation, and custom coding of metal interconnections among preprocessed logic gates on the array. The design techniques and the implementation processes are analogous to the design of a Printed Circuit Board.

Logic functions are defined by the user and are implemented by interconnecting 2016 ISL NAND gates, using two layers of metal routing. Seventy-two Schottky buffers are provided to drive multi-load internal clock or enable signals. For external interface, up to 76 LSTTL I/O buffers can be specified.

Each 8-milliampere I/O site can be configured as 1-of-6 input/internal buffers or as 1-of-8 output buffers; each 24-milliampere I/O site can also be configured as 1-of-6 input/internal buffers but the output buffer configuration can be 1-of-12. For a transceiver, either I/O site can be connected in combinations of one input and one output buffer.

FEATURES

- **Customer programmable LSI**
- **2016 ISL (NAND) gates**
- **72 Schottky buffers**
- **76 I/O buffers**
- **LS TTL compatible**
- **Standard PNP inputs**
- **8 mA and 24 mA output current sink**
- **−55°C to +125°C ambient temperature**
- **4 ns gate speed (typical)**
- **Speed power product −0.7 picojoules**
- **28, 40, 68, or 84 pin package**

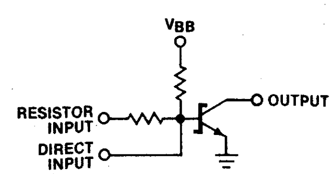

Figure 3. Schottky Buffer — Schematic Diagram

PRODUCT DESCRIPTION

Composite Cell Logic (CCL) provides a standard-cell approach to semi-custom bipolar logic. Besides the inherent advantages of LSI and proprietary design, CCL offers the designer a fast turnaround time, a high probability of first-pass success, and a die size that exactly meets all functional requirements of the logic. The CCL approach is particularly well suited to design applications where circuit complexities fall within a range of 100-to-1000 gates.

Figure 1 shows the CCL device together with two standard cells that might be used in the design process. At present, the available cells form two libraries—the Extended Performance Library (EPL) and the Integrated Schottky Library (ISL). Typically, the EPL cell (Figure 2) is used where speed is a critical factor—the speed of EPL cells is comparable to that of Schottky T^2L logic. *Note. Refer to table elsewhere in this data sheet for nominal figures pertaining to circuit propagation speeds of Schottky, Low-Power Schottky, T^2L, and Low-Power T^2L.* All EPL cells are input-expandable with no added delay, are highly immune to internal/external noise, and use active pullups to reduce sensitivity to lead capacitance and the effects of wire-ANDing.

The packing density of an ISL cell (Figure 3) is two to three times greater than that for EPL and the power required is only one-tenth (1/10) to one-twentieth (1/20) as great. The speed of ISL is slightly faster than that of Low-Power Schottky logic. For some circuits, the propagation speeds for ISL and EPL are nearly the same; for other circuits, there are appreciable differences. The speed-comparison table shown later in this data sheet provides a worthwhile guide for overall circuit design.

Output cells of both libraries can sink up to 80-milliamperes of current and both EPL and ISL cells use a 16-micron grid for easy conversion to "Automatic Place and Route" techniques—see Table 1 for a technical summary of both libraries.

Designing with CCL requires a cooperative effort between Signetics and the Customer. The contribution of each party and the overall development sequence are shown in Figure 4.

DESIGN FEATURES

- **Customer designed LSI**
- **Two cell libraries—EPL and ISL**
- **TTL compatible—each cell is functionally similar to the equivalent 7400 Logic Device**
- **Two-layer metal interconnects**
- **PNP or diode inputs**
- **Open-collector, active pullup, or three-state outputs**
- **80-milliampere sink-current capability for output cells**
- **Accommodate custom cell design**
- **Most standard packages available**
- **−55°C to +150°C junction temperature**
- **+5V (±10%) supply voltage; conditions permitting, on-chip derivation of V_{BB} (+1.5V)**

Table 1. Technical Summary of EPL and ISL Libraries

PARAMETER	EPL		ISL
Output structure	Active pullup		Open collector
Input structure	Schottky diode		Schottky diode
Worst-case noise margin	300mV (F.O. = 15)		70mV (F.O. = 15)
Junction temperature range	−55° to +155°C		−55° to +155°C
Power supply	+5V (±10%)		+1.5V (±10%)
	MEDIUM POWER	LOW POWER	
Max average speed (in ns)			
F.O. = 1 (T_J = 150°C)	4.5	5.5	6
F.O. = 6 (T_J = 150°C)	5.5	7.5	6 or 9*
Max average power (in mW):			
T_J = 150°C	5.6	2.6	0.3
Packing density gates/mm**	14 to 42		26 to 78

*Average speed of 6ns requires the use of a resistor pullup cell (optional).

**See Note 5 in Selection Guide regarding derivation of maximum values.

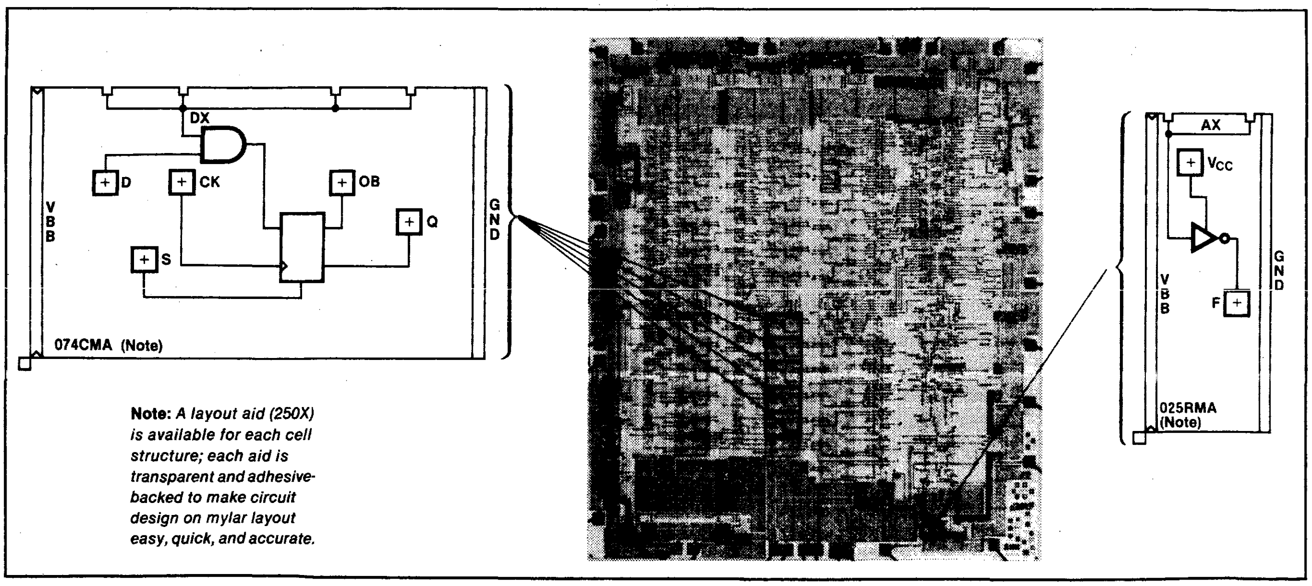

Figure 1. Composite Cell Logic Showing Typical Cell Placement with the Use of Layout Aids.

			20 mA output		−40		−100	

Notes:
1. Maximum power dissipation is determined from individual cell data sheets; the figures are then summed to calculate total power for the chip. The total power must be less than the Maximum Power Dissipation (P_d) calculated earlier in this data sheet.
2. For test circuits and timing waveforms, refer to individual cell data sheets in the CCL Design Guide.
3. Design limits are based on standard modeling with similar circuits used in Signetics standard bipolar LSI products. Actual simulation limits are maintained to be consistent with characterization updates for the CCL libraries.

ORDERING INFORMATION

For additional information pertaining to Composite Cell Logic, Gate Arrays, and other Semicustom Products, contact the nearest Signetics Sales Office.

PRODUCT DESCRIPTION

The Signetics Advanced Customized ECL (ACE) family of products provides the user with a cost-effective technology, futuristic speeds, and other high-performance alternatives for the design of LSI-based systems. Basic cell designs are implemented with Emitter Coupled and Common Mode Logic (ECL/CML) to guarantee the very best compromise between speed, power, and interface capabilities—see Figure 1 and TECHNICAL SUMMARY that follows.

At present, the ACE product line is available with gate complements of 600, 900, 1320, 1400, and 2200; the 1320 array actually contains 1000 gates with an on-board 320-bit RAM. The 600/900-gate arrays, described in this data sheet, are well-suited for low-cost applications and for use in systems that do not require 25-ohm terminations. To meet the flexibility requirements, the rise-and-fall times for I/O cells of these arrays are mask-selectable and bidirectional and TTL interfaces are standard.

All ACE arrays are I/O compatible with the 10K/100K ECL logic family and all are fabricated with a very mature process; thus, even with 3-micron first-metal geometry, first pass success is a virtual certainty. The speed-power product for devices in the ACE family is in the neighborhood of 1 to 3 picojoules, permitting heat-sink cooling at ambient air temperatures. The ACE family and MACRO library is alternately sourced by a major supplier of semicustom devices.

To summarize, the designer, using ACE, is limited only by innovation and imagination:

- ECL/CML Technology for SPEED and EFFICIENCY
- Mature process for PRODUCT CERTAINTY
- Computer aided design for QUICK DELIVERY
- Pin grid packages (socket insertion) for RELIABILITY
- Signetics for QUALITY

FEATURES

- **3-micron geometry (first metal)**
- **Internal gate delays as low as 300 picoseconds (average gate delay of 450 picoseconds)**
- **Expandable 80-cell MACRO library**
- **Mask-selectable rise/fall times for I/O interface cells**
- **Bidirectional and TTL interfaces**
- **10K/100K ECL compatibility**
- **Computer aided design (CAD) for layout, simulation, and testing**
- **Mature process (SUBILO P)**
- **Pin grid array packages for easy socket insertion**
- **25 and 50 ohm drive capability**

PRODUCT DESCRIPTION

The SCCXXXX gate array family offers the circuit designer the facility to create a semi-custom circuit with a unique set of CAD (Computer-Aided Design) tools in a well-established CMOS process.

Signetics M-Series CMOS Gate Arrays are single chip programmable devices that allow customization of user logic. Only metalization and contact are programmed in these mature CMOS devices. Thus, fast turnaround from logic to completed silicon is achieved.

Each device in this family of low power gate arrays contains numerous identical, uncommitted unit cells (Figure 1) which are interconnected by two custom masks (metal and contact). Each unit cell contains four pairs of N and P transistors. Access to the transistors is from both the top and bottom of the cells and, additionally, there are two poly feed-throughs at each side of the cell. This homogenous cell design allows for excellent routing flexibility, and many designs result in better than 80% utilization of the gates available.

The M-Series Gate Arrays are built on a mature, state-of-the-art 4-micron Si-gate CMOS process incorporating an epi-substrate, which significantly reduces the potential for latch as compared with other bulk CMOS processes.

Computer Aided Design (CAD) is used throughout the design process to ensure accurate implementation of customer logic (see Figure 14 for typical process flow).

FEATURES

- **Customer programmable LSI**
- **330 to 1100 gate complexity**
- **Mature silicon gate technology with local oxidation**
- **Library of 60 pre-designed, fully characterized macrocells available**
- **Full CAD, including auto-place and auto-route, for quick error-free design**
- **Very low power consumption (e.g. standby power for SCC 0700 is 0.25mW)**
- **Excellent noise immunity**
- **Power supply range 3 to 15V**
- **Over 80% utilization typical**
- **Fully programmable I/O pins, each having a wide range of functions**
- **Input protection by series resistor and diode clamp to V_{SS}**
- **TTL outputs (buffers) drive up to four LSTTL loads**
- **-55°C to +125°C operating temperature**
- **Plastic and ceramic DIP, ceramic leadless chip carriers, and plastic leaded chip carriers available**

GATE DELAYS

Nominal Propagation Delay

In Figures 6 through 12, examples are given of the nominal propagation delay times of several library cells, these being calculated from the delay figures given in the individual macro descriptions. These graphs are intended to provide quick-reference data to enable the designer to make an estimate of critical a.c. path without having built or simulated a network.

Accurate delay figures can only be obtained after incorporating the wiring length load automatically calculated by INGATE (i.e., the result of the automatic routing program). A maximum delay is obtained by multiplying the nominal value by 2.2.

ABSOLUTE MAXIMUM RATINGS Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage range	V_{DD}	-0.5 to $+18V$
Voltage on any input when pin pull up/down resistors are: Used Not used	 V_I V_I	 -0.5 to $V_{DD}+0.5V$ -0.5 to $+18V$
DC current into any input or output	±1	Max. 10mA
Power dissipation per output	P	Max. 100mW
Power dissipation per package For standard temperature range: $-40°C$ to $+85°C$ (plastic and ceramic DIP) For $T_{amb} = -40°C$ to $+60°C$ For $T_{amb} = +60°C$ to $+85°C$	 P_{tot} P_{tot}	 Max. 400mW Derate linearly by 8mW/K to 200mW
For extended temperature range: $-55°C$ to $+125°C$ (ceramic DIP) For $T_{amb} = -55°C$ to $+100°C$ For $T_{amb} = +100°C$ to $+125°C$	 P_{tot} P_{tot}	 Max. 400mW Derate linearly by 8mW/K to 200mW
Storage temperature range	T_{stg}	$-65°C$ to $+150°C$

DC ELECTRICAL CHARACTERISTICS $V_{SS}=0V$; for all devices unless otherwise specified.

CMOS GATE ARRAYS (H-Series)

Preliminary

PRODUCT DESCRIPTION

The SCCXXXX gate array family offers the circuit designer the facility to create a semi-custom circuit with a unique set of CAD (Computer-Aided Design) tools in a well-established CMOS process.

Signetics H-Series CMOS Gate Arrays are single chip programmable devices that allow customization of user logic. Only metalization and contact are programmed in these mature CMOS devices. Thus, fast turnaround from logic to completed silicon is achieved.

Each device in this family of low power gate arrays contains numerous identical, uncommitted unit cells (Figure 1) which are interconnected by two custom masks (metal and contact). Each unit cell contains four pairs of N and P transistors. Access to the transistors is from both the top and bottom of the cells and, additionally, there are two poly feed-throughs at each side of the cell. This homogenous cell design allows for excellent routing flexibility, and many designs result in better than 80% utilization of the gates available.

The H-Series Gate Arrays are built on a mature, state-of-the-art 3-micron Si-gate CMOS process incorporating an epi-substrate, which significantly reduces the potential for latch as compared with other bulk CMOS processes.

Computer Aided Design (CAD) is used throughout the design process to ensure accurate implementation of customer logic (see Figure 14 for typical process flow).

FEATURES

- **Customer programmable LSI**
- **330 to 1100 gate complexity**
- **Mature silicon gate technology with local oxidation**
- **Library of 60 pre-designed, fully characterized macrocells available**
- **Full CAD, including auto-place and auto-route, for quick error-free design**
- **Very low power consumption (e.g. standby power for SCC 0705 is 0.25mW)**
- **Excellent noise immunity**
- **Power supply range 3 to 6V**
- **Over 80% utilization typical**
- **Fully programmable I/O pins, each having a wide range of functions**
- **Input protection by series resistor and diode clamp to V_{SS}**
- **TTL outputs (buffers) drive up to four LSTTL loads**
- **−55°C to +125°C operating temperature**
- **Plastic and ceramic DIP, ceramic leadless chip carriers, and plastic leaded chip carriers available**

Preliminary

ABSOLUTE MAXIMUM RATINGS Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage range	V_{DD}	-0.5 to $+7$V
Voltage on any input when pin pull up/down resistors are:		
Used	V_I	-0.5 to $V_{DD}+0.5$V
Not used	V_I	-0.5 to $+7$V
DC current into any input or output	$\pm$ 1	Max. 10mA
Power dissipation per output	P	Max. 100mW
Power dissipation per package		
For standard temperature range: -40°C to $+85$°C (plastic and ceramic DIP)		
For $T_{amb} = -40$°C to $+60$°C	P_{tot}	Max. 400mW
For $T_{amb} = +60$°C to $+85$°C	P_{tot}	Derate linearly by 8mW/K to 200mW
For extended temperature range: -55°C to $+125$°C (ceramic DIP)		
For $T_{amb} = -55$°C to $+100$°C	P_{tot}	Max. 400mW
For $T_{amb} = +100$°C to $+125$°C	P_{tot}	Derate linearly by 8mW/K to 200mW
Storage temperature range	T_{stg}	-65°C to $+150$°C

DC ELECTRICAL CHARACTERISTICS $V_{SS}=0$V; for all devices unless otherwise specified.

SYMBOL AND PARAMETER	OPERATING TEMP (T_{amb})[1]	SUPPLY VOLTAGE	TEST CONDITIONS	TEMPERATURE RANGE[1] T_{amb} = LOW		T_{amb} = 25°C		T_{amb} = HIGH		UNIT
				MIN	MAX	MIN	MAX	MIN	MAX

NOTES:
1. T_{amb} Low: −40°C for standard temperature range; −55°C for extended temperature range. T_{amb} High: +85°C for standard temperature range; +125°C for extended temperature range
2. Pin-connected pull-up and pull-down resistors are typically 7 to 78 K-ohms — see PERIPHERY.
3. When pull-up or pull-down resistors are used, current limits for I_{DD} must be extrapolated.

Preliminary

AC ELECTRICAL CHARACTERISTICS $V_{SS} = 0V$; $T_{amb} = 25°C$

SYMBOL AND PARAMETER		PWR SUP (V_{DD})	MIN	TYP	MAX	UNIT
f_{max}	Maximum toggle frequency flip-flop GT00 (no set/reset)	5	—	30	—	MHz
f_s	Maximum system frequency (may depend on number of gates in sequence)	5	—	12	—	MHz
t_p	Propagation delays for 2-input NAND gate with fanout of 2	5	—	3.5	—	ns

SYMBOL AND PARAMETER		PWR SUP (V_{DD})	MIN	TYP	MAX	UNIT
OUTPUT STAGE TRANSITION TIMES: Input transition ≤ 20ns, $C_L = 50pF$; $V_{SS} = 0V$, $T_{amb} = 25°C$.						
t_{THL}	Driver outputs High-to-Low	2.0	—	130	260	ns
		4.5	—	26	52	ns
		6.0	—	22	44	ns
t_{THL}	Buffer outputs High-to-Low	2.0	—	65	130	ns
		4.5	—	13	26	ns
		6.0	—	11	22	ns
t_{TLH}	Buffer outputs Low-to-High	2.0	—	125	250	ns
		4.5	—	25	50	ns
		6.0	—	21	43	ns

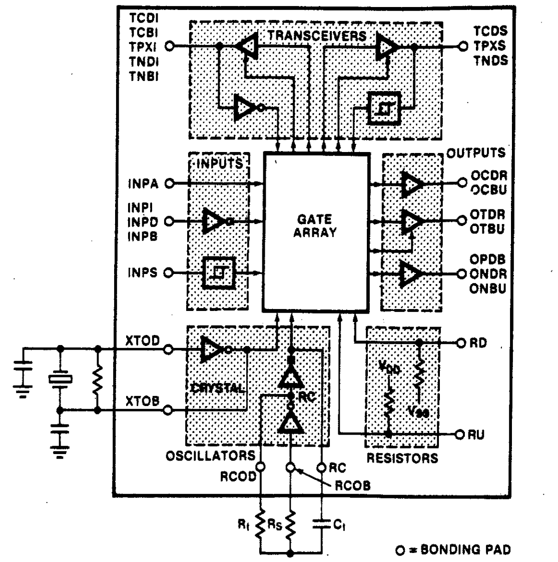
Preliminary

PERIPHERY

To provide a versatile interface, H-Series CMOS arrays have numerous I/O pads—see Figure 1a. These peripheral elements can be configured to match the input or output requirements of a wide variety of logic families. Accordingly, a bonding pad may have one of the following functions assigned to it:

- INPUT STAGE which includes an input protection circuit (series resistor and single diode clamp to V_{SS}). The recommended maximum load is 260 array gates, or 100 array gates for optimum speed performance. Because the input voltage is not clamped to V_{DD}, input voltages greater than the supply voltage is possible, thus allowing voltage level shifting.
- SCHMITT TRIGGER input stage for noise reduction, pulse shaping, or suppression of oscillation spikes associated with slow input clock transitions. The recommended maximum load is 10 array gates, or 5 for optimum speed performance.
- TRANSCEIVER input/output stage
- THREE-STATE output with driver or buffer performance capability for bussing applications
- COMPLEMENTARY OUTPUT with driver or buffer performance capability.
- OPEN DRAIN N- or P-transistor output
- PULL-UP/PULL-DOWN resistors (see Figure 2 for availability) may be added at various I/O stages. The values available are 5, 10, 15, 30, 60, 65, 70 and 75 Kohms.



TRANSCEIVERS WITH INVERTER INPUT	
TCDI	complementary driver output
TCBI	complementary buffer output
TPXI	open drain p-channel driver output
TNDI	open drain n-channel driver output
TNBI	open drain n-channel buffer output
TRANSCEIVER WITH SCHMITT TRIGGER INPUT	
TCDS	complementary driver output
TPXS	open drain p-channel driver output
TNDS	open drain n-channel driver output
INPUTS	
INPA	direct access to array
INPI	inverter
INPD	driver
INPB	buffer
INPS	Schmitt trigger
OUTPUTS	***FANOUT: DRIVER = 4 LSTTL LOADS @ 4.5V BUFFER = 6 LSTTL LOADS @ 4.5V***
OCDR	complementary driver
OCBU	complementary buffer
OTDR	3-state driver
OTBU	3-state buffer
OPDB	open drain p-channel driver
ONDR	open drain n-channel driver
ONBU	open drain n-channel buffer
OSCILLATORS	
XTOD	crystal oscillator with driver stage
XTOB	crystal oscillator with buffer stage
RCOD	RC oscillator with driver stage
RCOB	RC oscillator with buffer stage
RESISTORS	
RD	pull-down resistors
RU	pull-up resistors

Custom and Semicustom Circuit Capabilities

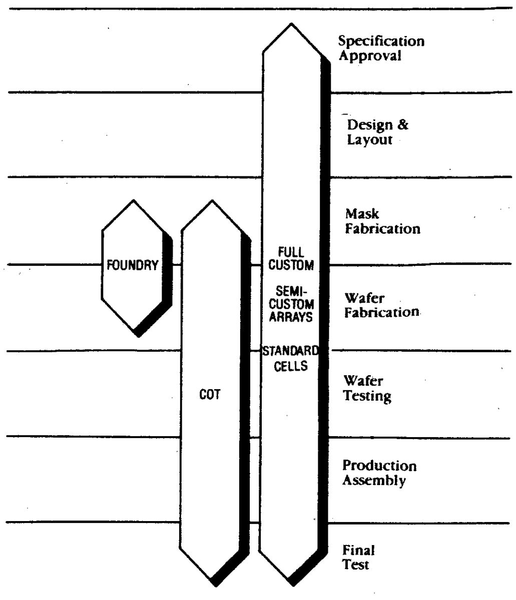
Full custom or COT/Foundry — SSi offers it all.

SSi is committed to providing cost-effective, quality custom solutions to your most specialized applications. We offer it all: Bipolar, as well as MOS; Analog, Digital, and combinations of both.

Advanced CAD development tools enable our experienced staff of IC designers to create the optimal solution for you efficiently and accurately.

Our state-of-the-art manufacturing facility allows us to provide you with the highest quality product when you need it. If you already have your own design or tooling, SSi can provide very fast turnaround on just those foundry and full production services you require.

For low cost, quick turn around semicustom requirements, ask us about our new standard cell program. Remember, we have a program to meet all of your "application specific" integrated circuit needs.



Semicustom Arrays

SCA-6 AND SCA-12 SWITCHED CAPACITOR CUSTOM ARRAYS

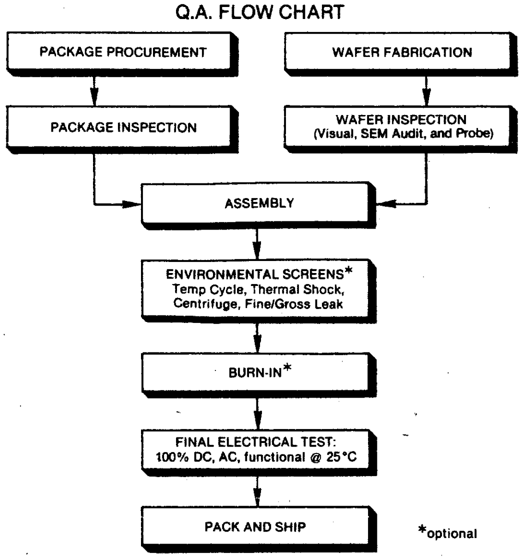
The SCA-6 and SCA-12 are CMOS, switched-capacitor filter semicustom arrays, which can be configured to implement up to six or twelve biquadratic filter sections, other switched capacitor filter (SCF) architectures, and general analog functions. Intended primarily for analog signal processing applications, the SCA-6 and SCA-12 are efficient replacements for many active RC and discrete implementations, providing precision high-order filtering on a single chip.

Quality Assurance

SSi Quality Assurance Capabilities include:

- Environmental testing
- Burn-in
- Hi-Rel screening

STANDARD PRODUCT
Q.A. FLOW CHART



*optional

Hi-Rel Screening Options
• Reliability Screening (Method 5004)
• Qualification and Quality Conformance Procedure (Method 5005)
• Pre-Seal Visual Inspection (Method 2010)
• Stabilization Bake (Method 1008)
• Temperature Cycle (Method 1010)
• Thermal Shock
• Constant Acceleration
• Fine Leak (Method 1014)
• Gross Leak (Method 1014)
• Burn-in
• SEM Analysis of Wafer Lots (Metallization)

Q.A. CAPABILITIES

The quality assurance program at Silicon Systems specifies and implements standards and controls on all SSi products during all phases of design, manufacture, and assembly. Product quality is carefully monitored at each critical point. For those clients whose applications require extraordinary reliability, SSi offers special Hi-Rel screening procedures and burn-in. All Hi-Rel processing steps are in accordance with MIL Standard 883, and SSi quality assurance procedures can include any of those shown above.

Silicon Systems® incorporated

14351 Myford Road, Tustin, California 92680 (714) 731-7110, TWX 910-595-2809

Why Go Custom and Why Use Synertek?

Your decision to use a Custom circuit rests basically on the requirements of your system. You'll want to consider the alternatives available to you:

- **Standard circuits** are off-the-shelf products designed for general product applications. If your yearly system volume will be less than 10,000, SSI (small scale integration) and MSI (medium scale integration) circuits may be your best solution.
- **Microprocessors** may fill your need if your application requires great flexibility and cost is not an overriding factor. They are most practical when total circuit volume does not exceed 50,000.

Advantages of Custom Circuits

A Custom circuit is an exclusive proprietary design built specifically to meet your product requirements. Its advantages are:

- **Reduced system cost** — Through circuit integration the total number of discrete and integrated components can be cut by 75-90%. This dramatically reduces component inventory, PC board assembly, and power supply costs.
- **Increased reliability** — As circuit device count and total system size is reduced, system reliability increases. For you, the more reliable a system you sell to your customers, the less you will have to expend on warranty costs.
- **Features** — Special features not available in standard circuits or microprocessors can be cost-effectively designed into a Custom circuit.
- **Market Leadership** — CUSTOM MOS/LSI technology can revolutionize a product. It enables new features to be built which would otherwise be unavailable or too expensive to implement. When your product is manufactured with a proprietary design, competitors have a more difficult time copying it. As a result, you can enjoy longer periods of market leadership and penetration.

Why Use Synertek?

Our ability to develop sophisticated technologies insures our market leadership position in custom integrated circuits. We currently offer silicon gate HMOS, NMOS, and HCMOS technologies. Our advanced computer-aided design facilities, projection alignment equipment, 4-inch wafer fabrication lines, and VLSI testing equipment further demonstrate Synertek's commitment to state-of-the-art technology. Synertek offers the following services:

- **Classic Custom Designs** — We will design your circuit from concept. You may initially provide us with a written explanation of the function you want, or with a logic diagram of the circuit, or with just a specification.
- **Customer Design Teams (C.D.T.)** — We will train your engineers to do their own custom design. The full spectrum of design capability can be approached: classic custom hand-drawn circuits, designs using the Cell Library™, or seminars for C.O.T.™ customers. Your systems knowledge is combined with our IC design capability for optimum circuits.
- **C.O.T.™** — Synertek will become the manufacturing arm of your in-house design group or your consulting design house. By providing you with process design rules, parameters, computer simulation programs and, most of all, our total cooperation, we can assure you the manufacturing capability you want.

Classic Custom Design

A masterpiece is never developed overnight. An artist needs time to think, plan, and create. At Synertek, the average length of time needed to bring a circuit from the concept stage to prototype production is 6-9 months. Depending on the complexity of the device, this may be longer or shorter. Simple circuits can be completed within 3-4 months. All circuits, however, are subjected to the same stringent testing, quality control, and verification checks.

Keeping with our philosophy of partnership, our engineers will confer with you often throughout the design and development phases.

The Custom Design and Development Process

- **System definition** — Synertek and the customer establish block diagrams, flow charts, and mechanical and electrical specifications
- **Logic design and computer simulation** — Our design engineers convert system functions to MOS logic. Computer simulations of critical logic design characteristics are done in our DA (design automation) center. SCEPT™ (Synertek Circuit Emulation Program and Test) is a conventionally designed breadboard which duplicates MOS logic. Once approved by you, SCEPT™ is used to write and debug a test program. From this point, SCEPT™ is the functional reference for the remaining design steps. **1-10 weeks.**
- **Circuit design and analysis** — Individual transistors are laid out to implement the SCEPT™ logic. Particular attention is paid to critical speed paths. Additional computer-aided circuit simulation information is analyzed and incorporated into the actual circuit design. **1-4 weeks.**
- **Composite layout design** — A layout of the circuit design, called a composite, is hand drawn to minimize final chip size.
- **Digitizing** — The composite drawing is converted in our CAD (Computer Aided Design) center to a database tape using a Calma interactive graphic system. The digitized information is used to generate plots of each circuit layer. The plots are compared to the original composite and editing changes are made. Editing and checking continues until the database tape is approved for the entire composite.**1-14 weeks.**
- **Mask generation** — Once the database tape is approved a PG (pattern generation) tape is produced. This tape is used to create each mask level.

  We use three methods in mask making — photolithography, E-beam and a combination of both.
- **Prototype wafer fabrication** — During prototype fabrication, numerous quality and electrical inspections are performed to assure that every wafer lot meets our specifications.
- **First samples** — These are untested devices commonly referred to as "Cut & Go's." They are placed in ceramic packages, assembled, and sent to you for initial evaluation. **2-3 weeks.**
- **Test generation** — The Cut & Go's play an essential role in the completion of the test program, which was initiated during the circuit design stage. The test program must be verified with the Cut & Go's before it is finalized.
- **Prototype production** — After fully tested samples are approved, prototype production begins.
- **Full production** — Scheduled delivery commences after prototype qualification and test verification are completed.

Customer Design Teams (C.D.T.)

C.D.T. is a program by which customers can be trained to do their own IC designs. It encompasses the full spectrum of custom design from the classical, hand-drawn approach, with Synertek's engineers doing the full design, to the customer owned tooling program. CDT's are designed to take advantage of the customer's system knowledge and Synertek's IC design and production capabilities. The customer has access to our facilities, design courses, the Cell Library™, advanced CAD tools, processes, design expertise, and on-going support.

The CDT design course is approximately ten weeks long and is based upon the structured design methodology. The major portion of the course demonstrates how to use the Cell Library™, with hands-on experience using our CAD tools to complete a simple design. Very little time is spent on design physics. As an on-going project we are continually developing additional short courses as updates as well as video tapes on specific topics.

Our CAD tools revolve around our mainframe computer, a VAX 11/780, to enable our customers to use commercially available software written for the VAX. NCA corporation's software is used for layout verification, including Design Rule Check, Electrical Rule Check and Network Continuity Check. The Network Continuity Check compares the layout data to the Netlist derived from schematic entry. Other services, such as sizing and PG tape generation, can also be performed on the VAX.

Silvar-Lisco's SOS package including CASS and CAL-MP is installed on the VAX. CASS is used for schematic entry via a Genisco 1000 or other graphics terminals. Once the schematic has been entered, a design data base is created from which several output data formats can be generated. The following outputs are presently available: Netlist, TEGAS for logic generation and test verification, SPICE for circuit simulation, Network Continuity Checker and CAL-MP.

CAL-MP is used for automatic placement and routing of the cells in the Cell Library™. All cells are designed to take advantage of the CAL-MP program capability. The program can handle up to 1800 cells (not gates) with 3600 cell capability to be installed soon. Chips of larger size can be created by assemblying partitioned sections of up to 3600 cells each.

We are constantly updating and improving our software. Any improvements in the NCA or Silvar-Lisco software will be installed so that design capability and turn-around times can constantly be improved. Dial-up facilities to the VAX are available enabling our CDT customers to access the above software via remote terminals.

As an important part of the CDT program Synertek provides support in the form of helping with the design, instruction in the use of our CAD equipment, providing updates in the course, and providing advancements in our process capabilities. Synertek's CDT team is organized to assist the customer in all the crucial steps of the design. Once the customer reaches design proficiency, we have a separate Customer Owned Tooling (C.O.T.™) team to move designs quickly into production. As a customer's needs or designs change, CDT's are flexible enough to tailor ongoing support to the specific requirements of the customer.

The Cell Library™

The Cell Library™ evolves around our n-well, single poly, single metal 3 micron HCMOS process. The cells developed are the basic cells required to do random logic design. We will continue to design increasingly complex cells, such as multi-stage counters, voltage comparators, microprocessor cores, ALU's, etc. Customers have the option of designing and using any additional cells required in their system. These cells should conform to our format requirements, and the customer has the option of including them in the Cell Library™ user group.

Designs can be done on any graphics system with the interface preferably using GDS II formatted tapes. All cells are fully characterized over the −55°C to +125°C range. Each cell has its own data sheet, with all the electrical and topological parameters. The Cell Library™ manual is a TTL type book containing all the information on the cells.

Almost all cells are of constant height and variable width, however some cells are of different height to improve layout efficiency. For example, there is a tall and narrow flip-flop that will be used for long chains of ripple counters. Some of the basic cells, such as inverters, NOR gates, NAND gates, are of two different heights to optimize the auto-router.

Each cell has inputs at both the top and the bottom with two power lines running horizontally through the cell. The cells are self-contained, so that no external connections will be required to complete them. For most of the cells, connections are made by either poly or metal. Production type cells, such as alignment marks, CD's, etc. are also available as part of the Cell Library™.

The Cell Library™ is available to our classic custom, CDT and C.O.T.™ customers. Synertek's engineers will design a circuit for you or teach your engineers to do their own designs using the Cell Library™. C.O.T.™ customers may purchase the Cell Library™ with or without a production commitment.

Training for C.O.T.™ customers is also available for a nominal fee.

C.O.T.™

Perhaps you have your own MOS design group, or have chosen to have your circuit designed by a consulting firm. Or maybe another MOS supplier designed the chip and you want to tool-up a second-source supplier. Whatever your design source, we can produce your circuit on a customer owned tooling (C.O.T.™) basis.

Because of our extensive experience with MOS/LSI technology, we understand your reasons for going C.O.T.™. You want to minimize design cost and production time while maximizing proprietary design control. We guarantee that your Custom circuit will receive the same confidential, proprietary treatment as our own in-house designed circuits.

You may enter the production cycle at a number of various stages. We'll accept your design on a database tape, a pattern generator tape, or working plate. You'll be given an initial documentation package that includes an overview of design rules and parameters for our MOS processes.

C.O.T.™ customers provide Synertek's Product Engineering with their chosen form of tooling along with the test tape and specifications for testing the customer's circuit.

Synertek maintains a policy of requiring characterization data for all circuits prior to transfer to production. This measure enables Synertek to do further studies on yield enhancements and correlation. Synertek strives to maximize yields at final test and ultimately reduce circuit costs to the customer. We view C.O.T.™ as a joint effort on the part of vendor and customer. Our goal is to work with the customer's design group, to lend the necessary technical support and to build a successful working relationship.

Again, we will meet with you as early in the program as possible to establish a close working relationship. If you wish to design your own proprietary circuit, our engineering staff is available for design aid and general program guidance. We take measures to enhance a smooth product flow. Our program managers monitor your circuit from our CAD center through production. We also have a back-log control system that continually updates you on product schedules and shipments.

As a C.O.T.™ customer, you have access to our extensive manufacturing and assembly facilities in addition to our advanced processes.

A Process for Every Masterpiece

Selecting the right process for your Custom circuit is one of your most important decisions in the design cycle.

Synertek's offering of fully proven manufacturing processes has the right answer for you. It includes state-of-the-art HMOS, HCMOS and EEPROM in addition to the industry standard NMOS silicon gate technology. Electrical and Topological Design Rules are available under a non-disclosure agreement.

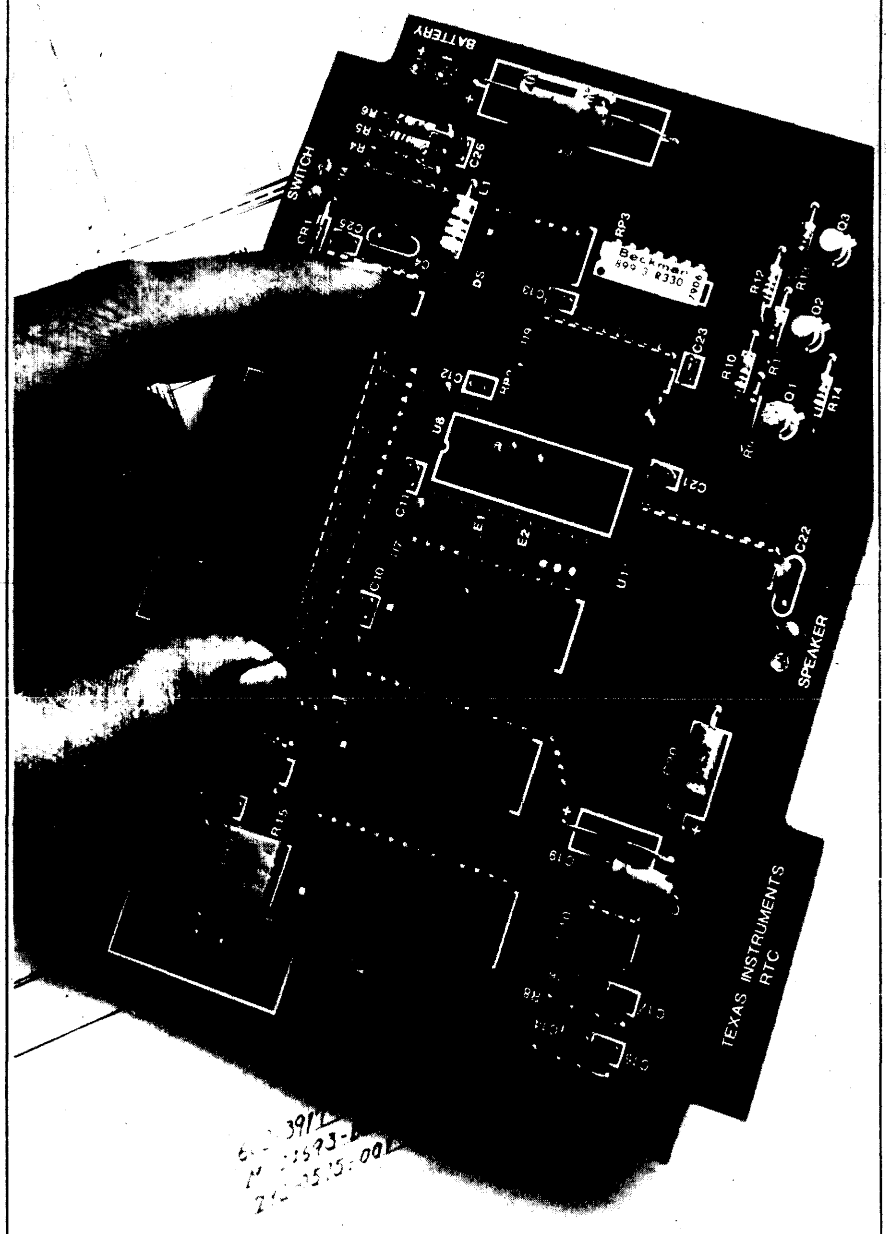
TI Standard-cell Technology:



Now, you can achieve better performance by matching logic more closely to your design requirements. TI's new 3-µm CMOS standard-cell technology is the fast, simple means by which you can gain the advantages of VLSI custom chips at a price you can afford. TI CMOS standard-cell technology lets you design your own semicustom ICs. Quickly. Economically. And best of all, using familiar design rules and techniques that let you focus on your logic design, rather than on IC design.

Semicustom logic made affordable

A single semicustom chip created with TI's standard-cell technology lets you replace hundreds of discrete TTL components. Allowing you to dramatically reduce your system parts count. Improve reliability. Lower power dissipation. Develop a lighter, more compact product. And decrease assembly costs because of fewer parts and fewer inter-package connections.

What's more, system cost with TI's standard-cell logic is often much less than with discrete logic.

Easy does it

TI's standard-cell system makes developing semicustom logic as easy as arranging packaged logic chips on a PC board. All you do is develop your design using familiar TTL logic functions as your building blocks.

Your schematic can be in the form of a discrete IC breadboard. Or you can draw your schematic on paper, or set it up using an engineering work station. Then, you create a simulation model for your schematic and exercise it to verify performance and define the tests that your chips must pass in production.

◀ **Simple yet advanced,** TI standard-cell technology lets you develop one-chip logic systems using traditional TTL design techniques. Extensive support from TI includes advanced engineering work stations now located at all TI Regional Technology Centers. The reduced cost, size, weight, and power consumption of TI standard-cell chips can benefit products ranging from simple electronic games to logic-intensive systems for advanced computers.

PRODUCT PREVIEW

Semicustom CMOS logic you design using your TTL know-how.

TYPICAL STANDARD-CELL DESIGN

APPLICATION
- FLOPPY-DISK LOGIC DISPLACEMENT—8-BIT MICROPROCESSOR DESIGN WITH ROM AND DRAM INTERFACES
- PRESENT DESIGN—48 LPS AND SCHOTTKY DEVICES
- THIS DESIGN—1-40 PIN 1,550-GATE STANDARD CELL

PERFORMANCE ANALYSIS

IMPACT AREA	LPS DESIGN	STANDARD CELL
PERFORMANCE	LPS	LPS EQUIVALENT OR BETTER
POWER DISSIPATION	1.35 W	50 mW
PC BOARD AREA	40 SQ. INCHES	3 SQ. INCHES
NO. OF SOLDER JOINTS	720	40
COMPONENT COST	X	0.3X

DESIGN DELIVERY TIMING

ACTIVITY	WEEKS	CUM.	COMMENTS
DESIGN IDENTIFIED	0	0	QUOTE, TERMS, AND CONDITIONS
DESIGN SUBMITTED TO RTC	4	4	LPS SCHEMATICS AND TEST DATA
RTC SUBMISSION TO FACTORY	6	10	COMPUTER-GENERATED DATA BASE AND LAYOUT
FACTORY SUPPLIES PROTOTYPES	7	17	20 UNITS TO SPECIFICATION
FIRST PRODUCTION DELIVERY	6	23	HIGH-VOLUME MANUFACTURE

Low logic costs per installed gate combine with quick turnaround times to help bring your system cost down the learning curve faster.

After that, your responsibilities are over. TI handles all the time-consuming details of chip layout, testing, and verification. Turnaround time and costs are kept to a minimum by TI's automated design system.

This approach gives you two key advantages. First, it lets you capitalize on the expertise you've developed over years of using standard logic families like SN54/74LS Low-power Schottky TTL. Second, it gives you the benefit of TI's decades of experience in IC design.

If you prefer, you can do the chip layout yourself. In this case, TI supplies the specifications you need to lay out your design using standard cells.

Wide choice of functions eases design task

Many popular functions equivalent to SN54/74 devices are already available in TI's new SN54/74SC family of standard-cell logic functions. The current family members are 3-µm twin-well CMOS parts based on TI's SN54/74HC family of high-speed CMOS logic functions. The new SN54/74SC family meets or exceeds SN54/74HC specifications and offers the same advantages of low power consumption, high noise immunity, flexible power-supply requirements, and switching speeds comparable to Low-power Schottky performance.

With a 2-picofarad load, the typical propagation delay is 3 ns per gate, with a typical power dissipation of 60 µW per gate at 1 MHz. Electrostatic discharge protection on input and output buffers exceeds 2000 volts. Latchup protection on outputs has been shown to exceed ±300 mA at room temperature.

Many new standard-cell functions are coming soon. Plans include unique "procedural cells" that let you partially define your own on-chip RAM, ROM, ALU, counters, and other functions. Also upcoming is a series of advanced standard-cell functions offering Advanced Low-power Schottky performance levels.

Depending on your design needs, TI standard-cell ICs can be packaged in anything from 8-pin DIPs to multipin chip carriers. And MIL versions will also be available.†

Sized to fit

What's more, standard-cell ICs are sized to meet your specific design requirements. You aren't tied to a specific chip size, as in the case of gate or logic arrays.

†Check field sales office for availability.

Standard-cell functions are also packed much more densely than logic-array functions. That's because the functions are separately selected and placed on chip for each design. In contrast, logic arrays must implement the desired functions using a preset collection of logic elements, such as NOR gates.

TI standard-cell ICs let you avoid the problem of "unused" gates. They also minimize silicon-consuming routing areas needed to interconnect logic arrays.

The result is cost-effective, compact ICs that pack much more functionality in less chip space.

This translates into substantial savings in IC production costs. Savings that make TI standard-cell solutions an attractive choice for low- as well as high-volume products.

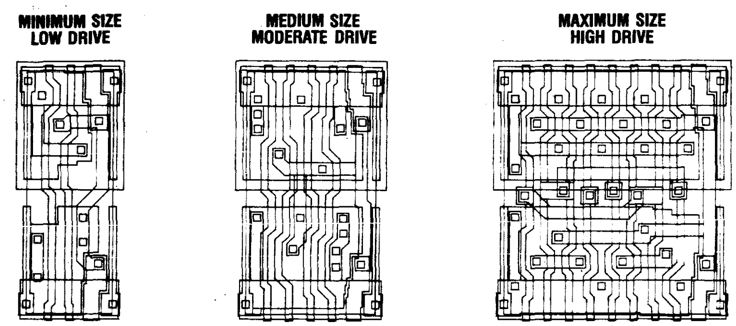
Versatile logic ICs

You can put standard-cell ICs from TI to work in just about any system requiring digital logic. Like printers and terminals. Dedicated controllers. Instrumentation. Automotive controls. Video games, personal computers, and other consumer electronic products.

Standard-cell ICs from TI provide the affordable logic you need to build better man-to-machine and machine-to-machine interfaces into your products. For "friendlier" computers and "smarter" office systems.

The modest power, size, and weight requirements of TI's CMOS standard-cell chips are also ideal for battery-powered and portable equipment.

TYPICAL CELLS



Each function in the SN54/74SC family has a number of physical implementations, allowing TI to better optimize your circuit design.

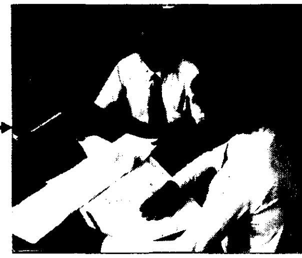
TEXAS INSTRUMENTS
POST OFFICE BOX 225012 • DALLAS, TEXAS 75265

Simple design system with quick

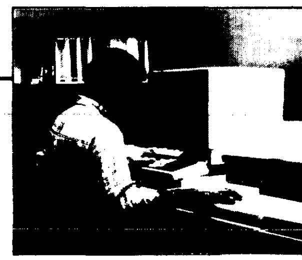
Texas Instruments step-by-step approach speeds development of SN54/74SC semicustom logic.

TI's standard-cell integration system offers two basic routes for developing standard-cell ICs. With one, you design the logic system you need and leave the chip layout and verification to TI. Or you can do the layout yourself, using standard-cell specifications. Here's the typical design sequence you'll follow if TI does the layout:

1 You develop a schematic or discrete IC breadboard of the required logic system using SN54/74SC functions (your schematic can be drawn on paper or via an engineering work station).



2 You create a TIDAL* data base for your design using a schematic-capture program. This can be done either at your plant site using an engineering work station or at your local TI Regional Technology Center.



3 You input your TIDAL data base to various design tools to perform simulation, testability analysis, test generation, and test-pattern grading. All these tools are available through your local TI Technology Center, along with computers to run them. Some of the tools can be run on your own computer or accessed via a remote-job-entry connection (depending on the type of computer you have).

4 TI runs a simulation, testability analysis, test-pattern grading, and technology check to double-check your logic design.

5 TI develops a computer-aided layout of your design.

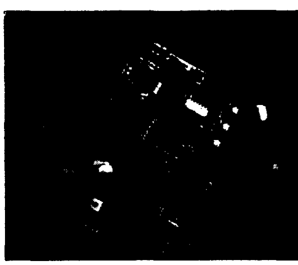
6 TI runs a post-layout simulation to validate the performance from the layout, including the extraction of the interconnect delays.

7 TI runs a schematic-verification program to check the chip layout against the TIDAL-encoded logic diagram.

8 TI runs a final simulation step to demonstrate the AC performance of the logic design. Results are submitted to you prior to prototype fabrication and become, on your approval, the final conformance specification of your standard-cell IC design.

9 TI inputs the layout data base to pattern-generation/slice-writing equipment.

10 Prototypes are fabricated, assembled, and tested against prefabrication test specifications. Testing is performed using your simulation model as a "known good unit."



11 Prototypes are shipped to you for in-system evaluation and the decision to go to production.

turnaround.

Important Notice: Texas Instruments reserves the right to make changes at any time in order to improve designs and to supply the best possible product.
Texas Instruments provides customer assistance in varied technical areas. Since TI does not possess full access to data concerning all of the uses and applications of customers' products, responsibility is assumed by TI neither for customer product design nor for any infringements of patents or rights of others which may result from TI assistance.

All the support you need... nearby

The support you need to create your standard-cell design is conveniently available at your nearest TI Regional Technology Center.

Each Technology Center is staffed with a team of standard-cell specialists who will work closely with you to coordinate TI's layout, testing, and fabrication efforts with your design goals and product schedule.

Support services include a telephone hot line for getting fast answers to technical questions. In-depth training courses on standard-cell technology. Assistance in design optimization and test development. Access to hardware and software design tools. Even complete turnkey design services. With the all-important personal contact that ensures a quick response to your needs.

Streamlined design system

TI's standard-cell integration system features a set of state-of-the-art, fully integrated design-automation tools. These range from schematic-capture and design-simulation programs to design-verification software and automated tooling equipment.

All the tools can share design information via TI's TIDAL Transportable Integrated Design Automation Language. This saves valuable engineering time by eliminating the need to recode incompatible programs.

Many of the design tools can run on your own system (depending on the level of the tool). Systems like the IBM personal computer, IBM 4341, VAX 11/780™ systems, and a wide variety of engineering work stations.

Some of the software tools are also available for licensing. Dial-up access to the more complex design software is available through the Regional Technology Centers. In addition, engineering work stations are located at each of the Technology Centers for designers who wish to come in and use them.

TI's design system is the outcome of two decades of involvement in design automation. Many of the tools—such as TI's proprietary layout-verification software—have provided major productivity improvements on scores of TI designs for ICs. This sophisticated design system gives your standard-cell design a very high probability of first-pass prototypes which are not only functional but producible.

Fast turnaround

TI's design system cuts manual intervention in the design process to a minimum, resulting in very short design-cycle times.

To speed things up still further, TI's Customized Components Division (the division responsible for TI's standard-cell product area) has its own dedicated wafer-fabrication facility and assembly and test facility for prototype and low-volume IC production.

In most cases, you'll have prototypes in your hands within six to eight weeks after joint approval of design data base.‡ Our objective is to be fast— our commitment is to provide on-time delivery of ICs that fully meet your specifications. Providing the crucial edge you need in getting a product to market ahead of your competition.

For more information

To find out more about the TI standard-cell integration system, please contact your nearest TI field sales office as listed on the back cover.

‡Cycle time from initial design to prototype shipments is typically 10 to 12 weeks.

TAL-002, TAL-004 LOW POWER SCHOTTKY LOGIC ARRAYS

JUNE 1983 – REVISED OCTOBER 1983

- **Family**

TWO ARRAYS	INTERNAL GATES	I/O BUFFERS
TAL-002	320	28
TAL-004	500	36

- **Technology**

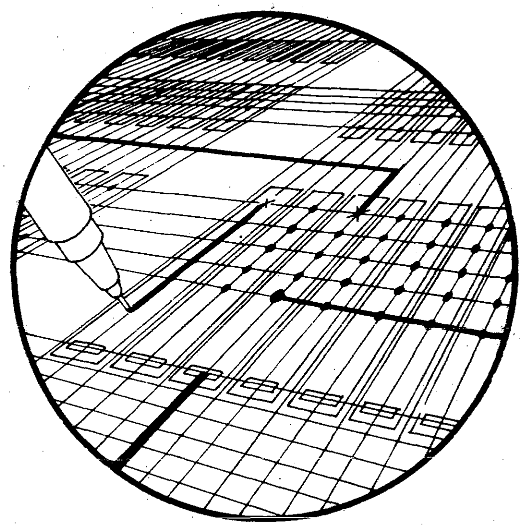
  Established Double Level Metal Low Power Schottky

- **Layout**

  Designed for the user at His Own Location or by TI Regional Technology Centers

- **Internal Gates**
  - **Single 5-V Power Supply**
  - **5 ns Maximum Gate Delay at 1.25 mW Gate Dissipation**
  - **Toggle Rate 25 MHz**
  - **Twenty-Two Standard Macros currently available**

- **I/O Buffers**
  - **Standard True and Complement Input**
  - **NAND Output**
  - **Three-State Output**
  - **Standard I/O**
  - **Open-Collector NAND Output**
  - **Schmitt Trigger Input**
  - **Power-Up Reset Circuit**



- **Design Verification**
  - **Closed Loop Logic to Layout Check**
  - **Test Pattern and Design Rule Check**
  - **Logic, Timing and Fault Simulation**
  - **Easy Access by User to TI Software**

description

The TAL family of devices are Low Power Schottky master slices which are held in stock at TI. The master slices are converted into LSI slices by the deposition of two layers of metal according to an interconnection pattern drawn by the user on a TI supplied translucent grid. The resulting devices are tested according to input-output logic patterns devised by the user, and become the user's proprietary LSI parts.

A comprehensive design manual sets out the logic and layout rules for the process and also explains a simple short-hand method of describing the circuit so that a detailed check of layout and test patterns can be carried out at TI. This computer aided check comprehends logic, layout, and test patterns and results in a dialogue in which the user and TI work together to eliminate errors prior to mask fabrication.

The layout task is considerably eased by the availability of standard overlays for commonly used logic functions and standard buffers are provided for inputs and outputs. The user is also able to specify his own blocks of logic in cases where a number of identical pieces of circuit occur in the design.

As can be seen from Figure 1, the array consists of blocks of five input NAND gates of which any four are useable in any one cell. The gates consist of output transistor TI and multi-emitter transistor T2. The emitter of T1 is normally connected to ground and its collector can feed up to eight subsequent multi-emitter inputs within the array. The logic design rules for the interconnection of gates are explained in detail in the design manual.

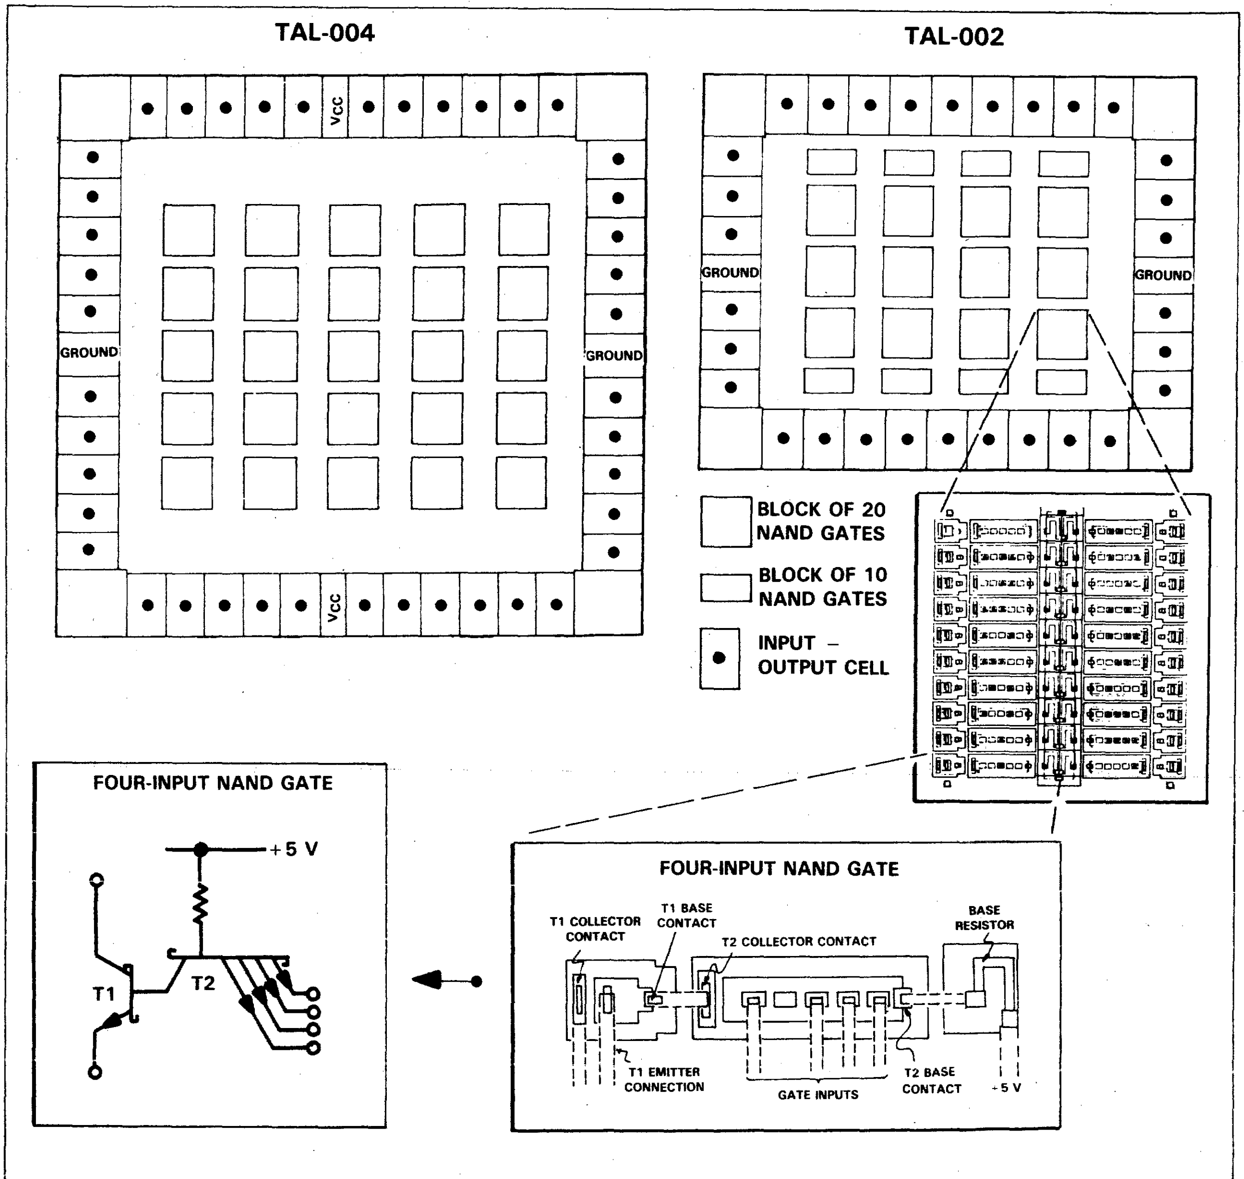


FIGURE 1 – ARRAY STRUCTURE

The TAL-004 has 500 internal four-input NAND gates and the TAL-002 has 320. A single 5-V power supply is needed for the arrays and both device types are available in 28- and 40-pin DIL plastic packages, with the option also, of a 20-pin package for the TAL-002.

manual layout

A reproduction of the translucent user layout grid is shown in Figure 2. The lower level of metal interconnect on the finished device is called Metal 1 and is specified on the grid by marking the vertical lines and the upper level, Metal 2, is similarly designated by marking the horizontal lines. Electrical connection between the two layers is made by so called "vias" and to underlying gates by "contacts." Layout design rules govern the location of interconnections, vias, and contacts and these are clearly explained in the design manual.

Standard logic functions and I/O buffers are specified by attaching cut outs to the user grid. Symbols for the logic function overlays (macros) and I/O's are supplied on a sheet similar to the user grid.

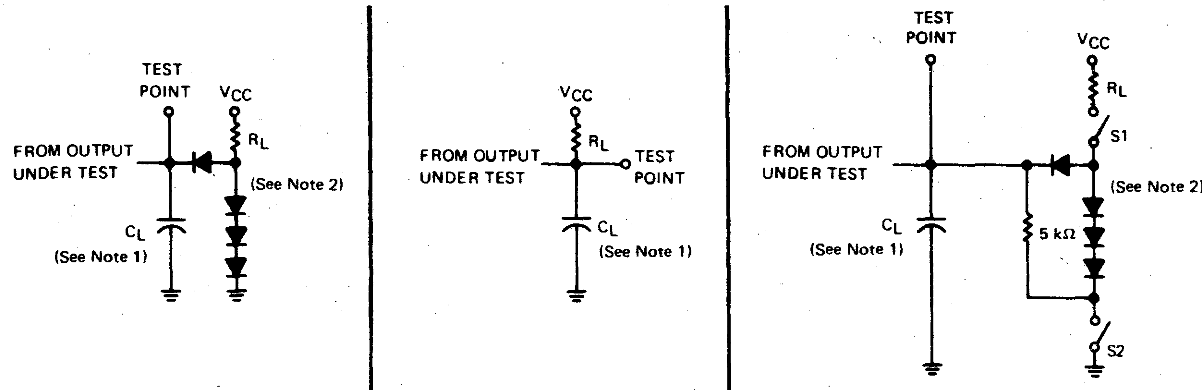
PARAMETER MEASUREMENT INFORMATION†



LOAD CIRCUIT FOR BI-STATE TOTEM-POLE OUTPUTS

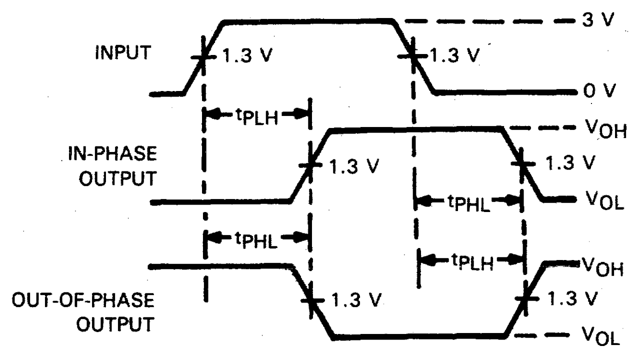
LOAD CIRCUIT FOR OPEN-COLLECTOR OUTPUTS

LOAD CIRCUIT FOR THREE-STATE OUTPUTS

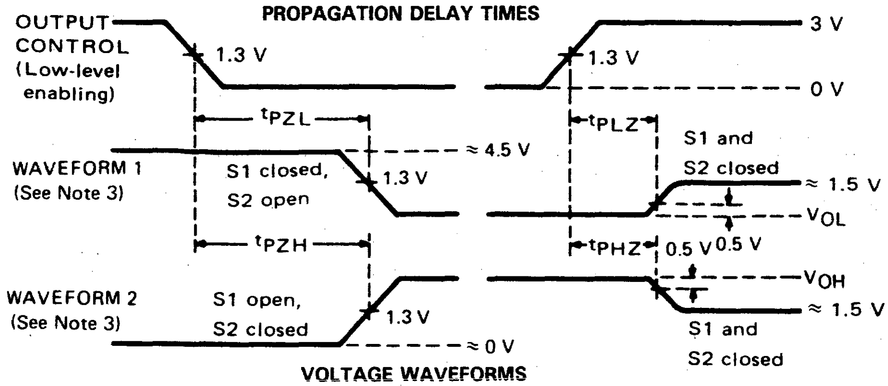
† I/O cells only.

NOTES: 1. C_L includes probe and jig capacitance.
2. All diodes are 1N916 or 1N3064.

FIGURE 3 – LOAD CIRCUITS



VOLTAGE WAVEFORMS
PROPAGATION DELAY TIMES



VOLTAGE WAVEFORMS
ENABLE AND DISABLE TIMES, THREE-STATE OUTPUTS

NOTES: 3. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
4. In the examples above, the phase relationships between inputs and outputs have been chosen arbitrarily.
5. All input pulses are supplied by generators having the following characteristics: $t_r \leq 15$ ns, $t_f \leq 15$ ns, PRR ≤ 1 MHz, $Z_{out} \approx 50\ \Omega$.
6. When measuring propagation delay times of 3-state outputs, switches S1 and S2 are closed.

TAT004, TAT008 STL LOGIC ARRAYS

DECEMBER 1980 – REVISED OCTOBER 1983

- **High-Performance Master Logic Arrays**
  - **Designed for Automated Layout**
  - **Mask Programmable**
  - **Supported by TI Logic Array Design System (TILADS*)**
- **Two Master Arrays**

	Internal Gates	Typical Usable Internal Gates	I/O Buffers
TAT008	1008	800	104
TAT004	540	430	76

- **High-Performance Schottky Transistor Logic (STL) Design**
  - **2.5 ns Typical Gate Propagation Delay at 600 μW**
  - **80-MHz Toggle Rate**
- **Low-Power Schottky TTL Compatible Input and Output Buffers**
  - **Non-Inverting Inputs**
  - **Choice of 3-State, Totem-Pole and Open-Collector Outputs**

description

The TAT004 and TAT008 are a pair of high-performance logic arrays, using Schottky Transistor Logic (STL) technology. The arrays can be mask configured to fulfill unique logic requirements, allowing for efficient implementation of custom IC functions, SSI or MSI logic replacement, and, in many cases, complete board replacement.

The master array employs a cellular organization with channels dedicated to intercellular connections. The internal cells contain 18 high-performance STL gates, and the peripheral cells contain low-power Schottky TTL (TTL-LS) compatible input and output buffers.

All Texas Instruments TAT Series logic arrays are supported by a totally integrated software design utility, which allows the user to encode his logic design and test pattern set for simulation, analysis, and verification of the design prior to release to TI for layout and prototyping. The computer-automated layout system has a recommended 80% gate utilization level.

package options

The TAT004 and the TAT008 are available in the packages indicated by check marks in the table below.

TAT004	40-PIN	64-PIN		
Dual-in-line plastic (N) packages	√	√		
TAT008	**40-PIN**	**68-PIN**	**84-PIN**	**108-PIN**
Dual-in-line plastic (N) packages	√	–	–	–
Ceramic chip carriers	–	–	√	–
Plastic chip carriers	–	√	–	–
Pin grid arrays	–	–	√	√

input/output buffer options

The TAT004 and TAT008 are provided with a library of input/output circuits for maximum design flexibility. The buffers are arranged around the periphery of the array in cells, called buffer cells. Each buffer cell contains two bond pad locations plus the basic components needed to mask program the cell into various TTL low-power Schottky-compatible buffers. A buffer cell can contain two input buffers, but if a cell contains one of the available output buffer types, then only one input buffer can share the buffer cell with it. Table 1 lists the available buffers along with their label as used by the TI Logic Array Design System.

TABLE 1 – TAT004 AND TAT008 BUFFERS

SYMBOL	DESCRIPTION	SYMBOL	DESCRIPTION
SNI	Noninverting Input	SOT	Inverting 3-State Output with Active Low Enable
SNI2	Dual Noninverting Inputs		
SAND	AND Input	SBD	Bidirectional Buffer with Inverting 3-State Output, Active Low Enable
SAND2	Dual AND Inputs		
SO	Inverting Totem-Pole Output	SNIO	Bidirectional Buffer with Inverting Open-Collector Output
SOC	Inverting Open-Collector Output		

absolute maximum ratings over operating free-air temperature range

Supply voltage: V_{CC1} (see Note 1) .... 7 V
V_{CC2} .... 3 V
Input voltage .... 7 V
Output voltage .... 7 V
Operating free-air temperature range .... 0°C to 70°C
Operating junction temperature .... 150°C
Storage temperature range .... −65°C to 150°C

NOTE 1: All voltages are with respect to network ground terminal.

recommended operating conditions

	MIN	NOM	MAX	UNIT
Supply voltage, V_{CC1}	4.5	5	5.5	V
Supply voltage, V_{CC2}	1.8	2	2.2	V
Fan-in (internal gate)			8	
Fan-out (internal gate)			4	
High-level output current, I_{OH}			−400	μA
Low-level output current, I_{OL}			8	mA
Transition time at any input, t_T	2.4		30	ns
Operating free-air temperature range, T_A	0		70	°C

electrical characteristics over recommended ranges of supply voltages and operating free-air temperature

PARAMETER		TEST CONDITIONS	MIN	TYP†	MAX	UNIT
V_{IH}	High-level input voltage		2			V
V_{IL}	Low-level input voltage				0.8	V
V_{IK}	Input clamp voltage	$I_I = -18$ mA			−1.5	V
V_{OH}	High-level output voltage (see Note 2)	$I_{OH} = -400$ μA	2.5	3.4		V
V_{OL}	Low-level output voltage	$I_{OL} = 8$ mA			0.5	V
I_{OZH}	Off-state output current, high-level voltage applied (see Note 3)	$V_O = 2.4$ V			20	μA
I_{OZL}	Off-state output current, low-level voltage applied (see Note 3)	$V_O = 0.4$ V			−20	μA
I_I	Input current at maximum input voltage	$V_I = 7$ V			0.1	mA
I_{IH}	High-level input current	$V_I = 2.7$ V			20	μA
I_{IL}	Low-level input current	$V_I = 0.4$ V			0.8	mA
I_{OS}	Short-circuit output current (see Note 2 and 4)	$V_{CC1} = 5.5$ V	−20		−100	mA
I_{OH}	High-level output current (see Note 5)	$V_{OH} = 5.5$ V			250	μA

† All typical values are at $T_A = 25°C$, $V_{CC1} = 5$ V, $V_{CC2} = 2$ V.

NOTES: 2. Does not apply to SOC or SNIO buffers.
3. Applies only to SOT buffer.
4. Not more than one output should be shorted at a time, and duration of the short circuit should not exceed one second.
5. Applies only to SOC and SNIO buffers.

switching characteristics of internal gate over full range of operating conditions

PARAMETER		MIN	TYP	MAX	UNIT
t_{pd}	Propagation delay time per gate, fan-in = 1	1.5	2.5	3.5	ns
Δt_{PLH}	Increased propagation delay time for each additional fan-in		0.27	0.40	ns
Δt_{PHL}	Increased propagation delay time for each additional fan-in		0.13	0.20	ns
$\Delta t_{PLH(M1)}$†	Additional propagation delay time for each mil of metalized interconnect pattern		0.017	0.040	ns
$\Delta t_{PLH(M2)}$†	Additional propagation delay time for each mil of metalized interconnect pattern		0.015	0.035	ns
$\Delta t_{PHL(M)}$†	Additional propagation delay time for each mil of metalized interconnect pattern			0.003	ns

† M1 = first-level metal, M2 = second-level metal, and M = first- or second-level metal.

switching characteristics of input buffer over full range of operating conditions

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PLH}	Propagation delay time, low-to-high-level output	See Note 6	1	2	4	ns
t_{PHL}	Propagation delay time, high-to-low-level output		2	3.5	6	ns

switching characteristics of tristate and totem-pole output buffers over full range of operating conditions

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PLH}	Propagation delay time, low-to-high-level output	$C_L = 50$ pF, $R_L = 2$ kΩ, See Note 6	4	7	11	ns
t_{PHL}	Propagation delay time, high-to-low-level output		6	12	19	ns
t_{PHZ}	Disable time from high level	$C_L = 15$ pF, $R_L = 2$ kΩ, See Note 6	8	14	20	ns
t_{PLZ}	Disable time from low level		6	10	15	ns
t_{PZH}	Enable time to high level		4	8	12	ns
t_{PZL}	Enable time to low level		5	10	16	ns

NOTE 6: Refer to the TAL-002, TAL-004 Data Sheet for load circuits and switching times.

description

These fixed-OR arrays provide 3-state outputs for bus-oriented systems. They combine Advanced Low-Power Schottky technology with proven titanium-tungsten fuses for reliable, high-performance substitutes for conventional TTL logic. Standard arrays and programmability allow quick design of "custom" functions and more compact boards. The −1 and −2 parts offer a choice of operating frequency, switching times, and power dissipation.

The SN54PL16' is characterized for operation over the full military temperature range of −55°C to 125°C. The SN74PL16' is characterized for operation from 0°C to 70°C.

description

These fixed-OR arrays provide 3-state outputs for bus-oriented systems. The 'PL20L8, 'PL20R4, and 'PL20R6 have output registers that can be loaded from the I/O pins by a preload procedure. All the outputs are automatically set to a low level when power is applied. The −1 and −2 parts offer a choice of operating frequency, switching times, and power dissipation.

The SN54PL20' is characterized for operation over the full military temperature range of −55°C to 125°C. The SN74PL20' is characterized for operation from 0°C to 70°C.

PRELOAD PROCEDURES

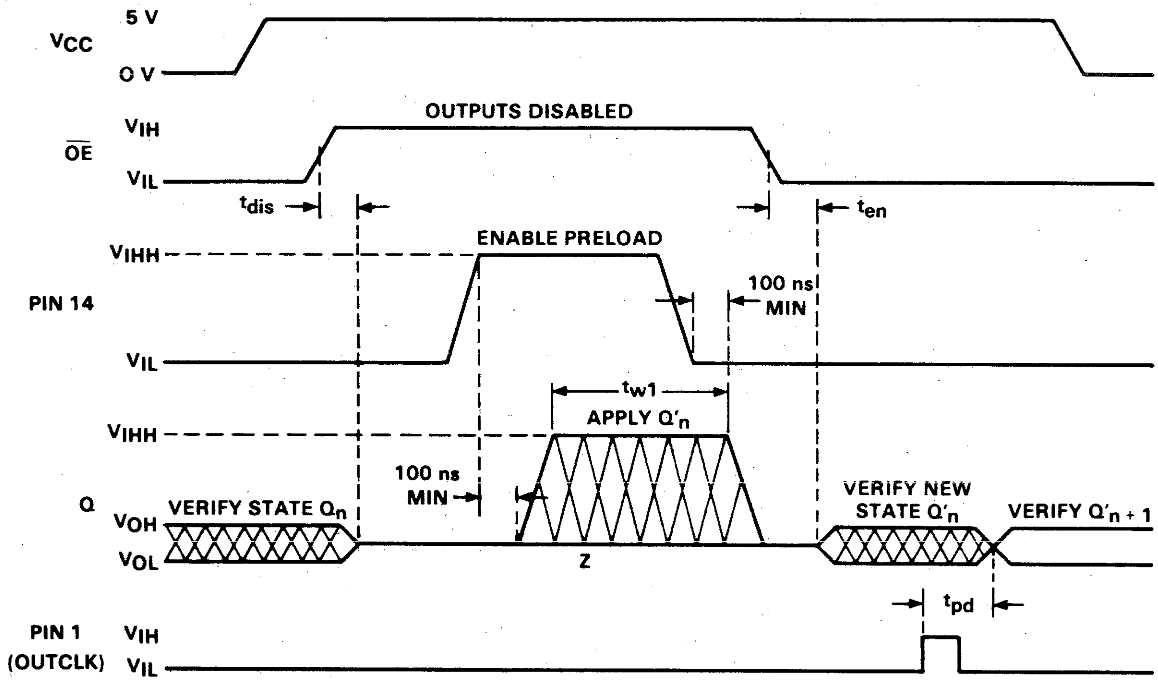

FIGURE 1—PRELOAD WAVEFORMS

preload procedure for registered outputs

Step 1	Pin 13 to V_{IH}, Pin 1 to V_{IL}, and V_{CC} to 5 volts.
Step 2	Pin 14 to V_{IHH} for 10 to 50 microseconds.
Step 3	Apply an open circuit for a low and V_{IHH} for a high at the Q outputs.
Step 4	Pin 14 to V_{IL}.
Step 5	Remove the voltages applied to the outputs.
Step 6	Pin 13 to V_{IL}.
Step 7	Check the output states to verify preload.

TYPES SN54PL839, SN54PL840, SN74PL839, SN74PL840

LOGIC FUNCTION

f(I) = P0 + P1 . . . P31 for polarity link intact
f(I) = $\overline{P0}$* $\overline{P1}$* . . . *$\overline{P31}$ for polarity link open
where P0 through P31 are product terms

description

The 'PL839 (3-state outputs and the 'PL840 (open-collector outputs) are TTL field-programmable logic arrays containing 32 product terms (AND terms) and six sum terms (OR terms). Each of the six sum-of-products output functions can be programmed either high or low true. The true condition of each output function is activated by the programmed logical minterms of 14 input variables. The outputs are controlled by two chip-enable pins to allow output inhibit and expansion of terms.

These devices provide high-speed data-path logic replacement where several conventional SSI functions can be designed into a single package.

The SN54PL839 and SN54PL840 are characterized for operation over the full military temperature range of −55°C to 125°C. The NS74PL839 and SN74PL840 are characterized for operation from 0°C to 70°C.

description

These fixed-OR arrays with eleven data inputs feature input registers that can be used as they are or be programmed into buffers. Some outputs of the 'PL19R8, 'PL19R6, and 'PL19R4 have registers that can be loaded from the I/O pins by a preload procedure, while others are I/O ports and standard 3-state outputs. All the outputs are automatically set to a low level when power is applied. The −1 and −2 parts offer a choice of operating frequency, switching times, and power dissipation.

The SN54PLR19' is characterized for operation over the full military temperature range of −55°C to 125°C. The SN74PLR19' is characterized for operation from 0°C to 70°C.

PRELOAD PROCEDURES

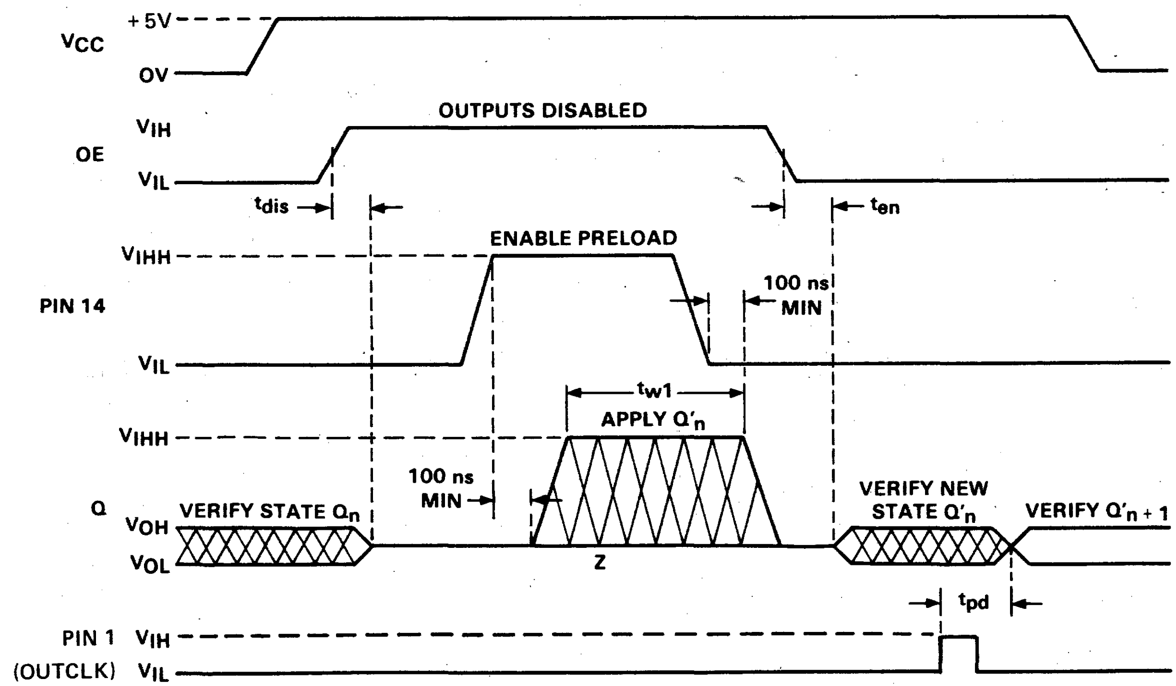

FIGURE 1—PRELOAD WAVEFORMS

preload procedure for registered outputs

Step 1 Pin 13 to V_{IH}, Pin 1 to V_{IL}, and V_{CC} to 5 volts.
Step 2 Pin 14 to V_{IHH}.
Step 3 Apply an open circuit for a low and V_{IHH} for a high at the Q outputs.
Step 4 Pin 14 to V_{IL}.
Step 5 Remove the voltages applied to the outputs.
Step 6 Pin 13 to V_{IL}.
Step 7 Check the output states to verify preload.

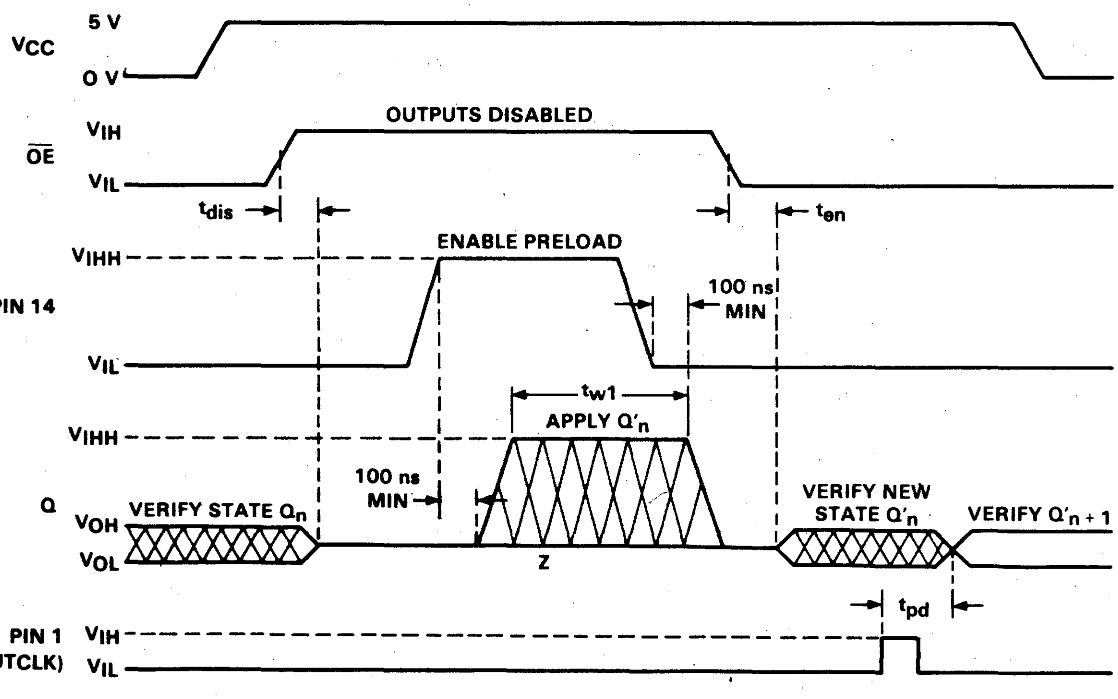

FIGURE 1—PRELOAD VOLTAGE WAVEFORMS

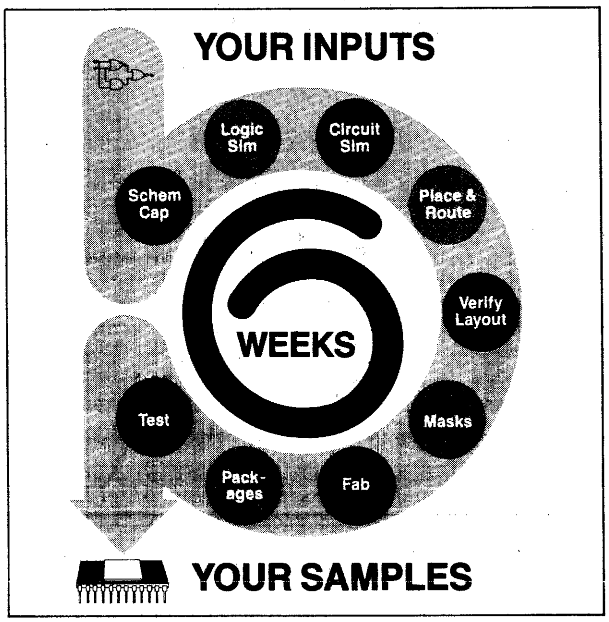
preload procedure for registered outputs

Step 1	Pin 13 to V_{IH}, Pin 1 to V_{IL}, and V_{CC} to 5 volts.
Step 2	Pin 14 to V_{IHH}.
Step 3	Apply an open circuit for a low and V_{IHH} for a high at the Q outputs.
Step 4	Pin 14 to V_{IL}.
Step 5	Remove the voltages applied to the outputs.
Step 6	Pin 13 to V_{IL}.
Step 7	Check the output states to verify preload.

NEED A HIGH PERFORMANCE CMOS GATE ARRAY IN A HURRY? HOW ABOUT 6 WEEKS* FROM TODAY!



We specialize in fast turnaround. We have to. Most of our customers are in computers or peripherals. Fast-breaking markets with narrow windows. Our 6-week design cycle helps them hit these windows. Here's how we do it.

Weeks 1 and 2—We computer-capture your schematic and create a net list. Next, we run complete logic and circuit simulations. Any problems are noted, discussed with you, and fixed. Then, we start developing the test program.

Week 3—Using computer assistance, we place and route your circuit. All functions are implemented with standard precharacterized macrocells.

Week 4—We verify the circuit design. Engineering and design rules are checked. Any violations are repaired. Then, the IC layout is verified against the net list. This guarantees the actual silicon will be error free.

Week 5—We generate PG tapes and convert them to masks. Test program development is completed.

Week 6—Your wafers are personalized and die sorted. Good dice are packaged in our prototype shop and retested. Then, 10 functional engineering samples are shipped to you—air express, if necessary.

From engineering drawings to silicon in 6 weeks. That's the kind of service that can help you beat your toughest competition into the marketplace. It's the difference between winning and losing. First prize versus the booby prize.

The Products—At Universal, you have a choice of two technologies. Choose our fast ISO-5 process for toggle rates to 25MHz. If you need more speed, our ultrafast ISO-3 process can take you to 40 MHz. Eighteen different arrays, ranging in size from 180 to 2400 gates, are available. Chances are, there's an array to fit your circuit perfectly. Also, we offer a complete assortment of packages including leaded plastic chip carriers.

Our Philosophy—Service is our business. Your problems are our problems. You're more than a customer to us—you're a partner. Your success will be our success and we know it.

Give Universal a try! Call us at (408) 279-2830 today. Or contact us at Universal Semiconductor Inc., 1925 Zanker Road, San Jose, California 95112. TWX 910 338 7617.

UNIVERSAL SEMICONDUCTOR INC.

The *Fastest* CMOS in the West!™

*500 gate complexity.

1925 Zanker Road, San Jose, CA 95112 (408) 279-2830

TRAILBLAZING THE VLSI FUTURE

CUSTOM DESIGN, TOOLS AND FABRICATION SERVICES FROM VTI

VTI's custom IC design package features the most advanced CAE/CAD tools, training and support in the industry. What's more, we offer the optimum in quick turn wafer fabrication services that will turn your design into silicon faster than ever before. With VTI, you decide how you want us to assist you in designing a custom chip—so that you get your product out the door and to your customers quickly, efficiently and economically. Our VLSI design services and capabilities include:

- **USER-DESIGNED VLSI** • Our complete and integrated set of CAE/CAD IC design tools provides you with everything you need to design your own ICs. They're easy-to-learn. And they'll help you get your design into silicon today, way ahead of your competition.
- **JOINT DEVELOPMENT VENTURES** • With VTI's joint development program, your engineers work with ours at one of our design centers. You provide your systems design expertise; we complement that with our CAE/CAD tools, IC designer support and facilities. Together, we design ICs for your specific applications needs.
- **DESIGN CONSULTATION** • Use VTI's extensive capabilities as a consulting service. You take primary responsibility for your chip design; when you want or need specialized IC design experience, call on us and exploit our VLSI expertise.
- **VTI DESIGNED** • Or call on VTI's full-custom services. Tell our experienced and innovative design engineers your application requirements. We'll analyze your IC needs, and provide the best design solution for you using our computer-aided design system, the most fully-integrated VLSI circuit CAE/CAD system available.

VTI'S SILICON FOUNDRY: WE CALL IT THE SILICON EXPRESS™

So where do you go once you have your custom IC design? How do you turn it into silicon? Before, you had to deal with fabrication services that had high volume requirements. But VTI has changed that for good.

The VTI Silicon Express, our silicon foundry service, accommodates all of your fabrication needs—from prototypes to full production runs. Regardless of your volume requirements, whether you use our design system or design your own chip. And there's something else we give you that was unheard of until now: superfast turn times.

We've invested enormously in our high technology, quick turn wafer fabrication facility. You'll find that our foundry offers you more options, more services and more benefits than any other silicon fabricator.

- **QUICK TURNS** • Usually 14 days from mask entry to wafers out, 21 days to packaged prototypes.
- **ADVANCED PROCESSES** • State-of-the-art CMOS, HMOS and NMOS in a variety of process options.
- **TECHNOLOGY COMPATIBILITY** • Assured for custom ICs designed either with VTI's integrated CAE/CAD system or your own CAD tools.
- **VTInet™** • The electronic foundry network that links you directly with us. Send your CIF, pattern generator or data base files through VTInet. Transmit your data base within hours through a system with built-in safeguards that enforce security and ensure our proprietary obligations to you.

Bring us your designs or your tooling. VTI's Silicon Express—just think of us as your silicon manufacturing arm. We do.

AVAILABLE PROCESSES

Rule	NMOS	HMOS I	HMOS II	CMOS

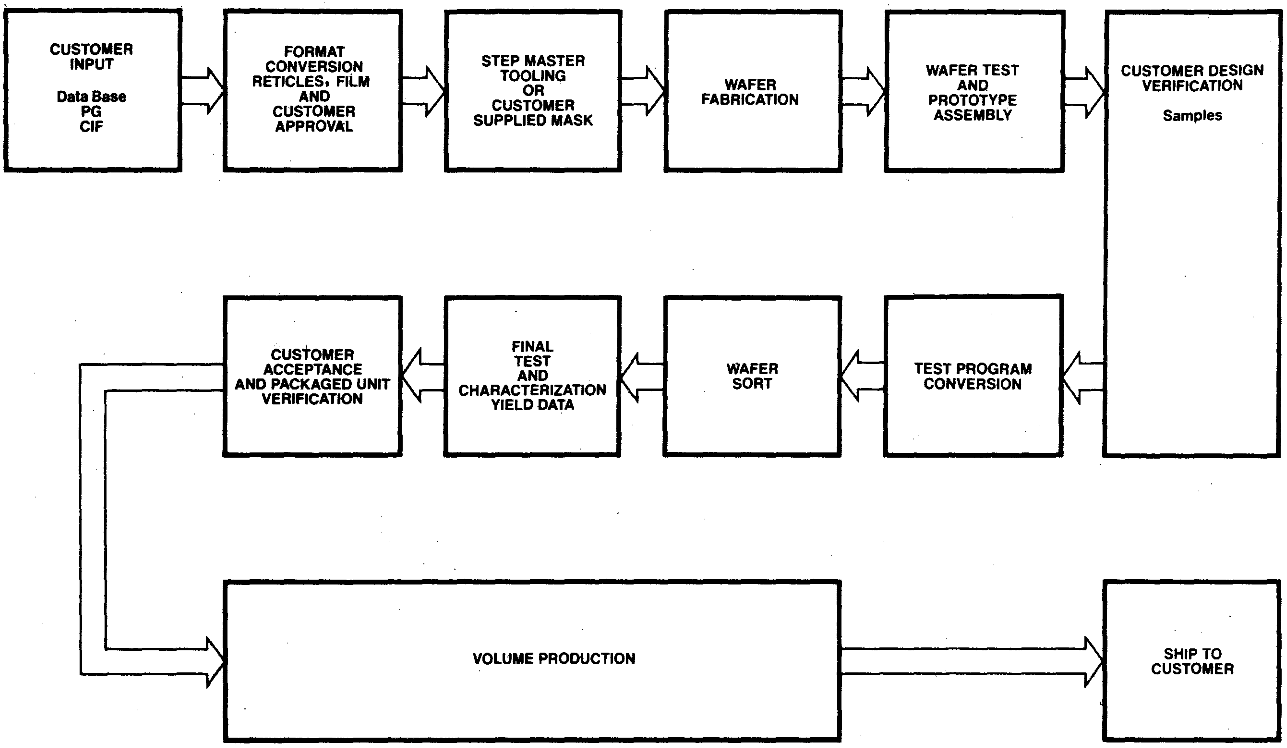
VTI CUSTOMER INTERFACE—THE SILICON EXPRESS



NEW APPROACHES, NEW IDEALS: VTI'S VLSI DESIGN SYSTEM

Times change. We've entered the VLSI technology era. Here today for tomorrow's designs. Until recently, specialized IC design hardware simply didn't have all the capabilities you needed, and cost a fortune. Today, low cost advanced workstations do a better job at a fraction of that cost. VTI has exploited this technological breakthrough to develop a CAE/CAD package which operates on general purpose computers, yet offers higher performance than ever before. And all in a familiar environment, including multiple-windows and mouse-controlled entry:

- Chip planning and schematic capture
- Composition tools
- Cell Compiler libraries
- Logic and timing simulators

We've created a CAE/CAD VLSI design system that involves your specialized knowledge and unique requirements right from the inception of your custom chip. And without requiring MOS/VLSI design expertise. VTI's complete array of VLSI CAE/CAD tools are unparalleled in the industry. After all, we've based these tools on our extensive real-world experience in IC design and manufacture.

So you get the best of all worlds: a set of CAE/CAD tools designed by the premier group of VLSI CAE/CAD programmers in the semiconductor industry—refined and tested under real world conditions before they're released to you. With VTI, you get the high performance and efficiency, proprietary security and long-term economy associated with conventional full-custom design. . . but with the convenience, ease of use and fast turnaround you'd normally expected only from gate arrays.

We offer a tri-level design system. So you get a design system that suits your present needs along with the capability to add increasingly sophisticated features as you require them, when you want them. Flexible, user-friendly, powerful—VTI's state-of-the-art VLSI integrated design system.

TRAILBLAZING THE VLSI FUTURE

VTI OFFERS A CHOICE OF DESIGN APPROACHES

Design Approach	User	Benefits
LEVEL 1 LOGICOMP™	Logic and Systems Engineer	▪ Easy to Learn ▪ Very Rapid Design
LEVEL 2 SYMCAD™	Systems and IC Designer	▪ Unique Cell Design ▪ Higher Performance
LEVEL 3 GEOCAD™	Experienced IC Designer	▪ Lowest Cost ▪ Highest Performance

LOGICOMP: DESIGN TOOLS THAT SPEAK YOUR LANGUAGE

VTI's LOGICOMP design system gives you, the systems designer, access to the most fully-integrated and sophisticated CAD tools in the industry. Whether or not you've ever designed an IC before, LOGICOMP serves as an accessible, highly-efficient package that includes all the CAD tools you need to:

- Enter a system schematic
- Construct a corresponding physical layout from predefined functional elements in VTI's Cell Compiler library
- Verify interconnection and function correctness of the physical layout, as specified by your schematic representation
- Automatically route all interconnects

LOGICOMP LOGIC COMPILER™ SYSTEM

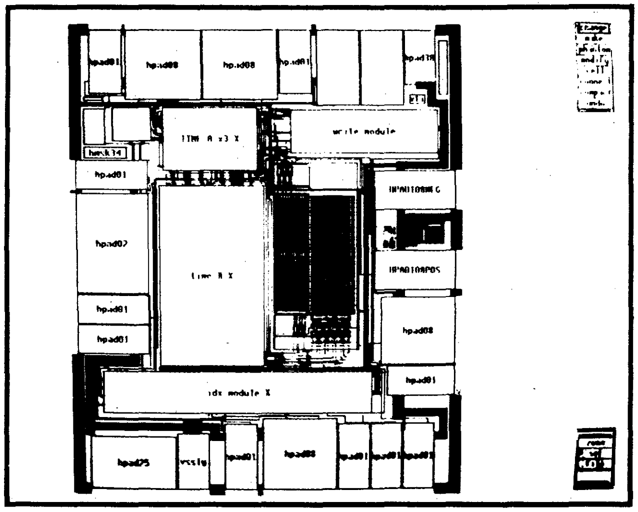
VTI'S SCHEMATIC EDITOR



CELL COMPILERS: BUILDING BLOCKS FOR YOUR SYSTEM

VTI's unique Cell Compiler library—a concept that offers you ready-to-use functional elements to design your chip. Sounds like a standard cell library? Most people think so too, at first. Until they realize that VTI's Cell Compiler library offers the most advanced alterable set of cells available. Our Primary and Extended cell libraries compile physical layout databases for simple and complex IC building blocks. And we offer them in CMOS as well as HMOS. You specify the cell characteristics before compiling to physical layout. So you get a library with thousands of cell variations. Far more than the few hundred that conventional standard cell libraries offer.

With VTI's Cell Compilers, you specify your IC's unique requirements such as circuit speed, drive capability, data path width and functional repetition. What's more, with automatic cell layout generation, you don't need first-hand knowledge of MOS design rules or specific process details.

CELL COMPILER FUNCTIONS

VTS810: Primary Library
AND/NAND Gates
Clock Generators
Exclusive OR/NOR Gates
Flip-Flops
Input Buffers
Inverting Buffers
OR/NOR Gates
Quasi-Static Latches
3-State Buffers
TTL I/O Buffers

VTS820: Extended Library
Adders/Subtractors
ALUs
Counters
Data Demultiplexers
Data Multiplexers
Full Adders
Pad-Ring Generators
PLA Generators
RAM Generators
ROM Generators
Shift Registers
Up/Down Counters

SYMCAD: BETTER CAD, LOWER COST

Your system design requires an IC made up of cells that simply don't exist. You could settle for a chip that's been glued together and works; but you'd like to design your own cells. You want a custom VLSI circuit that performs exactly the way you want it to, consumes the minimal power and takes only as much (or as little) room as necessary.

Obviously, you want access to a custom VLSI CAD system. Specifically, an interactive symbolic design package. And you'd prefer one without having to deal with awkward grids. Well, that system exists and is available to you. It's called SYMCAD: VTI's SYMbolic CAD system.

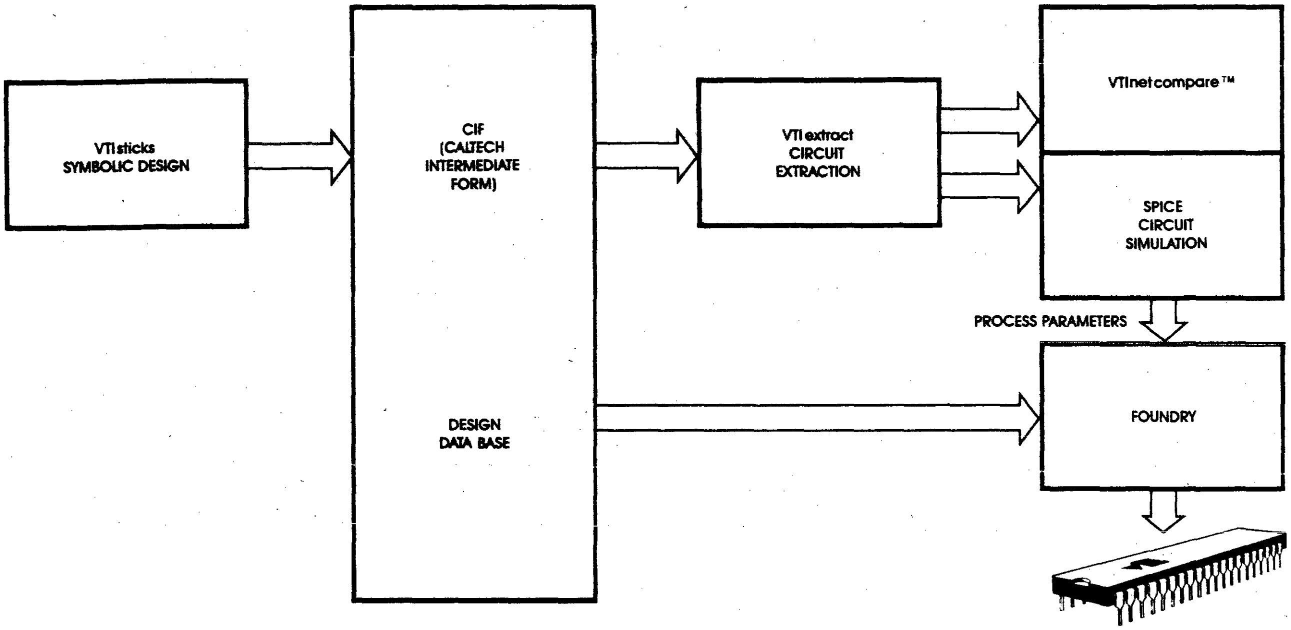
SYMCAD offers you:

- VTIsticks™ editor
- VTIextract™—Circuit function and evaluation tool
- ERC—Electrical Rule Checker

A variety of features, integrally connected. The ideal way to design your system's components. SYMCAD: heralding your VLSI design future.

TRAILBLAZING THE VLSI FUTURE

SYMCAD SYMBOLIC COMPUTER-AIDED DESIGN SYSTEM



VTIsticks : THE KEY TO PRODUCTIVITY THROUGH SYMBOLIC DESIGN

You've been locked out of the IC design phase for your system. That is, up until today. Now, VTIsticks opens the door that's kept you from designing the chip you need. VTIsticks gives you total control over every facet of your system design. That's how it should have been. That's how it can be now. VTI's cell design tool automatically generates your IC layouts in compliance with user-specified design rules. Most importantly, the system is simple to use. You only have to specify the chip topology symbolically; then VTIsticks converts your IC design to layout and compacts it to the minimal size. The benefit? Immediate custom MOS/VLSI circuit design capability without detailed knowledge of MOS/VLSI design techniques. And with assured results everytime.

VTIsticks features:

- Automatic conversion from VTIsticks to layout
- Automatic compaction to the minimum size allowed by design rules
- User-defined constraints on IC compaction
- Automatic recognition and placement of contacts
- Transistor size display and editing
- Symbolic naming

VTIsticks automatically recognizes and places contacts between layers and transistors. And VTIsticks' pop-up menus and mouse input provide you with an efficient way to enter your design. With VTIsticks, you virtually eliminate keyboard entry in the layout phase of IC design.

With VTIsticks, you'll create new cells that are nearly as dense as those laid out by hand. Even with those industry-unique features, VTIsticks is easy-to-learn and easy-to-use. Your design will cost you less time, effort and money.

GEOCAD PHYSICAL LAYOUT EDITOR: GETTING THE SMALLEST CELLS POSSIBLE

VTI's Physical Layout Editor, GEOCAD, is the premier interactive graphics tool for developing the most compact custom cells while maximizing performance. VTI allows you to design with arbitrary geometries. Once you've completed your design, the design rules can be verified with VTIdrc and the layout against the original logic design using VTIextract and VTIcompare.

Using GEOCAD is easy. You gain access through multiple windows whose sizes and positions you define. And then draw the graphics with a mouse.

The Layout Editor features:

- Any angle lines, any angle polygons
- Predefined and user-defined macros
- Edit-by-layer capability
- Cut, paste and edit commands, both within a window and between windows

VTI DESIGN CENTERS: PROVIDING DESIGN FACILITIES AND CONSULTING SERVICES

We're putting all our design tools in your neighborhood—so you can reap the benefits of custom design. Use one of VTI's Design Centers as your own. We've staffed each of them with applications engineers, all of whom are ready to assist you in every way with chip design requirements and software support.

Our design centers are located at:

- 2235 Qume Drive
San Jose, CA 95131
408-943-0264
- 83 Cambridge Street
Burlington, MA 01803
617-229-6555
- 850 East Arapaho Road
Richardson, TX 75081
214-387-8350
- Via G. Jervis, 77
10015 Ivera (To)
Italy
39-125-52-2010

You can come to our training classes. In less than two weeks, our VLSI Design Training Program will teach you the complexities and the simplicity of VTI's CAE/CAD design tools. In fact, by the end of your first week in Level 1, you'll be ready to design your own custom IC with VTI's unique Cell Compiler library. In Level 2, you'll learn the latest in MOS/VLSI design principles and the use of the VTIsticks graphics editor so you can design your own custom ICs. Our Level 3 course teaches you how to design your own Cell Compiler library as well as advanced layout editing techniques and advanced packaging and test considerations.

VLSI TRAINING, TOOLS AND SERVICES FROM VTI. INTENSIVE. FAST. COMPREHENSIVE.

VLSI technology. An idea that's become a reality. With VTI, you'll take a step-by-step path to macrocell-based VLSI design nurtured by the experience and innovative prowess of a leading full-service VLSI semiconductor company. Whether you only need design training, our exciting design tools, or want the services of our designers or silicon foundry, you'll get the highest performance, the most efficient design combined with the latest knowledge in the semiconductor state-of-the-art.

After all, that's how VLSI technology is defined.

MANUFACTURERS AND DISTRIBUTORS/ REPRESENTATIVES DIRECTORY

The Manufacturers and Distributors/Representatives Directory is a comprehensive telephone directory of the entire IC industry. It places at your fingertips the names and phone numbers you need to know. It includes manufacturers, international sales offices, representatives and distributors; for manufacturers with data pages, it also includes domestic sales offices, representatives and distributors. The manufacturers' listings tell you where and whom to call to obtain technical and ordering information. It enables you to ask for the right person or phone extension. It gives you the terminology understood by the individual company's switchboard operators, e.g., in some companies you should ask for sales, in others, customer service. This directory will reduce frustration and save you time.

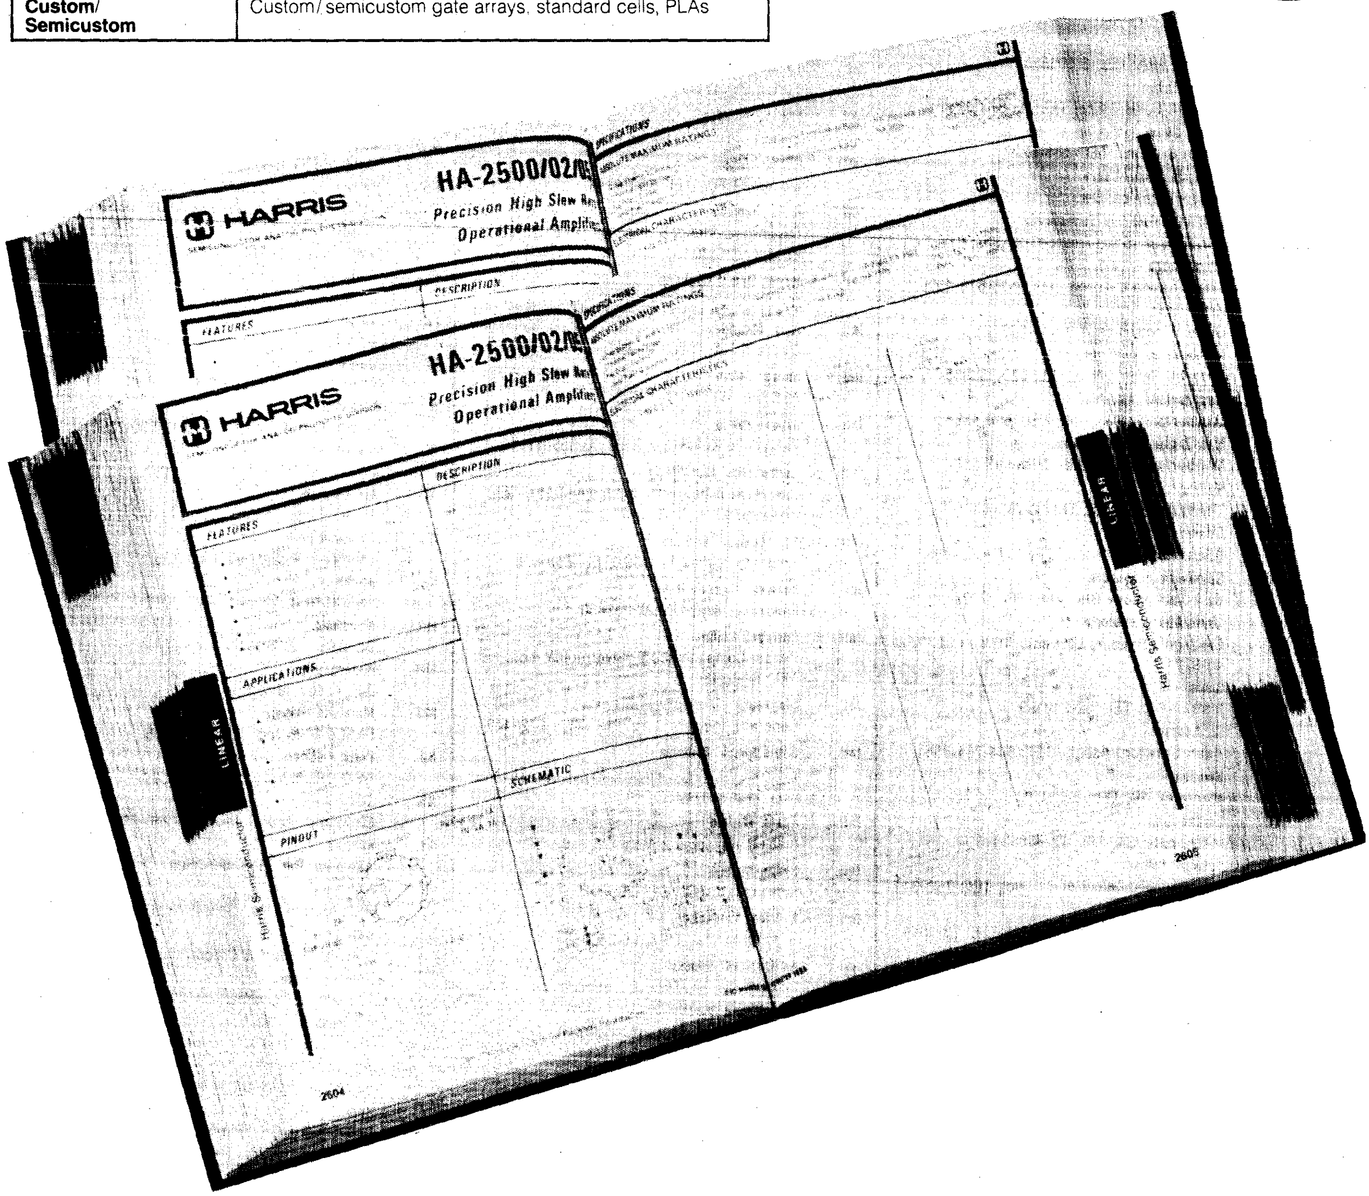
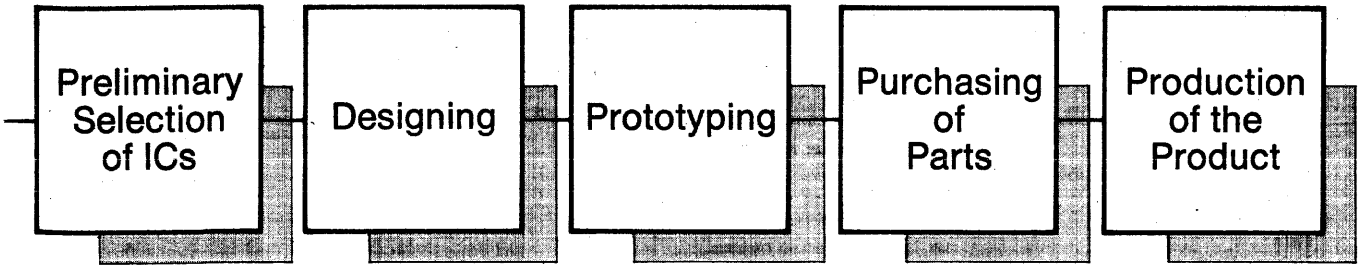
SECTION	PRODUCTS IN SECTION
Digital	Arithmetic functions, buffers/inverters, counters, decoders, drivers, flip-flops, gates, latches, memories, multiplexers, multivibrators, oscillators/dividers, shift registers, translators.
Military	Military-commercial/commercial-military cross-references; QPL-38510/xx list; military ICs.
Microprocessor	Microprocessors, microcomputers, and microprocessor system components.
Microprocessor Development Systems	Systems covered range from simple, single-user, text-editing stations to multi-user computers, dedicated to software development.
Microcomputer Boards	Microcomputer boards, hardware and software support.
Microcomputer Support Boards	Boards with functions and peripheral controllers
Interface	Analog switches, analog-to-digital converters, digital-to-analog converters, display converters, display drivers, error checking circuits, keyboard encoders-decoders, drivers, sense amplifiers, and transmitters/receivers.
Linear	Special-purpose amplifiers, arrays, comparators, consumer circuits, followers, operational amplifiers, phase locked loop circuits, telecommunication circuits, timers, voltage regulators, and special functions.
Memory	Character generators, code converters, FIFOs, LIFOS, E²PROMs, PROMs, RAMs, ROMs, and shift registers.
PROM Programmers	Programmers for system development, production, and field service.
Custom/ Semicustom	Custom/semicustom gate arrays, standard cells, PLAs

SIX KEY PHASES OF NEW SYSTEM DEVELOPMENT

Planning

A good desigr





is "mastered" early.

When is the best time for an engineer to pick the integrated circuits that will go into his next design?

The best time is at an early stage in the design process when the engineer's plans are still flexible enough to take full advantage of the features selected.

There is a point in the early phases of every design when engineers focus on selecting integrated circuits. Specifications are examined, relative strengths and weaknesses of various devices are weighed, and the field of candidates is chosen. This is the critical time in the design cycle when designers want to be sure the right devices are in serious contention for their applications.

It is at this moment that the engineer reaches into his technical reference library. Of the material on his shelves, **IC MASTER** is the only reference source that has been especially prepared for this moment.

The engineer can look up each precise function that he needs and see all of the devices and their manufacturers that might satisfy his requirements. He sees this information for all manufacturers, not just for advertisers. But if an IC maker has chosen to include technical data for his products in **IC MASTER,** the engineer sees each index listing for that manufacturer in **bold face type** accompanied by the **page number** on which the data appears; the engineer can then turn immediately to the advertiser's technical data and see if the device fits his needs.

Next time, begin with the MASTER.

IC MASTER
